Re: Transmittal of Annual Groundwater Monitoring Status Report for 2008
Order on Consent Index #A7-0502-0104, Site #704014

Dear Mr. Knizek:

The purpose of this letter is to transmit the Annual Groundwater Monitoring Status Report for 2008 in accordance with the April 15, 2009 submission date specified in the Operation, Maintenance, and Monitoring Plan, Third Update, Appendix A-3 (Groundwater Monitoring Plan), Section 6.2.

Should you have any questions concerning the contents of this Annual Report for the Site, please contact me at 703-257-2587.

Sincerely,

M. E. Meyers

1 INTRODUCTION

This Annual Groundwater Monitoring Status Report for 2008 has been prepared by Groundwater Sciences Corporation (GSC) and Groundwater Sciences, P.C. (GSPC) for International Business Machines Corporation (IBM). Its purpose is to satisfy the annual reporting requirement for IBM's former Endicott facility, located in the in the Village of Endicott, New York (Figure 1-1, "Huron Plant Site"). This report is being submitted to the New York State Department of Environmental Conservation (NYSDEC) pursuant to Order on Consent Index # A7-0502-0104 (Order) for the former IBM Endicott facility (Site # 704014).

The section of the Order entitled, "Miscellaneous Activity C: Operation, Maintenance and Monitoring" describes the requirements for a comprehensive operation, maintenance and monitoring plan (OM&M Plan) and this report has been prepared in accordance with the site-specific OM&M Plan entitled "Draft Groundwater Remediation Systems Operations, Maintenance and Monitoring Plan, Fourth Update," dated May 29, 2008. Figure 1-2 shows the Site and the operable units (OUs) identified in the Order, which initially were coincident with various hydraulic capture zones. Also shown on Figure 1-2 is the area of the Site referred to as Miscellaneous Activity A, which is identified in the Order as an Interim Remedial Measure for Off-Site Capture Zone A.

As specified in Section 4.2.2 of the May 2008 OM&M Plan, groundwater monitoring data generated from January 1, 2008 to December 31, 2008, including groundwater extraction volumes, groundwater elevations, and analytical chemistry data, is presented in this report.

1.1 Background Information

The corrective action history at the Site covers a period of roughly 29 years, beginning with the discovery of contamination in groundwater at the Site in 1979. IBM subsequently began a Corrective Measures Program to evaluate groundwater quality and remediate groundwater contamination beneath IBM's former Main Plant facility on North Street in the Village of Endicott. In early 1980, IBM began to control and remove sources of contamination beneath its former facility at the Site through the use of vertical extraction wells to remove both groundwater and separate-phase volatile organic compounds (VOCs). Since 1980, extraction operations have been

performed at 31 extraction wells operating over various time periods. This report presents the results of the groundwater remediation activities for calendar year 2008.

1.2 2008 Highlights

The following subsections summarize the activities and results from the operation, maintenance and monitoring of groundwater remediation systems at the Site in 2008. The highlights of operation and monitoring for 2008 include:

- The operation of four (4) extraction wells in the On-Site Capture Zone continues to control potential flux from sources in the Railroad Corridor Source Area (RCSA, Operable Unit #1 (OU#1)) and is responsible for the removal of nearly 2,800 pounds of volatile organic compounds (VOCs) from the groundwater in OU#1.

- The installation of 23 additional wells (22 monitoring wells and one extraction well) brought the total number of wells installed since 1979 to 523.

- A total of 23 groundwater extraction wells operating at the Site in 2008 removed nearly 3000 pounds of VOCs, bringing the total mass of VOCs extracted since 1979 to approximately 802,000 pounds.

- Groundwater sampling was performed at 317 monitoring and extraction wells and water levels were measured in 475 wells in accordance with the Groundwater Monitoring Program and various work plans.

- The nearly continuous operation of six extraction wells in Off-Site Capture Zone A and the Southern Area (OU#3) during 2008, augmented by operation of two other extraction wells during part of 2008, continues to generate the following benefits:

    - Virtually all chemical flux crossing North Street (Operable Unit #2) continues to be intercepted before reaching Off-Site Capture Zone A.

    - Chemical concentration maps of the various compounds of concern show that the core of the plume continues to be segmented into numerous discontinuous areas, which are the result of aggressive groundwater extraction efforts.

- Extraction well EN-D49 extracted nearly the same mass of VOCs from the bedrock aquifer in 2007 and 2008 as former extraction well EN-CAF extracted in 2005, although this was achieved at a higher flow rate. Extraction well EN-D49 is maintaining control of the plume of VOCs in bedrock groundwater.

- Re-injection of treated groundwater and city water began at the end of November 2008 at injection well EN-510T. The purpose of this re-injection is to partially re-saturate the Upper Aquifer and enhance flushing of the remaining TCE mass from this unit.

1.2.1 Site Characterization

In the time period from early 1979 through the end of 2008, 523 wells were installed as part of the corrective action program or ongoing investigations at this Site; 23 of these wells were installed in 2008. The total includes 227 wells (monitoring and extraction) installed north of North Street on the manufacturing portion of the former IBM facility at the Site, and another 296 wells (monitoring and extraction) installed south of North Street off the manufacturing portion of the former IBM facility at the Site. Plate 1 shows the locations of monitoring wells and extraction wells that were completed through the end of 2008. These wells are also coded on this map according to the geologic unit in which they are completed. Water levels and groundwater samples collected from these wells have been used to characterize the pattern of groundwater flow beneath the Site and adjacent areas. The most recent comprehensive interpretations of these data are provided in the annual reports for 2004 through 2007 and in the *Supplemental Groundwater Assessment Final Report* (SGA Final Report, December 31, 2003, revised and updated May 17, 2004), which presents extensive analysis and interpretation of the geology, hydrogeology and groundwater chemistry at and in the vicinity of the Site. Additionally, a comprehensive interpretation of the most recent bedrock groundwater data is presented in the *Annual Groundwater Monitoring Status Report for 2007* (2007 Annual Report, dated April 14, 2008) and in the *Bedrock Groundwater Supplemental Remedial Investigation (SRI) Report* dated December 19, 2005.

Following recommendations made in the SGA Report and in accordance with the Order, additional investigations were performed in 2004 and work plans were prepared for additional investigations, some of which are ongoing or were completed from 2005 to 2008. As prescribed in the Order, these additional investigations are organized within seven distinct operable units (OUs), as shown

on Figure 1-2. Also shown on this figure are areas corresponding to various capture zones (e.g., Off-Site Capture Zone A). As extraction well operations are altered or expanded, the boundaries of these capture zones change. However, the terminology for these areas originally established in the SGA and carried over into the Order has been maintained where practical. The label titled, "Miscellaneous Activity A: Plume Reduction in Off-Site Capture Zone A" on Figure 1-2 corresponds to the fast-track start-up of additional extraction wells in Off-Site Capture Zone A that began in 2004 and was completed in the first quarter of 2005 as an Interim Remedial Measure (IRM). Extraction test well EN-284TD (now operated as well EN-284P), which was installed as part of the fast-track IRM, continues to operate.

1.2.2 Groundwater Extraction and Treatment Systems

As of December 31, 2008, groundwater containment and recovery operations consisted of 22 extraction wells pumping at an average combined rate of about 255 gallons per minute (gpm), based on data from the last three months of 2008. The locations of these extraction wells are shown on Figure 1-3. Average well yields during 2008 ranged from less than 0.5 gpm at wells EN-89R and EN-428 to greater than 40 gpm at extraction wells EN-447T and EN-499T. Groundwater pumped from the extraction wells was treated during 2008 at one of six separate standalone treatment facilities operated by IBM on Jefferson, Garfield, Adams and Robble Avenues; on Clark Street; and on Hayes Avenue (through April 10, 2008). All of these treatment facilities are shown on Figure 1-3. Significant activities in 2008 relating to extraction and treatment operations are described in Appendix H.

1.2.3 Groundwater Monitoring

In August 2004, the groundwater monitoring program activities that were being performed pursuant to the RCRA Permit for Corrective Action were incorporated into the Order. The Order, which became effective in August 2004, terminated the RCRA Permit for Corrective Action. During the first half of 2008, sampling was performed in accordance with the Groundwater Monitoring Plan (GMP) shown on Tables A-1 and A-2 of Appendix A-3 of the Third Update to the OM&M Plan (May 30, 2007). Sampling during the second half of 2008 was performed in accordance with the GMP shown on Tables A-1 and A-2 of Appendix A-3 of the Fourth Update to the OM&M Plan (May 29, 2008). A total of 380 hydraulic effectiveness monitoring wells are included in the

groundwater monitoring program that was implemented on July 1, 2008. Groundwater sampling is performed at 283 of these wells.

In addition to these routine sampling activities, many samples were collected as part of investigations to further characterize the Site. Some of this sampling data has previously been reported to NYSDEC in Supplemental Remedial Investigation (SRI) reports or Analytical Summary Reports (ASRs). Although these data were included in the previous reports, the results of all groundwater samples collected during the 2008 calendar year are included in this annual report.

1.3 Organization of Report

The remainder of this report is organized as follows. Section 2 describes the Groundwater Monitoring Program (GMP) activities conducted in 2008. Sections 3 and 4 discuss updated analysis and interpretation of the geology, hydrogeology, and hydrogeochemistry of the Site. Sections 5 and 6 discuss the remediation systems, including contaminant recovery, and the progress of remediation. Finally, Section 7 provides a list of references.

2 GROUNDWATER MONITORING PROGRAM

Field activities for the groundwater monitoring program consist of groundwater elevation measurements, groundwater sampling, and monitoring well inspections. These activities were performed by qualified field personnel from Groundwater Sciences Corporation.

2.1 Groundwater Extraction Wells

As described in Section 1.3, the groundwater collection and treatment system in 2008 consisted of 23 extraction wells operating at various times throughout the year, with 22 extraction wells operating at the end of 2008. (For the purposes of this report, wells that operate as backup wells for an adjacent extraction well were not counted.) Except for periods of testing and maintenance, the system has operated continuously since 1980. Prior to 2006, between 110 and 140 million gallons of groundwater was being extracted and treated annually. With the startup in 2006 of six new extraction wells (EN-215T, EN-447T, EN-451P, EN-491T, EN-492T, and EN-499T), groundwater extraction increased significantly to 176 million gallons in 2006. This extraction rate could not be sustained through 2007 and 2008 as the Upper Aquifer was being significantly dewatered and, as a result, the volume of water available for pumping during 2008 decreased to 142 million gallons.

Pumping volumes are recorded daily for each extraction well. The first table in Appendix A summarizes the monthly pumping volumes and average flow rates for each extraction well for the period January 1, 2008 through December 31, 2008. Also shown on this table is the volume treated at each of the groundwater treatment facilities. The mass of VOCs recovered through groundwater treatment is discussed in Section 5.2.

One new extraction well, EN-107R, was installed in November 2008 as a replacement for extraction well EN-107 in 2009. EN-107R is located about 10 feet west of EN-107 in the Railroad Corridor Source Area (OU#1). EN-107R was installed with a metered well sequestering agent feed system in the well sand pack and was constructed in this manner to limit biological fouling of the well screen and the resulting frequency of needed well rehabilitation activities. Groundwater pumped from EN-107R will be treated at the Clark Street GTF.

2.2 Groundwater Monitoring Wells

Groundwater monitoring well activities performed during 2008 included installation of new monitoring wells, measurement of groundwater elevations, inspection and maintenance of monitoring wells including repairs to surface seals, and collection of samples for chemical analysis. Each of these activities is described in one of the subsections that follow.

2.2.1 Installation of New Monitoring Wells

Twenty-two monitoring wells were installed in 2008 to support various investigation activities at the Site. Installation of these wells is described in the following sections, which are organized by operable unit or miscellaneous activity for which each well was intended.

2.2.1.1 OU#1: Railroad Corridor Source Area Monitoring Wells

Well EN-522 was installed in May 2008 immediately east of extraction well EN-107. The purpose of this well was to provide an additional monitoring point for EN-107R startup operations planned for 2009.

2.2.1.2 OU#2: North Street Area Monitoring Wells

Well EN-521 was installed in January 2008 in accordance with the Interim Remedial Measures Work Plan for Enhanced Flux Control dated July 12, 2007. This monitoring well and well EN-520, together with a series of direct-push borings drilled in OU#2, provided additional information on configuration of the Upper Aquifer in the area east of Oak Hill Avenue between North Street and the railroad tracks.

2.2.1.3 MA-A: Off-Site Capture Zone A Effectiveness Monitoring Wells

No new monitoring wells were installed in Off-Site Capture Zone A.

2.2.1.4 OU#3 and OU#4: Southern Area and Ideal Cleaners Area Monitoring Wells

No new monitoring wells were installed in the Southern Area or Ideal Cleaners Area.

2.2.1.5 OU#5: Building 57 Area Monitoring Wells

Twenty monitoring wells were installed in OU#5 as part of continuing investigation activities in 2008. Wells EN-678 through EN-687 were installed in the Hayes Avenue Parking Area (Lot 26). Wells EN-674 and EN-675 were installed near extraction well EN-623. The remaining eight wells (EN-660, EN-661, EN-669, EN-670, EN-671, EN-672, EN-676, and EN-677) were installed inside Buildings 57 and 57A.

2.2.1.6 OU#6: Plume Control in Bedrock Groundwater (Upper Aquifer Wells)

No new monitoring wells were installed in OU#6 as part of the Supplemental Remedial Investigation Work Plan for Dye Tracer Testing dated October 26, 2006.

2.2.2 Groundwater Elevation Measurements

Groundwater elevation data is maintained in a spreadsheet and is calculated by subtracting the measured depth to water from the surveyed elevation of the measurement point listed in Appendix C. For most wells, the designated measurement point is the top of the inner well casing (the "TOC Elevation"). This measurement reference point is typically notched into the top of the well casing.

2.2.2.1 Supplemental Groundwater Elevation Measurements

Groundwater elevations were measured manually using portable electronic water level meters at each active or inactive extraction well and its associated observation well weekly throughout 2008. Water levels were also measured each time a well was sampled. More than 3,500 supplemental groundwater elevations were measured in 2008.

2.2.2.2 Comprehensive Water Level Measurement Events

In addition to the supplemental measurements described above, 1899 water levels were measured manually using portable electronic water level meters during water level measurement events. This total does not include 193 instances where a well was determined to be "dry" at the time of measurement. The total also does not include instances where a well was inaccessible or could not be measured due to the dye tracer testing being conducted for the SRI associated with OU#2 and

OU#6; water levels in those wells were not measured so as to avoid the potential for cross-contamination of various dyes due to the use of non-dedicated water level meters.

The principal water level measurement events are listed below.

1. A supplemental water level measurement event on February 26, 2008 (171 measurements) associated with the IRM investigation for enhanced flux control in the western portion of OU#2.

2. Comprehensive semiannual water level measurement events on May 29, 2008 (331 measurements) and August 28-29, 2008 (385 measurements). These events included monitoring wells completed in the Bedrock Aquifer as well as those completed in the Upper Aquifer.

4. A supplemental, comprehensive water level measurement event on November 18, 2008 (354 measurements). This event was performed in advance of starting up the injection test at well EN-510T.

5. Water level measurement events associated with OU#3 in March, April, July, October, and December (66 to 80 measurements per event).

6. Water level measurement events associated with activities at OU#5 in April 2008 (192 measurements) and November 2008 (69 measurements).

These measurements were made in accordance with the Groundwater Monitoring Plan (GMP) and investigation work plans. Additional wells not listed in the GMP were also measured during these events. All of these data are shown on the groundwater elevation tables in Appendix C of this report.

2.2.2.3 Continuous Water Level Monitoring

Continuous water level recorders were operated in 94 monitoring wells in accordance with approved work plans for Interim Remedial Measures in Off-Site Capture Zone A (Miscellaneous Activity A) and the Southern Area (OU#3). These measuring and recording devices consist of a pressure transducer and datalogger that electronically records periodic readings from the transducer.

Water level data was periodically downloaded from these dataloggers and was converted to groundwater elevations. Manual water level measurements were used to calibrate the data collected by the dataloggers. Continuous water level recorders installed in five monitoring wells in the Southern Area (EN-210, EN-401, and the three-well cluster consisting of EN-460A, EN-460B and EN-460C) continued to monitor background groundwater levels and potential effects of river level changes on groundwater levels in that area.

2.2.3 Monitoring Well Specifications and Inspections

All wells have been surveyed for planar coordinates (northing and easting on the state coordinate grid), ground surface elevation and measurement point elevation (typically top of casing). The table of Physical Well Data and Well Specifications in Appendix B presents all of this data plus other information, including a location description, installation date, depth, well screen intervals, casing and screen size and materials, and depth to the bottom of the Upper Aquifer (where the lacustrine silt was encountered). A separate table is provided for the wells in OU#5.

In addition to the inspection performed when each monitoring well is sampled, a comprehensive inspection of the well field was performed throughout 2008. This inspection covered wells in all areas of the Site, including OU#5 (Building 57 Area). The following items were covered during the inspections: (1) measurement of the depth to bottom and comparison of this depth to the well's reference depth to determine the need for redevelopment due to buildup of silt; (2) assessment of the legibility of the well tag, visibility of the survey mark, and need for painting or maintenance of the standpipe or manhole; (3) assessment of the condition of the well seal; (4) assessment of the general downhole condition of the well, including the presence of bends or obstructions and (5) documentation of dedicated equipment. The depth to bottom in some wells was not measured due to concerns associated with the potential for cross-contamination of various dyes injected as part of the dye tracer testing being conducted in OU#2 and OU#6.

2.2.4 Groundwater Sampling

The groundwater sampling and analysis plan for 2008 is summarized in Appendix D. The principal quarterly sampling events occurred in February, May, August, and November 2008. The semiannual sampling events occurred in May and August 2008 and the comprehensive annual

sampling event occurred in August 2008. Monthly samples were collected from all active extraction wells and extraction test wells.

All groundwater samples collected during the first nine months of 2008 (except for interlaboratory duplicate samples) were analyzed by the IBM Hudson Valley Environmental Laboratory, Hopewell Junction, New York. All interlaboratory duplicate samples and all groundwater samples collected during the last three months of 2008 were analyzed by Lancaster Laboratories, Inc., Lancaster, Pennsylvania.

Groundwater samples were also collected from three new monitoring wells installed during field investigation activities from December 2007 through June 2008. These wells consisted of Upper Aquifer monitoring wells EN-520, EN-521, and EN-522. At least three groundwater samples were collected from each new monitoring well.

The remainder of this section presents the analytical results for environmental samples collected during 2008, including QA/QC samples and samples from groundwater monitoring wells and extraction wells.

2.2.4.1 Groundwater Chemistry Results

Groundwater chemistry data generated in 2008 from groundwater monitoring activities is maintained in relational databases that allow for the efficient storage of all parameters analyzed and concentrations reported for a particular combination of field and laboratory sample identification numbers. The relational databases also include fields such as laboratory name, analytical method, sample date and time, sampling personnel, analytical parameter, parameter value or concentration, and units of measure.

Full report packages of analytical chemistry data ("data deliverables packages") were prepared for samples collected and analyzed in 2008. Information regarding the analytical method, sample results, QA/QC results, chain-of-custody documentation, laboratory correspondence, and raw data was provided with these data deliverables packages.

Following review and verification of the data deliverables, analytical data were submitted to a third-party data validator (Trillium, Inc. or Conestoga-Rovers & Associates), who assessed the acceptability and usability of the data according to criteria contained in the most current EPA

Region 2 validation criteria for organic data. Laboratory analytical results were assessed by the data validator for compliance with chain-of-custody procedures, holding times, system monitoring compound (surrogate) recovery, matrix spikes, blanks, contamination, GC/MS instrument performance check, compound quantitation and reported detection limits, instrument calibration, and internal standards.

Upon completion of validation, a data validation report or data usability summary report (DUSR) was prepared for each data deliverables package. Limitations on the use of laboratory data were reported by means of qualification codes as summarized in the data validation reports or marked on the laboratory analytical data report hard copies. The most common qualification code is a "J", which indicates that the reported concentration is estimated. The relational databases were then updated accordingly with the data qualification codes and corrected concentrations, where necessary.

A summary printout of the groundwater chemistry data for all samples collected in 2008, including duplicate samples, is presented in Appendix E. The data presented in Appendix E are shown in alphanumeric ascending order by sample location (well number) and then chronologically within each sampling location. Analytical chemistry data for the influent and effluent of the groundwater treatment facilities is also presented in Appendix E. Groundwater chemistry data for monitoring wells located on private property has been previously reported quarterly to the property owners.

2.2.4.2 Quality Assurance/Quality Control Results

QA/QC analytical data for 2008, including duplicate samples, equipment rinse blanks, and trip blanks, is discussed in the following subsections. Analytical chemistry data for duplicate samples is presented in Appendix E. Analytical chemistry data for blank samples is presented in Appendix F. Although VOCs were not detected in most of the blank samples, the most common VOCs detected in equipment rinse blanks and trip blanks were toluene, ethylbenzene, and xylenes, mostly at concentrations less than 1.0 microgram per liter (ug/L). The corresponding groundwater analytical data was qualified as necessary in accordance with EPA Region 2 validation criteria.

2.2.4.2.1 Duplicate Samples

Duplicate samples were collected by filling multiple sample containers from the same sampling device during each sampling round at a frequency of at least one duplicate sample per 20 groundwater samples (i.e., a minimum of five percent of all groundwater samples). Ninety-nine duplicate samples were collected in 2008, which is 6.5 percent of all groundwater samples collected. The duplicate samples were analyzed by the secondary (non-IBM) laboratory for SW-846 Method 8260 VOCs plus Freon 113 and Freon 123a. Duplicate samples were used to assess interlaboratory comparability and were assigned blind field identification numbers.

Comparative results for a portion of the data from the duplicate samples collected during the annual sampling event in August 2008 are presented in Table F-1 at the end of Appendix F. (A similar table has been presented in previous annual reports.) The relative percent difference (RPD) between the result for each primary sample and duplicate sample was calculated as recommended by NYSDEC data validation guidance. Based on criteria including the results of the calculations, the parameters analyzed and reported, the absolute differences given sample dilutions, concentration levels, and professional judgment, the duplicate results for the August 2008 sampling event are generally in good agreement and do not show gross variations that would indicate serious analytical quality control problems. Where the RPD is greater than 50%, one must consider cases where the very low concentrations are being measured and realize that an absolute difference of only a few micrograms per liter can produce a high RPD. The difference in concentrations at these low levels is considered to be acceptable.

2.2.4.2.2 Trip Blanks

In addition to duplicate split samples, 107 trip blanks for VOCs were prepared by the laboratories in 2008 using analyte-free deionized (DI) water for each cooler containing VOC samples to be delivered to the analytical laboratory. The purpose of the trip blanks is to detect contamination in sample transportation or storage. A trip blank was the first item placed into each cooler by the laboratory and accompanied the sample containers from the laboratory to the field sampling locations and back to the laboratory. Analytical results for these trip blanks are presented in Appendix F. Groundwater samples associated with each trip blank can be determined by noting the dates over which the trip blanks are valid (refer to “Sample Description” heading in Appendix F) and comparing the groundwater sampling date with the trip blank date range.

2.2.4.2.3 Equipment Rinse Blanks

Equipment rinse blanks were collected to confirm the efficiency of decontamination procedures for each sampling round by rinsing non-dedicated equipment with laboratory-supplied analyte-free DI water. Eighty-eight equipment rinse blanks for VOCs were collected during 2008 from water level indicators. These results are presented in Appendix F.

3 GEOLOGY AND HYDROGEOLOGY

This section of the report reviews the geology and hydrogeology of the Site and presents updates regarding geologic and hydrogeologic interpretations, and the hydraulic effectiveness of the groundwater extraction wells.

3.1 Summary of Site Geology and Hydrogeology

The geology of the Site is characterized by a sequence of unconsolidated glacial and post-glacial sediments overlying a buried bedrock valley. The bedrock unit is the Devonian Age Catskill Formation, which is composed primarily of gray siltstone and shale and, in some places, sandstone. The unconsolidated sediments occur in a general sequence from the surface downward as follows:

1. ***Post-glacial alluvium***: Present within or near the Site in only two localities - beneath a low terrace adjacent to the Susquehanna River and in a shallow late-deglacial channel near the north valley wall.

2. ***Outwash***: Typically 25 to 30 feet thick but thicker where downwarped or collapsed in a few ice-block depressions. To the extent that it is saturated (i.e., below the water table) this outwash unit constitutes the Upper Aquifer, which is an unconfined, water table aquifer.

3. ***Lacustrine deposits***: Fine-grained lake-bottom deposits, typically varved silt with pink clay seams, but locally grading to silty very fine sand. The top of this unit generally defines the bottom of the Upper Aquifer. Where the lacustrine deposits are absent, the bottom of the Upper Aquifer rests on till or on coarse-textured ice contact deposits that comprise the Lower Aquifer (where they are not silt-bound). Where the lacustrine deposits are present, they form an effective aquitard between the overlying Upper Aquifer and the underlying Lower Aquifer (where the latter is present).

4. ***Ice contact deposits***: Stratified drift deposited by sub-glacial meltwater in tunnels or crevasses. This stratified drift, where present and of proper texture and sorting, constitutes the Lower Aquifer. Based on the interpretation provided in the SGA Report, which has been confirmed by subsequent drilling of additional wells to the top of bedrock, ice contact deposits such as those comprising the Lower Aquifer are not present as a continuous layer in the area north of Broad Street in the west and East Main Street in the east, although such

materials may be present in isolated areas. Thus, the Lower Aquifer in the Endicott area is apparently confined to a thick sequence of ice contact deposits along the axis of the valley where it is used for both municipal and industrial water supply.

5. ***Glacial till***: Dense, poorly sorted mixtures of clay, silt, sand and angular rock fragments deposited directly by glacial action. Whereas till is the lowermost unit in this overall section, it is not always present. Therefore, it is not always the "basal" unit in contact with bedrock. Available borehole data indicate that where the till is absent in some areas near the axis of the valley, ice contact deposits lie directly over bedrock.

3.2 Top of Lacustrine Silt Unit

The lacustrine silt unit is nearly continuous throughout the valley with the exception of discrete areas where the presence of ice blocks prevented its deposition onto ice-contact sand and gravel and/or glacial till strata. An updated lacustrine silt surface elevation contour map that includes additional information gathered during 2008 is shown on Plate 2. In 2008, a minor revision to the lacustrine silt surface map was made in the area of Building 18 based on hydrogeologic conditions inferred as a result of dye tracer testing.

3.3 Upper Aquifer

This section presents a discussion of the hydrogeology of the Site and vicinity that focuses on the geometry, groundwater flow, and groundwater capture zones in the Upper Aquifer. In general, results of remedial investigations from 2005 through 2008 have further refined the understanding of hydrogeologic conditions for the Upper Aquifer, especially in the areas of groundwater withdrawal by means of extraction wells.

3.3.1 Aquifer Geometry

The geometry of the Upper Aquifer is defined by the difference between two surfaces: (1) the surface defining the top of the lacustrine silt, and (2) the surface defining the top of the saturated zone in the outwash unit (i.e., the water table). As discussed in the Section 3.2, Plate 2 shows the latest revision to the top-of-silt contour map based on hydrogeologic conditions inferred from dye tracer testing performed in 2008.

To determine the saturated thickness of the Upper Aquifer in previous annual reports (with the exception of 2006), the top of the saturated zone was determined from the groundwater elevation survey performed in August of each year and the associated groundwater elevation contours. These data and contours are shown on Figure 3-1 for August 2008. However, with the startup of groundwater injection at EN-510T in November 2008, a round of groundwater elevation measurements closer to the groundwater injection test date was determined to be more relevant for comparison purposes. Therefore, the water level data and associated contours for November 2008 (Figure 3-2) were used to characterize the extent of dewatering that was accomplished in 2008. A map showing the variation in saturated thickness of the Upper Aquifer was then derived by cross-contouring the top-of-silt contour map (Plate 2) with the November 2008 groundwater elevation contour map (Figure 3-2). The resultant saturated thickness contour map for the Upper Aquifer in November 2008 is shown on Figure 3-3. The areas where the Upper Aquifer is unsaturated or has less than two feet of saturation are shaded on Figure 3-3. These "dry" or nearly dry areas of the Upper Aquifer are also shown on the corresponding groundwater elevation contour map, Figure 3-2.

A comparison of the dry or minimally saturated areas in November 2008 as shown on Figure 3-2 with the August 2007 Upper Aquifer Saturated Thickness Contour Map presented in the 2007 Annual Report shows similar dry or nearly dry areas within the Upper Aquifer.

3.3.2 Groundwater Flow and Capture Zones

This subsection examines groundwater flow within the Upper Aquifer under pumping conditions with the extraction wells operating. As noted above, Figure 3-2 shows the groundwater elevation contours for the Upper Aquifer based on a comprehensive water level monitoring round of groundwater elevations recorded on November 18, 2008. Apparent groundwater flow directions based on contouring the groundwater elevation data reveal that groundwater withdrawals have established three general capture zones. These three capture zones, which are described in the SGA Report, are (1) the On-Site Capture Zone, including the Railroad Corridor Source Area (OU#1) and the Northwestern Area (OU#7); (2) Off-Site Capture Zone A, including the North Street Area (OU#2); and (3) Off-Site Capture Zone B, including the Ideal Cleaners Area (OU#4). A fourth area of interest consists of the Southern Area (OU#3), some of which still lies beyond the limits of Off-Site Capture Zones A and B, as discussed further in Section 3.3.2.4.

3.3.2.1 On-Site Capture Zone

The On-Site Capture Zone is well-defined by groundwater elevation data on the Site. In OU#1 and OU#2, control of groundwater flow in the vicinity of the railroad is primarily the result of groundwater withdrawals from extraction wells located in three areas along the north side of the railroad tracks. From west to east, the extraction wells in these three areas consist of (1) well EN-107, (2) wells EN-428/428P and nearby well EN-253, and (3) well EN-219R.

As shown on Figure 3-2, groundwater flow in the western portion of the On-Site Capture Zone (OU#7) is controlled by withdrawals from extraction well EN-154R, located near the railroad corridor, and from extraction well EN-218, located south of Clark Street. Consistent with past monitoring results, apparent groundwater flow directions suggest that groundwater extracted at EN-218 would nonetheless be prevented from discharging off the Site by the operation of EN-154R. In aggregate, the 2008 water level data suggest similar hydraulic capture compared to previous years of extraction operations at EN-154R and EN-218.

3.3.2.2 Off-Site Capture Zone A

Off-Site Capture Zone A is defined by four general pumping centers in the area between North Street and East Main Street. Overall, this capture zone is created by:

1. EN-133 and EN-451P located east of Jefferson Avenue and west of Washington Avenue to prevent westward plume migration;

2. EN-276 located between Building 18 (B018) and Building 14 (B014) for flux control on the north side of North Street;

3. EN-284P (previously EN-284TD) operated for flux control in the ice-block depression about 200 feet south of North Street; and

4. EN-215T and EN-499T located on Grant Avenue south of Monroe Street, and EN-447T located at the northern end of the McKinley Avenue interchange operated for plume reduction in Off-Site Capture Zone A and the Southern Area.

Wells EN-215T, EN-499T, and EN-447T are being operated to enhance extraction in the top of silt surface trough located south of Monroe Street between Garfield and Adams Avenues (Plate 2)

where the saturated thickness in November 2008 was on the order of 10 feet (Figure 3-2) but previously was more than 20 feet in some places. Approximate capture zones for these four pumping centers are shown on Figures 3-1 and 3-2. The operation of EN-215T and EN-499T was augmented from July to November 2008 by pumping of EN-194, which previously had been shut down due to insufficient available drawdown. Extraction wells EN-92P, EN-120, and EN-160 were shut down in November 2006 due to insufficient available drawdown.

3.3.2.3 Off-Site Capture Zone B

Off-Site Capture Zone B is associated with the former Ideal Cleaners Area (OU#4). Consistent with past monitoring results, the aggregate water level data suggest that operation of extraction wells EN-195, EN-185, and EN-222, together with extraction test wells EN-491T and EN-492T, provides capture of groundwater flow originating from the area of the former Ideal Cleaners property and areas farther west and north. EN-491T and EN-492T were installed to enhance capture of the OU#4 plume along Monroe Street. As shown on Figures 3-1 and 3-2, operation of the five extraction wells in this area has resulted in similar limits of capture suggested by past monitoring.

3.3.2.4 Southern Area

As was the case in 2007, the groundwater monitoring data for 2008 continue to suggest that this area is hydraulically separate from Off-Site Capture Zones A and B, which implies that groundwater flow in this area is derived primarily from direct recharge to the Upper Aquifer within the limits of the Southern Area. Similar to August 2007, the apparent groundwater flow divide separating the Southern Area from Off-Site Capture Zone A inferred for November 2008 (shown on Figure 3-2) follows the trend of the trough in the top-of-silt contours south of the intersection of Tracy Street and Adams Avenue. This is about 1600 feet farther to the southeast from the position of this divide in August 2003, when the divide passed through the position of current extraction test well EN-499T on Grant Avenue south of Monroe Street. As a result of this expansion of the capture zone associated with the operation of extraction wells in Off-Site Capture Zone A, as of November 2008, only the extreme southeastern and southwestern portions of the area defined in the SGA Report as the Southern Area remain beyond the limits of this capture zone.

As depicted on Figure 3-2, the surface topography of the lacustrine silt in the Southern Area appears to influence the position of this groundwater flow divide, which is coincident with a saddle in the top-of-silt contours on Plate 2 and groundwater flow directions, with at least some portions of the western and eastern groundwater flow divides corresponding to topographic high points in the silt surface. The eastern boundary of this area was determined by monitoring completed in 2005 to be essentially coincident with the boundary shown in the SGA Report, and groundwater flow in the Southern Area and associated chemistry are distinctly separate from groundwater flow in the area to the east on the opposite side of this boundary, which is shown on Figure 3-2. Water level declines in the Southern Area have also resulted in the continued presence of apparent dry areas, including one along this eastern flow boundary in the vicinity of wells EN-464, EN-465, and EN-466 (Figure 3-2).

3.4 Bedrock Groundwater

As shown on Figure 3-4, which is a bedrock potentiometric surface contour map for August 2008, the operation of extraction well EN-D49 creates a substantial zone of capture within the bedrock aquifer at the Site. The capture zone extends from slightly south of Monroe Street south of bedrock monitoring well EN-D11 to slightly west of Adams Avenue west of monitoring wells EN-D48, EN-D35, EN-D10 and EN-D36.

4 HYDROGEOCHEMISTRY

This section of the annual report presents an analysis of the chemical concentration data collected in 2008, including an assessment of trends that may be occurring at specific monitoring locations.

4.1 Chemicals of Concern

The chemicals of concern at this Site include chlorinated ethenes, chlorinated ethanes, and other compounds.

4.1.1 Chlorinated Ethenes

The chlorinated ethenes present in groundwater at this Site include tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cis12-DCE), 1,1-dichloroethene (11-DCE), and vinyl chloride (VC). All of these chlorinated ethenes are present in some portion of the source zones or groundwater plumes being remediated by IBM. PCE is a primary solvent used typically in degreasing operations and dry cleaning operations and does not occur in groundwater as a degradation product of another compound. TCE is also a primary solvent used for various industrial applications, and historically in dry cleaning operations, and can be either a degradation product of PCE by reductive dechlorination or a primary solvent itself. cis12-DCE is a degradation product of PCE and TCE by reductive dechlorination. 11-DCE is a transformation product of 1,1,1-trichloroethane (111-TCA) by an abiotic elimination reaction. Finally, vinyl chloride is a reductive dechlorination product of either cis12-DCE or 11-DCE.

4.1.2 Chlorinated Ethanes

111-TCA is a primary solvent used in many industrial applications and in printing operations among other uses. Its principal transformation products are 1,1-dichloroethane (11-DCA) by reductive dechlorination and 11-DCE by the abiotic elimination reaction. As noted above, 11-DCE may transform by reductive dechlorination to vinyl chloride and 11-DCA may transform to chloroethane (CEA), again by reductive dechlorination.

4.1.3 Other Compounds

Other compounds that are present in groundwater at this Site include methylene chloride, also known as dichloromethane (DCM); Freon 113 (1,1,2-trichloro-1,2,2-trifluoroethane); and Freon 123a (1,2-dichloro-1,2,2-trifluoroethane), which is a transformation product of Freon 113. DCM has not been observed in groundwater south of North Street because it degrades both aerobically and anaerobically and is rarely transported beyond the immediate vicinity of a source zone. Likewise, Freon 113 and Freon 123a have not been observed as significant constituents (i.e., concentrations greater than 10 ug/L) in groundwater south of North Street. Freon 113 and Freon 123a have been observed at concentrations greater than 100 ug/L in extraction wells EN-89R and EN-623 and in nearby monitoring wells at OU#5.

4.2 Distribution of Chemical Concentrations in the Upper Aquifer

The GMP (Appendix A of the OM&M Plan, Fourth Update) requires isoconcentration contour maps to be included in the Annual Report for nine principal VOCs along with a map showing data postings for total VOCs. Figure 4-1 presents the data postings for total VOCs. Isoconcentration contour maps for nine individual constituents are presented on Figures 4-2 to 4-10 and are discussed below. These isoconcentration contour maps are based on data from the August 2008 sampling event. Although data from samples collected in 2008 in OU#5 are posted on these maps, these data were not contoured because the unit they monitor is not the outwash sand and gravel that comprises the Upper Aquifer.

In the following subsections, the maps for these compounds are discussed in groups and in an order that reflects the relationship of these individual VOCs as parent or daughter products. One general observation that can be made is that the maps for constituents that are present in Off-Site Capture Zone A show the core of the plume in that area continues to be fragmented and to be drawn steadily into the extraction wells in that area.

4.2.1 Tetrachloroethene and Trichloroethene Transformation Series Compounds

Dissolved PCE degrades by reductive dechlorination to TCE. Dissolved TCE, whether derived from PCE or directly from the solvent TCE, degrades by this same mechanism to either cis12-DCE

(preferentially) or to trans-1,2-dichloroethene (tr12-DCE). These two isomers of dichloroethene then degrade by reductive dechlorination to VC, which ultimately degrades to ethene. As a group, these compounds are referred to as the ethene series in the text that follows. Isoconcentration contour maps for PCE, TCE, cis12-DCE, and VC are presented on Figures 4-2 to 4-5.

These four figures show that some or all of the ethene series compounds occur in source areas and plumes associated primarily with the Railroad Corridor Source Area (OU#1), the North Street Area (OU#2) and the Former Ideal Cleaners Area (OU#4). They are also present in dissolved phase plumes in Off-Site Capture Zone A (MA-A), the Southern Area (OU#3), the Building 57 Area (OU#5) and the Northwestern Area (OU#7). For the most part, where ethene series compounds are present, one of the parent compounds predominates. However, this is not the case in the area between Buildings 18 and 41 in OU#2 and in the plume downgradient from the source area on the former Ideal Cleaners property (OU#4) In OU#4 the data show that PCE and TCE are rapidly replaced in the downgradient direction by cis12-DCE and VC due to reductive dechlorination likely caused by the geochemical effects of petroleum products sourced from the former Endicott Forging site. These transformations occur as groundwater flows downgradient in the direction of the extraction well cluster near the intersection of Monroe Street and Adams Avenue, where the plume of these constituents is captured primarily by the operation of extraction wells EN-185, EN-195, EN-222, EN-491T and EN-492T. In OU#5, TCE and its degradation products (mostly cis12-DCE) are present in an apparent source area near the southeast corner of Building 057A.

In the North Street Area (OU#2), the data show a high degree of spatial variability associated with the degree to which TCE has degraded to cis12-DCE and VC. This may be attributable to variable conditions that control reductive dechlorination, including the observed presence of petroleum impacts in some areas that would favor formation of the daughter products.

Near the western limits of Off-Site Capture Zone A, the spatial distribution of PCE and TCE concentration data suggests that PCE and TCE are being drawn toward extraction well EN-133 from an area or areas west of Jefferson Avenue. Similarly, concentrations of PCE detected in OU#7 suggest that PCE is being drawn toward extraction well EN-154R from the south. Specifically, the integrated concentrations of ethene series compounds at extraction well EN-154R cannot be explained by other data, as there are only limited or sporadic detections of these compounds to the north and west of EN-154R.

4.2.2 1,1,1-Trichloroethane Transformation Series Compounds

As noted in Section 4.1.2, dissolved 111-TCA degrades by reductive dechlorination to 11-DCA, which in turn degrades by this same process to CEA, which occurs in only limited areas at this Site. 111-TCA also degrades by an abiotic elimination reaction to 11-DCE. Even though 11-DCE is an ethene compound, this group of VOCs is referred to in the following text as the ethane series, after the parent compound 111-TCA. Isoconcentration contour maps for these three VOCs (excluding CEA) are shown on Figures 4-6 to 4-8.

As with the ethene series compounds, the ethane series VOCs occur in source areas and plumes associated primarily with the Railroad Corridor Source Area (OU#1) and the North Street Area (OU#2). They also occur as dilute constituents of the aqueous plume in the Northwestern Area (OU#7). However, these compounds are virtually absent from the sources and plumes in OU#4. 111-TCA is present in the Southern Area at low concentrations compared to TCE, although its degradation products have only been detected at concentrations equal to or less than 2 ug/L. In OU#5, 111-TCA and its degradation products are present in an apparent source area near the southeast corner of Building 57A.

The concentrations of 111-TCA, 11-DCA, and 11-DCE detected in OU#7 suggest that extraction well EN-154R is capturing dissolved-phase ethane mass from areas to the south. Specifically, the ethane concentrations detected in samples from extraction well EN-154R cannot be explained by the sporadic and limited detections of these compounds detected in OU#7 monitoring wells located to the north and west of EN-154R.

4.2.3 Freons

Dissolved Freon 113 degrades by reductive dechlorination to Freon 123a. Isoconcentration contours for these two VOCs are shown on Figures 4-9 and 4-10. As shown on these two figures, these Freons were identified at elevated concentrations only in two apparent source zones, one in the vicinity of EN-89R at Building 57 (OU#5) and the other in the vicinity of EN-428 in the Railroad Corridor Source Area (OU#1). Comparatively low concentrations of Freons were identified beyond these two areas.

4.3 Concentration Trends in the Upper Aquifer

The groundwater chemistry database was examined to identify apparent trends in concentration of the principal constituents at the Site. This includes the 2008 data published in Appendix E as well as the historical groundwater chemistry database. Particular attention was paid to the monitoring wells where sampling is being performed to assess concentration trends following (1) the fast-track startup of EN-284TD (now EN-284P) in late June 2004 and (2) implementation of extraction operations in Off-Site Capture Zone A at EN-451T, EN-215T, EN-499T, and EN-447T in 2006.

Appendix G presents time versus concentration graphs through the end of 2008 for wells that have been monitored to assess the effectiveness of extraction wells located principally within the portion of the plume that is bounded by North Street, McKinley Avenue, Monroe Street and Jefferson Avenue. By inspection of the graphs in Appendix G, the following wells were determined to exhibit decreasing concentrations since 2004 of at least one principal constituent:

EN-29A	EN-161	EN-419	EN-444B	EN-451
EN-91	EN-204	EN-430	EN-446B	EN-451P
EN-91A	EN-206	EN-437	EN-447B	EN-479B
EN-92	EN-213A	EN-438	EN-447T	EN-492T
EN-92A	EN-214B	EN-442B	EN-449	EN-499B
EN-133	EN-284TD/P	EN-443	EN-450	EN-500B
				EN-506

As shown on Figure 4-3, most of these wells monitor concentrations in the TCE plume within Off-Site Capture Zone A. Concentration reductions in this portion of the Upper Aquifer are attributable to (1) operation of EN-284P (formerly EN-284TD) to intercept flux crossing North Street, thus preventing replenishment of the VOC mass in the plume and (2) operation of extraction wells EN-133, EN-215T, EN-447T, EN-451P, and EN-499T together with EN-284P to remove VOC mass that was present in this portion of the plume prior to the startup of EN-284TD in June 2004.

4.4 Distribution of Chemical Concentrations in the Bedrock Aquifer

As shown on Figure 3-4, the operation of extraction well EN-D49 creates a substantial capture zone within the bedrock aquifer at the Site. Figure 4-11 shows the TCE-series isoconcentration contours based on data from the bedrock monitoring wells sampled in August 2008 along with the potentiometric contours from groundwater elevation measurements for that same month (from Figure 3-4). As shown on this map, it is apparent that the operation of well EN-D49 controls the

plume of VOCs in bedrock groundwater, with no detections of TCE-series compounds greater than 1 ug/L outside the capture zone at bedrock monitoring wells EN-D10, EN-D35, EN-D36, and EN-D48. The highest concentrations of TCE-series compounds (greater than 1,000 ug/L) in the bedrock VOC plume are found at wells EN-D33, EN-D44, EN-D46, and EN-D47, all within the capture zone of extraction well EN-D49.

5 REMEDIATION SYSTEM PERFORMANCE

This section of the Annual Report discusses the groundwater extraction and contaminant recovery achieved by extraction wells operating at the Site during 2008 and the efficiency of groundwater treatment to remove these contaminants from the groundwater prior to discharge to surface water via the storm sewer system. A summary description of significant maintenance activities conducted in 2008 for the groundwater extraction and treatment systems is included in Appendix H.

5.1 Groundwater Extraction

A tabulation of groundwater extraction volumes by well and by month is provided in Appendix A. As shown on this table, the total volume of groundwater extracted at the Site in 2008 was about 142 million gallons (MG). A breakdown of this total by remediation area for 2008 (with 2005 through 2007 shown for comparison) and the change in 2008 compared to 2005 is as follows:

Area	2008	2007	2006	2005	Change from 2005 to 2008
On-Site Capture Zone (OU#1 and OU#7)	34.5 MG	38.0 MG	40.9 MG	37.9 MG	-3.4 MG
Off-Site Capture Zone A/ North Street Area (OU#2 and MA-A)	75.7 MG	84.7 MG	104.6 MG	72.2 MG	+3.5 MG
Off-Site Capture Zone B (OU#4)	12.2 MG	12.6 MG	17.8 MG	13.7 MG	-1.5 MG
Building 57/57A (OU#5)	1.5 MG	2.0 MG	1.4 MG	0.3 MG	+1.2 MG
Bedrock Groundwater (OU#6)	18.0 MG	25.1 MG	11.3 MG	10.9 MG	+7.1 MG

Additional IRM activities implemented over the past five years have most substantially influenced the comparative extraction volumes in the Building 57/57A area, in Off-Site Capture Zone A, and in the Bedrock Aquifer. In the case of Building 57/57A, although the magnitude of the total volume pumped from the three OU#5 extraction wells is not great compared to the other areas, this extraction rate has been increased from 31,000 gallons in 2004 to 1.4 million gallons or more in 2006, 2007, and 2008. This significant increase was accomplished through the installation and

startup of replacement extraction well EN-89R in 2005, the addition of extraction wells EN-623 and EN-624 in January 2006, and continued optimization of these extraction wells from 2006 through 2008.

In Off-Site Capture Zone A (including the North Street Area), the 2008 extraction volume (75.7 MG) is lower than the 2007 and 2006 extraction volumes but is still 5% higher than the 2005 extraction volume (72.2 MG) and 70% higher than the 2003 extraction volume (44.5 MG). The increased extraction volume over the past three years is due primarily to startup in 2006 of extraction wells EN-215T, EN-447T, EN-451T, and EN-499T in Off-Site Capture Zone A. Significant dewatering of the Upper Aquifer associated with pumping at these four extraction wells significantly reduced the flow from Garfield Avenue extraction wells EN-120, EN-160, EN-194, and EN-92P, and from extraction test well EN-91T. As a result, extraction at all five of these wells was discontinued in 2006. Extraction at well EN-215T was discontinued in January 2007 but resumed in April 2008. Extraction well EN-194 was pumped from July through November 2008.

In the Bedrock Aquifer, the 2008 extraction volume is lower than the 2007 volume but higher than the volumes pumped in 2006 and 2005. This is due to the higher yield sustained from extraction well EN-D49 relative to former bedrock extraction well EN-CAF, and the need to pump well EN-D49 at a higher rate to sustain a similar mass removal rate for VOCs compared to former extraction well EN-CAF. The rate at extraction well EN-D49 was adjusted downward by 7.1 MG relative to 2007 without reducing the mass removal rate for VOCs.

5.2 Mass Removal

Using chemical concentrations and monthly flows for each extraction well, the mass (in pounds) of chemicals removed from groundwater was calculated for the 12-month period from January 1, 2008 through December 31, 2008. During this period, nearly 3,000 pounds of VOCs were removed from the subsurface by extraction of 142 million gallons of groundwater. This data, including the concentration and mass removed for individual VOCs at each extraction well, is tabulated in Appendix A. The treated groundwater was discharged to storm sewers in accordance with the terms of the Order and with the Addendum to the Groundwater Remediation Systems Operation, Maintenance, and Monitoring Plan (Fourth Update) approved by NYSDEC on July 21, 2008.

Approximately 93% of the total VOC mass removed, or 2,758 pounds, was recovered by the four extraction wells in the Railroad Corridor Source Area (OU#1): EN-107, EN-219R, EN-253, and EN-428. This is nearly identical to the percentage of the total VOC mass removed by these wells in 2007. Discharge from these wells is treated at the Clark Street GTF. Approximately 59 pounds of VOCs were recovered from 11 Upper Aquifer extraction wells in Off-Site Capture Zone A, the Southern Area (OU#3) and the Ideal Cleaners Area (OU#4); discharge from these wells is treated at the Garfield, Jefferson, and Adams Avenue GTFs. Nearly 27 pounds of VOCs were recovered from Bedrock Aquifer extraction well EN-D49 (where pumped groundwater is treated at the Adams Avenue GTF) and 77 pounds were recovered from three extraction wells at Building 57 (OU#5), with treatment at the Hayes Avenue GTF at the beginning of 2008 and at the Clark Street GTF after April 10, 2008. Nearly 17 pounds of VOCs were recovered from the two wells in OU#7 (EN-154R and EN-218) with treatment at the Robble Avenue GTF. Nearly 31 pounds of VOCs were also recovered from extraction wells EN-276 and EN-284P, which provide flux control in OU#2; groundwater from these two wells was treated at the Garfield Avenue GTF.

Approximately 74.6 percent of the total VOC mass recovered in 2008 consisted of 111-TCA and its degradation products, 11-DCA, 11-DCE and CEA. TCE and its degradation products cis12-DCE and vinyl chloride comprised approximately 21.5 percent of the total VOC mass recovered. PCE made up 0.3 percent of the total. The remaining 3.6 percent consisted primarily of Freon 113.

5.3 Treatment Efficiency

Treatment efficiency was calculated for the six GTFs that operated in 2008 by comparing the concentration of VOCs in the influent to the concentration in the effluent from each treatment system. At a minimum, monthly samples of the influent and effluent were collected at the Garfield, Jefferson, Adams, and Robble Avenue GTFs, and at the Clark Street GTF in 2008. Monthly samples were also collected from the Hayes Avenue GTF during the first four months of 2008. More frequent effluent samples were collected as needed in accordance with comments #4 and #5 of NYSDEC's December 12, 2006 letter approving the Addendum to the Groundwater Remediation Systems Operation, Maintenance, and Monitoring Plan (Second Update). Weekly samples were collected from the Clark Street GTF for three months following startup of this system on December 11, 2007. Influent and effluent analytical chemistry data collected in 2008 is presented in Appendix E.

The concentration of VOCs in the effluent from all six GTFs operated by IBM was within the limits allowed by the former SPDES permit, and the treatment efficiency, based on the ratio of influent to effluent concentrations, was greater than 99.9% in 2008.

6 PROGRESS OF REMEDIATION

This section of the annual report discusses the progress toward remediation of the sources and plumes of VOCs at this Site. As such, this section relates the data analysis presented in previous sections to the overall goals enumerated in the OM&M Plan.

6.1 Restatement of Site Remediation Goals

VOCs are detected in groundwater present in two geologic units beneath the Site, the bedrock and the glacial outwash, the latter containing the Upper Aquifer. The VOC plume in the bedrock is contained by the operation of a single well and the overall objective is to maintain that containment. For the Upper Aquifer, there are two principal goals of the remedial measures program. The first is the overall goal of attaining groundwater standards to the extent practicable. The second is to shrink the groundwater plumes containing VOCs, in particular TCE, to mitigate potential concentrations of TCE in soil vapor. Specifically, the objective is as follows:

Reduce groundwater concentrations south of North Street, and to the extent practicable, to within New York State 6NYCRR Part 703 groundwater standards in order to reduce potential soil vapor impacts. Such objective will be accomplished by the following actions:

i. Continue to control the source(s) of VOCs in groundwater on the plant site and enhance this control as appropriate.

ii. Control and/or treat the groundwater flux crossing North Street.

iii. In conjunction with the above actions (i and ii), accelerate the rate of reduction of the plume areas south of North Street.

The overall objective of these actions is to reduce the mass of TCE in groundwater within the plumes IBM is remediating south of North Street by 50% in five years and by 80% in ten years, using the year in which a remediation system is first implemented as the base year.

6.2 Source Area Control

As described in Section 3 and shown on Figures 3-1 and 3-2, the operation of extraction wells EN-107, EN-219/219R, EN-253, and EN-428/428P within the On-Site Capture Zone continues to

prevent groundwater chemical flux from leaving the source areas along the railroad corridor in OU#1. Furthermore, operation of extraction wells EN-154R and EN-218 also provides hydraulic control of groundwater in OU#7, which exhibits comparatively low concentrations. Finally, the operation of EN-276 adjacent to the southwest corner of Building 18 (B018) in OU#2 also contributes to the control of apparent source zones in that operable unit.

Previous efforts to enhance the hydraulic control exerted by these extraction wells north of North Street have included the installation and startup of test well EN-428 which was upgraded in 2005 to a permanent, vacuum-assisted extraction well and upgrading of the pump and controls systems at EN-276. In 2006, EN-219 was replaced by EN-219R, resulting in a substantial increase in the extraction rate at this well and in the Railroad Corridor Source Area in general, substantially enhancing the hydraulic effectiveness of groundwater extraction in the Railroad Corridor Source Area (OU#1). This is reflected in a shift to the south of the groundwater flow divide that separates the On-Site Capture Zone from Off-site Capture Zone A (Figures 3-1 and 3-2).

6.3 Control of Flux Crossing North Street

Both the hydraulic effectiveness data and the chemical concentration data collected since June 2004 indicate that the fast-track startup of EN-284TD (now EN-284P) has effectively intercepted the groundwater chemical flux crossing North Street. This can be seen clearly in the groundwater elevation contours and associated capture zones shown on Figures 3-1 and 3-2, and in the effect that the operation of this well has had on the chemical isoconcentration contours in the vicinity of North Street as shown on Figures 4-2 through 4-8. It is clear from the pattern of chemical concentrations shown on these figures along North Street that the operation of EN-284P has drawn into it the groundwater chemical flux crossing North Street along a line extending from the boundary of Off-Site Capture Zone A with Off-Site Capture Zone B to the intersection of Washington Avenue with North Street. Prior to the startup of EN-284P, this flux crossing North Street was previously captured by extraction well EN-133 and the Garfield Avenue Well Cluster 600 to 1000 feet farther downgradient.

Table 6.1 shows the recent history of annual extraction volume from wells in the vicinity of North Street that contribute to source/flux control in OU#2. As noted on this table, in 2003 groundwater was extracted from this area only at well EN-276 at an annual rate of 1.5 MG. In 2004, the annual

extraction rate increased at this well to 3.0 MG following upgrades to pump and control systems. While this increase at EN-276 had some additional effect on flux crossing North Street, it is believed to have had more effect on increased mass removal from source zones in the vicinity of B018 (as discussed in Section 6.2).

Table 6.1: Control of Flux Crossing North Street - Annual Extraction Volume

Well	2003 Volume (MG)	2004 Volume (MG)	2005 Volume (MG)	2006 Volume (MG)	2007 Volume (MG)	2008 Volume (MG)
EN-276	1.5	3.0	3.8	3.9	1.4	1.9
EN-284P & EN-284TD	NA	11.4 (6 months)	15.3	12.3	7.6	7.6
Subtotal	**1.5**	**14.4**	**19.1**	**16.2**	**9.0**	**9.5**
EN-284P & EN-284TD (Plume Reduction)	NA	-7.6 (estimated)	-7.6 (estimated)	-4.2 (estimated)	-1.9 (estimated)	-1.9 (estimated)
Net Total Source/Flux Control	**1.5**	**6.8 (estimated)**	**11.5 (estimated)**	**12.0 (estimated)**	**7.1 (estimated)**	**7.6 (estimated)**

The more significant improvement in control of flux crossing North Street occurred when extraction operations were begun at EN-284TD (now EN-284P) at the end of June 2004. While much of the groundwater extracted by this well in the last six months of 2004 was derived from partial dewatering of the Upper Aquifer, groundwater elevation contours for the Upper Aquifer in December 2004 (published in the 2004 Annual Report) showed that by the end of 2004, extraction operations at EN-284TD were controlling flux crossing North Street from apparent source zones in OU#2.

The increases in annual extraction rates from 2004 to 2005 resulted primarily from the application of improvements and additions to the extraction system made in 2004 over a full year of operation in 2005. However, as Table 6.1 shows, the annual extraction volume from EN-284TD for 12 months in 2005 (15.3 MG) was not two times the extraction rate for six months in 2004 (11.4). This apparent discrepancy actually reflects the fact that much of the groundwater extracted by this well in 2004 came from partial dewatering of the Upper Aquifer and, once removed, this source of groundwater was no longer available for extraction at this well. Therefore, the 2005 annual extraction volume of 15.3 MG for EN-284TD is believed to be more attributable to groundwater

flow from this well's capture zone resulting from recharge during that year than from continued dewatering of the Upper Aquifer. As shown on Figure 3-1 in the 2005 Annual Report, the capture zone for EN-284TD included apparent source areas north of North Street, to the extent they were not controlled by EN-276, and a portion of the plume area to the south in Off-Site Capture Zone A extending west to a divide with the capture zone of extraction well EN-92T/P. While it is not possible based on the existing data to apportion the flow to this well between control of flux crossing North Street and plume reduction in Off-Site Capture Zone A, the pattern of groundwater flow on Figure 3-1 from the 2005 Annual Report and the pattern of chemical isoconcentration contours on Figures 4-2 to 4-8, also from that report, suggest that flow associated with these two areas may have been roughly equal. Taking all of these factors into account, adjustments were made for the year 2005 in Table 6.1 to subtract the estimated portion of annual extraction volume at EN-284TD believed to be attributable to initial dewatering in the Upper Aquifer and flow to this well from the plume area in Off-Site Capture Zone A. With these adjustments made, Table 6.1 shows that the annual extraction volume applied to control of flux across North Street increased from 1.5 MG in 2003 to at least 11.5 MG in 2005.

This table also shows that for 2006, the total extraction rate estimated to be attributable to flux control crossing North Street remained relatively constant (2004 annualized is 13.6 MG compared to 11.5 MG in 2005 and 12.0 MG in 2006). The 2006 estimate is based on the assumption that the reduction in extraction volume at EN-284TD results mainly from that well deriving less flow from dewatering of the Upper Aquifer in its third year of operation. It therefore assumes that just one-third of the volume extracted by EN-284TD (4.2 MG) was derived from local dewatering of the plume and flow toward EN-284TD from the south. This reduction in flow from the plume area to EN-284TD is likely also to have been attributable to the startup of the trough area wells EN-215T, EN-447T, and EN-499T in May 2006.

In 2007, Table 6.1 shows that the combined extraction rate for EN-276 and EN-284P (which replaced EN-284TD in January 2007) declined by 45%. Since the groundwater elevation contours show no loss of control associated with the operation of these wells, this decline was not associated with reduced effectiveness. It is believed that this decline is due to several factors, including:

- Expansion of the On-Site Capture Zone into a portion of the area previously controlled by EN-276 and EN-284P due to the startup of replacement well EN-219R;

- Further dewatering of the Upper Aquifer following the initiation of pumping at EN-215T, EN-447T and EN-499T; and

- A lower recharge rate in 2007 due to reduced precipitation.

Based on the groundwater elevation contours and divides shown on Figure 3-1 in the 2007 Annual Report, it is unlikely that more than 25% of the extracted volume at EN-284P was derived from flow towards this well from the south (i.e., the plume reduction component). This component was therefore estimated to be only 1.9 MG in Table 6.1, leaving 7.1 MG extracted for flux control at North Street.

The values in Table 6.1 for 2008 indicate little change from those for 2007. This condition reflects the fact that groundwater flow patterns and rates have stabilized since the startup of the trough area wells in mid-2006.

Table 6.2 presents the recent history of annual mass removal for these two wells operating in the vicinity of North Street. As shown on this table, the mass removal in OU#2 in 2003 was 22.6 pounds removed by EN-276. Mass removal from this well increased substantially in 2004 to 65.5 pounds due to the increased extraction rate discussed above. This higher mass removal rate was sustained in 2005 at 60.4 pounds. As noted above, this mass removal is believed to primarily reflect increased dissolution of VOCs from apparent source zones in the vicinity of B018.

Table 6.2: Control of Flux Crossing North Street - Annual Mass Removal

Well	2003 Mass Removal (lbs)	2004 Mass Removal (lbs)	2005 Mass Removal (lbs)	2006 Mass Removal (lbs)	2007 Mass Removal (lbs)	2008 Mass Removal (lbs)
EN-276	22.6	65.5	60.4	24.4	7.9	5.1
EN-284P & EN-284TD	NA	79.3 (6 months)	110.7	73.8	35.9	25.6
Subtotal	**22.6**	**144.8**	**171.1**	**98.2**	**43.8**	**30.7**
EN-284P & EN-284TD (Plume reduction)	NA	-29.3 (estimated)	-10.7 (estimated)	-5.2 (estimated)	-1.1 (estimated)	-1.1 (estimated)
Net Total Source/Flux Control	**22.6**	**115.5 (estimated)**	**160.3 (estimated)**	**93.0 (estimated)**	**42.7 (estimated)**	**29.6 (estimated)**

Table 6.2 also shows the contribution to mass removal from the operation of EN-284TD and EN-284P beginning in late June 2004. The mass removed by well EN-284TD in the last six months of 2004 represents both interception of mass flux crossing North Street and removal of mass dissolved in groundwater extracted from the plume in Off-Site Capture Zone A. If the annual mass removal for this well for 12 months in 2005 (110.7 pounds) is assumed to be primarily representative of intercepted flux from apparent source zones north of North Street (estimated to be 100 pounds), then the mass removed from this well in the last six months of 2004 may be roughly apportioned as 50 pounds to control of flux crossing North Street and 29.3 pounds to removal of mass dissolved in the plume within Off-Site Capture Zone A. With these adjustments made, as shown in Table 6.2, the total annual mass removal associated with source / flux control in OU#2 increased from 22.6 pounds in 2003 to at least 160.3 pounds in 2005.

In 2006, the combined mass removal from these two wells dropped to a total of 98.2 pounds. This does not signal a reduction in control of flux crossing North Street, since, as shown on Figure 3-1 published in the 2006 Annual Report, there was no reduction in hydraulic effectiveness. Reference to the time-versus-concentration graph for well EN-284TD/P in Appendix G shows that the reduction in mass removal is directly attributable to declining concentrations in these two wells. This is consistent with the adjustments that have occurred in the Upper Aquifer after the extraction rate was increased at EN-276 and extraction began in EN-284TD. These adjustments included dewatering of the Upper Aquifer with accompanying removal of mass in storage in addition to the active flux and the changes in flow direction and gradients in the Upper Aquifer that likely

enhanced the short-term flushing of one or more sources. As shown on Table 6.2, after subtracting 5.2 pounds attributed to plume reduction, the comparable mass removal rate for control of flux crossing North Street in 2006 was estimated at 93.0 pounds. In 2007, this combined mass removal rate had declined by almost 50% and was directly attributable to the decline in the extraction rate that occurred as a result of the factors discussed above.

Although Table 6.1 shows a moderate increase in the overall extraction for these two wells in 2008, nonetheless, the total mass removal for the year declined from 43.8 pounds in 2007 to 30.7 pounds in 2008. Examination of time versus concentration graph for EN-284TD/P in Appendix G shows that this reduction is due primarily to continued declining concentrations in both wells.

6.4 Plume Reduction South of North Street

With the flux crossing North Street now controlled primarily by the operation of EN-284P, groundwater extraction from the remaining wells in Off-Site Capture Zone A has been applied to plume reduction in this area. The following subsections discuss the annual groundwater extraction volume and mass removal associated with these plume reduction measures.

6.4.1 Annual Groundwater Extraction Volume

Table 6.3 presents the recent history of extraction volumes for wells involved in this plume reduction effort. In 2003, prior to the beginning of extraction operations at EN-284TD, the combined annual extraction volume from EN-133 and the Garfield Avenue Well Cluster (EN-120, EN-160, and EN-194) (GAWC) was 43.0 MG. However, in the absence of flux control at North Street, the groundwater extracted by these wells in 2003 effectively controlled the migration of the plume to the west and south, but could not contribute to plume reduction. The same is believed to be true of groundwater extracted by these wells in the first half of 2004 prior to the startup of extraction operations at EN-284TD at the end of June 2004. Therefore, 2004 must be viewed as a transition year during which flux control was shifted from these other wells in Off-Site Capture Zone A to EN-284TD, which permitted the groundwater extracted from EN-133 and the GAWC to contribute to plume reduction beginning in the latter part of 2004 and continuing into 2005.

Therefore, the values shown in Table 6.3 indicate that in 2003, 43.0 MG of groundwater was extracted from EN-133 and the GAWC to control flux in this plume and to prevent its further

migration. In 2005, Table 6.1 suggests that this same flux control function was being accomplished by EN-284TD extracting 15.3 MG per year (or as little as 7.6 MG per year when the plume reduction component is subtracted).

With appropriate adjustments made to the values in Table 6.3 to reflect that component of the EN-284TD extraction volume being applied to flux control, this table shows that in 2005 at least 60.8 MG of groundwater was extracted in Off-Site Capture A to address plume reduction compared to no such benefit being derived from the 43.0 MG extracted by these wells in 2003 for plume control.

Table 6.3: Plume Reduction in Off-Site Capture Zone A - Annual Extraction Volume

Well(s)	2003 Volume (MG)	2004 Volume (MG)	2005 Volume (MG)	2006 Volume (MG)	2007 Volume (MG)	2008 Volume (MG)
EN-133	29.3	29.4	29.9	29.3	18.8	17.1
EN-120, EN-160 & EN-194 (GAWC)	13.7	16.1	15.6	9.4	0	0.6
EN-91T & EN-92P	NA	NA	7.6	1.6	0	0
EN-284P & EN-284TD	NA	11.4 (6 months)	15.3	12.3	7.6	7.6
EN-215T, EN-447T, EN-451P & EN-499T	NA	NA	NA	47.4	56.9	48.5
Subtotal	**43.0**	**56.9**	**68.4**	**100.0**	**83.3**	**73.8**
EN-284P & EN-284TD (Source/Flux Control)	NA	-3.8 (6 months) (estimated)	-7.6 (estimated)	-8.1 (estimated)	-5.7 (estimated)	-5.7 (estimated)
Net Total Plume Reduction	**43.0**	**53.1**	**60.8**	**91.9**	**77.6**	**68.1**

Table 6.3 further shows that in 2006 the extraction volume in this plume area increased by more than 50% to 91.9 MG due to the startup of four new extraction wells (EN-215T, EN-447T, EN-451T and EN-499T) that operated for the last half of 2006. However, as previously discussed, dewatering caused by the operation of these wells resulted in substantial reduction of available drawdown associated with other wells (EN-91T, EN-92P, EN-120, EN-160, and EN-194), and the extraction volume for those wells declined. While Table 6.3 shows the extraction volume for EN-133 being sustained, near the end of 2006 the extraction rate in this well also began to decline in response to expansion of the capture zones of the new wells. For the most part this increase in extraction volume reflects dewatering of the elongated area of higher saturated thickness extending

from the intersection of Garfield Avenue and Monroe Street to the intersection of Adams Avenue and Tracy Street as shown on Figures 3-1 and 3-2.

While Table 6.3 shows a decrease in this extraction volume for plume reduction in 2007, this volume is still much higher than the annual volumes from 2003 to 2005, and reflects continued dewatering of the Upper Aquifer. The same is true for the total extraction volume for plume reduction in 2008, which continued to diminish in 2008 as dewatering progressed within Off-Site Capture Zone A. As shown on Table 6.3, this volume declined to 68.1 MG in 2008 from 77.6 MG in 2007. Although re-injection of treated groundwater and city water was begun at the end of November 2008 at injection well EN-510T, there was no appreciable effect of that injection volume on extraction rates from this plume area in the one month remaining in 2008.

6.4.2 Annual Mass Removal

As in the case of the annual extraction volume, it is particularly important to examine the mass removal that is occurring in Offsite Capture Zone A, including the changes that have occurred over the past three years in response to implementation of additional remedial measures. The following table presents a summary of the annual mass removal calculated for extraction wells in this area.

Table 6.4: Plume Reduction in Off-Site Capture Zone A - Annual Mass Removal

Well(s)	2003 Mass Removal (lbs)	2004 Mass Removal (lbs)	2005 Mass Removal (lbs)	2006 Mass Removal (lbs)	2007 Mass Removal (lbs)	2008 Mass Removal (lbs)
EN-133	25.7	21.4	11.3	5.9	1.9	1.4
EN-120, EN-160 & EN-194	48.6	46.6	33.4	19.0	0	1.5 (EN-194)
EN-284P & EN-284TD (Plume Reduction)	NA	29.3 (6 months) (estimated)	10.7 (estimated)	5.2	1.1	1.1
EN-91T & EN-92P	NA	NA	39.4	4.2	0	0
EN-215T, EN-447T, EN-451P & EN-499T	NA	NA	NA	96.7	87.6	52.4
Total	**74.3**	**97.3**	**94.8**	**131**	**90.6**	**56.4**

As shown on this table, the annual mass removal from wells in Off-Site Capture Zone A increased from 74.3 pounds in 2003 to 94.8 pounds in 2005 as a direct result of the installation and startup of the three new wells, EN-284TD, EN-91T and EN-92T/P. More importantly, the mass removed from the Upper Aquifer in this area beginning in the latter half of 2004 was not being replenished by continuing flux across North Street as it was prior to the startup of EN-284TD in mid-2004. Therefore, the effective increase in mass removal for plume reduction from 2003 to 2005 was equal to the full 94.8 pounds extracted in 2005.

Table 6.4 further shows that in 2006, this mass removal rate increased by nearly 40% over the 2005 rate to 131 pounds per year. This increase is directly attributable to the start-up of the four new extraction wells, which more than compensated for declining mass removal rates in other wells. Those declines were attributable to several factors, including reduced extraction rates (as described above) and reduced concentrations of VOCs in areas of the Upper Aquifer in which they operate. The increase in mass removal is primarily due to the removal of mass in storage as a consequence of the extensive dewatering that the operation of the new wells generated.

While the overall mass removal rate declined in 2007 to 90.6 pounds, the values for 2007 shown on Table 6.4 show the importance of the OU#3 IRM wells (EN-215T, EN-447T, EN-451P and EN-499T) in terms of the percentage of the mass removal for plume reduction represented by these

wells. This is consistent with the changes seen in capture zones for the various wells and well groupings in Off-Site Capture Zone A on Figures 3-1 and 3-2. These figures show that the capture zone for these wells has expanded to impinge on areas previously draining to EN-133 and EN-284P. Table 6.4 indicates that this trend in declining mass removal continued in 2008 as the total volume of groundwater extracted decreased and concentrations of most VOCs in these extraction wells also declined (see graphs in Appendix G).

6.5 Reduction of TCE Mass in Place

As described above, the overall objective of this enhanced remediation is to reduce the TCE mass within the plumes that IBM is remediating south of North Street by 50% in the first five years of operation of the enhanced remediation systems. The analysis presented herein demonstrates positive results from the first four and one-half years of operations at EN-284TD, nearly one year of operations at EN-91T and EN-92P, and roughly two and one-half years of operation at EN-215T, EN-447T, EN-451P and EN-499T.

The purpose of calculating the mass of TCE dissolved in groundwater in the Upper Aquifer south of North Street is to provide the agencies with an indication of IBM's progress with respect to the stated goals. These goals include the overall corrective action objective of reducing the mass of TCE in groundwater within Off-Site Capture Zone A and the Southern Area by 50% in five years and by 80% in ten years, from the June 2004 baseline, as defined in Section 3.6 of the Supplemental Groundwater Assessment (SGA) dated May 17, 2004.

6.5.1 Initial TCE Mass in Place, June 2004

The initial TCE mass in place was calculated in an addendum to the 2007 Annual Report dated August 19, 2008**.** That addendum explains the logic for selecting June 2004 as the initial date for calculating TCE mass in place as well as the methodology for making these initial calculations and those for each subsequent year. Recapping this logic, June 2004 was selected as a starting date for the initial TCE mass calculation for three primary reasons:

1. Extraction test well EN-284TD started pumping continuously on July 6, 2004, marking the first significant change in the dynamics of groundwater flow south of North Street since field activities associated with the SGA were completed in 2003. EN-284TD began to intercept the

mass flux across North Street that was previously intercepted by the Garfield and Jefferson Avenue extraction wells. Shortly after July 6, 2004, therefore, no appreciable mass flux was being added to the plume south of North Street. Furthermore, the initiation of pumping at this well location was identified in the SGA Report as the first step in attaining the corrective action objectives.

2. A comprehensive round of groundwater elevations was measured on June 6-8, 2004, providing a snapshot of the groundwater flow system one month prior to startup of groundwater extraction at EN-284TD. This groundwater elevation data was previously published in Appendix C of the *Annual Groundwater Monitoring Status Report for 2004* (2004 Annual Report, dated April 15, 2005). These data therefore provided a basis for calculating the volume of water in storage within the Upper Aquifer in the area of concern prior to the initiation of flux control pumping at EN-284TD.

3. Most of the existing monitoring wells at the Site were sampled at least once between the conclusion of the SGA field activities in late 2003 and before June 8, 2004, including monitoring wells EN-429 through EN-451, which were installed in April 2004 in Off-Site Capture Zone A and the Southern Area. As a result, a comprehensive set of chemical concentration and distribution data exists for the period immediately prior to the startup of groundwater extraction at EN-284TD. This analytical chemistry data was previously published in Appendix E of the 2004 Annual Report. Therefore, these data provide the basis for assessing the magnitude and distribution of TCE in groundwater within the area of concern prior to the initiation of flux control pumping at EN-284TD.

The initial TCE mass-in-place calculation was done in a straightforward step-by-step manner, which is explained in detail in the addendum to the 2007 Annual Report. The method divided the plume area into cells measuring 100 feet by 100 feet and then calculated the volume of groundwater within each cell using a porosity of 35% and the concentration of TCE in each cell based on a TCE concentration contour map. This method yielded a calculation of the total volume of groundwater in storage within the footprint of the TCE plume, the total mass of TCE dissolved in that volume of groundwater and the average TCE concentration in the plume. Based on this method, the total volume of water in storage within the plume area in June 2004 was calculated to be 135 million gallons (MG) and the calculated mass of dissolved TCE in June 2004 was 89.5 pounds.

6.5.1.1 Mass Calculation for November 2008

The dissolved TCE mass calculation for November 2008 was done in a similar fashion to the calculation for June 2004. First, an isoconcentration map of TCE in the Upper Aquifer was constructed by hand-contouring the TCE concentration data from November 2008. This TCE isoconcentration contour map is shown on Figure 6-1. Next, the groundwater elevations measured on November 18, 2008 were contoured to create a groundwater elevation contour map of the Upper Aquifer with a maximum contour interval of one foot. This groundwater elevation contour map is shown on Figure 3-2. Then, using the current top-of-silt contour map (Plate 2), a map of the Upper Aquifer saturated thickness was derived by cross-contouring the November 2008 groundwater elevation contour map with the current top-of-silt contour map. This saturated thickness contour map of the Upper Aquifer is shown on Figure 3-3.

An orthogonal grid with cell dimensions of 100 feet by 100 feet oriented parallel to McKinley Avenue was overlain on both the TCE isoconcentration map for November 2008 and the Upper Aquifer saturated thickness map for November 2008, as shown on Figures 6-1 and 6-2**.** An average saturated thickness was assigned by an experienced hydrogeologist to each cell of the gridded Upper Aquifer saturated thickness map and an average TCE concentration was assigned to each cell of the gridded TCE isoconcentration map. The saturated thickness and TCE concentration values for each cell were then transferred to Excel worksheets such that each 100 feet by 100 feet grid cell corresponds to a cell in the worksheet, with TCE concentration on the first page of the spreadsheet and saturated thickness on the second page (Figures 6-3 and 6-4). Assuming an Upper Aquifer effective porosity of 35 percent, the volume of groundwater in storage within the plume area was calculated on a separate Excel worksheet (Figure 6-5). Based on this worksheet calculation, the volume of groundwater in storage within the plume area of the Upper Aquifer in November 2008 was 69.7 MG.

The mass of TCE dissolved in groundwater in each cell was then calculated on yet another Excel worksheet by multiplying the volume of groundwater in storage (in gallons) by the TCE concentration (in micrograms per liter), with a correction factor of 8.35×10^{-9} to convert the resulting TCE mass units to pounds. Where either the volume of groundwater in storage or TCE concentration of a worksheet cell was zero, the calculated TCE mass for that cell was zero, and the

cell was effectively excluded from the mass calculation. The dissolved TCE mass calculated for each cell is shown on Figure 6-6.

The total dissolved TCE mass in groundwater south of North Street in November 2008 was calculated by summing the cells in each column of the TCE mass worksheet such that the total of each column accrued in a single row of the worksheet. The columnar totals in this row were then summed to yield the total TCE mass in place south of North Street, excluding the EN-284P capture area, as had been done for the initial mass-in-place calculation. The estimated mass of dissolved TCE in November 2008 calculated using the aforementioned method is 20.4 pounds.

6.5.2 Progress toward Reducing Mass of TCE in Groundwater

This section of the report assesses IBM's progress toward meeting the objectives described in Section 6.1 by comparing the June 2004 mass calculation with the November 2008 mass calculation. It also examines the factors that have contributed to the reduction in mass.

The TCE mass totals discussed above for June 2004 and November 2008 show that the overall reduction of TCE mass dissolved in groundwater from 89.5 pounds to 20.4 pounds over a four-year, five-month period amounts to a 77% reduction. As such, the progress made in that period of time exceeds the goal set for the first five years (i.e., 50%).

This reduction of mass in place has resulted from two factors. The first is a reduction in the concentration of TCE in groundwater at a large number of groundwater monitoring well locations within this plume area. The second factor is a reduction in the amount of groundwater in storage within the plume area due to the extensive dewatering that has been accomplished by new and previously existing extraction wells.

The spreadsheet calculations comparing the volume of groundwater in storage for June 2004 to that in November 2008 show that the volume of groundwater was reduced from 135 MG in 2004 to 69.7 MG in 2008 or a 48% reduction of groundwater in storage within the plume area. Coupling the groundwater volume in storage and TCE mass dissolved in groundwater for each of these time periods shows that the average concentration of TCE in groundwater within the plume declined over that same period from 79.4 ug/L to 35.1 ug/L, or a 56% reduction in average TCE concentration in the plume.

Finally, although these calculations show that the goal of 50% reduction of TCE mass dissolved in groundwater has been reached in a little over three years, it is important to note that this is a result of only the first step in the implementation of the enhanced remediation program. The next step is to begin the re-injection of treated groundwater to partially re-saturate the Upper Aquifer and enhance flushing of the remaining TCE mass from this unit. In so doing, however, there will be times when the volume of water in storage will increase once again, and will exceed the volume from November 2008. This re-injected groundwater can also be expected to contain dissolved TCE that will likely desorb from the soil particles in the aquifer, thus adding to the mass of TCE dissolved in groundwater in the plume. The use of injection to aid in flushing the remaining TCE from the aquifer began with the operation of EN-510T in late November 2008 and will continue in 2009 and future years.

The potential for mass transfer from vadose zone and saturated zone soil to the aqueous phase (dissolved in groundwater) is supported by a comparison of the decline in dissolved TCE mass (69.1 pounds), as described above, with the amount of TCE mass calculated to have been removed from the plume between June 2004 and November 2008 via groundwater extraction wells (324 pounds). It is most likely that the higher calculated value of TCE mass removed as compared to the calculated lower TCE mass dissolved in groundwater may reflect desorption and diffusion of mass from vadose zone and saturated zone soils in the area of the plume. IBM is currently conducting research to better understand the potential effects of these fate and transport mechanisms on groundwater plume reduction efforts. It is anticipated that groundwater monitoring activities during groundwater re-injection will also provide some insight into the long-term effects of these mechanisms.

Although the data for 2004 through 2008 show a substantial reduction of TCE mass dissolved in groundwater in the plume, it is anticipated that the percent decline in TCE mass dissolved in groundwater will likely fluctuate as the next steps are implemented in the enhanced remediation effort. It is unlikely, however, that during this process the TCE mass dissolved in groundwater at any one time will reflect less than a 50% reduction of mass in place compared to the initial mass calculated for June 2004. Rather, the ongoing and future enhancements to plume reduction will be focused on sustaining the gains already achieved, and attaining the goal of an 80% reduction of TCE mass dissolved in groundwater over ten years.

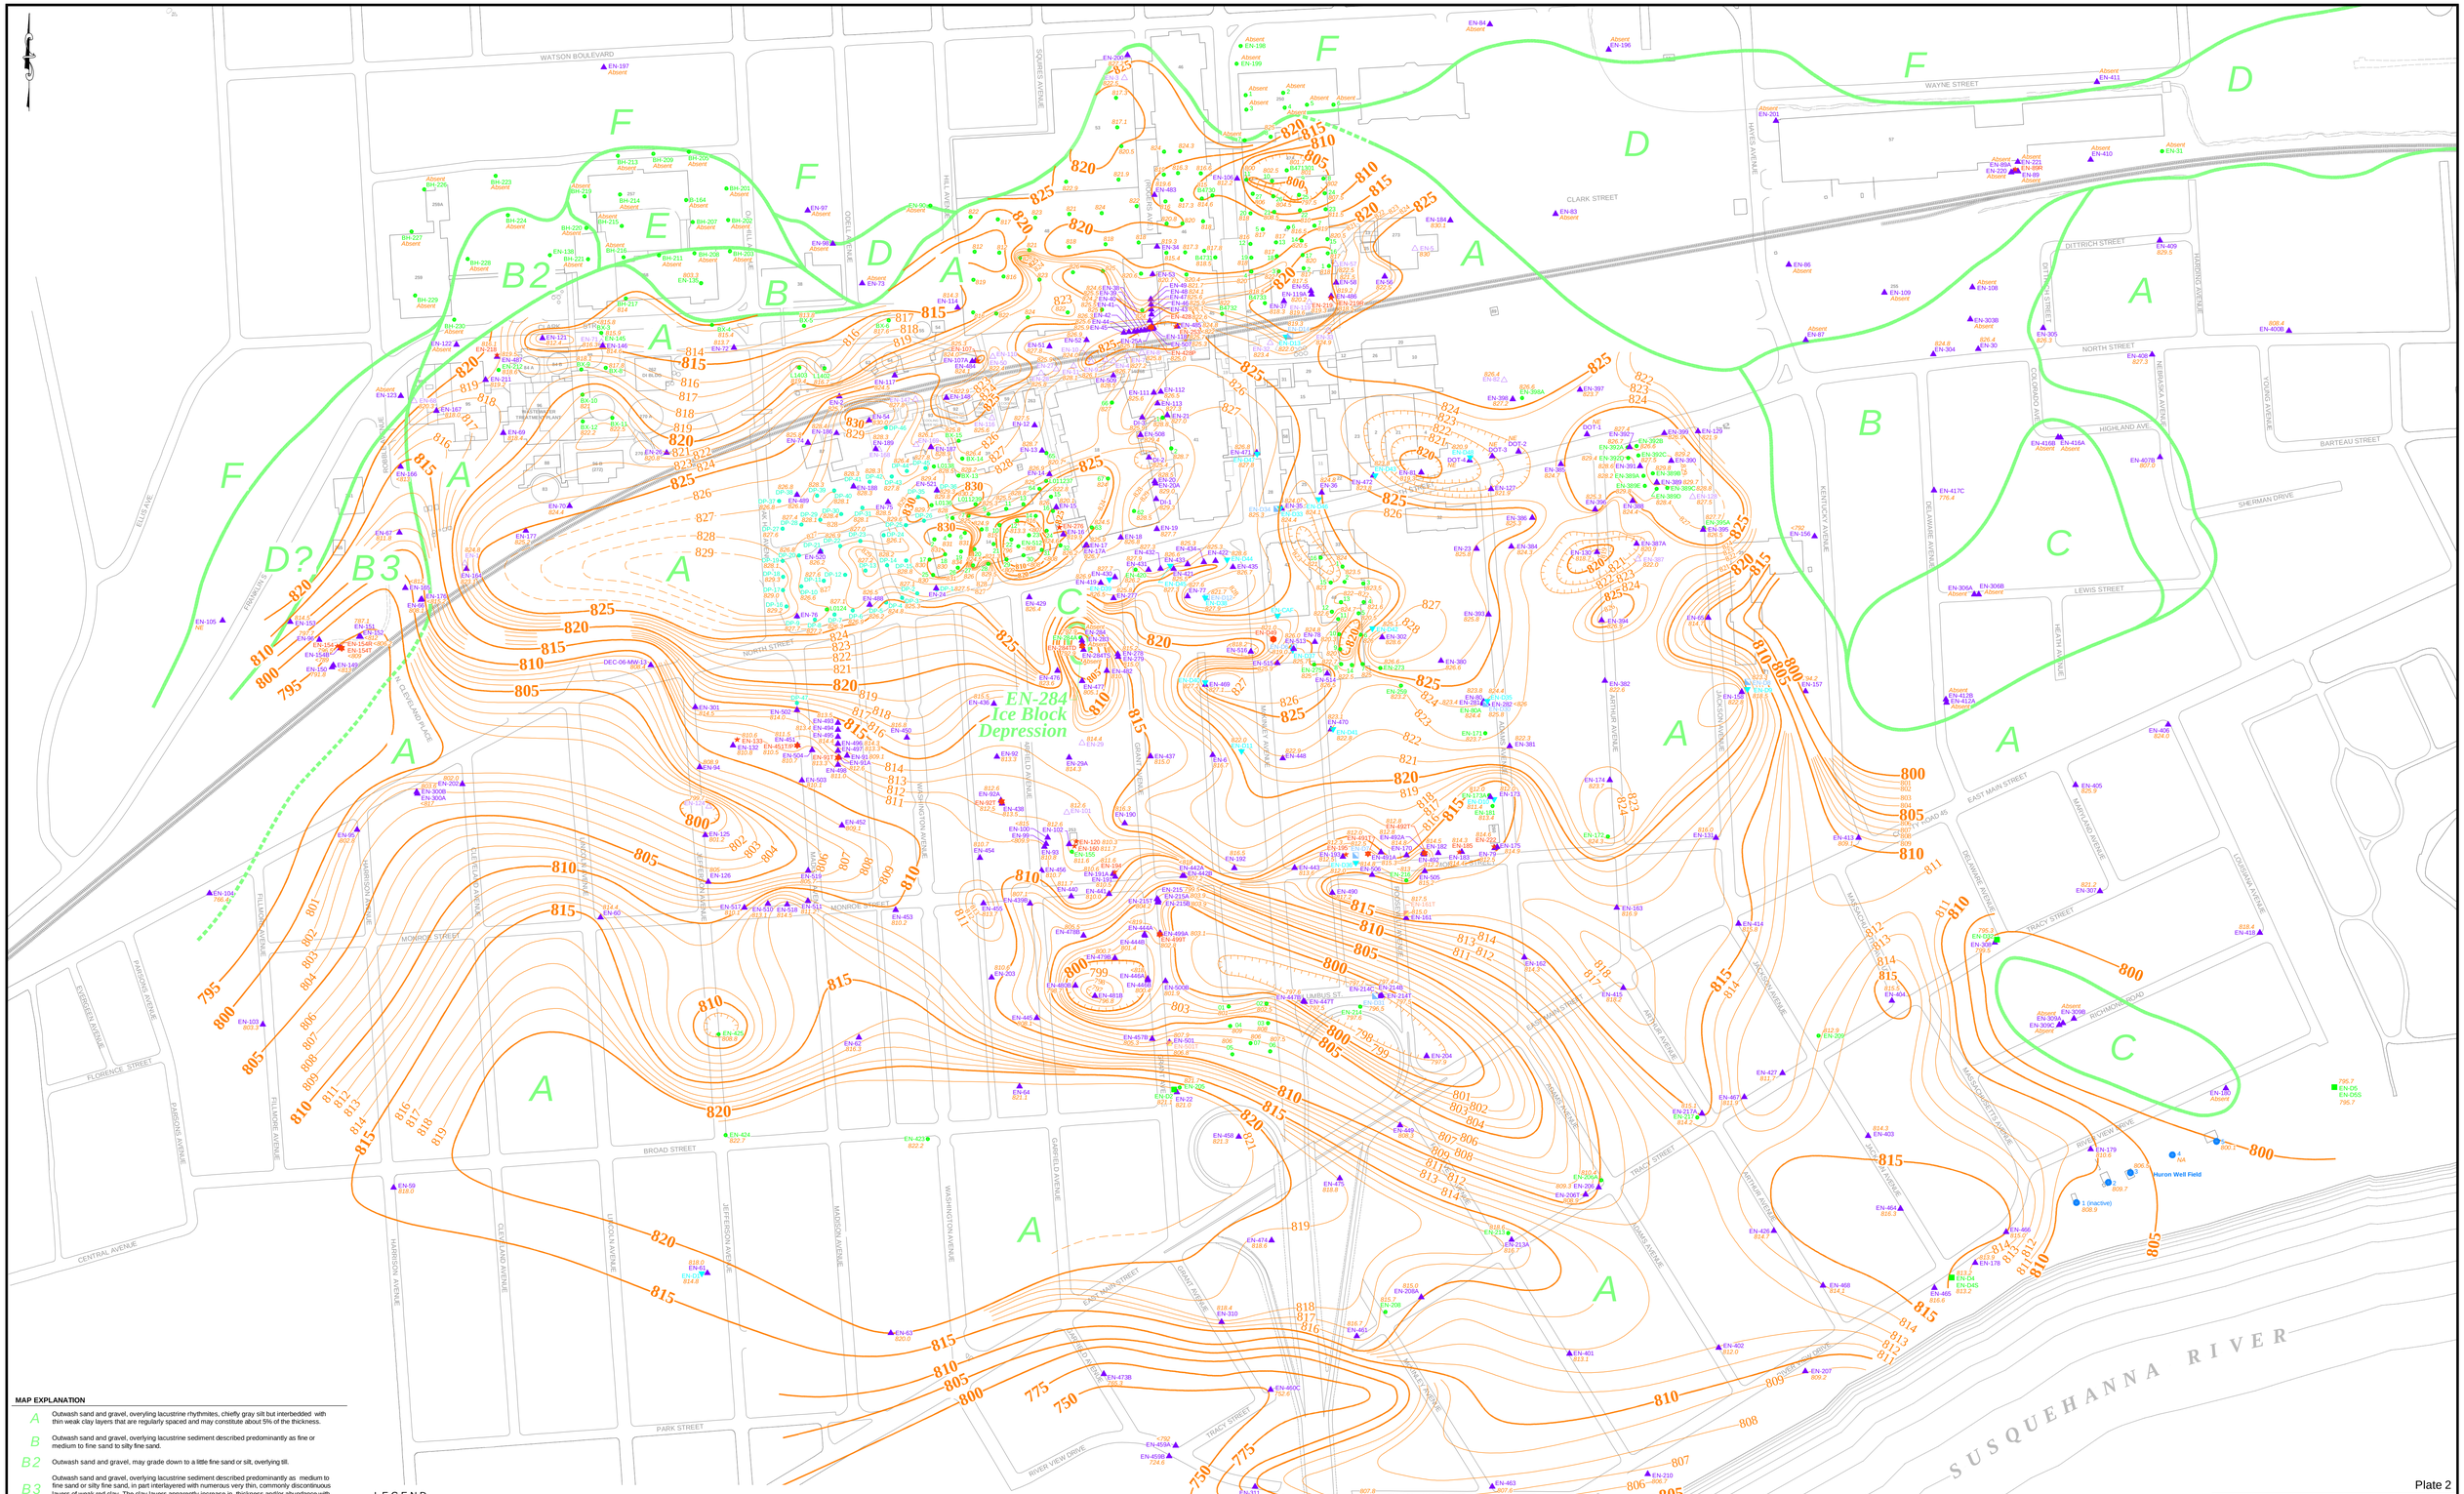

MAP EXPLANATION

A	Outwash sand and gravel, overlying lacustrine rhythmites, chiefly gray silt but interbedded with thin weak clay layers that are regularly spaced and may constitute about 5% of the thickness.
B	Outwash sand and gravel, overlying lacustrine sediment described predominantly as fine or medium to fine sand to silty fine sand.
B2	Outwash sand and gravel, may grade down to a little fine sand or silt, overlying till.
B3	Outwash sand and gravel, overlying lacustrine sediment described predominantly as medium to fine sand or silty fine sand, in part interlayered with numerous very thin, commonly discontinuous layers of weak red clay. The clay layers apparently increase in thickness and/or abundance with depth. The sand may grade down into silt interbedded with weak red clay.
C	Lacustrine unit generally absent in deepest part of an ice-block depression; outwash is downwarped and generally overlain by postglacial peat and/or organic-rich silt and fine sand.
D	Postglacial alluvial silt with organic matter, commonly gravelly at the base, possibly deposited in a former meltwater channel.
E	Organic-rich postglacial sediments overlie fine sand to silt that may also be postglacial or may be stratigraphic equivalents of the lacustrine deposits in A and B; deposited in ice-block depression.
F	Valley wall; chiefly till or colluvium derived from till.

Prepared by Allan D. Randall, USGS Ret., edited by Groundwater Sciences Corp.

LEGEND

- Upper Aquifer Monitoring Well
- Abandoned Upper Aquifer Monitoring Well
- Upper Aquifer Extraction Well
- Upper Aquifer Extraction Test Well

												Totals	141,898,704	10	220	394	26	1948	197	31	37	61	5	40	2968	pounds		

Acetone and THF were not included in the mass removal calcuations because these compounds are present in the materials used to repair and join pipe.
441 gallons was pumped form EN-160 on 7/24/08; however, this total is not included in the above calculations because it is not significant.

Appendix B

Notes:
Planar coordinates, measuring point elevations and ground surface elevations are based on the May 2003 comprehensive well field survey with subsequent followup surveys through June 2008.
Coordinate base is New York State Central, NAD1983.

Key:
M.P./TOC = measuring point / top of casing (groundwater elevation reference point)
G.S. = ground surface
ft bgs = feet below ground surface
ft amsl = feet above mean sea level
SP = Standpipe surface completion

MH = Flush-mount manhole surface completion
PVC = Polyvinyl Chloride
LCS = Low carbon steel
SS = Stainless steel
BS = Bare steel

GS = Galvanized steel
OH = Open hole completion (no casing in bedrock)
NA = Data not available or not applicable
NE = Silt layer not encountered (silt may be present at greater depth)
Absent = Silt layer not present

NOTES:
1. Soil samples were screened for volatile organic compounds (VOCs) using a Photovac Model 2020 Photoionization Detector (PID) and a Photovac MicroFID Flame Ionization Detector (FID). The PID was equipped with a 10.6 eV lamp calibrated to a 100 part per million (ppm) isobutylene standard. The FID was calibrated to a 100 ppm methane standard. The typical detection limit for both instruments is 1 ppm. Screening results are recorded in the "PID values" column as follows: PID/FID.

2. Samples S-1, S-2, S-3, S-4B, S-5B, S-6B, S-7, S-8, S-9, S-10, S-11 and S-12 were submitted for VOC analysis by EPA Method 8260B, were submitted for total petroleum hydrocarbon analysis by by DOH Method 310-13, and were submitted for % Solids analysis.

3. Samples S-3, S-6B, and S-11 were submitted for Total Organic Carbon analysis.

4. Sample S-4A was submitted for grain site analysis.

5. Samples S-4A and S-11/S-12 (combined) were submitted for specific gravity analysis.

6. Removed 8.5 gallons of water during 1.3 hours of development.

30										
32										
34										
36										

Boring terminated at 26 feet. No refusal encountered.

NOTES:
1. Soil samples were screened for volatile organic compounds (VOCs) using a Photovac Model 2020 Photoionization Detector (PID) and a Photovac MicroFID Flame Ionization Detector (FID). The PID was equipped with a 10.6 eV lamp calibrated to a 100 part per million (ppm) isobutylene standard. The FID was calibrated to a 100 ppm methane standard. The typical detection limit for both instruments is 1 ppm. Screening results are recorded in the "PID values" column as follows: PID/FID.

2. Sample S-6B was collected following an obstruction during collection of S-6A. Samples were collected from the same depth interval, in separate spoons.

3. Samples S-1, S-2, S-3, S-4, S-5, S-6B, S-7A, S-7B, S-8, S-9, S-10, S-11, S-12, S-13, and S-14A were submitted for VOC analysis by EPA Method 8260B, total petroleum hydrocarbon analysis by DOH Method 310-13, and % Solids analysis.

3. Samples S-2, S-3, S-4, S-6B, S-9 and S-13 were submitted for Total Organic Carbon analysis.

4. Sample S-11 was submitted for grain size analysis.

5. Samples S-3, S-6A, S-11, and S-14A were submitted for specific gravity analysis.

6. Removed 35.8 gallons of water over 3 days of development.

Groundwater Readings

Date	Time	Depth to Water	Ref. Pt.	Depth of Casing	Stab. Time
01/21/08	10:39	---	Top of PVC	Well Installed	4 days
02/04/08	14:56	10.48'	Top of PVC	Well Installed	18 days

Depth (ft)	Sample Information: Sample No.	Depth (ft)	Spoon Blows per 6 in.	Pen/Rec (in.)	PID Values (ppm)	Stratum: Log	Description	Geologic Description	Well Diagram	Well Description
20	S-11	18.7 - 22	50/0 0	0/0				drilling action. S-11: No Recovery.		Filter Sand (18.5 to 22.5')
							BEDROCK	Augered to 22'.		2" I.D. Schedule 40 PVC Well Screen (0.010"-slot) (19.5 to 22.5')
22	S-12	22 - 22.5	118/0.5	6/5	3.1/ 630		-----22.5'-----	S-12: Very dense, gray, weathered BEDROCK, some Sand, some Gravel.		
24								Boring terminated at 22.5 feet. No refusal encountered.		
26								NOTES: 1. Soil samples were screened for volatile organic compounds (VOCs) using a Photovac Model 2020 Photoionization Detector (PID) and a Photovac MicroFID Flame Ionization Detector (FID). The PID was equipped with a 10.6 eV lamp calibrated to a 100 part per million (ppm) isobutylene standard. The FID was calibrated to a 100 ppm methane standard. The typical detection limit for both instruments is 1 ppm. Screening results are recorded in the "PID values" column as follows: PID/FID.		
28								2.No water lost to borehole during drilling. 3. Samples S-1A, S-1B, S-2A, S-2B, S-2C, S-3A, S-3B, S-3C, S-4A, S-5, S-6A, S-6B, S-6C, S-6D, S-7A, S-7B, S-7C, S-8A, S-8B, S-8C, S-8D, S-9A, S-9B, S-9C, S-10A, S-10B, S-12 were submitted for VOC analysis by EPA Method 8260B and for % solids analysis.		
30								4. Samples S-1A, S-2A, S-3A, S-4A, S-5, S-6D, S-7A, S-8A, S-9A, S-10A, and S-12 were submitted for total petroleum hydrocarbon analysis by DOH Method 310-13.		
32								5. Samples S-3B, S-3C, S-4A, and S-8C were submitted for total organic carbon analysis. 6. Removed ~9.7 gallons of water during ~2 hours of development.

30							Photoionization Detector (PID) with a 10.6 eV lamp, calibrated to a 100 parts per million by volume (ppmv) isobutylene-in-air standard using a response factor of 1.0. They were also screened for VOCs using a MicroFID hand-held Flame Ionization Detector (FID) calibrated to a 100 ppmv methane-in-air standard using a response factor of 1.0. Results are presented in ppmv; the typical detection limit is 1 ppmv. ND indicates not detected. The PID and FID measure relative levels of VOCs. Although PID/FID screening cannot be used directly to quantify VOC concentrations or identify individual compounds, the results can serve as a relative indicator for the presence of VOCs.		
32									
34									
36							2. Hollow stem augers were advanced behind the MacroCore samplers to prevent the boring from collapsing.		
							3. Groundwater was encountered at 9.5 feet.

NOTES:

1. Soil samples were screened for volatile organic compounds (VOCs) using a Photovac Model 2020 Photoionization Detector (PID) with a 10.6 eV lamp, calibrated to a 100 parts per million by volume (ppmv) isobutylene-in-air standard using a response factor of 1.0. They were also screened for VOCs using a MicroFID hand-held Flame Ionization Detector (FID) calibrated to a 100 ppmv methane-in-air standard using a response factor of 1.0. Results are presented in ppmv; the typical detection limit is 1 ppmv. ND indicates not detected. The PID and FID measure relative levels of VOCs. Although PID/FID screening cannot be used directly to quantify VOC concentrations or identify individual compounds, the results can serve as a relative indicator for the presence of VOCs.

2. Hollow stem augers were advanced behind the MacroCore samplers to prevent the boring from collapsing.

3. Groundwater was encountered at 6.5 feet.

4. Groundwater sampled at 18.5' (EN-679SSLW).

5. Soil samples S-3, S-5A, S-8A and groundwater sample EN-679SSLW were submitted for laboratory analysis of VOCs by USEPA method 8260B.

Depth (ft)	Sample Information: Sample No.	Depth (ft)	Spoon Blows per 6 in	Pen/ Rec (in)	Field Testing Data	Stratum: Log	Description	Geologic Description	Well Diagram	Well Description
60								PGM-7600 Photoionization Detector (PID) with a 10.6 eV lamp, calibrated to a 100 parts per million by volume (ppmv) isobutylene-in-air standard using a response factor of 1.0. They were also screened for VOCs using a Photovac MicroFID hand-held Flame Ionization Detector (FID) calibrated to a100 ppmv methane-in-air standard using a response factor of 1.0. Results are presented in ppmv; the typical detection limit is 1 ppmv. 0 ppmv indicates not detected. The PID and FID measure relative levels of VOCs. Although PID/FID screening cannot be used directly to quantify VOC concentrations or identify individual compounds, the results can serve as a relative indicator for the presence of VOCs. 2. Soil samples were collected using direct push MacroCore sampler. Hollow stem augers were advanced behind the MacroCore samplers to prevent the boring from collapsing. At 53' switched to split spoon sampler and roller bit. Groundwater grab samples were collected using a screen point sampler and a peristaltic pump. 3. Groundwater was encountered ~12 feet. 4. Groundwater sampled at 22'-24' bgs (EN-684S20081002ADC) and 45'-47' bgs (EN-684I20081002ADC). 5. Soil samples S-5D (and MS/MSD), S-11B, and groundwater grab samples were submitted for laboratory analysis of VOCs by USEPA method 8260B. 6. Removed ~250 gals of water during development.

NOTES:

1. Soil samples were screened for volatile organic compounds (VOCs) using a MiniRAE Model PGM-7600 Photoionization Detector (PID) with a 10.6 eV lamp, calibrated to a 100 parts per million by volume (ppmv) isobutylene-in-air standard using a response factor of 1.0. They were also screened for VOCs using a Photovac MicroFID hand-held Flame Ionization Detector (FID) calibrated to a100 ppmv methane-in-air standard using a response factor of 1.0. Results are presented in ppmv; the typical detection limit is 1 ppmv. 0 ppmv indicates not detected. The PID and FID measure relative levels of VOCs. Although PID/FID screening cannot be used directly to quantify VOC concentrations or identify individual compounds, the results can serve as a relative indicator for the presence of VOCs.
2. Soil samples were collected using direct push MacroCore sampler and 2" splitspoon (S-6 and S-7). Hollow stem augers were advanced behind the MacroCore samplers to prevent the boring from collapsing. Switched to drive and wash at 21' and no additional samples were collected. Groundwater grab samples were collected using a screen point sampler and a peristaltic pump.
3. Groundwater was encountered ~7 feet.
4. Groundwater sampled at 15'-17' bgs (EN-685S20080924SLW).
5. Soil samples S-4, S-7, and groundwater grab samples were submitted for laboratory analysis of VOCs by USEPA method 8260B.
6. Removed ~250 gals of water during development over two days.

NOTES:

1. Soil samples were screened for volatile organic compounds (VOCs) using a MiniRAE Model PGM-7600 Photoionization Detector (PID) with a 10.6 eV lamp, calibrated to a 100 parts per million by volume (ppmv) isobutylene-in-air standard using a response factor of 1.0. They were also screened for VOCs using a Photovac MicroFID hand-held Flame Ionization Detector (FID) calibrated to a100 ppmv methane-in-air standard using a response factor of 1.0. Results are presented in ppmv; the typical detection limit is 1 ppmv. 0 ppmv indicates not detected. The PID and FID measure relative levels of VOCs. Although PID/FID screening cannot be used directly to quantify VOC concentrations or identify individual compounds, the results can serve as a relative indicator for the presence of VOCs.

2. Soil samples were collected using direct push MacroCore sampler and split-spoon (S-11 and S-12). Hollow stem augers were advanced behind the MacroCore samplers to prevent the boring from collapsing. Switched to split spoon sampler and roller bit at 35'. Groundwater grab samples were collected using a screen point sampler and a peristaltic pump.

3. Groundwater was encountered ~15 feet.

4. Groundwater sampled at 22'-24' bgs (EN-686S20080930SLW) and at 31'-33' bgs (EN-686I20080930ADC).

5. Soil samples S-6c, S-9 (Duplicate, MS, MSD), and groundwater grab samples were submitted for laboratory analysis of VOCs by USEPA method 8260B.

6. Removed ~35 gals of water during development over two days.

Key:

M.P. Elev. = Measuring Point Elevation
ft amsl = feet above mean sea level
-1.00 = Dry or Unsaturated Upper Aquifer
-2.00 = Not measured or not accessible

* Extraction well under vacuum assist. Although the depth to water was measured, the groundwater elevation was not adjusted for vacuum at the well head.

XYLENES, TOTAL	ug/l	NA		NA							

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit.
R	Result rejected due to analytical and quality control deficiencies. The presence or absence of the analyte cannot be verified.
X	Analytical data has not been validated by a third party.

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit.

Absolute Difference = |S - D|
Relative Percent Difference = (|S - D| / (S + D)/2) x 100
ND = Not detected.
NA = Not applicable; cannot be calculated.
*111-TCA was detected in both samples but the results are not comparable, possibly due to matrix interference.
Sample result, S, was reported by IBM Hudson Valley Environmental Laboratory, Hopewell Junction, NY.
Duplicate result, D, was reported by Lancaster Laboratories, Inc., Lancaster, PA.

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit.
R	Result rejected due to analytical and quality control deficiencies. The presence or absence of the analyte cannot be verified.
X	Analytical data has not been validated by a third party.

Appendix G

Time vs. Concentration Graphs

Timeline Key

1	Start of EN-284TD test (7/6/04)
2	EN-491T, 492T startup (2/16/06)
3	EN-447T and EN-499T startup (5/24/06)

Summary of Significant Remediation Systems Maintenance Activities

2008

Table of Contents

1 Groundwater Treatment Facilities 1
2 Operable Unit #1: Railroad Corridor Source Area 3
3 Operable Unit #2: North Street Area 5
4 Operable Unit #3 and Miscellaneous Activity A 6
5 Operable Unit #4: Ideal Cleaners Area (Off-Site Capture Zone B) 9
6 Operable Unit #5: Building 57 Area 10
7 Operable Unit #6: Plume Control in Bedrock Groundwater 11
8 Operable Unit #7: Northwestern Area 12

1 Groundwater Treatment Facilities

Groundwater remediation activities in 2008 included operation of six groundwater treatment facilities. The six facilities are referred to as the Jefferson Avenue Groundwater Treatment Facility (GTF), Garfield Avenue GTF, Adams Avenue GTF, Hayes Avenue GTF, Robble Avenue GTF and Clark Street GTF. On April 10, 2008, the Hayes Avenue GTF was shut down and taken out of service. On April 23, 2008 a new transfer station was started up in the Hayes Avenue area to collect the groundwater from the three extraction wells formerly treated at the Hayes Avenue GTF and transfer this groundwater to the Clark Street GTF for treatment.

Significant maintenance activities in 2008 for the six GTFs are listed below.

1. **Jefferson Avenue Groundwater Treatment Facility (GTF).** There were no significant maintenance activities at the Jefferson GTF during 2008. The Jefferson Avenue treatment system was modified during January and February 2008 to incorporate a groundwater injection system. The injection system modifications included the installation of a new injection water supply tank and related piping, instrumentation and controls to allow treated groundwater water and supplemental potable water to be injected at EN-510T. The Jefferson GTF effluent flow meter was inspected and barrel tested for calibration purposes in December 2008.

2. **Garfield Avenue Groundwater Treatment Facility (GTF).** There were no significant maintenance activities at the Garfield GTF in 2008. The Garfield GTF effluent flow meter was inspected and barrel tested for calibration purposes in December 2008.

3. **Adams Avenue Groundwater Treatment Facility (GTF).** GTF activities and upgrades that occurred at the Adams GTF in 2008 included the addition of inlet bag filters on the A1 conveyance pipeline, which includes groundwater extracted from wells EN-D49, EN-491T and EN-185 and installation of an injection supply tank, piping, instrumentation and controls similar to the Jefferson Avenue GTF injection system. The Adams injection system was designed to allow treated groundwater and supplemental potable water to be injected at EN-78T. New valves, an air-operated diaphragm pump and related piping were installed at the base of the third vessel in the GTF for use as an equalization and settling

tank and for water transfer during carbon changes. The Adams Avenue GTF carbon vessel 1A had its granular activated carbon (GAC) exchanged on June 5, 2008. The GAC in carbon vessel 1B was exchanged on February 21 and October 1, 2008. The vessel distribution Hydrosphere nozzles were replaced with new Kynar units in each vessel during scheduled carbon changes. The carbon vessel interiors were cleaned and inspected during each carbon exchange. The GTF effluent flow meter was calibrated and barrel tested in December 2008.

4. **Hayes Avenue Groundwater Treatment Facility (GTF).** The 2,000-pound lead bed of vapor-phase granular activated carbon was exchanged monthly between January 2008 and April 2008. On April 10, 2008 the Hayes Avenue GTF was shut down and it was decommissioned on May 16, 2008. The water previously treated at the Hayes Avenue GTF (from wells EN-89R, EN-623, and EN-624) was diverted to a newly constructed transfer station located next to the former GTF and conveyed from there to the Clark Street GTF for treatment starting on April 23, 2008.

5. **Robble Avenue Groundwater Treatment Facility (GTF).** 2008 marked the first full year of operations of the Robble Avenue GTF. The Robble air stripper was inspected six times and cleaned three times. The flow meter was cleaned and calibrated with barrel testing in September 2008. The GTF was briefly shut down eight times as a result of heavy rainfall and resulting high water levels along Robble Avenue in both the street and storm sewer during February, March, June, July, and August 2008. The vapor-phase carbon was changed once in March 2008.

6. **Clark Street Groundwater Treatment Facility (GTF).** 2008 also marked the first full year of operation for the Clark Street GTF. The air stripper was visually inspected monthly and was cleaned with pressure washing on an average of every four to five weeks. The liquid-phase carbon was switched from series to parallel operation in January 2008 to reduce operating discharge pressure. The flow meters were inspected, cleaned and tested in April and September 2008. The vapor-phase carbon was changed on April 8, July 28 and December 2, 2008.

2 Operable Unit #1: Railroad Corridor Source Area

Extraction wells EN-428/EN428P, EN-253, EN-107 and EN-219R are located within Operable Unit #1: Railroad Corridor Source Area. Building 46S (B046S) is the transfer station adjacent to EN-428 and EN-428P. Building 46S houses meters, controls and chemical dosing systems for the EN-428/EN-428P and EN-253 pump systems. The controls, flow meter and chemical dosing systems for EN-107 are located in a separate well house structure close to extraction well EN-107. Groundwater from EN-107 is pumped to the Building 46S transfer station where it joins with the groundwater from wells EN-428/428P and EN-253 in a small transfer tank and is pumped to the Clark Street GTF for treatment. Significant maintenance activities for this area are listed below by location or extraction well.

1. **Transfer Station Building 46S.** The new B46S transfer station was completed in December 2007. The B46S maintenance activities in 2008 including flushing of the conveyance piping to the Clark Street GTF with potable water one time and inspection and cleaning of the flow meters as required.

2. **Extraction Well EN-428**. In 2008, EN-428 continued to serve as an extraction well, with EN-428P remaining as a backup and monitoring well. The EN-428 flow meter was inspected and cleaned on February 20, April 22, and May 10, 2008 and during each well maintenance session. The flow meter was barrel tested in December 2008. The well was televiewed and the extraction pump was pulled and replaced on April 22, July 8 and August 20, 2008. The well was cleaned during the July and August 2008 maintenance events.

3. **Extraction Well EN-428P.** In 2008, EN-428P served as a backup and monitoring well to EN-428.

4. **Extraction Well EN-219R.** A new concrete well house was constructed for the EN-219R well as part of the Clark Street GTF system in 2007. In 2008, the EN-219R flow meter was cleaned four times (in February, April, May, and December), and the flow meter was barrel tested in December 2008. The conveyance piping between the EN-219R well building and Clark GTF was flushed with potable water in May 2008. The well was televiewed in February 2008, and the pump head was changed at that time.

5. **Extraction Well EN-253**. The EN-253 flow meter was cleaned four times (in February, April, May, and December), and the flow meter was barrel tested in December 2008. The well was televiewed and cleaned in June 2000. The pump head was replaced four times (in January, April, June and November) and the motor was replaced in late April 2008.

6. **Extraction Well EN-107**. A new concrete enclosure was installed to house the EN-107 above-ground conveyance piping, new Signet magmeter, and EN-107 controls as part of the Clark Street GTF design in 2007. The flow meter for EN-107 was inspected and cleaned three times in 2008 (in February, May, and December). The well pump assembly for extraction well EN-107 was pulled, inspected, cleaned, and replaced three times in 2008 (also in February, May, and December) due to material buildup in the pump head.

3 Operable Unit #2: North Street Area

One Upper Aquifer extraction well, EN-276, is located in the vicinity of North Street between B014 and B018. Significant maintenance activities for this area are listed below.

1. The pump and motor assembly and SubGard® level control device for extraction well EN-276 were pulled, inspected, cleaned and replaced in January and October 2008. The flow meter was cleaned in January and September 2008 and was calibrated and barrel tested in December 2008. The flow meter malfunctioned and was replaced with a new unit on March 8, 2008.

4 Operable Unit #3 and Miscellaneous Activity A

During 2008, seven of twelve extraction wells operated to remove groundwater from the Upper Aquifer in Off-Site Capture Zone A (Miscellaneous Activity A: Plume Reduction in Off-Site Capture Zone A) and Operable Unit #3: Plume Reduction in the Southern Area (OU#3). These twelve extraction wells include: EN-284TD, EN-284P, EN-133, EN-451T, EN-91T, EN-92P, the Garfield Avenue Well Cluster (EN120, EN-160, and EN-194), EN-215T, EN-499T, and EN-447T. The seven extraction wells in operation during 2008 included EN-284P, EN-451T, EN-133, EN-215T, EN-499T, EN-447T and EN-194. Groundwater extracted from EN-133 and EN-451T was treated at the Jefferson Avenue GTF. Groundwater extracted from EN-284P, EN-215T, EN-499T and EN-194 was treated at the Garfield Avenue GTF. Groundwater extracted from EN-447T was treated at the Adams Avenue GTF. Significant 2008 maintenance activities for MA-A and OU#3 extraction wells are listed below.

1. **Extraction Well EN-284TD/P.** On January 11, 2007 operation switched from EN-284TD to EN-284P, with EN-284P continuing to serve as the extraction well throughout 2008 and EN-284TD serving as a backup well. The EN-284P pump was pulled, the well, pump and motor were inspected, and the pump and motor were replaced on April 25, 2008. The EN-284TD backup well pump and motor were pulled, inspected and changed on May 15, 2008. The flow meter was inspected and barrel tested for calibration purposes in December 2008.

2. **Extraction Well EN-133**. The well, pump and motor for extraction well EN-133 were inspected and the pump and motor were replaced in March 2008. The flow meter was inspected, cleaned, calibrated and barrel tested in December 2008.

3. **Extraction Test Well EN-451T.** The EN-451T flow meter was replaced on May 16, 2008. The meter was cleaned and barrel tested in December 2008.

4. **Extraction Well EN-91T.** With NYSDEC approval, operation of EN-91T ceased on December 22, 2006 due to limited saturated thickness and available drawdown in the area of the well.

5. **Extraction Well EN-92P.** With NYSDEC approval, operation of EN-92P ceased on December 22, 2006 due to limited saturated thickness and available drawdown in the area of the well.

6. **Extraction Well EN-120.** With NYSDEC approval, operation of EN-120 ceased on December 22, 2006 due to limited saturated thickness and available drawdown in the area of the well.

7. **Extraction Well EN-160.** With NYSDEC approval, operation of EN-160 ceased on December 22, 2006 due to limited saturated thickness and available drawdown in the area of the well.

8. **Extraction Well EN-194.** With NYSDEC approval, operation of EN-194 ceased on December 22, 2006 due to limited saturated thickness and available drawdown in the area of the well. EN-194 was restarted for a portion of 2008, operating from July 23, 2008 to November 6, 2008.

9. **Extraction Well EN-215T.** With NYSDEC approval, operation of well EN-215T ceased on January 10, 2007 due to limited saturated thickness and available drawdown potential. EN-215T was restarted for a portion of 2008, operating from April 9 through the remainder of 2008. The flow meter was changed on April 10 and September 5, 2008 due to signal problems.

10. **Extraction Well EN-499T.** Vacuum-enhanced extraction at test well EN-499T continued throughout 2008. The vacuum pump was replaced on January 27, 2008. The Metron flow meter was inspected and barrel tested for calibration purposes in December 2008. Due to groundwater recharge in the spring of 2008, the EN-499T pump and motor were pulled and changed to either upsize or reduce its flow and pressure capabilities on four different occasions. These included upsizing the pump/motor assembly in April, May and October 2008, and reducing the motor size from 7.5 HP to 5 HP in November 2008. The well was inspected and televiewed during the October 7, 2008 pump change event.

11. **Extraction Well EN-447T.** Vacuum-enhanced extraction at test well EN-447T continued throughout 2008. The vacuum system was rebuilt on October 9, 2008. The flowmeter was

serviced and replaced on May 12 and June 17, 2008 due to signal issues. In September and October 2008, the pump and motor were pulled and upsized. In October 2008 the motor size was increased from 5 to 7.5 HP and the well was televiewed. The Metron flow meter was inspected and barrel tested for calibration purposes in December 2008.

5 Operable Unit #4: Ideal Cleaners Area (Off-Site Capture Zone B)

Five extraction wells operate to remove groundwater from the Upper Aquifer in Operable Unit #4 (OU#4 or Off-Site Capture Zone B). Historically, groundwater in OU#4 has been extracted from three extraction wells referred to as the Adams Avenue Well Cluster (EN-185, EN-195, and EN-222). In an effort to provide enhanced hydraulic containment in Off-site Capture Zone B, groundwater withdrawals were initiated at two additional extraction test well locations in 2006. These two test wells are designated EN-491T and EN-492T and are located along Monroe Avenue between wells EN-185 and EN-195. Groundwater extracted from all five wells is treated at the Adams Avenue GTF. Significant maintenance activities for this area are listed below.

1. **Extraction Well EN-222.** The pump and motor assembly were pulled and replaced in March and July 2008. The flow meter was cleaned and inspected in January, June and October, 2008 and barrel tested for calibration purposes in December 2008.

2. **Extraction Well EN-185.** The pump and motor assembly were pulled and replaced on March 6, 2008. The Metron flow meter was cleaned and inspected on ten occasions and replaced with a new meter body on September 7, 2008. The meter was barrel tested in December 2008.

3. **Extraction Well EN-195.** The pump and motor assembly were pulled and replaced on March 18, 2008. The Metron flow meter was inspected, cleaned and calibrated in December 2008.

4. **Extraction Well EN-491T.** The vacuum pump went off three times due to power losses and required resetting to reinitiate vacuum on the well (in January, July, and August). The Metron flow meter was inspected, cleaned and calibrated in December 2008.

5. **Extraction Well EN-492T.** The vacuum pump went off three times due to power losses and required resetting to reinitiate vacuum on the well (in January, July, and August). The pump and motor assembly were pulled and the well was televiewed on September 11, 2008. The Metron flow meter was calibrated in December 2008.

6 Operable Unit #5: Building 57 Area

During 2008, three extraction wells (EN-89R, EN-623 and EN-624) extracted groundwater from OU#5 at a combined rate of approximately 3 to 5 gallons per minute (gpm). On April 23, 2008, the water from these wells was diverted from the Hayes Avenue treatment system to a new Hayes transfer station which incorporates a small equalization tank, transfer pumps, and chemical pretreatment prior to conveying the groundwater to the Clark Street GTF. Significant maintenance activities for this area are listed below.

1. **Hayes Avenue Transfer Station Building.** The Hayes Avenue transfer station replaced the former Hayes Avenue treatment system in April 2008. Maintenance activities were minimal, including flushing of the conveyance piping to the Clark Street GTF with potable water once and inspection of the flow meters as required.

2. **Extraction Well EN-89R.** Groundwater withdrawals from extraction well EN-89R continued throughout 2008. The pump and motor assembly were pulled and replaced in January and November 2008. The well was inspected and cleaned in May 2008. The flow meter was cleaned, checked and calibrated in December 2008.

3. **Extraction Well EN-623.** The pump and motor were replaced in February 2008. The Signet flow meter was cleaned in April 2008 and inspected and calibrated in December 2008.

4. **Extraction Well EN-**624. The pump and motor were replaced in February 2008. The Signet flow meter was inspected and calibrated in December 2008.

7 Operable Unit #6: Plume Control in Bedrock Groundwater

In 2008, bedrock groundwater withdrawals continued from bedrock extraction well EN-D49 located near the southwest corner of Building 42. Groundwater extracted from EN-D49 is treated at the Adams Avenue GTF. The pump and motor assembly were pulled and replaced on May 15, 2008 at which time the well was also televiewed.

From September 3 to 24, 2008 a planned shutdown of the well occurred. Activities performed during the shutdown included:

1. Televiewing of the wellbore, which identified an obstruction.

2. Redevelopment of the well to remove the obstruction and accumulation of fine particles.

3. Backfilling of the lower portion of the wellbore with sand. The sand was capped with a two-foot thick clay plug at 140 feet below ground surface. The sand backfill and clay plug were installed to seal off the lower portion of the wellbore as an alternative to using a mechanical packer assembly due to the potential for borehole instability (approved by the NYSDEC during a September 22, 2008 telephone call with IBM and GSC).

4. Addition of an in-well solids separator assembly installed at the base of the motor assembly in an attempt to reduce solid particulates from being pumped to the Adams Avenue GTF.

EN-D49 bedrock groundwater withdrawal rates prior to the September 2008 shutdown were on the order of 40 to 50 gpm. Following the sealing of the lower portion of the wellbore, EN-D49 groundwater withdrawals resumed at a reduced rate of 25 gpm. Monitoring of the extraction well and nearby monitoring wells indicated sealing of the lower portion of the wellbore retained the well effectiveness and provided a reduction in particulates being pumped to the Adams Avenue GTF. This flow reduction also improved the ability of the Adams Avenue GTF to handle increased flow from extraction well EN-447T. A chemical pretreatment system was installed in December 2008. The EN-D49 flow meter was barrel tested and calibrated in December 2008.

8 Operable Unit #7: Northwestern Area

Groundwater extraction operations in Operable Unit #7 (OU#7) include groundwater withdrawals from the EN-154/EN-154R location and the EN-218 location. Groundwater extraction at these two locations is performed to control relatively low concentrations of VOCs in groundwater within this operable unit. In 2007, a new groundwater treatment facility consisting of air stripping and vapor phase carbon was completed to treat groundwater extracted from EN-154/EN-154R and EN-218. This new facility, referred to as the Robble Avenue GTF, began to accept water from EN-154R on March 26, 2007 and then from EN-218 on July 24, 2007. Significant maintenance activities for this area are listed below.

1. **Extraction Well EN-154/154R.** Replacement extraction well EN-154R is located close to former extraction well EN-154. EN-154R serves as the primary extraction well with well EN-154 serving as a monitoring well and backup extraction well in the event of a major pump failure or need for maintenance on the primary well. The EN-154R well controls, vacuum pump and chemical pretreatment equipment are located in a new well house structure next to the well. During 2008, the vacuum pump for the well required an operator response and manual reset approximately 15 times due to electrical power related problems and storm events in this area. The pump and motor assembly were pulled and replaced on April 24, 2008. The conveyance piping between the EN-154R well house and Robble Avenue GTF were flushed with potable water in August 2008. The EN-154R flow meter was barrel tested in December 2008.

2. **Extraction Well EN-218.** As part of the Robble GTF construction, a new concrete enclosure was installed to house the above ground piping, flow meter, chemical feed systems and controls for extraction well EN-218. The pump was pulled and replaced on January 9, 2008. The EN-218 flow meter was inspected and cleaned in September 2008 and barrel tested in December 2008. The conveyance piping between the EN-218 well house and Robble Avenue GTF was flushed with potable water in August 2008.
