Rome, New York 13441

SUBJECT: Final Site Closure Report, DP013 Building 255 AOC
Former Griffiss Air Force Base, Rome, New York
Contract No. FA8903-10-D-8595, Delivery Order No. 0014
April 2014

1. Enclosed is the "Final Site Closure Report for DP013 Building 255 AOC", for your review and comment.

2. Request concurrence with the recommendation for site closure with unrestricted use at DP013 Building 255 AOC. The draft report was provided on February 11, 2014.

3. During the forty five (45) day Federal Facilities Agreement review period, neither the New York State Department of Environmental Conservation nor the United States Environmental Protection Agency disagreed with the conclusions for site closure with unrestricted use. As required by the Federal Facilities Agreement, a final thirty (30) day review period is being provided for this final document.

4. Request that final concurrence be provided by May 26, 2014.

5. Should you have any questions or concerns please contact me at 315 356 0810 ex 202.

MICHAEL F. MCDERMOTT

# 1 INTRODUCTION

FPM Remediations, Inc. (FPM), in association with CAPE, Inc., under contract with the Air Force Civil Engineer Center (AFCEC), conducted site closure activities at the Land Use Control/Institutional Control (LUC/IC) Site DP013 Building 255 Area of Concern (AOC), at the former Griffiss Air Force Base (AFB) in Rome, New York.

## 1.1 Purpose

The Griffiss Local Redevelopment Agency has implemented reuse and redevelopment for the former Griffiss AFB that includes a mixture of commercial, industrial and airport use. The Air Force's initiative to reduce its long-term environmental liabilities and life cycle costs through site closure creates an opportunity to optimize benefits to the local public, the federal government, and the environment. This site is subject to a deed restriction in the form of land use restrictions for non-residential use. An evaluation of the site, including soil sampling, was conducted to determine if residual soil contamination is at levels below the Title 6 - New York Codes, Rules and Regulations (6-NYCRR) Part 375 Residential use Soil Cleanup Objectives (SCOs) [NYSDEC, December 2006] and to obtain site closure with unrestricted reuse at the site.

The site closure activities were conducted in accordance with the Final Site Closure Plan for LUC/IC Sites (CAPE/FPM, March 2013). The Updated 2013 Uniform Federal Policy Quality Assurance Project Plan (UFP QAPP) for Performance Based-Remediation at the Former Griffiss AFB (CAPE/FPM, May 2013) and Health and Safety Plan for Performance Based-Remediation at the Former Griffiss AFB (CAPE/FPM, July 2012) were also used in conjunction with the Site Closure Plan.

# 2 RECORD OF DECISION

The Record of Decision (ROD) for the Building 255 AOC was signed by the Air Force in June 2001 and by the United States Environmental Protection Agency (USEPA) in September 2001. The ROD is provided in Appendix A. Based on the previous investigations and environmental conditions at the site the selected remedy for the Building 255 AOC is no further action (NFA) for soils with LUC/ICs for industrial/commercial use and groundwater use restrictions. However, groundwater use restrictions were removed in spring 2012. The ROD states that:

- The property will be industrial/commercial use unless permission is obtained from the USEPA, New York State Department of Environmental Conservation (NYSDEC), and New York State Department of Health (NYSDOH).

# 3 SITE BACKGROUND

The Building 255 AOC is located in the west-central portion (Parcel F3A) of the former Griffiss AFB. Building 255 was a former vehicle maintenance shop located in the area referred to as Tin City. This building has been demolished. Several suspected drywell locations are associated with the site including several near Building 255 (west and south of building) and other nearby buildings, including Buildings 215/216, 222, and 223 (Figure 1). One drywell west of the former

building and one drywell located south of the former building were removed in 1998. All other drywells associated with the site were not located in previous investigations.

The Remedial Investigation (RI) soil and groundwater sampling conducted in 1994 showed volatile organic compound (VOC), semi-volatile organic compound (SVOC), pesticide, polychlorinated biphenyl (PCB) and metal detections. A risk assessment was conducted for the RI. For human health, contaminants in the soil and groundwater were within the lower end of the acceptable USEPA target risk range for industrial and commercial users (LAW, December 1996).

The soil sampling conducted during the RI included the collection of soil samples from borings positioned within the assumed drywell locations (215SB-1, 216SB-1, 222SB-1, 223SB-1, 230SB-1, 255SB-1, -3, and -5). These borings are illustrated in Figure 1. All samples showed VOC, SVOC, pesticide, PCB and metal detections. When compared to the 6-NYCRR Part 375 Residential use SCOs, all results from borings 216SB-1, 222SB-1, 223SB-1, and 230SB-1 met the residential use SCOs. Metal and/or SVOC concentrations were above the residential use SCOs at the remaining borings. Samples collected at 255SB-3, -5, and 215SB-1 showed total chromium exceedances at 72 parts per million (ppm), 45 ppm and 120 ppm, respectively. SVOCs were exceedances at 255SB-1 and -3. However, all soil boring detections met the 6-NYCRR Part 375 Commercial and Industrial use SCOs.

An Interim Remedial Action (IRA) was performed in 1998 which consisted of asphalt demolition, removal and disposal of the drywell (Drywell 255-1), and soil excavation. The former Drywell 255-1 location is associated with RI soil boring 255SB-5 as shown on Figure 1. Confirmatory sampling conducted in the soil excavation indicated clean-up goals had been met for all contaminants of concern (COCs) excluding chromium as stated in the Closure Certification Report (Ocuto Blacktop and Paving Environmental Services, February 2000). The chromium detection (45 ppm) found in the confirmatory sample collected in the southern wall of the excavation was attributed to background conditions. When compared to the 6-NYCRR Part 375 Residential use SCOs, the concentration was above the SCOs for hexavalent chromium (22 ppm) and trivalent chromium (36 ppm).

An additional drywell, Drywell 255-2, located south of the former building was removed followed by soil excavation in 1998 as part of the Hangar Road extension project. Following removal, the former drywell location was investigated as part of the Expanded Site Investigation and Confirmatory Sampling of Areas of Interest and Drywell/Waste water related Systems (Ecology and Environment, July 1998). Soil samples collected at boring D255-SD01 (Figure 1) showed a total chromium concentration of 43 ppm.

Long-term monitoring (LTM) was conducted at the site from 2001 to 2002 (FPM, August 2003). Groundwater was deemed clean and monitoring ceased at the site in 2002 with regulatory approval. Based on the results from previous sampling and the ROD requirements for the Building 255 AOC, the Air Force submitted an Explanation of Significant Differences (ESD) in 2003 to the USEPA. The document requested the deletion of ROD requirements for the groundwater investigations. The ESD was supported by groundwater monitoring data indicating groundwater Applicable or Relevant and Appropriate Requirements (ARARs) have been met.

The ESD was signed by the USEPA on September 26, 2003 (Air Force, September 2003). The remaining LTM wells at the site were decommissioned in the Round 3 Well Decommissioning event performed in summer/fall 2005 (FPM, January 2006).

A request to remove the groundwater restriction at the site was issued by the Air Force in March 2012. NYSDEC acceptance was provided on April 24, 2012 and USEPA acceptance was provided on May 16, 2012. The NYSDEC acceptance email and USEPA approval letter are provided in Appendix B.

# 4 SITE CLOSURE ACTIVITIES

Site Closure activities included a soil investigation to delineate/confirm the presence of residual soil contamination at the site above 6-NYCRR Part 375 Residential use SCOs. The site closure activities were conducted to obtain site closure with unrestricted reuse at the DP013 Building 255 AOC. Based on the soil investigation results, a human health risk assessment (HHRA) was also conducted. The results of the soil investigation and HHRA are provided below.

## 4.1 Site Investigation

For the purposes of the site investigation, the site was split into four sampling areas based on the previous investigation and removal results. The sampling areas are illustrated in Figures 2 and 3.

Sampling Area 1: This area corresponds with the southern drywell site and previous boring D255-SD01. Nine soil samples were collected from three borings on May 6, 2013 and analyzed for VOCs and metals. Samples were collected from 0 to 4 feet below ground surface (ft bgs), 4 to 8 ft bgs, and 8 to 12 ft bgs intervals at soil boring locations B255SCS-1, -2, and -3 (Figure 2).

Sampling Area 2: This area corresponds with the western drywell site and excavation. Six soil samples were collected from two borings on July 29, 2013 and analyzed for metals. Samples were collected from 0 to 4 ft bgs, 4 to 8 ft bgs, and 8 to 12 ft bgs intervals at soil boring locations B255SCS-7 and -8 (Figure 2). Soil borings B255SCS-7 and -8 were located at the southern wall of the former western drywell excavation.

Sampling Area 3: This area corresponds with the previous borings B255SB-1 and -3. Six soil samples were collected at two borings on July 29, 2013 from the 0 to 4 ft bgs, 4 to 8 ft bgs, and 8 to 12 ft bgs intervals. The soil borings are illustrated on Figure 2. Soil boring B255SCS-9 was positioned at the former 255SB-3 location. Based on the previous investigation results, the three samples collected at B255SCS-9 were analyzed for SVOCs and metals. Soil boring B255SCS-10 was positioned at the former 255SB-1 location. Based on the previous investigation results, the three samples collected at B255SCS-10 were analyzed for SVOCs only.

Sampling Area 4: This area corresponds with the previous boring 215SB-1. Four soil samples were collected at one boring from the 0 to 4 ft bgs, 4 to 8 ft bgs, 8 to 12 ft bgs, and 12 to 16 ft bgs intervals on July 29, 2013. The soil boring, B255SCS-11, is illustrated on Figure 3. Based on the previous investigation results, the samples were analyzed for metals. The additional sampling interval was conducted based on the previous investigation results. Total chromium

was detected above 6-NYCRR Part 375 Residential use SCOs in the 12 to 16 ft bgs interval at 215SB-1 during the RI.

Field screening for visual and olfactory characteristics was conducted prior to sampling at each soil boring location. The results of the soil characterization are provided in the daily chemical quality control reports (CQCRs) in Appendix C.

### 4.2 Site Investigation Sampling Results

Results from the site closure soil sampling showed that all VOC and SVOC concentrations met their respective 6-NYCRR Part 375 Residential use SCOs. In addition, all metals except for chromium met their respective 6-NYCRR Part 375 Residential use SCOs. Elevated chromium concentrations were detected at soil boring locations B255SCS-8 (8 to 12 ft bgs) and B255SCS-11 (12 to 16 ft bgs) at concentrations of 27 milligrams per kilograms (mg/kg) and 24 mg/kg, respectively. The concentrations met the trivalent chromium Residential use SCO of 36 mg/kg but exceeded the hexavalent chromium Residential use SCO of 22 mg/kg. As the chromium detections could not be speciated, the chromium exceedances are based on using the more stringent of the two chromium Residential use SCOs.

Sampling results are presented in Table 1. All field sampling forms are attached in the daily CQCRs in Appendix C. The validated data are attached in Appendix D and the raw lab data are provided in Appendix E.

## 5 HUMAN HEALTH RISK ASSESSMENT

A HHRA was previously conducted for the RI to evaluate potential health risks using an industrial/commercial land use scenario for the site. The RI HHRA results indicated acceptable risks for the identified receptors and pathways (Law, December 1996). A supplemental HHRA was conducted as part of the 2013 site closure activities. This HHRA addressed future residential land use scenario only and used the most recent soil data.

Risk assessment as defined in the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process consists of data evaluation, exposure assessment, toxicity assessment, and risk characterization (USEPA, December 1989). An uncertainty analysis was also completed as part of this risk assessment. The HHRA has been organized as follows:

- Data Evaluation – Ensures that the data are appropriate for use in the HHRA and to identify chemicals of potential concern (COPCs). Chemicals identified as COPCs are the focus of the following components of the risk assessment.
- Exposure Assessment – Identifies potential pathways by which exposure could occur, characterizes the potentially exposed populations (i.e. future residential use) and estimates the magnitude, frequency, and duration of exposures. Results of the assessment are combined with toxicity information to characterize potential risks.
- Toxicity Assessment – Identifies the types of adverse health effects associated with the exposure to the COPCs, lists the available toxicity factors (i.e., reference dose values

[RfDs]), and summarizes the relationship between magnitude of exposure and occurrence of adverse health effects.
- Risk Characterization – Integrates the results of the data evaluation, exposure assessment, and toxicity assessment into quantitative expressions of risk.
- Uncertainty Analysis – Provides an evaluation of the uncertainties that enter the risk assessment at each step of the process in order for regulators, stakeholders, and risk managers to put the risks in proper context.

These components are described briefly in the following sections. Tables prepared in accordance with USEPAs *RAGS, Volume 1, Human Health Evaluation Manual, Part D* were used to screen for COPCs, and to calculate estimated exposures and health risks associated with the COPCs. The tables are summarized in the following sections and presented at the end of the document.

## 5.1 Data Evaluation

The data used in the HHRA consisted of the following:

- Soil samples were collected from the B255 AOC at 8 locations and three or four sampling depths (0 to 4 ft bgs, 4 to 8 ft bgs, 8 to 12 ft bgs and 12 to 16 ft bgs). Four sampling depths only occurred at location B255SCS-11. Samples were analyzed by a Department of Defense Environmental Laboratory Accreditation Program certified laboratory.

Chemical analyses were performed in accordance with USEPA methods for VOCs (SW8260B), SVOCs (SW8270C), and metals (SW6010C). The analytical results were evaluated to assess data usability and laboratory compliance with the analytical methods. The analytical data were reviewed, validated, and evaluated using the criteria specified in the UFP QAPP (FPM, May 2013). The data validation reports are located in Appendix D. All "J" qualified detections (estimated values) were considered as detected concentrations for this HHRA. All undetected results, at the limit of detection (indicated with a "U" qualifier) were retained in the HHRA dataset.

The data evaluation included the calculation of statistics for each dataset evaluated in the HHRA. Basic statistics included frequency of detection, range of positive detections, arithmetic mean, and the most appropriate 95% upper confidence limit (UCL) of the mean. Statistics depended on the data distribution and the skewness, as predicted by USEPA Technical Support Center ProUCL Version 5.0 (USEPA, September 2013a) [results are located in Appendix F]. These statistics were also used in the determination of the exposure point concentration (EPC) selected in the exposure assessment.

### 5.1.1 Chemicals of Potential Concern

The purpose of the screening process is to eliminate chemicals for which no further risk evaluation is needed. COPCs for the HHRA are limited to those chemicals that exceed a selection criterion. For this risk assessment, SCOs and background screening values were used to reduce the number of chemicals and exposure routes considered. The background screening

values used to eliminate COPC were collected from the statewide rural surface soil survey conducted by NYSDOH and NYSDEC (August 2005). The department did not establish a background screening value for chromium (VI) because hexavalent chromium is not a commonly occurring natural form. The premise of this screening step is that risk is typically dominated by a few chemicals and that, although several may actually be detected, the concentration of these chemicals do not contribute to the total risk.

Environmental sampling results were compared to the SCOs and background screening values. The SCO levels represent a risk level of 1 x $10^{-6}$ for carcinogenic effects (i.e., a one-in-one-million excess chance of developing cancer over a lifetime) and a Hazard Index (HI) of 1.0 for non-carcinogenic effects (i.e., adverse non-carcinogenic health effects are not anticipated at or below this exposure concentration). If screening levels exist for a chemical for both carcinogenic and non-carcinogenic effects, the lower of the two values is used as the COPC selection criteria.

Chemicals that were not detected at concentrations exceeding the SCOs and background screening values were not retained as COPCs. Table 2 provides the summary of COPCs for the HHRA. The only detected analyte that is considered a COPC is chromium.

## 5.2 Exposure Assessment

The exposure assessment defines and evaluates the current and potential future exposures experienced by receptor populations. More specifically, an exposure assessment identifies the pathways by which humans are potentially exposed to COPCs, the magnitude of the potential human exposure, and the frequency and duration of exposure. This process involves several steps:

- Characterization of the exposure setting in terms of physical characteristics and the populations that may potentially be exposed to site-related chemicals.
- Identification of potential exposure pathways and receptors.
- Quantification of exposure for each receptor in terms of the amount of chemical that is ingested, inhaled, or absorbed through the skin from all potentially complete exposure pathways.

### 5.2.1 Characterization of Exposure Setting

The Building 255 AOC is located on relatively flat-lying terrain with less than a foot of relief in the west-central portion of the former base. The demolished building was located in an area of low industrial activity which was informally referred to as “Tin City”. The Building 255 AOC is outside the border of the Griffiss International Airport fencing and controls, therefore access is not restricted to the site. Currently the site is maintained for commercial businesses with open grassy areas. Future use of the Building 255 AOC is anticipated to be consistent with current commercial use. However, hypothetical residential development is evaluated.

Human receptors are identified based on hypothetical future land uses and include potential residents. The current land use scenario of industrial/commercial occupational use was adequately assessed during the RI HHRA (Law, December 1996).

### 5.2.2 Contaminants Pathway Analysis

Exposure describes ways that receptors come into contact with a source. Environmental contaminants, such as pesticides, often undergo various processes (i.e., migration) such that media other than the source area can become contaminated. Therefore, all potentially contaminated media (exposure media) were considered at the site.

Vertical soil profiling results indicated that the chromium contamination appears to exist from 8 to 16 ft bgs. The appropriate human receptors to soil exposure were selected for the Building 255 AOC. Human receptors considered for the evaluation included potential residents. A contaminants pathway analysis for the Building 255 AOC is provided in Figure 4. The primary complete exposure pathway for human receptors is ingestion, dermal contact or inhalation during intrusive activities. Surface soil was not evaluated due to the method of sample collection using direct push soil borings from 0 to 4 ft bgs, 4 to 8 ft bgs, 8 to 12 ft bgs and 12 to 16 ft bgs. For the inhalation pathway, chromium is likely to be stuck to particles or dust.

No pathway currently exists for drinking water, since all drinking water is supplied by municipal utilities from off-site. In addition, no pathway exists for subsurface soil to groundwater via infiltration due to the results of the LTM conducted at the site from 2001 to 2002. Groundwater was deemed clean and monitoring ceased at the site in 2002. The pathway between surface water/sediment runoff is considered incomplete since the site has less than a foot of relief and is covered with grass providing sufficient erosion control. The bioaccumulation pathway through vegetation, domestic animals and game/fish/prey to potential residents is also considered incomplete.

### 5.2.3 Quantification of Exposure

Data statistics were used during chromium EPC determination. Data statistics were derived from the USEPA Technical Support Center ProUCL Version 5.0 (USEPA, September 2013a) [results are located in Appendix F]. The most appropriate 95% UCL of the mean was retained as the EPC. This calculated EPC provides a reasonable maximum exposure scenario as an upper bound estimate of risks to individuals in the population. Data statistics were calculated for all soil samples collected from 8 locations at the Building 255 AOC. The EPC was calculated for the total range of depths. Even though the chromium exceedances only occurred from 8 to 16 ft bgs, including the total range of depths creates a larger population size and more accurate data statistics. Also, all range of depths had detections for chromium.

For the primary exposure pathway of ingestion and the contaminant chromium, the calculated EPC is the 95% Student's-t UCL of the mean at 14.32 mg/kg. For the primary exposure pathway of dermal, the EPC for the ingestion pathway was multiplied by the dermal absorption factor (ABS). The ABS for chromium (III) is 1.3% and the ABS for chromium (VI) is 2.5% as referenced from chapter 4 in the USEPA Risk Assessment Guidance for Superfund (Part E,

Supplemental Guidance for Dermal Risk Assessment) (USEPA, July 2004). The more conservative ABS value of 2.5% was used to calculate dermal EPC. Lastly, for the primary exposure pathway of inhalation, the EPC for the ingestion pathway was divided by the particulate emissions factor (PEF). The PEF is 1.36 x $10^{-9}$ $m^3$/kg as referenced from the Wind Erosion Model (Cowherd, 1985).

All HHRA assumptions for frequency and duration of exposure are located in Table 3 and are referenced from the Exposure Factors Handbook: 2011 Edition (USEPA, September 2011).

## 5.3 Toxicity Assessment

Toxicity assessment defines the relationship between the magnitude of exposure and possible severity of adverse health effects, and weighs the quality of available toxicological evidence. In general, chromium (VI) compounds are more toxic than chromium (III) compounds. The most sensitive targets of chromium (VI) are the respiratory, gastrointestinal, hematological and reproductive system. The primary targets for chromium (III) are the respiratory and immunological systems. Chromium allergic dermatitis is typically elicited by dermal contact in sensitized individuals (ATSDR, October 2012).

Reference toxicity values were obtained from the Integrated Risk Information System (IRIS) database (USEPA, updated monthly). Values in this database have been derived by expert toxicologists at USEPA and most values have undergone thorough review and validation both within and outside USEPA. Table 4 lists the toxicity values for chromium. The toxicity value for slope factor (SF) oral and dermal was not available through the IRIS database. Therefore, a tiered approach was used to reference other databases including tier 2 USEPA's provisional peer reviewed toxicity values and tier 3 California EPA, Agency for Toxic Substances and Disease Registry (ATSDR) and USEPA's Health Effects Assessment Summary Table (USEPA, December 2003). None of these databases provided a SF.

Under the previous USEPA guidelines (USEPA, September 1986), chromium (VI) was classified as a Group A - known human carcinogen by the inhalation route of exposure. Carcinogenicity by the oral and dermal routes of exposure could not be determined and was classified as Group D – not classifiable as to human carcinogenicity. Also, chromium (III) was most appropriately designated as Group D for all routes of exposure. Chromium data for carcinogenicity assessment for lifetime exposure has not been updated under the current USEPA guidelines (USEPA, March 2005).

## 5.4 Risk Characterization

Risk characterization combines the results of the previous elements of the risk assessment to evaluate the potential health risks associated with exposure to COPCs. The risk characterization is then used as an integral component in remedial decision making and selection of potential remedies or actions. Table 5 references the HHRA Equations and Models used for the risk characterization (USEPA, December 2002, July 2004, January 2009), Tables 6 through 8 apply the HHRA Equations and Models based on identified pathways and receptors and Table 9 summarizes the cancer risks and non-cancer hazard indices. For the purpose of this risk

assessment, it was assumed that the EPC of chromium existed only for the more toxic chromium (VI) compound. This assumption develops the most conservative risk approach.

### 5.4.1 Non-carcinogenic Health Effects Characterization

The USEPA benchmark level for evaluating non-carcinogenic effects is a HI of 1.0. A HI of 1.0 or less indicates that exposure to potential contaminants is not expected to result in adverse non-carcinogenic health effects.

The cumulative HI for potential residents, including adult residents and child residents, exposed to soil at a depth of 0 to 16 ft bgs at the Building 255 AOC is 0.072 (Table 9). This cumulative HI is below the benchmark value of 1.0. Of the three potential exposure pathways, the greatest potential non-carcinogenic hazard (0.068) was from the incidental ingestion of soil (Tables 6 through 8).

### 5.4.2 Carcinogenic Risk

The USEPA defines the target risk range for exposure to carcinogenic compounds as an excess upper bound lifetime risk within the range $1 \times 10^{-4}$ to $10^{-6}$. This translates to one excess cancer in a population of ten thousand to one excess cancer in a population of one million.

The cumulative carcinogenic risk (CR) associated with exposure by potential residents, including adult residents and child residents, to soil at a depth of 0 to 16 ft bgs at the Building 255 AOC is $2.6 \times 10^{-14}$ (Table 9), less than the USEPA's target risk range. The CR only accounts for the pathway-specific risk for potential residents from fugitive dust (Table 8). Chromium has not been identified as a carcinogen for the oral and dermal pathways.

## 5.5 Uncertainty Analysis

This section presents a brief summary of uncertainties inherent to risk assessments and includes a discussion of how they may affect the quantitative risk estimates and conclusions of the risk analysis. This HHRA was performed in accordance with current USEPA guidance; however, there are varying degrees of uncertainty associated with the HHRA.

Once the risk assessment is completed, the results must be reviewed and evaluated to identify the type and magnitude of uncertainty involved. Reliance on results from a risk assessment without consideration of uncertainties, limitations, and assumptions inherent in the process can be misleading.

Uncertainty in the selection of COPCs is related to the current status of the predictive databases, the grouping of samples, and the procedures used to include or exclude constituents as COPCs. Uncertainty associated with the exposure assessment includes the values used as input variables for a given intake route/scenario, the assumptions made to determine EPCs, and the predictions regarding future land use and population characteristics. Uncertainty in the toxicity assessment includes the quality of the existing toxicity data needed to support dose-response relationships and the weight-of-evidence used for determining the carcinogenicity of COPCs. Uncertainty in

the risk characterization includes the cumulative uncertainty from combining conservative assumptions made in earlier steps of the risk assessment process.

In general, assumptions, which are often based (in part) on safety factors, are made so that the final calculated risks are overestimated.

### 5.5.1 Uncertainty Associated with Data Evaluation

The following issues may contribute to uncertainty in COPC selection:

- Data collection and evaluation;
- The existing database; and
- The screening levels used.

#### 5.5.1.1 Data Collection and Evaluation

The analytical data used in this HHRA was soils data from investigation areas at the Building 255 AOC. These data are subject to uncertainty associated with sampling and analyses and subsequent evaluation.

In this HHRA, it was assumed that samples collected were representative of the area to which various populations may be exposed. The systematic characterization of the investigation areas focused on supplying the data needed to support the risk assessment and remediation decision making process. However, the collected samples may not be completely representative due to biases in sampling and to random variability of samples. Soils are not homogeneously distributed in the environment. While random variability of the media sampled could result in either an over- or under-estimation of site-related chemical concentrations, and thus, site risks, the use of biased data is more likely to over-estimate than under-estimate risks.

#### 5.5.1.2 Existing Databases

Samples were analyzed using Air Force-approved procedures and were subject to data validation procedures to assure that data were suitable for use in decision making. However, sample analyses are subject to uncertainties with precision and accuracy. Uncertainties associated with precision and accuracy of analytical methods are generally random. While these sources of error are typically of low magnitude compared to other sources of uncertainty, they may contribute to an over- or under-estimation of risks. Given that data validation efforts were performed on the data used to support this HHRA in accordance with Air Force and USEPA approved documents then the data used in this risk assessment is of acceptable quality as detailed in Appendix D.

Of the qualified data, many were either "U" qualified, indicating the analyte was undetected at the limit of detection, or "J" qualified, indicating that the analyte was positively identified, but the quantitation is an estimation. All chemical data used in this HHRA were reviewed by a qualified chemist. All data used in this HHRA were found to be of acceptable quality for use in this risk assessment; as such, both "J" and "U" qualified data were used. While there is some uncertainty as to whether these values over- or under-estimate actual concentrations, it is unlikely that any of these reported values greatly exceeded the actual values.

Analytes that were undetected at the limit of detection ("U" qualified) in all samples, and chemicals that were only detected at concentrations below their respective SCOs, were not retained as COPCs. While it is unlikely that major contaminants have been excluded on this basis, exclusion of these undetected chemicals or chemicals with elevated reporting limits could result in an underestimation of risk.

#### 5.5.1.3 Chemicals of Potential Concern Screening Levels

The use of risk-based screening values should ensure that the significant contributors to risk from a site are not eliminated but are retained for risk evaluation. COPC screening values were based on conservative land use scenarios (e.g., residential).

In addition, the toxicity values used in the derivation of project action levels are subject to change, as additional information (e.g., from scientific research) becomes available; these periodic changes in toxicity values may cause the project action levels to change as well.

### 5.5.2 Uncertainty Associated with Exposure Assessment

Uncertainty in the exposure assessment arises because of the methods used to calculate EPCs and the selection of exposure parameters.

#### 5.5.2.1 Exposure Parameters

Selected exposure parameters are generally designed to be conservative so that no actual exposed population will receive greater exposures than those estimated. Exposure parameters were used to encompass the upper and best estimate levels of reasonable maximum exposures. All pathways that could reasonably be completed under the land use scenarios were evaluated quantitatively for their potential to be associated with adverse health effects. There is a high degree of certainty that total exposures are not underestimated for any actual exposed population.

To demonstrate risks associated with residential land use, hypothetical future residents (adult and child) were considered in this HHRA to conservatively evaluate the site. The exposure scenario was developed to describe plausible frequency and duration of exposures for a future resident adult and child.

### 5.5.3 Uncertainty Associated with Toxicity Assessment

In general, the available scientific information is insufficient to provide a thorough understanding of all the potential toxic properties of chemicals to which humans may be exposed. Consequently, varying degrees of uncertainty surround the assessment of adverse health effects in the exposed populations. Sources of uncertainty related directly to toxicity data include:

- Use of dose-response data from experiments on homogeneous sensitive animal populations to predict effects in heterogeneous human populations with a wide range of sensitivities.
- Extrapolation of data from high dose animal studies to low dose human exposures; acute or sub-chronic toxicity studies to chronic exposure scenarios; and one exposure route to another (e.g., from ingestion to dermal absorption).
- Use of single-chemical test data that do not account for multiple exposures or synergistic and antagonistic responses.
- Toxicity values (reference doses and slope factors) are predicted values and have incorporated factors to provide a margin of safety for even the most sensitive subpopulations and likely over-estimate potential risks for all receptors evaluated in this risk assessment.

Based on the above, a high degree of uncertainty may be associated with the toxicity values used in this risk assessment. In an attempt to minimize the consequences of uncertainty, USEPA typically relies on a conservative approach in determining toxicity values. The current USEPA toxicity values used in this risk assessment are likely to over-estimate the potential risk and hazard.

### 5.5.4 Uncertainty in Risk Characterization

Uncertainties associated with risk characterization include the assumption of chemical additively and the basis that the contamination level is consistent over the lifetime of exposure. These uncertainties are inherent in any inferential risk assessment. USEPA-promulgated inputs to the quantitative risk assessment and toxicological indices are calculated to be protective of the human receptor and to err conservatively, so as not to underestimate the potential human health risks.

## 6 CONCLUSION

In previous investigations, two drywells associated with Building 255 were removed followed by soil excavation to reduce residual COCs in site soils. Additional drywells associated with the site were not identified or located in these investigations. However, previous investigations including soil sampling within the suspected drywell locations showed that COCs were below the 6-NYCRR Part 375 Residential use SCOs in all but four areas. In 2013, an additional site investigation was conducted to determine the presence of residual contamination in those four areas. The results showed that all SVOCs and VOCs were below the 6-NYCRR Part 375 Residential use SCOs. In addition, all metals, excluding chromium, were detected below the 6-NYCRR Part 375 Residential use SCOs. The total chromium detections in two soil samples were within an order of magnitude above the hexavalent chromium Residential use SCO but below the trivalent chromium Residential use SCO.

An HHRA was conducted to evaluate potential adverse health effects due to these exceedances. Under hypothetical future residential land use, residential receptors (adult and child) were considered. The exposure pathways evaluated included incidental ingestion of soil, dermal contact with soil, and inhalation of fugitive dusts. The cumulative HI for residents exposed to

subsurface soils was less than 1.0, indicating that exposure to potential contaminants is not expected to result in adverse non-carcinogenic health effects. The cumulative CR for residents exposed to subsurface soils was less than USEPA's target risk range.

# 7 RECOMMENDATIONS

The results of the site closure activities conducted at the Building 255 AOC show few exceedances of 6-NYCRR Part 375 Residential use SCOs for chemical constituents detected in subsurface soil. Based on these findings, the results of the previous RI (Law, December 1996), IRA (Ocuto, February 2000) and the results of this residential HHRA, there appear to be no unacceptable non-carcinogenic and carcinogenic risk from exposure to soil for potential residential receptors. Therefore, it is requested that New York State and USEPA grant permission to remove the remaining deed restrictions at the DP013 Building 255 AOC.

# Final Records of Decision for Areas of Concern (AOCs) at the Former Griffiss Air Force Base Rome, New York

June 2001

AIR FORCE BASE CONVERSION AGENCY

DEPARTMENT OF THE AIR FORCE
AIR FORCE BASE CONVERSION AGENCY

JUN 0 6 2001

MEMORANDUM FOR Ms. Lynn Hancsak
HQ AFBCA/DA- Env Section
4th Floor
1400 Key Blvd
Arlington VA 22209-2802

FROM: AFBCA/DA-Griffiss
Environmental Section
153 Brooks Road
Rome, NY 13441-4105

SUBJECT: Submittal – Final Records of Decision for Area of Concern Sites Building 20, Building 112, Building 222, Building 255, and T-9 at Griffiss AFB

1. Enclosed please find the final Record of Decisions (RODs) for Area of Concern Sites Building 20 (SS-23), Building 112 (SS-08), Building 222 (DP-22), Building 255 (DP-13), and T-9 (SS-25). Please forward to the Director for his signature and send three (3) signed copies to the US Environmental Protection Agency, Region 2.

2. Please note that in Section 1 "Declaration" of the RODs, there are statements to the fact that "Future landowners will be bound through the transfer documents, to the industrial/commercial reuse of the property." If AFBCA policy has been changed such that the AFBCA will not restrict reuse of the property being transferred, these RODs will be null and void and they will have to be reissued to reflect the new policy and undergo the full regulatory and public review process.

3. If you have any questions, please contact Mike Wojnas, 315-330-2275.

MICHAEL F. MCDERMOTT
BRAC Environmental Coordinator

Enclosure:
Final RODs for Area of Concern Sites
Building 20, Building 112, Building 222, Building 255, and T-9

NEW YORK, NY 10007-1866

SEP 27 2001

Mr. Albert F. Lowas
Director
AFBCA/DR
1700 North Moore Street, Suite 2300
Arlington, VA 22209-2802

Re: Records of Decision for Five Areas of Concern
Griffiss Air Force Base

Dear Mr. Lowas:

This is to inform you that after considering public comments on the Proposed Plans, Griffiss Air Force Base's responsiveness summary to those comments, the Draft Records of Decision and other supporting documents, the U.S. Environmental Protection Agency (EPA) concurs with the Records of Decision for Building 20, Building 112, Building 222, Building 255, and the T-9 Area. Enclosed is a copy of the signed Records of Decision, which I have co-signed on behalf of EPA.

These Records of Decision address only the above mentioned areas of concern. All other areas of Griffiss Air Force Base are being addressed under separate operable units. Please note that these Records of Decision require certain land use restrictions (e.g., deed restrictions) and are subject to EPA's 5-year review process.

If you have any questions regarding the subject of this letter, please contact me at (212) 637-5000 or have your staff contact Douglas Pocze at (212) 637-4432.

Sincerely,

William J. Muszynski, P.E.
Acting Regional Administrator

# 1 Declaration

## 1.1 Site Name and Location

The Building 255 Drywell Area of Concern (AOC) (site identification designation DP-13) is located at the former Griffiss Air Force Base (AFB) in Rome, Oneida County, New York.

## 1.2 Statement of Basis and Purpose

This Record of Decision (ROD) presents the no further action for soil with land use restrictions alternative for the Building 255 Drywell AOC at the former Griffiss AFB. This alternative has been chosen in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980 (USEPA 1980), as amended by the Superfund Amendment and Reauthorization Act (SARA) (USEPA 1986), and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (USEPA 1968). The Air Force Base Conversion Agency (AFBCA), the United States Environmental Protection Agency (EPA), and the New York State Department of Environmental Conservation (NYSDEC) have adopted this ROD through joint agreement. This decision is based on the administrative record file for this site.

## 1.3 Description of Selected Remedy

The selected remedy for the Building 255 Drywell AOC is no further action for soil with land use restrictions for industrial/commercial use. The agencies will perform

joint 5-year reviews to ensure that future land use is in compliance with the transfer documents (deed) and consistent with the risk assessment for industrial/commercial use.

## 1.4 Declaration Statement

The AFBCA, EPA, and NYSDEC have determined that no further action for soil with land use restrictions are warranted for the Building 255 Drywell AOC. An interim remedial action was performed at this site in which the majority of soil contamination found during the remedial investigation was removed. The remaining chemicals detected in the soil do not exceed standards and guidance values and the known source of groundwater contamination has been removed. The concentrations of the contaminants remaining in the site soil following the remedial action do not pose a current or potential threat to public health or the environment provided the property is used for industrial/commercial use with groundwater use restrictions. Groundwater at the Building 255 AOC is being further evaluated as part of the On Base Groundwater AOC Tin City Operable Unit. Future landowners will be bound, through transfer documents (deed), to the industrial/commercial reuse of the property.

## 1.5 Signature of Adoption of the Remedy

On the basis of the remedial investigations performed at the Building 255 Drywell AOC there is no evidence that residual contamination at this site poses a current or future potential threat to human health or the environment when used for industrial/commercial purposes. Future landowners will be bound, through transfer documents (deed), to the industrial/commercial reuse of the property. The New York State Department of Environmental Conservation has concurred with the selected remedial action presented in this Record of Decision.

# 2 Decision Summary

## 2.1 Site Name, Location, and Brief Description

The Building 255 Drywell Area of Concern (AOC) (site identification designation DP-13) is located at the former Griffiss Air Force Base (AFB) in Rome, Oneida County, New York.

The Building 255 AOC is located in the west-central portion of the base (see Figure 1). The suspected drywells associated with this site included several near Building 255 and other nearby buildings, including Buildings 215/216, 222, 223, and the former location of Building 230 (see Figure 2).

## 2.2 Site History and Investigation Activities

### The Former Griffiss AFB Operational History

The mission of the former Griffiss AFB varied over the years. The base was activated on February 1, 1942, as Rome Air Depot, with the mission of storage, maintenance, and shipment of material for the U.S. Army Air Corps. Upon creation of the U.S. Air Force in 1947, the depot was renamed Griffiss Air Force Base. The base became an electronics center in 1950, with the transfer of Watson Laboratory Complex (later Rome Laboratory). The 49th Fighter Interceptor Squadron was also added in that year. In June 1951, the Rome Air Development Center was established with the mission of accomplishing applied research, development, and testing of electronic air-ground systems. The Headquarters of the Ground Electronics Engineering Installations Agency was added in

June 1958 to engineer and install ground communications equipment throughout the world. On July 1, 1970, the 416th Bombardment Wing of the Strategic Air Command (SAC) was activated with the mission of maintenance and implementation of both effective air refueling operations and long-range bombardment capability. Griffiss AFB was designated for realignment under the Base Realignment and Closure Act in 1993 and 1995, resulting in deactivation of the 416th Bombardment Wing in September 1995. Rome Laboratory and the Northeast Air Defense Sector (NEADS) will continue to operate at their current locations; the New York Air National Guard (NYANG) operated the runway for the 10th Mountain Division deployments until October 1998, when they were relocated to Fort Drum; and the Defense Finance and Accounting Services (DFAS) has established an operating location at the former Griffiss AFB.

## Environmental Background

As a result of the various national defense missions carried out at the former Griffiss AFB since 1942, hazardous and toxic substances were used and hazardous wastes were generated, stored, or disposed at various sites on the installation. The defense missions involved, among others, procurement, storage, maintenance, and shipping of war materiel; research and development; and aircraft operations and maintenance.

Numerous studies and investigations under the U.S. Department of Defense (DoD) Installation Restoration Program (IRP) have been carried out to locate, assess, and quantify the past toxic and hazardous waste storage, disposal, and spill sites. These investigations included a records search in 1981 (Engineering Science 1981), interviews with base personnel, a field inspection, compilation of an inventory of wastes, evaluation of disposal practices, and an assessment to determine the nature and extent of site contamination; Problem Confirmation and Quantification studies (similar to what is now designated a Site Investigation) in 1982 (Weston 1982) and 1985 (Weston 1985); soil and groundwater analyses in 1986; a base-wide health assessment in 1988 by the U.S. Public Health Service, Agency for Toxic Substances and Disease Registry (ATSDR) (ATSDR 1998); base-specific hydrology investigations in 1989 and 1990 (Geotech 1991); a groundwater investigation in 1991; and site-specific investigations between 1989 and 1993. ATSDR issued a Public Health Assessment for Griffiss AFB, dated October 23, 1995 (ATSDR 1995), and an addendum, dated September 9, 1996.

Pursuant to Section 105 of CERCLA, Griffiss AFB was included on the National Priorities List (NPL) on July 15, 1987. On August 21, 1990, the agencies entered into a Federal Facility Agreement (FFA) under Section 120 of CERCLA.

Under the terms of the agreement, the Air Force was required to prepare and submit numerous reports to NYSDEC and EPA for review and comment. These reports address remedial activities that the Air Force is required to undertake under CERCLA and include identification of Areas of Concern on base; a scope of work for a Remedial Investigation (RI); a work plan for the RI, including a sampling and analysis plan and a quality assurance project plan; a baseline risk assessment; a community relations plan; an RI report; and a work plan and the report for a supplemental investigation. The Air Force delivered the draft-final RI report covering 31 AOCs to EPA and NYSDEC on December 20, 1996 (Law 1996). The draft Closure Certification Report for Interim Remedial Action was delivered on May 24, 2000 (Ocuto 2000).

This ROD for no further action for soil with land use restrictions is based on an evaluation of potential threats to human health and the environment due to contamination in the soil and groundwater, and the performance of interim remedial actions at the Building 255 Drywell AOC. During the RI, a site-specific baseline risk assessment (using appropriate toxicological and exposure assumptions to evaluate cancer risks and non-cancer health hazards) was conducted in order to evaluate the risks posed by detected site contaminants to the reasonably maximally exposed individual under current and future land use assumptions. In the RI report, the concentrations of the contaminants were compared to available standards and guidance values using federal and state environmental and public health laws that were identified as potentially applicable or relevant and appropriate requirements at the site. Chemical-specific ARARs are usually health- or risk-based numerical values or methodologies that result in a numerical value when applied to site-specific conditions. Currently, there are no chemical-specific ARARs for soil (other than for polychlorinated biphenyls [PCBs]), therefore, other non-promulgated federal and state advisories and guidance values, referred to as To-Be-Considereds (TBCs), and background levels of the contaminants in the absence of TBCs, were considered.

## Remedial Investigation

In 1994, an RI was performed (Law 1996). The main objective of the RI was to investigate the nature and extent of environmental contamination from historical releases at the AOC in order to determine whether any further remedial action was necessary to prevent potential threats to human health and the environment that might arise from exposure to site conditions. The RI included a visual survey, a ground-penetrating radar (GPR) survey, and the excavation of three test pits to try to locate the drywell; sampling and analysis of soil and grab groundwater; and installation of eight temporary monitoring wells. Observations from the visual survey included:

**Building 255.** Two features were noted east of Building 255 that may have been drywells associated with the storm water system. These features consisted of two corrugated metal pipes covered by steel grating and filled with gravel. No pipes were visible leading into these structures. No drywell was visibly evident in the parking lot west of Building 255. A storm drain, covered by a manhole and filled with dirt to 4 feet BGS, was assumed to be a drywell associated with Building 255.

**Building 222.** No drywell was evident in the vicinity of this building.

**Building 223.** The area at the suspected drywell location, south of Building 223, was reported by Griffiss AFB personnel to have been frequently excavated to at least 8 feet BGS for optical cable installation and repair. No drywell was reportedly encountered during this construction. The drywell at this location may have been unknowingly excavated or otherwise disturbed during construction activities.

**Former Building 230.** The area at the suspected drywell location east of the former location of Building 230 (now a covered pesticide storage/wash facility) was highly disturbed during construction of the new facility. No drywell was found at this location.

**Building 215/216.** An open surface-water drainage swale directs flow to a corrugated pipe where drainage is diverted beneath the driveway southwest of Building 216. It

was uncertain as to whether this was a drywell; however, this feature was at the location reported to be a drywell. No drywell was evident east of Building 215/216.

There were no anomalies detected during the GPR survey, which was conducted in 1993 at the suspected Building 255 drywell. In 1994, test pits were excavated at Building 222, Building 230, and Building 215/216 in an attempt to confirm the location of the reported drywells. Drywells were not located by any of the test pit activities and all test pits were backfilled.

Eight temporary monitoring wells were installed in August 1994 to collect grab groundwater samples. Six additional temporary wells were installed in April 1995 to collect additional grab groundwater samples. A total of 10 samples were collected. Analysis of the grab groundwater samples indicated the presence of 22 volatile organic compounds (VOCs), 20 semivolatile organic compounds (SVOCs), 34 pesticides, two PCBs, 26 metals, total glycols, cyanide, and petroleum hydrocarbons. The concentrations of 12 VOCs, six SVOCs, two pesticides, one PCB, 18 metals, and petroleum hydrocarbons exceeded the most stringent criteria for groundwater (see Table 1).

Eleven soil borings were drilled in the vicinity of the reported drywell locations. Six borings were associated with known drywell locations and five borings were located downgradient of presumed drywell locations. A total of 63 soil samples were collected. Analysis of the subsurface soil samples indicated the presence of 12 VOCs, 30 SVOCs, 23 pesticides, two PCBs, and 26 metals, as well as cyanide and petroleum hydrocarbons. The concentrations of six VOCs, nine SVOCs, one pesticide, one PCB, and 17 metals exceeded the most stringent criteria for subsurface soil (see Table 2). The high concentrations shown in Table 2 were all measured in one borehole (255SB-5) at a depth greater than 4 feet. This borehole is located near the drywell in the parking lot to the west of Building 255 Drywell. This soil was removed during the interim remedial action.

## Supplemental Investigations

An RI supplemental investigation was performed in 1997 in the Tin City area, which includes the Building 255 Drywell AOC. This investigation included the installation and sampling of two new wells at Building 255. Low levels of chloroform and trichloroethylene were detected in one of the wells, but the concentrations did not exceed the NYSDEC groundwater guidance values.

## 2.3 Highlights of Community Participation

The final proposed plan, indicating no further action for soil with land use restrictions at this site, was released to the public on Friday, February 9, 2001 (AFBCA 2001). The document was made available to the public in both the administrative record file located at Building 255 in the Griffiss Business and Technology Park and in the Information Repository maintained at the Jervis Public Library. The notice announcing the availability of this document was published in the *Rome Sentinel* on Friday, February 9, 2001. A public comment period lasting from February 9, 2001, to March 11, 2001, was set up to encourage public participation in the alternative selection process. In addition, a public meeting was held on March 1, 2001. The AFBCA and the New York State Department of Health were present at the meeting and the AFBCA answered questions about issues at the AOC and the proposal under consideration. A response to the comments received during this period is included in the Responsiveness Summary, which is part of this ROD (see Section 3).

## 2.4 Scope and Role of Site Response Action

The scope of the plan for no further action for soil with land use restrictions for the Building 255 Drywell AOC addresses the soil at the site. The land use restrictions for industrial/commercial use are consistent with the risk assessment performed for occupational workers.

## 2.5 Site Characteristics

The Building 255 AOC is located in the west-central portion of the base (see Figure 1). Building 255 was the Vehicle Maintenance Building. The suspected drywells associated with this site included several near Building 255 and other nearby buildings, including Buildings 215/216, 222, 223, and the former location of Building 230.

Two drywells, which were reportedly located near Building 255 were reportedly stone- and gravel-filled pits measuring approximately 3 feet square by 10 feet deep. The exact location of these two drywells was not known; although they were suspected (but never found) in an area on the east side of the building in the grassed area across Langley Road (see Figure 2). A third drywell was located during a site reconnaissance on the west

side of Building 255 Drywell, beneath a manhole cover in the paved parking lot. The third drywell reportedly received liquid wastes from the Vehicle Maintenance Shop and possibly a small glass repair shop located within Building 255. The quantity of wastes disposed by these facilities was estimated at less than 5 gallons per day. Wastes reportedly disposed included lube oil, engine cleaning compounds, caustics, acids, and paint. Pesticide rinse water, solvents, and other waste liquids generated in small quantities by activities in Buildings 215/216, 222, 223, 230 and 255 may also have been disposed in the Building 255 drywell. Use of this drywell was discontinued in the early 1970s.

The former Griffiss AFB covered approximately 3,552 contiguous acres in the lowlands of the Mohawk River Valley in Rome, Oneida County, New York. Topography within the valley is relatively flat, with elevations on the former Griffiss AFB ranging from 435 to 595 feet above mean sea level. Three Mile Creek, Six Mile Creek (both of which drain into the New York State Barge Canal, located to the south of the base), and several state-designated wetlands are located on the former Griffiss AFB, which is bordered by the Mohawk River on the west. Due to its high average precipitation and predominantly silty sands, the former Griffiss AFB is considered a groundwater recharge zone.

The Building 255 Drywell AOC is located on relatively flat lying terrain with less than 1 foot of relief. This AOC is not located near major natural surface water drainage features. Run-off from the site is channeled into the base drain storm system, which discharges to the Mohawk River. Groundwater has been encountered at depths ranging from 13.5 feet below ground surface (BGS) to 21 feet BGS. Groundwater flows to the south-southeast across the site. Site soil consists of brown, silty fine to coarse sand and gravel to a depth of 19 feet BGS.

## 2.6 Current and Potential Future Site Use

The Building 255 Drywell AOC is currently designated for industrial use. Future land use at this AOC is assumed to be industrial/commercial.

## 2.7 Summary of Site Risks

Site risks were analyzed based on the extent of contamination at the Building 255 Drywell AOC. As part of the RI, a baseline risk assessment was conducted to evaluate

current and future potential risks to human health and the environment associated with contaminants found in the soil and groundwater at the site. The results of this assessment and the interim remedial action were considered when formulating the no further action for soil with land use restrictions proposal.

## Human Health Risk Assessment

A baseline human health risk assessment was conducted during the RI to determine whether chemicals detected at the Building 255 Drywell AOC could pose health risks to individuals under current and proposed future land use. As part of the baseline risk assessment, the following four-step process was used to assess site-related human health risks for a reasonable maximum exposure scenario:

- Hazard Identification—identifies the contaminants of concern at the site based on several factors such as toxicity, frequency of occurrence, and concentration;
- Exposure Assessment—estimates the magnitude of actual and/or potential human exposures, the frequency and duration of these exposures, and the pathway (e.g., ingestion of contaminated soil) by which humans are potentially exposed;
- Toxicity Assessment—determines the types of adverse health effects associated with chemical exposures and the relationship between magnitude of exposure (dose) and severity of adverse effects (response); and
- Risk Characterization—summarizes and combines outputs of the exposure and toxicity assessments to provide a quantitative (e.g., one-in-a-million excess cancer risk and non-cancer Hazard Index value) assessment of site-related risks and a discussion of uncertainties associated with the evaluation of the risks and hazards for the site.

Chemicals of potential concern (COPCs) were selected for use in the risk assessment based on the analytical results and data quality evaluation. All contaminants detected in the soil and groundwater at the site were considered chemicals of potential concern with the exception of inorganics detected at concentrations less than twice the mean background concentrations; iron, magnesium, calcium, potassium, and sodium, which are essential human nutrients; and compounds detected in less than 5% of the total samples (unless they were known human carcinogens). As a class, petroleum hydrocarbons were

not included as a chemical of concern; however, the individual toxic constituents (e.g., benzene, toluene, ethylbenzene) were evaluated.

The human health risk assessment evaluated potential exposure of occupational workers including utility, construction, and industrial workers. The various exposure scenarios for each population are described in Table 3. Intake assumptions, which are based on EPA guidance, are more fully described in the RI.

Quantitative estimates of carcinogenic and noncarcinogenic risks were calculated for the Building 255 Drywell AOC as part of a risk characterization. The risk characterization evaluates potential health risks based on estimated exposure intakes and toxicity values. For carcinogens, risks are estimated as the incremental probability of an individual developing cancer over a lifetime as a result of exposure to the potential carcinogen. The risks of the individual chemicals are summed for each pathway to develop a total risk estimate. The range of acceptable risk is generally considered to be 1 in 10,000 ($1 \times 10^{-4}$) to 1 in 1,000,000 ($1 \times 10^{-6}$) of an individual developing cancer over a 70-year lifetime from exposure to the contaminant(s) under specific exposure assumptions. Therefore, sites with carcinogenic risk below the risk range for a reasonable maximum exposure do not generally require cleanup based upon carcinogenic risk under the NCP.

To assess the overall noncarcinogenic effects posed by more than one contaminant, EPA has developed the Hazard Quotient (HQ) and Hazard Index (HI). The HQ is the ratio of the chronic daily intake of a chemical to the reference dose for the chemical. The reference dose is an estimate (with uncertainty spanning perhaps an order of magnitude or greater) of a daily exposure level for the human population, including sensitive sub-populations, that is likely to be without an appreciable risk of deleterious effects during a portion of a lifetime. The HQs are summed for all contaminants within an exposure pathway (e.g., ingestion of soil) and across pathways to determine the HI. When the HI exceeds 1, there may be concern for potential noncarcinogenic health effects if the contaminants in question are believed to cause similar toxic effects.

EPA bases its decision to conduct site remediation on the risk to human health and the environment. Cleanup actions may be taken when EPA determines that the risk at a site exceeds the cancer risk level of 1 in 10,000 ($1 \times 10^{-4}$) or if the noncarcinogenic HI exceeds a level of 1. Once either of these thresholds has been exceeded, the 1 in

1,000,000 ($1 \times 10^{-6}$) risk level and an HI of 1 or less may be used as the point of departure for determining remediation goals for alternatives.

## Results of Site-Specific Health Risk Assessment

Potential risks from exposure to COPCs at the Building 255 Drywell AOC were evaluated for utility, construction, and industrial workers during the RI, prior to the interim remedial action. The potential carcinogenic and noncarcinogenic risks from exposure to soil and groundwater are summarized below.

## Carcinogenic Risk

The total carcinogenic risk associated with exposure of utility workers to subsurface soil was 2 in 1,000,000 ($2 \times 10^{-6}$), which is within EPA's target risk range. The total carcinogenic risk associated with exposure of construction workers to soil was 1 in 1,000,000 ($1 \times 10^{-6}$), which is within EPA's target risk range. The total carcinogenic risk from exposure to contaminants in groundwater of industrial workers was 5 in 10,000 ($5 \times 10^{-4}$), which is above EPA's target risk range. PAHs and PCBs were the major risk contributors via the inhalation and dermal pathways.

## Noncarcinogenic Risk

The total HI for utility workers exposed to soil was 0.03. The total HI for construction workers exposed to subsurface soil was 0.6. The total HI for industrial workers exposed to constituents in groundwater was 0.8. All HIs for noncarcinogenic effects are below the benchmark level of 1.

Groundwater at the Building 255 Drywell AOC is being further evaluated under On Base Groundwater AOC as part of the Tin City operable unit.

## Uncertainties

Uncertainties exist in many areas of the human health risk assessment process. However, use of conservative variables in intake calculations and health-protective assumptions throughout the entire risk assessment process results in an assessment that is protective of human health and the environment. Examples of uncertainties associated with the risk assessment for this AOC include (1) Chemical samples were collected from

the suspected source of contamination rather than through random sampling, which may result in a potential overestimation of risk; (2) The HIs associated with dermal contact with soil were not quantified for the majority of COPCs, which may lead to underestimation of the overall risk due to dermal contact; (3) The models used in the RI are likely to overestimate exposure point concentrations in air, which would cause an overestimation of risk for the inhalation pathway; (4) It was assumed that groundwater would be used as a potable water source under the industrial use scenario (i.e., showering, ingestion, industrial processes) in the future, which is unlikely since the site has ready access to the existing water supplies at the former base and in the City of Rome. This would result in an overestimation of risk; and (5) Toxicological criteria were not available for all chemicals found at the site, which may result in an underestimation of risk.

### Ecological Risk Assessment

Building 255 Drywell is located in a highly developed portion of the base with little habitat available for ecological receptors. However, potential future exposures to ecological receptors were evaluated and a baseline risk assessment was performed. The assessment modeled risks to the raccoon and short-tailed shrew for exposures to surface soil.

The hazard quotients for both the raccoon and the shrew were less than 1; the potential for adverse impacts to these ecological receptors is considered to be insignificant. Modeling of bioaccumulation to higher order species was not performed, nor was the cumulative effect of multiple contaminants considered; this tends to underestimate the risk to ecological receptors.

Although certain state-listed endangered plants and animals have been observed on or in the vicinity of the base, no threatened and/or endangered species have been identified at this site (Corey 1994). There are no federally listed (U.S. Department of the Interior) threatened or endangered plant or animal species at the former base.

## 2.8 Interim Remedial Action

In 1998, based upon the results of the RI and baseline risk assessment, an interim remedial action was performed to remove contaminated subsurface soil at the drywell located west of the former site of Building 255 (see Figure 3) (Ocuto 2000). It was deter-

mined that the removal of contaminated soil from this location would mitigate the majority of contamination and resulting risk associated with this site. The work consisted primarily of asphalt demolition, removal and disposal of the drywell, soil excavation, confirmation sampling and analysis, transportation and off-site disposal of excavated materials, backfilling and site restoration. Building 255 was demolished prior to remedial actions at the site. A brief summary of this remedial action is provided below.

Remedial action work activities began on July 7, 1998. Equipment was mobilized and work zones were established. The extent of contaminated soil was estimated as an approximately 20 foot square area, centered on the drywell, from a depth of 4 to 14 feet BGS. Excavation of the drywell involved removing the first four feet of clean overburden and stockpiling. All of the remaining material removed from the excavation was assumed contaminated, segregated, and stockpiled on a bermed liner. Two underground pipes, one that came from the Building 255 floor drain to the parking lot drywell, and one of unknown origin, were cut and removed to the edge of the excavation. The remaining pipe ends were plugged and grouted closed. Excavation was completed on July 13, 1998. The estimated volume of soil excavated, stockpiled, and disposed was 192.3 cubic yards.

Confirmatory samples were taken after the removal action was completed to verify the effectiveness of this interim remedial action. The Air Force, EPA, and NYSDEC compared the results of the confirmatory soil samples to the risk-based cleanup goals and NYSDEC Technical and Administrative Guidance Memorandum (TAGM) 4046: Determination of Soil Cleanup Objectives and Soil Cleanup Levels (NYSDEC 1994). After agreement was reached that the project goals were met, the excavated area was backfilled with the estimated 59.3 cubic yards of clean, stockpiled soil and additional clean material.

Material from the contaminated soil stockpile was loaded for transport to Seneca Meadows Landfill for disposal on September 14, 15, and 16, 1998.

## 2.9 Principal Threat Waste

There are no principal threat wastes at the Building 255 AOC.

## 2.10 Description of the No Further Action for Soil with Land Use Restrictions

No further action for soil with land use restrictions for industrial/commercial use is proposed for the Building 255 Drywell AOC. Five-year reviews will be performed by the Air Force, in conjunction with the EPA and NYSDEC, to ensure that future land use is in compliance with the transfer documents (deed) for industrial/commercial use. The transfer documents will contain the following restrictions to ensure that the reuse of the site is consistent with the risk assessment:

- The property will be designated for industrial/commercial use unless permission is obtained from the EPA, NYSDEC, and the New York State Department of Health; and
- The owner or occupant of the property shall not extract, utilize, consume, or permit to be extracted any water from the subsurface aquifer within the boundary of the property unless such owner or occupant obtains prior written approval from the New York State Department of Health.

As a result of the interim remedial action, the majority of soil contamination found during the RI investigations at this AOC were removed. The remaining chemicals detected in the soil do not exceed standards and guidance values and the known source of the groundwater contamination has been removed. In addition, the baseline risk assessment for industrial/commercial use indicated that the levels of contamination present in the soil prior to remediation fell within or below EPA's acceptable carcinogenic risk range and posed no noncarcinogenic risk to utility, construction, and industrial workers. Therefore, the concentrations of the chemicals remaining in the soil after the completion of the remedial action demonstrate that the remaining site contaminants pose no current or potential threat to public health or the environment. Groundwater at the Building 255 Drywell AOC is being further evaluated as part of the On Base Groundwater AOC Tin City operable unit.

## 2.11 Statutory Determinations

The selected remedy must meet the statutory requirements of CERCLA, Section 121, which are described below.

### Protection of Human Health and the Environment

The plan for no further action for soil with land use restrictions for industrial/commercial use will provide adequate protection from exposure to contaminants by limiting the use of the site in accordance with the risk assessment.

### Compliance with ARARs

Contaminant concentrations in the soil following the interim remedial action comply with the applicable ARARs. Furthermore, land use restrictions for industrial/commercial use will be consistent with the risk assessment, which was performed for occupational workers.

### Cost-Effectiveness

No costs are associated with the selected alternative.

### Utilization of Permanent Solutions and Alternative Treatment Technologies to the Maximum Extent Practicable

Treatment technologies are not included in the selected alternative.

### Preference for Treatment as a Principal Element

Treatment technologies are not included in the selected alternative.

## 2.12 Documentation of Significant Changes

No significant changes have been made to the selected alternative from the time the proposed plan was released for public comment.

# 3 Responsiveness Summary

On Friday, February 9, 2001, AFBCA, following consultation with and concurrence of the EPA and NYSDEC, released for public comment the proposed plan for no further action for soil with land use restrictions at the Building 255 Drywell AOC at the former Griffiss Air Force Base. The release of the proposed plan initiated the public comment period, which concluded on March 11, 2001.

During the public comment period, a public meeting was held on Thursday, March 1, 2001, at 5:00 p.m. at the Floyd Town Hall located at 8299 Old Floyd Road, Rome, NY. A court reporter recorded the proceedings of the public meeting. A copy of the transcript and attendance list are included in the Administrative Record. The public comment period and the public meeting were intended to elicit public comment on the proposal for remedial action at the site.

This document summarizes and provides responses to the verbal comments received at the public meeting and the written comments received during the public comment period.

**Comment #1 (oral - Carmen Malagisi)**

Mr. Malagisi requested an explanation of the five-year review process and whether there was a termination criteria for the five-year review.

**Response #1**

The five-year review is conducted by the Air Force, in conjunction with the EPA and NYSDEC, to assure that human health and the environment are being protected by the remedial actions being implemented. In this case, the review will ensure that the land use is in compliance with industrial/commercial use, deed restrictions remain in place and that the cleanup standards used in the ROD are still appropriate. During the first five-year review, and any subsequent review, if it is determined that conditions at a portion of the site have improved such that it meets unlimited and unrestricted use, then that portion of the site can be excluded from future review. However, it is the policy of the EPA that five-year reviews be conducted on a site-wide basis whenever any portion of a site requires a review.

**Comment #2 (oral - John Fitzgerald)**

Mr. Fitzgerald asked if it was possible to have only one five-year review.

**Response #2**

At a minimum, one five-year review will be conducted. During that five-year review, it could be decided that no additional reviews are necessary.

**Comment #3 (oral - John Fitzgerald)**

Mr. Fitzgerald asked if there would be a record of when the five-year reviews will occur.

**Response #3**

CERCLA regulations do not require that the public be an active participant in the five-year reviews, but they do require that the results of the five-year reviews be made available to the public in the Information Repository. EPA guidance, however, suggests that the public be consulted during the five-year review process. While the Air Force has an active presence at the former Griffiss AFB, the Restoration Advisory Board (RAB) will be informed of and invited to participate in the five-year reviews.

**Comment #4 (oral - John Fitzgerald)**

For the record, Mr. Fitzgerald noted that he and other residents have concerns about the groundwater, but they understand that those issues will be addressed at a later time.

Re: Removal of Groundwater Deed Restrictions
Tin City – Bldg. 214, Bldg. 219, Bldg. 222 & Bldg 255
Former Griffiss AFB, Rome NY

Dear Mr. McDermott:

The U.S. Environmental Protection Agency (EPA) has reviewed your request to remove the groundwater restrictions from the deed(s) at the area known as Tin City, located at the former Griffiss AFB in Rome, New York.

As you are aware, groundwater restrictions and further investigative work were required as part of the selected remedies for certain Areas of Concern (i.e., Bldg. 214; Bldg. 219; Bldg. 222; & Bldg 255) located in the Tin City area. These restrictions and further investigative work were required as part of the remedies and documented in the CERCLA Records of Decision (RODs), dated Sept. 30, 1999 (Bldgs. 214 & 219) and Sept 27, 2001 (Bldgs. 222 & 255).

Since the selection of these remedies, the relevant properties have been transferred and the restrictions were incorporated into the appropriate deeds, and the required additional work has been performed. Based upon this subsequent work, EPA then approved an Explanation of Significant Differences (ESD) concerning the remedy for Bldgs 214, 219, 222 and 255, which is a modification to the selected remedy, which is dated Sept. 26, 2003. The ESD acknowledges that the remedy has achieved NYSDEC Groundwater Standards, and thus EPA approved the removal of the groundwater monitoring requirement from the remedies. Furthermore, annual land use and institutional control certifications were performed, as well as CERCLA-mandated Five-Year reviews, with results indicating that the remedies remain protective of human health and the environment.

Therefore, based upon this information (i.e. the remedies, the ESD, the Five-Year Reviews, the annual land use and institutional control certification reports, and recent Long-Term Monitoring data), EPA concurs with your request to remove the groundwater restrictions from the applicable deed(s). This approval is only for this request and does not applied to any other requirements of the RODs or ESD.

Should you have any questions, please contact Douglas Pocze, of my staff, at (212) 637-4432.

Sincerely,

John S. Malleck, Chief
Federal Facilities Section

## MCDERMOTT, MICHAEL F GS-13 USAF DoD AFCEE/EXC

**Subject:** Re: Groundwater Deed Restriction Removal

Mike,
We (NYSDEC and NYSDOH) have reviewed the request for the deed restriction removal for Tin city and SS017 Lot 69. We have no comments or problems with the request and can go forward with it. Please let me know if you need more information.
Thanks -Heather

**Daily Health and Safety Meeting Form**

*Date:* 5/6/13 *Time :* 830

*Location:* FPM office (sample room)

*Weather Conditions:* sunny / 70°s

*Meeting Type:* Daily Health and Safety

*Personnel Present:*

Dan Baldyga, Justin Damann, Mike Grifasi, Josh Wenzel

*Visitors Present:* None

*Visitor Training:* None

*PPE Required:* Modified D

*Possible risks, injuries, concerns:*

underground utilities (unmarked), slip/trip/fall, car traffic.

*Anticipated Releases to Environment (if so, describe and detail response action/control measures implemented):*

None

*Property Damage:*

None

*Description (include sequence of events describing step by step how incident happened):*

None

*Analysis for, and Implementation of Corrective/Preventative Procedure to Prevent Future Occurrences (to be formulated by SSHO + FOM, approved by PM, and SSHO implemented):*

None

*Report made by (Name):* Dan Baldyga

*SSHP Organization Title:* Site Safety and Health Officer

**Daily Chemical Quality Control Report**

Project/Delivery Order Number: 1015-11-01 Date: 7/29/2013

Project Name/Site Number: Site Closure Sampling at Building 255/ FDA

Weather conditions: Temperature: 73 F Barometric reading: 30.06
Wind speed and direction: 0-8 mph, W
Significant wind changes: 18 mph

General description of tasks completed: Soil Sampling with geoprobe.

Explain any departures from the SAP or deviations from approved procedures during the day's field activities: None

Explain any technical problems encountered in the field or field equipment/field analytical instrument malfunction: None

Corrective actions taken or instructions obtained from AFCEE/USACE personnel: No corrective actions necessary.
None

Sampling shipment completed: √ Yes □ No Airbill #: …. …. ….

# SOIL / SEDIMENT SAMPLING FORM

Project: 1015-11-01 Sampled by: DB/JW

Site and Site Code (**SITEID**): B255

Sampling Location ID. (**LOCID**): B255SCS-7

Date (**LOGDATE**): 7/29/13 Time: 1545

**FIELD OBSERVATIONS:**

| Sample Depth or Interval | Material Description/ Color |
|---|---|
| 0-4 | fine sand with gravel, no odor |
| 4-8 | brown - sand with silt, gravel |
| 8-12 | sand with silt, gravel. |

**Comments/Observations:**

Sample Time: 1550 Sample ID: B255SCS0704AA/AC

Sample Time: 1554 Sample ID: B255SCS0708AA

Sample Time: 1600 Sample ID: B255SCS0712AA

# SOIL / SEDIMENT SAMPLING FORM

Project: 1015-11-01 Sampled by: NB / JW

Site and Site Code (**SITEID**): B255

Sampling Location ID. (**LOCID**): B255SCS-8

Date (**LOGDATE**): 7/29/13 Time: 1530

**FIELD OBSERVATIONS:**

| Sample Depth or Interval | Material Description/ Color |
|---|---|
| 0-4 | fine sand, powder, light brown |
| 4-8 | fine sand, no odor, light brown |
| 8-12 | fine sand, brown to gray, gravel |

**Comments/Observations:**

Sample Time: 1530 Sample ID: B255SCS0804AA

Sample Time: 1535 Sample ID: B255SCS0808AA

Sample Time: 1540 Sample ID: B255SCS0812AA

## LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

| Sample ID | Date | QC Samples | Date |
|---|---|---|---|
| B255SCS0104AA | 5/6/13 | B255SCS0104AC | |
| B255SCS0108AA | 5/6/13 | 050613AE, 050613AF, 050613AR | |
| B255SCS0112AA | 5/6/13 | | |
| B255SCS0204AA | 5/6/13 | | |
| B255SCS0208AA | 5/6/13 | | |
| B255SCS0212AA | 5/6/13 | | |
| B255SCS0304AA | 5/6/13 | | |
| B255SCS0308AA | 5/6/13 | | |
| B255SCS0312AA | 5/6/13 | | |

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.
AA – Primary environmental samples
AC – Field duplicate sample
AE – Equipment blank sample
AF – Ambient blank sample
AR – Trip blank sample

## DELIVERABLES

The data deliverable report was per requirements of the DOD QSM, version 4.2, as specified in the project-specific QAPP. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

## ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the sample analyses were per methods as specified in the DOD QSM, version 4.2, with project-specific modifications as listed in the project-specific QAPP. The analytical methods employed included SW-846 8260B, Volatile Organic Compounds (VOCs), and 6010C, Metals.

## VERIFICATION GUIDANCE

The analytical work was performed by TestAmerica Denver in accordance with the DOD QSM, version 4.2, and QC requirements of the respective analytical methods and of the project-specific QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the DOD QSM, and the criteria as listed in the project-specific QAPP.

## QA/QC CRITERIA

The following QA/QC criteria were reviewed for the metals analyses, as applicable:

- Method detection limits and limits of quantitation (DL, LOQ)
- Holding times
- Initial and Continuing calibration summaries
- Method blanks
- Field duplicate results
- Serial dilution results
- Matrix spike/matrix spike duplicate (MS/MSD) analysis
- Laboratory control samples (LCS)
- Results reported between DL and LOQ (J-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with DOD QSM, version 4.2, and project-specific QAPP criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

***GENERAL NOTES:***

SAMPLE LABELING/CHAIN-OF-CUSTODY

No errors in the chain-of-custody were noted. There were no discrepancies noted between the sample labels and the chain-of-custody, or the cooler contents and the chain-of-custody.

**VOCs**

- Field duplicate samples, which are collected at the same location and at the same time using identical collection, handling, and analytical procedures, are used to assess precision of the sample collection process. The UFP QAPP requires qualification of data for field duplicates criterion if the duplicate samples contain detected compounds with concentrations above 5x the reporting limits (RL's) and the relative percent differences (RPD's) between the duplicate sample results exceed RPD control limits (20% for water samples, 30% for soil samples). If either the parent or the duplicate sample is less than 5x the RL, then the difference between the parent and duplicate sample must be less than 2x the RL. "J" flags for detects and "UJ" flags for non-detects are required per the QAPP for any exceedances. For these purposes the RL is considered equal to the LOQ.

  The following table summarizes the relative percent differences (RPD's) of field duplicate sample set B255SCS0104AA/AC.

| Sample ID, Normal | Sample ID, Field Duplicate | Analyte | Normal Result (mg/kg) | Field Dup Result (mg/kg) | LOQ (mg/kg) | RPD | Flag Applied | Rationale |
|---|---|---|---|---|---|---|---|---|
| B255SCS0104AA | B255SCS0104AC | Methylene Chloride | 4.4 J | 3.6 J | 5.3, 5.4 | 0.8 | None | Total difference < 2xRL |

  **Corrective Action:** "J" qualifiers were applied to the results, since the RPD's and/or total differences among the sample duplicate set B255SCS0104AA/AC were within QAPP limits.

- According to the case narrative, in the following continuing calibration verification (CCV), analytes exhibited the following exceedances:

| Type of Calibration Exceedance Affected Analytes | %D/ %RSD | AFCEE QC Limit | Flag Applied | Rationale |
|---|---|---|---|---|
| *CCV 280-174695/3* | | | | |
| Carbon disulfide | ***22.3*** | ±20 | None | %D greater than upper control limit, all results non-detect |

  **Corrective Action**: In accordance with the case narrative, no corrective action was required for the compounds listed in the above table when the %D was above the upper control limit and all associated sample results were non-detect.

**METALS**

- According to the case narrative, the solution used as the interference check standard showed the result for copper at a level greater than the LOD for the analytical batch associated with the field samples. The solution is believed to contain trace impurities of these elements, consistent with those found by the manufacturer of the solution. Using professional judgment, the "Q" qualifiers assigned by the laboratory were removed since the sample results are not due to matrix interference; (the levels in the soil samples were also well above those levels observed in the ICS solution).

| **Metal** | **Level in the ISCA solution 174408/14 (µg/L)** | **LOD (µg/L)** |
|---|---|---|
| Chromium | 1.94 | 1.5 |
| Copper | 4.05 | 3.5 |
| Manganese | 3.94 | 0.5 |
| Vanadium | 2.91 | 2.5 |
| **Metal** | **Level in the ISCA solution 175050/16 (µg/L)** | **LOD (µg/L)** |
| Chromium | 2.15 | 1.5 |
| Copper | 4.47 | 3.5 |
| Vanadium | 4.72 | 2.5 |
| **Metal** | **Level in the ISCA solution 175407/14 (µg/L)** | **LOD (µg/L)** |
| Manganese | 3.82 | 0.5 |

- According to the case narrative, the following sample was analyzed at an initial dilution:

| **Sample** | **Analyte** | **Dilution** |
|---|---|---|
| B255SCS0312AA | Sodium | 1:5 |

The dilution results only are reported and are used in data verification as representing original results.

- Field duplicate samples, which are collected at the same location and at the same time using identical collection, handling, and analytical procedures, are used to assess precision of the sample collection process. The UFP QAPP requires qualification of data for field duplicates criterion if the duplicate samples contain detected compounds with concentrations above 5x the reporting limits (RL's) and the relative percent differences (RPD's) between the duplicate sample results exceed RPD control limits (20% for water samples, 30% for soil samples). If either the parent or the duplicate sample is less than 5x the RL, then the difference between the parent and duplicate sample must be less than 2x the RL. "J" flags for detects and "UJ" flags for non-detects are required per the QAPP for any exceedances. For these purposes the RL is considered equal to the LOQ.

The following table summarizes the relative percent differences (RPD's) of field duplicate sample set B255SCS0104AA/AC.

| Sample ID, Normal | Sample ID, Field Duplicate | Analyte | Normal Result (mg/kg) | Field Dup Result (mg/kg) | LOQ (mg/kg) | RPD | Flag Applied | Rationale |
|---|---|---|---|---|---|---|---|---|
| B255SCS0104AA | B255SCS0104AC | Aluminum | 9000 | 9800 | 47, 52 | 8.5 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Arsenic | 4.8 | 3.5 | 2.4, 2.6 | 1.3 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Barium | 46 | 33 | 1.9, 2.1 | ***33*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Beryllium | 0.41 J | 0.39 J | 0.47, 0.52 | 0.020 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Boron | 1.6 J | 1.7 J | 9.5, 10 | 0.10 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Cadmium | 0.18 J | 0.17 J | 0.47, 0.52 | 0.010 | None | Total difference < 2xRL |

| B255SCS0104AA | B255SCS0104AC | Cobalt | 7.6 | 5.6 | 0.95, 1.0 | ***30*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Copper | 33 | 21 | 4.7, 5.2 | 12 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Iron | 21000 | 17000 | 76, 83 | 21 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Lead | 6.8 | 9.4 | 0.85, 0.93 | ***32*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Magnesium | 3700 | 3400 | 28, 31 | 8.5 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Manganese | 1300 | 540 | 4.3, 4.7 | ***83*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Molybdenum | 0.29 J | 0.52 J | 2.4, 2.6 | 0.23 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Nickel | 18 | 14 | 3.8, 4.1 | 4 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Potassium | 990 | 910 | 280, 310 | 80 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Vanadium | 16 | 17 | 1.9, 2.1 | 1.0 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Zinc | 43 | 48 | 7.6, 8.3 | 11 | None | RPD < 30% |

**Corrective Action:** "J" qualifiers were applied to the results, since the RPD's and/or total differences among the sample duplicate set B255SCS0104AA/AC were within QAPP limits.

## DATA USABILITY RESULTS

### VOCs

Based on the evaluation of all information in the analytical data groups, the results for VOCs are usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

### METALS

Based on the evaluation of all information in the analytical data groups, the results for metals are usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

**DATA USABILITY SUMMARY**

All data in Job # 280-42039-1 are valid and usable with qualifications as noted in the data review.

Signed: Concordia van Hoesel Date: 7/6/13

| **Metal** | **Level in the ISCA solution 175407/14 (µg/L)** | **LOD (µg/L)** |
| Manganese | 3.82 | 0.5 |

- According to the case narrative, the following sample was analyzed at an initial dilution:

| **Sample** | **Analyte** | **Dilution** |
|---|---|---|
| B255SCS0312AA | Sodium | 1:5 |

The dilution results only are reported and are used in data verification as representing original results.

- Field duplicate samples, which are collected at the same location and at the same time using identical collection, handling, and analytical procedures, are used to assess precision of the sample collection process. The UFP QAPP requires qualification of data for field duplicates criterion if the duplicate samples contain detected compounds with concentrations above 5x the reporting limits (RL's) and the relative percent differences (RPD's) between the duplicate sample results exceed RPD control limits (20% for water samples, 30% for soil samples). If either the parent or the duplicate sample is less than 5x the RL, then the difference between the parent and duplicate sample must be less than 2x the RL. "J" flags for detects and "UJ" flags for non-detects are required per the QAPP for any exceedances. For these purposes the RL is considered equal to the LOQ.

The following table summarizes the relative percent differences (RPD's) of field duplicate sample set B255SCS0104AA/AC.

| Sample ID, Normal | Sample ID, Field Duplicate | Analyte | Normal Result (mg/kg) | Field Dup Result (mg/kg) | LOQ (mg/kg) | RPD | Flag Applied | Rationale |
|---|---|---|---|---|---|---|---|---|
| B255SCS0104AA | B255SCS0104AC | Aluminum | 9000 | 9800 | 47, 52 | 8.5 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Arsenic | 4.8 | 3.5 | 2.4, 2.6 | 1.3 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Barium | 46 | 33 | 1.9, 2.1 | ***33*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Beryllium | 0.41 J | 0.39 J | 0.47, 0.52 | 0.020 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Boron | 1.6 J | 1.7 J | 9.5, 10 | 0.10 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Cadmium | 0.18 J | 0.17 J | 0.47, 0.52 | 0.010 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Calcium | 7300 | 2000 | 95, 100 | ***114*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Chromium | 10 | 11 | 3.3, 3.6 | 1 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Cobalt | 7.6 | 5.6 | 0.95, 1.0 | ***30*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Copper | 33 | 21 | 4.7, 5.2 | 12 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Iron | 21000 | 17000 | 76, 83 | 21 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Lead | 6.8 | 9.4 | 0.85, 0.93 | ***32*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Magnesium | 3700 | 3400 | 28, 31 | 8.5 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Manganese | 1300 | 540 | 4.3, 4.7 | ***83*** | J | RPD > 30% |
| B255SCS0104AA | B255SCS0104AC | Molybdenum | 0.29 J | 0.52 J | 2.4, 2.6 | 0.23 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Nickel | 18 | 14 | 3.8, 4.1 | 4 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Potassium | 990 | 910 | 280, 310 | 80 | None | Total difference < 2xRL |
| B255SCS0104AA | B255SCS0104AC | Vanadium | 16 | 17 | 1.9, 2.1 | 1.0 | None | RPD < 30% |
| B255SCS0104AA | B255SCS0104AC | Zinc | 43 | 48 | 7.6, 8.3 | 11 | None | RPD < 30% |

**Corrective Action:** "J" qualifiers were applied to the results, since the RPD's and/or total differences among the sample duplicate set B255SCS0104AA/AC were within QAPP limits.

## DATA USABILITY RESULTS

### VOCs

Based on the evaluation of all information in the analytical data groups, the results for VOCs are usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

### METALS

Based on the evaluation of all information in the analytical data groups, the results for metals are usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

**DATA USABILITY SUMMARY**

All data in Job # 280-42039-1 are valid and usable with qualifications as noted in the data review.

Signed: Concordia van Hoesel Date: 7/6/13

# ANALYTICAL REPORT

Job Number: 280-42039-1

Job Description: Griffiss AFB DP013 Bldg 255

For:
FPM Remediations Inc
584 Phoenix Drive
Rome, NY 13441

Attention: Daniel Baldyga

M. Elaine Walker

Approved for release.
Elaine Walker
Project Manager I
5/30/2013 12:37 PM

Elaine Walker, Project Manager I
4955 Yarrow Street, Arvada, CO, 80002
(303)736-0156
elaine.walker@testamericainc.com
05/30/2013

The test results in this report relate only to the samples in this report and meet all requirements of NELAC, with any exceptions noted. Pursuant to NELAP, this report shall not be reproduced except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Denver Project Manager.

The Lab Certification ID# is E87667.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

# CASE NARRATIVE
# Client: FPM Remediations Inc
# Project: Griffiss AFB DP013 Bldg 255
# Report Number: 280-42039-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**

Thirteen samples were received on 05/08/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 0.1°C and 0.4°C.

Per email from the client on 05/10/2013, the equipment blank received for pesticides analysis was not logged with this delivery group as there were no pesticide field samples received for this site. The pesticide equipment blank (050613AE) was logged with the samples received for DP012 Building 301, reported under a separate delivery group.

**VOLATILE ORGANIC COMPOUNDS (GC-MS) - SOIL**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/17/2013.

Acetone, Carbon Disulfide, and Methylene Chloride were detected in method blank MB 280-174775/1-A at levels that were above the method detection limits but below the reporting limits. The values should be considered estimates, and have been flagged "J". However, because the result concentrations were less than ½ the respective reporting limits, no corrective action was necessary.

No other difficulties were encountered during the VOC analyses.

All other quality control parameters were within the acceptance limits.

**VOLATILE ORGANIC COMPOUNDS (GC-MS) - WATER**

Samples 050613AE (280-42039-11), 050613AF (280-42039-12), and 050613AR (280-42039-13) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/11/2013, 05/14/2013 and 05/15/2013.

Methylene Chloride was detected in method blank MB 280-173812/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

Naphthalene was detected in method blank MB 280-174063/35 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

No other difficulties were encountered during the VOC analyses.

All other quality control parameters were within the acceptance limits.

**TOTAL METALS (ICP) - SOIL**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for Total Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 05/10/2013 and analyzed on 05/15/2013, 05/16/2013 and 05/17/2013.

Aluminum, Barium, and Boron were detected in method blank MB 280-173661/1-A at levels that were above the method detection limits but below the reporting limits. The values should be considered estimates, and have been flagged "J". However, because the result concentrations were less than ½ the respective reporting limits, no corrective action was necessary.

Sample B255SCS0312AA (280-42039-9) required a dilution prior to analysis. The reporting limits have been adjusted accordingly.

The interference check standard solution (ICSA) associated with prep batch 280-173661 showed results for Chromium, Copper, Manganese, and Vanadium at a level greater than the limit of detection (LOD). It is believed that the solution contains trace impurities of these elements and the results are not due to matrix interference. These results are consistent with those found by the manufacturer of the ICSA solution. The associated sample results have been flagged "Q" for these elements.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

**TOTAL METALS (ICP) - WATER**

Sample 050613AE (280-42039-11) was analyzed for Total Metals (ICP) in accordance with EPA SW-846 Method 6010C. The sample was prepared on 05/17/2013 and 05/23/2013 and analyzed on 05/18/2013, 05/21/2013 and 05/23/2013.

Manganese was detected in method blank MB 280-174378/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

Iron was detected in method blank MB 280-175463/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

The interference check standard solution (ICSA) associated with prep batch 280-174378 showed results for one or more elements at a level greater than the limit of detection (LOD). The initial ICSA results were greater than the LOD for Chromium, Copper, Manganese, and Vanadium. It is believed that the solution contains trace impurities of these elements and that the results are not due to matrix interference. These results are consistent with those found by the manufacturer of the ICSA solution. The associated sample results have been flagged "Q" for these elements.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

**PERCENT SOLIDS**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for percent solids in accordance with EPA SW846 3550C. The samples were analyzed on 05/24/2013.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

## LIST OF DATA VERIFICATION SAMPLES

This verification report pertains to the following environmental samples and corresponding QC samples:

| Sample ID | Date | QC Samples | Date |
|---|---|---|---|
| B255SCS0704AA | 7/29/13 | B255SCS0704AC | 7/29/13 |
| B255SCS0708AA | 7/29/13 | | |
| B255SCS0712AA | 7/29/13 | | |
| B255SCS0804AA | 7/29/13 | | |
| B255SCS0808AA | 7/29/13 | | |
| B255SCS0812AA | 7/29/13 | | |
| B255SCS0904AA | 7/29/13 | | |
| B255SCS0908AA | 7/29/13 | | |
| B255SCS0912AA | 7/29/13 | | |
| B255SCS1004AA | 7/29/13 | | |
| B255SCS1008AA | 7/29/13 | | |
| B255SCS1012AA | 7/29/13 | | |
| B255SCS1104AA | 7/29/13 | | |
| B255SCS1108AA | 7/29/13 | | |
| B255SCS1112AA | 7/29/13 | | |
| B255SCS1116AA | 7/29/13 | | |

Notes:

Refer to attached chain-of-custody for detailed sampling information and sample specific analyses requested.

## DELIVERABLES

The data deliverable report was per requirements of the DOD QSM, Final Version 4.2, as specified in the project-specific UFP QAPP. The report consisted of the following major sections: lab attachment letter, case narrative, chain-of-custody, lab qualifier definitions, analytical results (sheet 2) based on analytical batch, calibration summaries, method blank summaries, laboratory control sample summaries, matrix spike/matrix spike duplicate summaries, holding time forms, performance checks, surrogate and internal standard recoveries, as applicable.

## ANALYTICAL METHODS

The analytical test methods and QA/QC requirements used for the sample analyses were per methods as specified in the DOD QSM, Final Version 4.2, with project-specific modifications as listed in the project-specific UFP QAPP. The analytical methods employed included SW-846: Semivolatile Organic Compounds (SVOCs) by Method 8270C, and Metals by Method 6010C.

## VERIFICATION GUIDANCE

The analytical work was performed by Microbac Laboratories, Inc. in accordance with the DOD QSM, Final Version 4.2, as specified in the project-specific UFP QAPP. The data was verified according to the protocols and QC requirements of the respective analytical methods and of the project-specific UFP QAPP. The data usability analysis was based on the reviewer's professional judgment and on an assessment of how this data would fare with respect to the DOD QSM, Final Version 4.2, and the criteria as listed in the project-specific UFP QAPP.

## QA/QC CRITERIA

The following QA/QC criteria were reviewed for the SVOCs analyses, as applicable:

- Limits of Detection and Limits of Quantitation (LOD, LOQ)
- Holding times
- GC/MS tune performance
- Initial and Continuing calibration summaries
- Method blanks
- Trip blank (VOCs only)
- Field duplicate results
- Matrix spike/matrix spike duplicate (MS/MSD) analysis
- Surrogate spike recoveries
- Internal standard areas counts and retention times
- Laboratory control samples (LCS)
- Results reported between LOD and LOQ (J-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)

- Case narrative and deliverables compliance
- Tentatively identified compounds (TICs)

The following QA/QC criteria were reviewed for the metals analyses, as applicable:

- LODs and LOQs
- Holding times
- GC/MS tune performance
- Initial and Continuing calibration summaries
- Method blanks
- ICP interference check sample analysis
- Field duplicate results
- Matrix spike/matrix spike duplicate (MS/MSD) analysis
- Laboratory control samples (LCS)
- ICP serial dilution analysis
- Results reported between LOD and LOQ (J-flag)
- Sample storage and preservation
- Data system printouts
- Qualitative and quantitative compound identification
- Chain-of-custody (COC)
- Case narrative and deliverables compliance

The items listed above were in compliance with DOD QSM, Final Version 4.2 and project-specific UFP QAPP criteria and protocols with exceptions discussed in the text below. The data have been verified according to the procedures outlined above and qualified accordingly.

***GENERAL NOTES:***

SAMPLE LABELING/CHAIN-OF-CUSTODY

No errors in the chain-of-custody were noted. There were no discrepancies noted between the sample labels and the chain-of-custody, or the cooler contents and the chain-of-custody.

MS/MSD

For all analyses, the lab performed matrix spike and matrix spike duplicate samples for an internal quality control sample. Since these samples were not requested by the client in the chain-of-custody, no action was taken for the MS/MSD criterion.

REPORTING LIMITS

In accordance with the UFP QAPP, some quality control criteria (field duplicate and blank evaluations), required comparison to the reporting limit (RL). For this project, the RL was assumed to be equal to the LOQ.

## SEMIVOLATILE ORGANIC COMPOUNDS (SVOCs)

- According to the case narrative, the following sample was analyzed at initial dilution due to the nature of the sample matrix (viscosity of the extract):

| Sample | Dilution |
|---|---|
| B255SCS0904AA | 1:4 |

The dilution results only are reported and are used in data verification as representing original results. The case narrative describes that these samples were analyzed at dilution due to extract appearance.

## METALS (ICP)

- According to the case narrative, the following samples were analyzed at dilution:

| Sample | Dilution | Analytes |
|---|---|---|
| B255SCS0912AA | 1:5 | Aluminum, barium, beryllium, calcium, iron, manganese, potassium, sodium, strontium |
| B255SCS0708AA | 1:5 | Manganese |
| B255SCS0908AA | 1:5 | Manganese |
| B255SCS1112AA | 1:5 | Manganese |
| B255SCS1116AA | 1:5 | Manganese |

The dilution results only are reported these analytes and are used in data verification as presenting original results. The case narrative describes samples were analyzed at dilution to obtain results within the linear range.

- According to the case narrative, the ICSA solution for prep batch 280-186959 reported cadmium, chromium, copper, manganese, and strontium above the LOD. The laboratory contacted the manufacturer, and the source of these analytes is suspected to be trace impurities of the element in the solution, rather than an artifact of matrix interference. The laboratory applied "Q" flags for all associated results. Using professional judgment, the "Q" flags were removed and the unqualified results are deemed usable.

- Field duplicate samples, which are collected at the same location and at the same time using identical collection, handling, and analytical procedures, are used to assess precision of the sample collection process. The QAPP requires qualification of data for field duplicates criterion if the duplicate samples contain detected compounds with concentrations above 5x the LOQ and the relative percent differences (RPDs) between the duplicate sample results exceed RPD control limits (30% for aqueous samples). If either the parent or the duplicate sample is less than 5x the LOQ, then the difference between the parent and duplicate sample must be less than 2x the LOQ. "J" flags for detects and "UJ" flags for non-detects are required per the QAPP for any exceedances.

  The following table summarizes the RPDs/total differences of field duplicate sample set B255SCS0704AA/AC:

| Sample ID, Normal | Sample ID, Field Duplicate | Analyte | Normal Result (mg/kg) | Field Dup Result (mg/kg) | LOQ | RPD or ±differ-ence | Flag Applied | Rationale |
|---|---|---|---|---|---|---|---|---|
| B255SCS0704AA | B255SCS0704AC | Arsenic | 2.4 J | 2.0 J | 2.7, 2.5 | 0.4 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Aluminum | 3700 | 3200 | 54, 50 | 14.5 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Barium | 12 | 10 | 2.1, 2.0 | 18.2 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Beryllium | 0.17 J | 0.14 J | 0.54, 0.50 | 0.03 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Boron | 1.4 J | 1.3 J | 11, 10 | 0.1 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Cadmium | 0.083 J | 0.052 J | 0.54, 0.50 | 0.031 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Calcium | 1900 | 2000 | 110, 100 | 5.1 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Chromium | 4.2 | 3.8 | 3.8, 3.5 | 0.4 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Cobalt | 3.2 | 2.6 | 1.1, 1.0 | 0.6 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Copper | 8.5 | 8.2 | 5.4, 5.0 | 0.3 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Iron | 7900 | 7000 | 86, 80 | 12.1 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Lead | 2.2 | 1.8 | 0.97, 0.90 | 0.4 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Magnesium | 1700 | 1500 | 32, 30 | 12.5 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Manganese | 270 | 240 | 4.8, 4.5 | 11.8 | None | RPD < 30% |
| B255SCS0704AA | B255SCS0704AC | Nickel | 6.4 | 5.7 | 4.3, 4.0 | 0.7 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Potassium | 540 | 490 | 320, 300 | 50 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Strontium | 5.6 | 4.7 | 1.6, 1.5 | 0.9 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Vanadium | 6.7 | 5.8 | 2.1, 2.0 | 0.9 | None | Difference < 2x LOQ |
| B255SCS0704AA | B255SCS0704AC | Zinc | 15 | 14 | 8.6, 8.0 | 1.0 | None | Difference < 2x LOQ |

**Corrective Action:** There were no RPD or difference exceedances for duplicate sample set B255SCS0704AA/AC.

- According to the case narrative, the low level calibration check standard (280-187483/81) associated with batch 280-186959 recovered outside the ±20% control criteria (at +37%). Using professional judgment, since associated detections were greater than 10x the RL, the method blank was non-detect for aluminum, and the LCS recovered within the established control limits, no flagging is deemed required. The laboratory applied "Q" flags for all

associated results. Using professional judgment, the “Q” flags were removed and the unqualified results are deemed usable.

## DATA USABILITY RESULTS

### SVOCs

Based on the evaluation of all information in the analytical data groups, the results for SVOCs are highly usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

### Metals (ICP)

Based on the evaluation of all information in the analytical data groups, the results for metals are highly usable with the data qualifiers as noted. Using the verification approach as presented above, the results for all above samples are 100% usable.

**DATA USABILITY SUMMARY**

All data in Job # 280-45026-1 are valid and usable with qualifications as noted in the data review.

(280-45026-8), B255SCS0908AA (280-45026-9), B255SCS0912AA (280-45026-10), B255SCS1004AA (280-45026-11), B255SCS1008AA (280-45026-12), B255SCS1012AA (280-45026-13), B255SCS1104AA (280-45026-14), B255SCS1108AA (280-45026-15), B255SCS1112AA (280-45026-16), and B255SCS1116AA (280-45026-17) were analyzed for percent solids in accordance with EPA SW846 3550C. The samples were analyzed on 08/13/2013 and 08/15/2013.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

# CASE NARRATIVE
## Client: FPM Remediations Inc
## Project: Griffiss AFB DP013 Bldg 255
## Report Number: 280-45026-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**
Seventeen samples were received on 08/01/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 2.1°C, 3.2°C, and 5.2°C.

**SEMIVOLATILE ORGANIC COMPOUNDS (GC-MS)**
Samples B255SCS0904AA (280-45026-8), B255SCS0908AA (280-45026-9), B255SCS0912AA (280-45026-10), B255SCS1004AA (280-45026-11), B255SCS1008AA (280-45026-12), and B255SCS1012AA (280-45026-13) were analyzed for semivolatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8270C. The samples were prepared on 08/09/2013 and analyzed on 08/14/2013.

Dimethyl phthalate was detected in method blank MB 280-186667/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

Sample B255SCS0904AA (280-45026-8) required a dilution prior to analysis due to the nature of the sample matrix (viscosity of the extract). The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the SVOC analyses.

All other quality control parameters were within the acceptance limits.

**TOTAL METALS (ICP)**
Samples B255SCS0704AA (280-45026-1), B255SCS0704AC (280-45026-2), B255SCS0708AA (280-45026-3), B255SCS0712AA (280-45026-4), B255SCS0804AA (280-45026-5), B255SCS0808AA (280-45026-6), B255SCS0812AA (280-45026-7), B255SCS0904AA (280-45026-8), B255SCS0908AA (280-45026-9), B255SCS0912AA (280-45026-10), B255SCS1104AA (280-45026-14), B255SCS1108AA (280-45026-15), B255SCS1112AA (280-45026-16), and B255SCS1116AA (280-45026-17) were analyzed for Total Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 08/14/2013 and analyzed on 08/15/2013.

Samples B255SCS0708AA (280-45026-3), B255SCS0908AA (280-45026-9), B255SCS1112AA (280-45026-16), and B255SCS1116AA (280-45026-17) required dilutions prior to analysis to bring the concentration of Manganese within the daily calibration range. Internal Standard failures occurred at a 1x dilution. The reporting limits have been adjusted accordingly.

Sample B255SCS0912AA (280-45026-10) required a dilution prior to analysis due to the nature of the sample matrix. The reporting limits have been adjusted accordingly.

The CCVL associated with prep batch 280-186959 recovered above the established control criteria for Aluminum. The associated samples contained detections for this analyte greater than 10x the RL, the Method Blank was non-detect for Aluminum, and the LCS recovered within the established control limits; therefore the data have been reported.

The analysis of the ICSA solution, which is used as the interference check standard, shows results for Cadmium, Chromium, Copper, Manganese, and Strontium at a level greater than the LOD for prep batch 280-186959. We believe that the solution contains trace impurities of these elements and that the results are not due to matrix interference. These results are consistent with those found by the manufacturer of the ICSA solution. The associated sample results have been flagged "Q" for these elements.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

**PERCENT SOLIDS**
Samples B255SCS0704AA (280-45026-1), B255SCS0704AC (280-45026-2), B255SCS0708AA (280-45026-3), B255SCS0712AA (280-45026-4), B255SCS0804AA (280-45026-5), B255SCS0808AA (280-45026-6), B255SCS0812AA (280-45026-7), B255SCS0904AA

The test results in this report relate only to the samples in this report and meet all requirements of NELAC, with any exceptions noted. Pursuant to NELAP, this report shall not be reproduced except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Denver Project Manager.

The Lab Certification ID# is E87667.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

# CASE NARRATIVE
# Client: FPM Remediations Inc
# Project: Griffiss AFB DP013 Bldg 255
# Report Number: 280-42039-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**

Thirteen samples were received on 05/08/2013; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 0.1ºC and 0.4ºC.

Per email from the client on 05/10/2013, the equipment blank received for pesticides analysis was not logged with this delivery group as there were no pesticide field samples received for this site. The pesticide equipment blank (050613AE) was logged with the samples received for DP012 Building 301, reported under a separate delivery group.

**VOLATILE ORGANIC COMPOUNDS (GC-MS) - SOIL**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/17/2013.

Acetone, Carbon Disulfide, and Methylene Chloride were detected in method blank MB 280-174775/1-A at levels that were above the method detection limits but below the reporting limits. The values should be considered estimates, and have been flagged “J”. However, because the result concentrations were less than ½ the respective reporting limits, no corrective action was necessary.

No other difficulties were encountered during the VOC analyses.

All other quality control parameters were within the acceptance limits.

**VOLATILE ORGANIC COMPOUNDS (GC-MS) - WATER**

Samples 050613AE (280-42039-11), 050613AF (280-42039-12), and 050613AR (280-42039-13) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 05/11/2013, 05/14/2013 and 05/15/2013.

Methylene Chloride was detected in method blank MB 280-173812/6 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

Naphthalene was detected in method blank MB 280-174063/35 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

No other difficulties were encountered during the VOC analyses.

All other quality control parameters were within the acceptance limits.

**TOTAL METALS (ICP) - SOIL**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for Total Metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 05/10/2013 and analyzed on 05/15/2013, 05/16/2013 and 05/17/2013.

Aluminum, Barium, and Boron were detected in method blank MB 280-173661/1-A at levels that were above the method detection limits but below the reporting limits. The values should be considered estimates, and have been flagged “J”. However, because the result concentrations were less than ½ the respective reporting limits, no corrective action was necessary.

Sample B255SCS0312AA (280-42039-9) required a dilution prior to analysis. The reporting limits have been adjusted accordingly.

The interference check standard solution (ICSA) associated with prep batch 280-173661 showed results for Chromium, Copper, Manganese, and Vanadium at a level greater than the limit of detection (LOD). It is believed that the solution contains trace impurities of these elements and the results are not due to matrix interference. These results are consistent with those found by the manufacturer of the ICSA solution. The associated sample results have been flagged "Q" for these elements.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

**TOTAL METALS (ICP) - WATER**

Sample 050613AE (280-42039-11) was analyzed for Total Metals (ICP) in accordance with EPA SW-846 Method 6010C. The sample was prepared on 05/17/2013 and 05/23/2013 and analyzed on 05/18/2013, 05/21/2013 and 05/23/2013.

Manganese was detected in method blank MB 280-174378/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

Iron was detected in method blank MB 280-175463/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". However, because the result concentration was less than ½ the reporting limit, no corrective action was necessary.

The interference check standard solution (ICSA) associated with prep batch 280-174378 showed results for one or more elements at a level greater than the limit of detection (LOD). The initial ICSA results were greater than the LOD for Chromium, Copper, Manganese, and Vanadium. It is believed that the solution contains trace impurities of these elements and that the results are not due to matrix interference. These results are consistent with those found by the manufacturer of the ICSA solution. The associated sample results have been flagged "Q" for these elements.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

**PERCENT SOLIDS**

Samples B255SCS0104AA (280-42039-1), B255SCS0108AA (280-42039-2), B255SCS0112AA (280-42039-3), B255SCS0204AA (280-42039-4), B255SCS0208AA (280-42039-5), B255SCS0212AA (280-42039-6), B255SCS0304AA (280-42039-7), B255SCS0308AA (280-42039-8), B255SCS0312AA (280-42039-9), and B255SCS0104AC (280-42039-10) were analyzed for percent solids in accordance with EPA SW846 3550C. The samples were analyzed on 05/24/2013.

No difficulties were encountered during the % solids analyses.

All quality control parameters were within the acceptance limits.

## DATA REPORTING QUALIFIERS

Client: FPM Remediations Inc Job Number: 280-42039-1

| Lab Section | Qualifier | Description |
|---|---|---|
| GC/MS VOA | | |
| | J | Estimated: The analyte was positively identified; the quantitation is an estimation |
| | U | Undetected at the Limit of Detection. |
| Metals | | |
| | J | Estimated: The analyte was positively identified; the quantitation is an estimation |
| | Q | One or more quality control criteria failed. |
| | D | The reported value is from a dilution. |
| | U | Undetected at the Limit of Detection. |

| Review Items | Level 1 Yes | Level 1 No | Level 1 N/A | Level 2 | Comments |
|---|---|---|---|---|---|
| **Initial Calibration** | | | | | |
| 1. BFB meets criteria? | ✓ | | | ✓ | |
| 2. ICAL date and instrument ID verified? | ✓ | | | ✓ | |
| 3. Does the Form VI match the data in the Chrom source method? | ✓ | | | ✓ | |
| 4. Sufficient number of calibration points used? | ✓ | | | ✓ | |
| 5. Reasons for removal of points documented? | ✓ | | | ✓ | Some points < RL removed |
| 6. %RSD or correlation coefficient within method limits? | ✓ | | | ✓ | |
| 7. Response factors meet criteria? | ✓ | | | ✓ | |
| 8. Isomeric pairs checked for correct peak assignment?<br>Vinyl acetate/Isopropyl ether<br>1,3- /1,4- /1,2-Dichlorobenzene<br>Ethylbenzene/Xylenes<br>1,3,5- /1,2,4-Trimethylbenzene / isopropylbenzene<br>2-Nitropropane between Bromodichloromethane &MIBK<br>2- /4-Chlorotoluene / n-propylbenzene<br>MIBK/2-Hexanone<br>Methyl/Ethyl Methacrylate<br>1,1-Dichloroethene /cis-1,2 & trans-1,2-Dichloroethene<br>1,1-Dichloropropene / cis / tran -1,3-Dichloropropene /1,2,3-Trichloropropane | ✓ | | | ✓ | |
| 9. Data checked for detector saturation? | ✓ | | | ✓ | |
| 10. Label number of standards used recorded? | ✓ | | | ✓ | |
| 11. Manual integrations documented and checked? | ✓ | | | ✓ | |
| 12. 2nd source ICV recovery 80-120% (±20%drift) for DoD projects, 65-135% (±35%,or ±55% of expected for poor performers) for non-DoD? Exceptions noted in comment section. | ✓ | | | ✓ | |
