GROUND-WATER REMEDIATION PROGRAM
OLD BETHPAGE, NEW YORK**

INTRODUCTION

Geraghty & Miller, Inc. prepared this report at the request of Lockwood, Kessler & Bartlett, Inc. (LKB) and the Town of Oyster Bay to summarize and evaluate data collected during the July and October 1991 water-level measurement rounds, and the July/August 1991 ground-water quality monitoring round (hereinafter referred to as the baseline rounds) conducted as part of the Old Bethpage Landfill Ground-Water Remediation Program, Old Bethpage, New York. The purpose of these measurements and sampling rounds was to establish baseline conditions prior to start-up of the ground-water recovery/treatment system. Water-level data are summarized on Table 1; analytical results are provided in Appendix A.

Because the ground-water recovery system was designed to capture and treat the volatile organic compound (VOC) portion of the landfill plume, this report focuses on analysis of the VOC data. An analysis of the leachate (inorganic) portion of the landfill plume is provided in Appendix B. For reference, data collected during the baseline round are compared to data previously reported by Geraghty & Miller, Inc. (1985 and 1986).

WATER-LEVEL MEASUREMENTS AND MAPPING

On July 30, 1991 and October 31, 1991, Geraghty & Miller, Inc. collected synoptic water-level measurements in site monitoring wells (see Table 1). These water-level measurement rounds were not required under the town's consent order, but were performed to obtain static (baseline) water-level elevations and ground-water flow directions at the site, prior to the start-up of the ground-water recovery/treatment system. Depth to water measurements and water-level elevations for these two rounds are summarized on Table 1; well construction details are provided on Table 2.

Water-level elevation data from these rounds were contoured by Geraghty & Miller and revealed similar ground-water flow directions across the site on these two dates. Contour maps depicting elevations of the water table, shallow, and deep potentiometric surfaces on October 31, 1991 are shown on Figures 1, 2, and 3, respectively. In general, ground-water elevations observed in the October 1991 round ranged from 72 ft above mean sea level (msl) (north of the site) to 59 ft above msl (south of the site), and the horizontal direction of ground-water flow was to the southeast across the site. This flow direction is similar to the regional flow direction reported by the U.S. Geological Survey (USGS) and local flow conditions reported by Geraghty & Miller (1985).

GROUND-WATER SAMPLING AND CONTAMINANT DISTRIBUTION

In accordance with requirements of the town's consent order, Geraghty & Miller conducted the initial (baseline) round of ground-water quality monitoring at the site between July 30 and August 2, 1991. The system became operational on April 1, 1992. The wells sampled are summarized on Table 3; the analytical parameters and results obtained are presented on Tables 4 through 8. Laboratory data reports for this round are provided in Appendix A.

Except as noted below, the sample collection, equipment decontamination, and quality assurance/quality control (QA/QC) procedures used for the baseline round are identical to those used for previous site sampling events, as described in Geraghty & Miller's September 1986 report, entitled "OBSWDC Offsite Ground-Water Monitoring Program, Old Bethpage, Long Island, New York." Because Well 30A (upgradient monitoring well), Well N-9980 (well at Melville Road), and Observation Wells OBS-1 and OBS-2 are not equipped with dedicated sampling equipment, they were evacuated and sampled using a stainless-steel submersible pump and Teflon bailer, respectively.

VOLATILE ORGANIC COMPOUND PLUME

VOCs detected in the July/August 1991 sampling round depict a pattern of ground-water contamination similar to that described in Geraghty & Miller's September 1986 report, i.e., three groupings of VOCs located in specific portions of the study area. These include (1) volatile halogenated organics (VHOs), except tetrachloroethene, (2) volatile aromatic hydrocarbons, and (3) tetrachloroethene. Results of analysis of VOC samples collected during the baseline sampling round are described below. The most noticeable difference between the baseline data and data previously collected at the site is a broadening of the plume(s) along the southern boundary of the site. Although it is expected that the plume will broaden over time as a result of natural dispersion, the historical water-quality and baseline data also indicate that this broadening may be the result of potential, upgradient sources (see Possible Sources of Volatile Organic Compounds section of this report for details).

In the first grouping, the most dominant compounds detected, in terms of occurrence and concentration, were trichloroethene and 1,1-dichloroethane. Other VHOs were also detected, but in fewer wells and typically at concentrations less than 10 micrograms per liter (ug/L). Well 8A had the highest concentration of total VHOs detected, followed by Wells 6B and 8B. Concentrations of VHOs detected in the baseline round were appreciably less than that detected in previous sampling rounds and generally show a decreasing trend in VHO concentrations (Geraghty & Miller, Inc. 1986). For example, concentrations of 1,2-dichloroethene (which was previously the most dominant compound detected) ranged from not detected to 570 ug/L in September 1986 and ranged from not detected to 3 ug/L in the baseline round. In addition, methylene chloride, previously detected at the site, was not detected in the baseline round.

Figure 4 illustrates the approximate lateral extent of VHOs in July/August 1991. Compared to the approximate lateral extent for VHOs reported by Geraghty & Miller in

1986, the 1991 extent is somewhat broader along the southeastern site border and slightly longer.

The second grouping, aromatic hydrocarbons, which consist of benzene, ethylbenzene, chlorobenzene, p-dichlorobenzene, and o-dichlorobenzene, were detected in a more limited area than the first grouping. The highest concentrations of aromatic hydrocarbons were detected in Well OBS-1 and Well Cluster 6. In general, concentrations of aromatic hydrocarbons detected in the baseline round were appreciably less than that detected in previous sampling rounds and show a decreasing trend of aromatic hydrocarbon concentrations (Geraghty & Miller, Inc. 1986). For example, concentrations of benzene ranged from not detected to 48 ug/L in September 1986 and ranged from not detected to 13 ug/L in the baseline round (not including baseline sampling result for Well OBS-1 [110 ug/L], which was installed after September 1986). In addition, toluene and xylene, previously detected at the site, were not detected in the baseline round.

Figure 5 illustrates the approximate lateral extent of aromatic hydrocarbons in July/August 1991. Compared to the approximate lateral extent for aromatic hydrocarbons reported by Geraghty & Miller in 1986, the 1991 extent is broader along the southeastern site border and slightly longer.

The third grouping, tetrachloroethene, exhibits a very different distribution than the first two groupings. Figure 6 illustrates the approximate lateral extent of tetrachloroethene in July/August 1991. Compared to the approximate lateral extent for tetrachloroethene reported by Geraghty & Miller in 1986, the 1991 extent is considerably different, in that two separate plumes (east and west) are now apparent. The western plume, which encompasses Well OBS-1, was not identified in Geraghty & Miller's 1986 report because Well OBS-1 was installed after the report was issued. The eastern plume is slightly longer than depicted in 1986. The highest concentration of tetrachloroethene was detected in Well 8A, followed by Wells 7B and OBS-1. Concentrations of tetrachloroethene detected in the baseline round

were generally lower than in September 1986, except for Wells 7B and 8A, which increased from 71 to 140 ug/L and 110 to 440 ug/L, respectively (Geraghty & Miller, Inc. 1986).

POSSIBLE SOURCES OF VOLATILE ORGANIC COMPOUNDS

As previously described by Geraghty & Miller (1986), historical water-quality data for the site indicates that a portion of the observed VOC contamination may be potentially attributable to upgradient sources, including the industrial area north of the Bethpage State Park (which includes the Claremont Polychemical site, a USEPA National Priority List site) and the Nassau County Fireman's Training Center located northwest of the site.

Although the monitoring wells sampled for the baseline monitoring round were installed to identify contamination attributable to the Old Bethpage Landfill, the distribution of VOCs and the ground-water flow direction measured support the findings of the 1986 report that a portion of the VOC contamination detected at the site may be attributable to upgradient sources. Furthermore, the baseline water-quality data indicate that the concentrations of VOCs from upgradient sources is increasing. For example, the highest concentration of tetrachloroethene detected in September 1986 was 110 ug/L in Well 8A, and the highest concentration of tetrachloroethene detected in the baseline round was 440 ug/L, also in Well 8A. In addition, tetrachloroethene and benzene, which were previously detected in Well Cluster 5 at a maximum concentration of 3 ug/L and 2 ug/L, respectively, were detected at 28 ug/L and 110 ug/L, respectively, in nearby Well OBS-1 during the baseline round.

SOURCE OF SAMPLE: Old Bethpage Landfill, Bethpage, NY 02807
COLLECTED BY: Client DATE COL'D: 08/02/91 RECEIVED: 08/02/91

SAMPLE: Water sample, OBS-2
UNITS: ug/L

ANALYTICAL PARAMETERS

N-Nitrosodimethylamine	<1
Bis(2-chloroethyl)ether	<1
13 Dichlorobenzene	<1
14 Dichlorobenzene	<1
12 Dichlorobenzene	<1
Bis(2-chloroisopropyl)ether	<1
N-Nitrosodi-n-propylamine	<1
Hexachloroethane	<1
Nitrobenzene	<1
Isophorone	<1
Bis(2-chloroethoxy)methane	<1
124-Trichlorobenzene	<1
Naphthalene	<1
Hexachlorobutadiene	<1
Hexachlorocyclopentadiene	<1
2-Chloronaphthalene	<1
Dimethyl Phthalate	<1
Acenaphthylene	<1
2,6-Dinitrotoluene	<1
Acenaphthene	<1
2,4-Dinitrotoluene	<1
Diethyl Phthalate	<1
Fluorene	<1
4-Chlorophenyl phenyl ether	<1
N-Nitrosodiphenylamine	<1

ANALYTICAL PARAMETERS

1,2-Diphenylhydrazine	<1
4-Bromophenyl phenyl ether	<1
Hexachlorobenzene	<1
Phenanthrene	<1
Anthracene	<1
Di-n-Butyl Phthalate	3
Fluoranthene	<1
Benzidine	<50
Pyrene	<1
BenzylButylPhthalate	<1
Benzo(a)anthracene	<1
3,3'-Dichlorobenzidine	<10
Chrysene	<1
Bis(2-ethylhexyl)phthalate	3
Di-n-octyl Phthalate	<1
Benzo(b)fluoranthene	<1
Benzo(k)fluoranthene	<1
Benzo(a)pyrene	<1
Indeno(1,2,3-cd)pyrene	<1
Dibenzo(a,h)anthracene	<1
Benzo(ghi)perylene	<1

COLLECTED BY: Client DATE COL'D: 08/01/91 RECEIVED: 08/01/91

SAMPLE: Water sample, 1-3

ANALYTICAL PARAMETERS

Antimony as Sb	mg/L	<0.005
Arsenic as As	mg/L	<0.002
Beryllium as Be	mg/L	<0.001
Cadmium as Cd	mg/L	<0.001
Chromium as Cr	mg/L	<0.005
Copper as Cu	mg/L	<0.02
Lead as Pb	mg/L	<0.005
Mercury as Hg	mg/L	<0.00025
Nickel as Ni	mg/L	<0.10
Selenium as Se	mg/L	<0.002
Silver as Ag	mg/L	<0.001
Thallium as Tl	mg/L	<0.005
Zinc as Zn	mg/L	<0.02
Chloride as Cl	mg/L	3
Ammonia as N	mg/L	<0.05
Iron as Fe	mg/L	0.10
Hardness as CaCO ₃	mg/L	2.9
Alkalinity tot CaCO ₃	mg/L	6
Manganese as Mn	mg/L	<0.02
Sodium as Na	mg/L	2.9
Potassium as K	mg/L	<0.50
Calcium as Ca	mg/L	0.77
Tot Dissolved Solids	mg/L	13
Nitrate as N	mg/L	<0.5
Sulfate as SO ₄	mg/L	<5

ANALYTICAL PARAMETERS

Carbonate Alk CaCO ₃	mg/L	0
Tot. Kjeldahl N.	mg/L	0.4
Bicarb. Alk CaCO ₃	mg/L	6

APPENDIX B

**ANALYSIS OF INORGANIC DATA COLLECTED
AS PART OF THE BASELINE MONITORING ROUND
OLD BETHPAGE LANDFILL
GROUND-WATER REMEDIATION PROGRAM**

APPENDIX B

ANALYSIS OF INORGANIC DATA COLLECTED AS PART OF THE BASELINE MONITORING ROUND OLD BETHPAGE LANDFILL GROUND-WATER REMEDIATION PROGRAM

INTRODUCTION

The purpose of this appendix is to evaluate inorganic data (including unfiltered metal samples) collected during the July/August 1991 ground-water quality monitoring round (hereinafter referred to as the baseline monitoring round) conducted as part of the Old Bethpage Landfill Ground-Water Remediation Program. The purpose of this sampling round was to establish baseline water-quality conditions prior to start-up of the ground-water recovery/treatment system. Because the ground-water recovery system was primarily designed to capture the volatile organic compound portion of the landfill plume, the following discussion is limited to a comparison of inorganic data/plume dimensions previously reported by Geraghty & Miller, Inc. (1985 and 1986).

INORGANIC LANDFILL LEACHATE PLUME

As described by Geraghty & Miller (1986), the leachate (inorganic) portion of the landfill plume is a body of ground water that has been impacted by the dissolution of compounds derived from the decomposition of sanitary wastes placed in the landfill. The extent of the landfill leachate plume has previously been determined by delineating the area in which the following leachate indicators are present in site monitoring wells above background values: alkalinity, ammonia, chloride, hardness, iron, manganese, pH, potassium, specific conductance, and zinc. Leachate indicators detected in unfiltered samples from the baseline round (see Table 7) depict a similar distribution to that described by Geraghty & Miller (1986). Compared to September 1986 data, baseline data indicate a further downgradient horizontal and vertical migration of the leachate plume. This continued

downgradient migration is expected considering the 5-year period separating the two monitoring events.

Similar to that reported by Geraghty & Miller in the September 1986 report, baseline data indicate that the landfill leachate plume exhibits its greatest, approximate lateral extent in the middle zone (approximate elevation of the "B" wells) and its greatest, approximate thickness (approximately 200 feet) in Well Cluster 6. The highest levels of alkalinity, hardness, iron, manganese, pH, and specific conductance measured during the baseline round were found in Well Cluster 6. However, ammonia and potassium, previously detected at their highest concentrations in Well Cluster 6, were detected during the baseline round at their highest concentration in Well 9C located further downgradient than Well Cluster 6, indicating further downgradient migration of the landfill leachate plume.

OLD BETHPAGE LANDFILL," JUNE 1992**

**HYDRAULIC EVALUATION OF THE
GROUND-WATER REMEDIATION SYSTEM
OLD BETHPAGE LANDFILL
OLD BETHPAGE, NEW YORK**

INTRODUCTION

The Ground-Water Remediation System at the Old Bethpage Landfill became operational on April 1, 1992. As required by the site Remedial Action Plan (RAP), Geraghty & Miller, Inc. initiated monthly hydraulic monitoring approximately 30 days after system start-up. In this regard, two synoptic rounds of water-level measurements (April 30 and June 12, 1992) were collected during the first calendar quarter of system operation. The purpose of hydraulic monitoring is to: (1) delineate the mounding effects (if any) in the vicinity of the recharge basin, and (2) delineate the effective capture zones of the recovery system.

DATA REDUCTION AND ANALYSIS

Water-level data from the April and June rounds (attached) were converted to elevations (relative to mean sea level) and plotted for the water table, and shallow and deep potentiometric zones on the site base map. Water-level contour lines (lines of equal water-level elevation) were then drawn on each map. In addition, the approximate extent of the volatile organic compound (VOC) plume (drawn using the initial [baseline] ground-water quality monitoring data collected in July/August 1991) and limiting flow lines (depicting the effective capture zone of the system) were drawn on the shallow and deep potentiometric maps. Contour lines were dashed where the data points are less than optimum, and limiting flow lines drawn through these areas are approximate.

The water-table map was prepared to determine if mounding is occurring in the vicinity of the recharge basin. The shallow and deep potentiometric zones were selected for water-level mapping because collectively they incorporate the screened intervals of the

recovery wells and the vertical extent of the VOC plume. Shallow and deep potentiometric zone contour maps for the April 30, 1992 round are shown on Figures 1 and 3; contour maps for the June 12, 1992 round are show on Figures 2 and 4. Water-table contour maps for the April 30 and June 12, 1992 rounds are shown on Figures 5 and 6, respectively. In addition to the data discussed above, monthly pumpage records for the system and the individual recovery wells were also reviewed by Geraghty & Miller.

FINDINGS

1. Data presented on Figures 1 through 4 indicate that current system pumpage (approximate average of 1,040 to 1,000 gallons per minute [gpm]) is sufficient to create and maintain hydraulic control over the VOC plume (horizontal and vertical extent).
2. An approximate 1 foot overall decline in water-level elevation was observed between the April 30 and June 12, 1992 rounds. Additional monitoring is needed to determine if this decline is due to system pumpage, seasonal effects, or both.
3. Data presented on Figure 5 indicates a localized mounding of the water table immediately adjacent to the recovery/treatment system recharge basin. Mounding is not apparent in the June round (see Figure 6). This may be because usable data were not obtained for Wells M-29A and M-30B.

RECOMMENDATIONS

1. Continue monthly hydraulic monitoring for a minimum of 1 year to determine/evaluate mounding effects, seasonal effects on capture zones, and when the system has reached equilibrium.

2. Modification(s) to system pumpage are not recommended at this time. Recovery wells should continue to be pumped at their present rate.
