FINAL ENGINEERING REPORT

1.0 BACKGROUND AND SITE DESCRIPTION

SAA/EVI MC Family, LLC (SAA/EVI) entered into a Brownfield Cleanup Agreement (BCA) with the New York State Department of Environmental Conservation (NYSDEC) on November 2, 2020, to investigate and remediate a 2.72-acre property located 1100 Michigan Avenue in Erie County, Buffalo, New York (Site). The Site is identified as Parcel No.: 100.72-1-1-1.1 and (part of) 100.71-3-1.11 on the Erie County Tax Map. The parcel boundaries along with metes and bounds description are provided in **Appendix L** – BCA Amendment – Survey Corrections to Parcel Size.

.

The property was remediated to meet 6 New York Codes, Rules and Regulations (NYCRR) Part 375 Track 1 – Unrestricted Use. The proposed re-development of the site will create affordable housing units and approximately 5,000 sf of commercial space. There will also be commensurate parking for the residential units and commercial space.

An electronic copy of this Final Engineering Report (FER) with all supporting documentation is included as **Appendix A**.

2.0 SUMMARY OF SITE REMEDY

2.1 REMEDIAL ACTION OBJECTIVES

Based on the results of the Remedial Investigation, the following Remedial Action Objectives (RAOs) were identified for this site.

Groundwater

Human Health Protection RAOs:

- Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.

Environmental Protection RAOs:

- Restore groundwater aquifer to pre-disposal/pre-release conditions, to the extent practicable.

Soil

Public Health Protection RAOs:

- Prevent ingestion/direct contact with contaminated soil.

Environmental Protection RAOs

- Prevent migration of contaminants that would result in groundwater or surface water contamination.

Soil Vapor

Public Health Protection RAOs:

- Mitigate impacts to public health resulting from existing or potential soil vapor intrusion into Site buildings.

2.2 DESCRIPTION OF SELECTED REMEDY

The site was remediated in accordance with the remedy selected by the NYSDEC Decision Document dated May 2021.

The factors considered during the selection of the remedy are those listed in 6 NYCRR 375-1.8. The following are the components of the selected remedy:

Track 1 – Unrestricted Use remedy consisted of the following:

1. REMEDIAL DESIGN

A remedial design program was implemented to provide the details necessary for the construction, operation, maintenance, and monitoring of the remediation program. Green remediation principles and techniques were implemented to the extent feasible in the design, implementation, and site management of the remedy per Division of Environmental Remediation. The major green remediation components are as follows:

- Considering the environmental impacts of treatment technologies and remedy stewardship over the long term;
- Reducing direct and indirect greenhouse gas and other emissions;
- Increasing energy efficiency and minimizing use of non-renewable energy;
- Conserving and efficiently managing resources and materials;
- Reducing waste, increasing recycling, and increasing reuse of materials which would otherwise be considered a waste;
- Maximizing habitat value and creating habitat when possible;
- Fostering green and healthy communities and working landscapes which balance ecological, economic, and social goals; and
- Integrating the remedy with the end use where possible and encouraging green and sustainable re-development.

2. EXCAVATION

Excavation and off-site disposal of all on-site soils which exceeded unrestricted soil cleanup objectives (SCOs), as defined by 6 NYCRR Part 375-6.8. Excavation included: removal

of impacted soils from all building exterior areas; all building floor slabs and impacted soil below slabs. Since the Track 1 cleanup has been achieved, a Cover System was not a required element of the remedy.

3. BACKFILL

Clean fill meeting the requirements of 6 NYCRR Part 375-6.7(d) was brought onto the site to complete backfilling of the excavation in accordance with new development requirements.

4. VAPOR INTRUSION EVALUATION

No VOCs exceeding Unrestricted SCOs were identified in any RI soil boring soil samples across the entire site, including the historic gas station location at the northeast corner of the site, except for a slight exceedance of the VOC acetone, a common lab contaminant, in one sample. During the removal of four abandoned USTs (refer to Section 4.3.3) from the historic gas station location the highest PID VOC reading was 176 ppm during excavation and after offsite removal of the USTs, their contents and impacted soil around the USTs, PID readings were 0.0 ppm. After the removal of all impacted soil confirmation soil samples collected from the bottom and sidewalls confirmed no remaining soil exceeded Unrestricted SCOs (refer to **Figure R3** and Section 4.5).

Monitoring well MW-2 installed during the RI program in the historic gas station location at the northeast corner of the site (refer to **Figure 5**) indicated the presence of elevated petroleum related VOC compounds in the groundwater sample that exceeded TOGS1.1.1. - New York State Ambient Water Quality Standards and Guidance Values (TOGS). No other monitoring wells installed across the site indicated the presence of any VOCs exceeding TOGS guidance values in samples. Upon completion of the removal of the USTs and impacted soil from the area a total of Four monitoring wells (REM-1 to 4) were also installed as part of the remediation to assess if impacted groundwater remained and was leaving the site. Two wells were installed along the north and two along east property perimeters at the Historic gas station location (refer to **Figure R3** and **Section 4.4**). Analysis of groundwater samples from the four wells indicated no VOC exceedances of TOGS Guidance Values (refer to **Table R4**).

Based on the above evaluations vapor intrusion has been eliminated as a concern for new buildings constructed on the site.

3.0 INTERIM REMEDIAL MEASURES, OPERABLE UNITS, AND REMEDIAL CONTRACTS

The remedy for this site was performed as a single project, and no interim remedial measures, operable units or separate construction contracts were performed.

4.0 DESCRIPTION OF REMEDIAL ACTIONS PERFORMED

Remedial activities completed at the Site were conducted in accordance with the NYSDEC-approved Remedial Action Work Plan (RAWP) for the Former Pilgrim Family Apartments (May 2021). All deviations from the RAWP are noted below.

4.1 GOVERNING DOCUMENTS

4.1.1 Site Specific Health & Safety Plan (HASP)

All remedial work performed under this Remedial Action was in full compliance with governmental requirements, including Site and worker safety requirements mandated by Federal Occupational Safety and Health Administration (OSHA).

The Health and Safety Plan (HASP) provided in Appendix A of the RAWP was complied with for all remedial and invasive work performed at the Site.

4.1.2 Quality Assurance Project Plan (QAPP)

The Quality Assurance Project Plan (QAPP) was included as Appendix B of the RAWP approved by the NYSDEC. The QAPP describes the specific policies, objectives, organization, functional activities, and quality assurance/quality control (QA/QC) activities designed to achieve the project data quality objective.

4.1.3 Stormwater Pollution Prevention Plan (SWPPP)

The erosion and sediment controls for all remedial construction were performed in conformance with requirements presented in the New York State Guidelines for Urban Erosion and Sediment Control and the requirements of the Stormwater Pollution Prevention Plan (SWPPP) (January 2021) which was included as Appendix H in the RAWP.

4.1.4 Community Air Monitoring Plan (CAMP)

The purpose of air monitoring for potential airborne contaminants is to verify that protection levels are suitable. Monitoring was performed for dust/particulates and volatile organic compounds (VOCs) during excavation activities. Daily background and calibration readings were recorded prior to the start of field activities. All monitoring equipment used during this

investigation was maintained and calibrated with records of calibration and maintenance kept in accordance with 29 Code of Federal Regulations (CFR) 1910.120(b)4(11)e. All CAMP results are provided in **Appendix C**. **Table R6** provides a tabularization of air monitoring conditions and responses from the Daily Field Reports when monitoring was not conducted.

Particulate Monitoring

Real-time air monitoring readings were obtained from upwind and downwind locations in accordance with DER-10 for community air-monitoring. Daily field reports were completed that document activities performed, equipment and manpower onsite, screening and monitoring results, general Site conditions, and weather conditions (refer to **Appendix C**). **Table R6** provides a tabularization of air monitoring conditions and responses from the Daily Field Reports when monitoring was not conducted.

Air Monitoring for Worker Protection

Real-time air monitoring was conducted whenever Site soils were disturbed during sampling, excavation, grading, etc. A real-time personal aerosol monitor (i.e., TSI Side-Pak AM5 10 Personal Aerosol monitor or equivalent) was used. This monitor is a laser photometer that measures data as both real-time aerosol mass-concentration and 8-hour time weighted average (TWA). The monitor was used to measure real-time concentrations in milligrams per meter cubed (mg/m^3). Action levels were based on potential exposure to calcium carbonate and were as follows:

- 15 mg/m^3 total dust
- 5 mg/m^3 respirable fraction for nuisance dusts

Dust suppression techniques were employed prior to exceeding the action levels. However, if these levels were exceeded, then work was halted, and additional dust suppression techniques were employed until safe levels were reached.

Total VOC Monitoring

Monitoring of VOCs was conducted using a photo-ionization detector (PID). If a sustained reading of 5 parts per million (ppm) above background occurs, then work would be

halted, and personnel would evacuate the work area. Sustained action levels did not occur on this project that required work to be halted.

4.1.5 Contractors Site Operations Plans

The Remediation Engineer reviewed all plans and submittals for this remedial project (i.e., those listed above plus contractor and subcontractor submittals) and confirmed that they were in compliance with the RAWP. All remedial documents were submitted to NYSDEC and New York State Department of Health (NYSDOH) in a timely manner and prior to the start of work.

4.1.6 Community Participation Plan (CPP)

All aspects of the Community Participation Plan (CPP) presented in the RAWP Appendix D were adhered to for this project.

4.2 REMEDIAL PROGRAM ELEMENTS

- General Remedial Contractor – Kulback's, Inc.
- Economy Tree Service – Tree Removal
- Empire Building Diagnostics – Building Demolition
- SJB – Monitoring Well Installation/Decommissioning
- ENSOL – UST Removals
- B. PARISO – Trucking
- Buffalo Well Drilling – Monitoring well Installation
- Environmental Service Group – Removal/Disposal of UST Contents

4.2.2 Site Preparation

- Mobilization – January 2022
- Erosion, sedimentation controls and perimeter fencing – January 2022
- Utility marker layout – layout conducted during the Remedial Investigation (RI).

4.2.3 General Site Controls

- Site security – The entire site was enclosed with security fencing.
- Job site record keeping – As per the RAWP, BE3's site inspector monitored all remediation activities, completed daily inspection reports and collected air monitoring data.
- Erosion and sedimentation controls – Compost filter sox rolls, and filter fabric were installed around site perimeter and work areas.
- Stockpile methods – Imported clean fill and stone were periodically stockpiled on site by dump truck unloading on cleared area. Soils excavated from the site were either directly loaded into trucks or soil moved within the excavation area using a bulldozer to a stockpile location where an excavator would later load trucks.
- No dewatering of excavations was required during remediation.

4.2.4 Nuisance controls

- Truck wash not required. Sweepers and hose water were used to control tracking of soil off-site when required.
- Dust control – Dust control was not an issue during winter and spring work, however, there were some dust issues during summer excavation work. The days that there were exceedances or monitoring equipment problems with responses are provided in **Table R6**.
- Odor control – No odor concern.
- Truck routing – No truck routing problems.
- Responding to complaints – No formal public complaints received.

4.2.5 CAMP results

VOC and particulate monitoring equipment were utilized as called for in the RAWP CAMP.

Fugitive dust migration was visually assessed by BE3's field inspector during all work

activities. There were occasions when the downwind PM-10 particulate level of the downwind units greater than 100 micrograms per cubic meter ($\mu g/m^3$) than background (upwind perimeter) for a 15-minute period. A water truck and sweeping were used during the summer months to reduce dust concerns. See **Table R6** for days with air monitoring conditions and responses.

VOC monitoring was undertaken through the remediation utilizing a handheld PID at the remediation work face and a downwind tripod mounted PID. Minor exceedances of VOC requirements occurred at the working face on a few occasions but quickly dissipated upon further excavation.

Copies of all field data sheets relating to the CAMP are provided with each of the Daily Field Reports in **Appendix C**.

4.2.6 Reporting

All daily field reports and progress photos taken during remediation activities are included in **Appendix C.** Daily field reports were completed at the end of each day or the following day by the site inspector and submitted to the Certifying Engineer for review and approval and then forwarded to the NYSDEC and NYSDOH project managers.

4.3 CONTAMINATED MATERIALS REMOVAL

It should be noted that excavation for new development (buildings, buried utilities to buildings, roadways/parking, etc.) took place concurrently with remediation activities. In many cases the removal of areas of impacted material coincided with removal requirements for new development. All material excavated was either stockpiled per the RAWP and NYDEC requirements prior to transport or transported directly to an approved disposal facility.

A Track 1 – Unrestricted Use cleanup was implemented based on the site-specific intended land use.

4.3.1 Building Foundation/Floor Slab Excavation/Pavement

A total of three buildings as shown on RAWP **Figure 7** were demolished and floor slabs/foundations removed along with asphalt paved areas. After examination, the concrete and asphalt materials were designated as C & D and sent to Swift River for disposal/recycling. The total amount of concrete/asphalt material sent for recycling to Swift River Concrete/asphalt Recyclers was 1860 tons. NYSDEC registration and documentation to accept Pilgrim Family site concrete and asphalt pavement for recycling along with a spreadsheet of daily shipments of concrete/asphalt to Swift River are provided in **Appendix E**.

4.3.2 Contaminated Soil Removal

Prior to excavation, soil samples were collected from areas across the site for analysis as requested by the Tonawanda Landfill to determine acceptability of impacted soil for disposal at their facility and to meet closure pursuant to its Consent Order with NYSDEC. A total of 36 samples were collected and analyzed per the landfill requirements and based on these results impacted soils from the site were accepted at the landfills. The laboratory results for the 36 samples were collected and analyzed per the landfill requirements as follows:

Method/Test	Description
1010A	Ignitability
1311	TCLP Extraction
1311	ZHE TCLP Extraction
6010C	TCLP Metals
7470A	TCLP Mercury
8015D	DRO
8015D	GRO
8081B	TCLP Pesticides
8082A	TCL PCBs
8151	TCLP Herbicides
8260C	TCLP Volatiles
8270D	TCLP Semi-volatiles
9012	Cyanide, Reactive
9034	Sulfide, Reactive
9045C	pH

Based on the results from these analyses impacted soils from the site were accepted at the landfills. The laboratory results for the 36 samples are provided in **Appendix E** along with a layout site plan showing where the samples were collected.

All open areas across the site were cleared and grubbed including existing asphalt/concrete surface areas, as necessary. The RI and previous investigations indicated that fill soils covered most of the open areas across the site (approximately 4 to 6 feet in depth) and were impacted with concentrations of primarily PAH/metal compounds and a few pesticides that exceeded Unrestricted SCOs (refer to **RI/AAR Tables 1 through 5 and Figures 1 through 9**). Impacted soils were removed until confirmation sampling indicated Unrestricted Use SCOs were achieved. **Figure R1** provides the location and depth confirmation samples were collected below existing grades (prior to remediation).

Confirmation samples were collected from sidewalls and bottom of the excavation to confirm all impacted material was removed that exceeded Unrestricted Use SCOs. One bottom confirmation sample did not meet the Unrestricted SCO for the metal compound nickel but was approved by the NYSDEC and soil allowed to remain in-place due to the nature of the contaminant (Nickel) and the relatively small magnitude of the exceedance (0.5 ppm above SCO). Section 4.5 discusses confirmation sample exceedances.

Petroleum impacted soil from around and beneath four uncovered abandoned USTs (see **Section 4.3.3**) in the historic gas station area were removed until confirmation sampling indicated Unrestricted Use SCOs were achieved (see **Figure R3**). Section 4.5 discusses confirmation sampling in the UST area.

The total amount of impacted soil material sent for disposal to the Tonawanda landfill was **31,693.76** tons. Summary totals of all soil disposed at the landfill, along with the NYSDEC landfill acceptance letter and permits, are provided in **Appendix E**.

4.3.3 Removal of Abandoned USTs

Between March 4 and March 10, 2022, the closure of four abandoned USTs uncovered in

the vicinity of the historic gas station location was undertaken in accordance with DER-10-Section 5.5. Two of the UST were removed from the same excavation, and they were each 1000 +/- gallon steel tanks filled with flowable fill and no liquid. The third and fourth USTs included a 250+/- gallon steel tank and a 1000+/- gallon steel tank each removed from a separate excavation (see **Figure R3**). Both the third and fourth USTs contained petroleum related liquid product which was removed from the tanks by the Environmental Service Group. Inc (ESG) using a vacuum truck. All four tanks were removed from their excavations, cleaned and certified clean by ESG. A total of **1635 gallons** of petroleum related product and impacted water was transported by ESG to the American Recyclers Company (ARC) in Tonawanda New York for recycling. Once the waste comes into ARC they take ownership of the waste according to ARC. This material is placed into their bulk gasoline tank with other gasoline generators. They then manifest the material out of ARC in bulk batches (ARC is the generator) to Environmental Specialist Inc. in Youngstown, OH for Recycle.

The steel tanks were crushed on site after cleaning and sent to Niagara Metals as scrap steel. Empty Tank Certifications, manifests and NYSDEC Pre-Work Notification for Tank Closure are provided in **Appendix G.**

The petroleum bulk storage (PBS) registration form showing the closure of the tanks is provided in **Appendix G** and has been submitted by email to the Department's PBS staff.

4.3.4 Removal of Existing Transformers

National Grid removed ten pad-mounted transformers from locations throughout the Pilgrim Village property. Of the total, four transformers were removed from the Pilgrim Family site. Transformers contained mineral oil dielectric fluid. The equipment was transported by National Grid to National Grid's Buffalo transformer shop, cataloged, inspected, and shipped for off-site recycling as surplus electrical equipment in accordance with National Grid environmental procedures. The transformers were inspected and documented to be intact and non-leaking by National Grid's lead Environmental Engineer.

A letter from National Grid's lead Environmental Engineer attesting to the above is provided in **Appendix F.**

4.4 NEW AND DECOMMISSIONED MONITORING WELLS

Upon completion of the removal of the USTs and impacted soil from the historic gas station area a total of Four monitoring wells (REM-1 to 4) were installed as part of the remediation to assess if impacted groundwater remained and was leaving the site. Two wells were installed along the north and two along east property perimeters at the Historic gas station location (refer to **Figure R3**). These monitoring wells were constructed in the same manner as the RI monitoring wells, including MW-2, using a truck mounted drill rig. All monitoring wells were constructed of 2-inch nominal inside diameter (ID) schedule polyvinyl chloride (PVC) pipe with threaded connections. The lower sections of the wells were constructed of 10-foot PVC well screen with 0.010-inch slots. Groundwater elevations of the four new wells and MW2 are provided in **Table R5** and well location coordinates are provided in **Table R7.**

Analysis of groundwater samples from the four wells indicated no VOC exceedances of TOGS Guidance Values (refer to **Table R4**). Based on these results, the removal of the abandoned USTs and impacted soil from this area reduced/eliminated the VOC impacts to the groundwater in this area and, therefore, groundwater treatment was not required.

For the decommission of monitoring wells removed from service for the new development, the grouting in-place method was used. The process followed, as outlined in CP-43, sealing the borehole and any remaining part of the monitoring well left in the ground with grout to prevent contaminants from entering the groundwater.

4.5 REMEDIAL PERFORMANCE/DOCUMENTATION SAMPLING

Impacted soil material exceeding Track 1 – Unrestricted Use SCOs was removed from areas as discussed in **Section 4.3.2**. Confirmation soil samples were collected from bottom and sidewalls of excavation areas to confirm all impacted material was removed. The sample locations were located by a field GPS (cell phone latitude-longitude using the North American Datum 1983) so that the approximate locations are documented (see **Figure R7**). All bottom soil confirmation samples were analyzed for TCL VOCs, TCL SVOCs and arsenic, barium, lead, total mercury, and zinc. In addition, 29 percent of the bottom samples were analyzed for TAL metals, TCL PCBs, and TCL pesticides. The results were compared to 6 NYCRR Part 375 Unrestricted

SCOs. All sidewall confirmation samples were collected from beyond the north, east and south boundary lines and, per agreement with NYSDEC, (see April 1, 2022, J. Walia email confirmation in **Appendix K**) only two samples were collected from each wall since most likely offsite soil is impacted urban fill. The samples were analyzed for the same parameters as the bottom samples including expanded list (TAL metals, TCL PCBs, and TCL pesticides). The reasoning for the reduced sampling was that offsite soil is likely impacted urban fill. **Table R2** provides the side-wall sample compound results that indicated the following exceedances:

SWNW-1 – Chromium 31.9 ppm vs SCO 30.0 ppm & Nickel 33.3 ppm vs SCO 30.0 ppm;

SWNW-2 - Chromium 33.9 ppm vs SCO 30.0 ppm & Nickel 38.6 ppm vs SCO 30.0 ppm;

SWSW-1 - Lead 238 ppm vs SCO 63 ppm, Zinc 146 ppm vs SCO 109 ppm, Mercury 0.41 ppm vs SCO 0.18 ppm & 4,4-DDT 0.0057 vs SCO 0.0033 ppm; and

SWSW-2 - Lead 356 ppm vs SCO 63 ppm, Zinc 173 ppm vs SCO 109 ppm, Mercury 0.63 ppm vs SCO 0.18 ppm & 4,4-DDT 0.0076 vs SCO 0.0033 ppm.

One bottom sample location (sample B7) did not meet the Unrestricted SCO for the metal compound nickel but was approved by the NYSDEC to remain in-place due to the nature of the contaminant and the relatively small magnitude of the exceedance. The concentration of nickel in sample B7 was 30.5 ppm versus with an Unrestricted Use SCO of 30 ppm or an overall exceedance of 0.5 ppm. The sample depth was at 7 feet bgs (see **Appendix K** for NYSDEC approval email).

There is a 16-inch buried gas line that runs the entire length of the western property line. To assess if the existing soil/stone material beneath the pipeline met Unrestricted SCOs, three samples (B-14A, B-29 and B-55) were collected from beneath the pipeline at various distances along its length (see **Appendix K** for NYSDEC approval on samples and locations). The analytical results from these three samples met Unrestricted SCOs.

The confirmation soil sample locations are shown on **Figures R1** (bottom)**, R2** (Sidewalls) and **R3** (UST area). Confirmation sample analytical summary results are provided on **Tables R1** (bottom)**, R2** (Sidewalls) and **R3** (UST area). All data was validated, and Data Usability Summary Reports (DUSRs) prepared by EDU Environmental Data Usability of Dansville, New York. All DUSRs and analytical lab data are provided in **Appendix J.** Coordinates for all samples are provided on **Table R7.**

4.6 IMPORTED BACKFILL

Imported backfill with quantities from each source are shown below.

- LaFarge-Holcim – Stone fill – 44,295.15 tons
- County Line – Stone fill – 513.56 Tons

Other sources of imported fill were assessed and material analyzed and submitted to NYSDEC for approval, including 4543 Walden and 293 Cemetery Road sites, but only the above sources were actually used.

NYSDEC Request to Import or Reuse Fill/Soil/stone Forms were provided per DER-10 Section 5.4(e) for each of the backfill providers listed above and are provided in **Appendix B.** Per NYSDEC (See 2/22/22 email in **Appendix K**) **,** every time the source of import material changes, a new form is required, therefore, one re-use form was provided to cover all of the stone sizes provided by LaFarge's single source.

Site locations where backfill was used at the site are shown on **Figure 9**

4.7 CONTAMINATION REMAINING AT THE SITE

All impacted soils were removed from the site through the remediation that exceeded Unrestricted Use SCOs. VOCs exceeding TOGs in the groundwater in the historic gas station area were removed by the excavation and offsite disposal of impacted soils and abandoned USTs in the gas station area.

4.8 SOIL COVER SYSTEM

All excavations were backfilled to meet new development requirements. The remedy required no specific soil cover or cap system.

4.9 OTHER ENGINEERING CONTROLS

The remedy for the site did not require the construction of any other engineering control (EC) systems.

4.10 INSTITUTIONAL CONTROLS

The site remedy did not require that an environmental easement (EE) or deed restriction be placed on the property.

4.11 DEVIATIONS FROM THE REMEDIAL ACTION WORK PLAN

Groundwater treatment of VOC impacted groundwater in the historic gas station location was not required due to the removal of the abandoned USTs and impacted soil that exceeded Unrestricted Use SCOs from this area and verified by groundwater sample results from the four perimeter monitoring wells indicating no VOC exceedances of TOGs guidance values.

All sidewall confirmation samples were collected from beyond the north, east and south boundary lines and, per agreement with NYSDEC, (see April 1, 2022, J. Walia email confirmation in **Appendix K**) only two samples were collected from each wall since most likely offsite soil is impacted urban fill.

Date:	Friday, April 15, 2022
Site Name:	Pilgrim Village - Family Site (915362)
Location:	1100 Michigan Ave., Buffalo
Contractor-Subcontrators:	Kulbacks
Weather Conditions:	Cloudy/PM Rain 41 Deg F Wind: S 9mph

Description of Work Performed:

Importing stone from Lafarge.

Concrete crew is forming and pouring walls for new building.

Increasing winds have caused dust clouds that have exceeded the threshlold for the CAMP at 10:20, 10:40 and 12:00pm. The dust is being caused by the trucks on the haul road. We spoke to the contractor about getting a water truck on-site to control the dust. Also instructed truck drivers to slow down to reduce dust clouds. Rain this afternoon will allow the contractor to sweep the haul road which will also help.

DEC Inspector Ben McPherson stopped at the site at 9:00am.

DAILY FIELD REPORT

Date:	Tuesday, May 10, 2022
Site Name:	Pilgrim Village-Family Site (915362)
Location:	1100 Michigan Ave., Buffalo
Contractor-Subcontrators:	Kulbacks
Weather Conditions:	Partly Cloudy 55 Deg F Wind: SE 7mph

Description of Work Performed:

Hauling contaminated material to Tonawanda Landfill.

Crew placing and compacting stone from stockpile around the foundations and raising the grade at the eastern property line.

Shifting winds today have caused significant dust on the site. At 9:30am we received an exceedance alert from the downwind monitor. The dust is coming from the haul road which is a mix fines from the clean imported stone which has been used to build the haul road, dirt from the clean imported soil and the contaminated on-site material. We instructed the trucks to slow down to try and mitigate the dust. This worked for a while, but the winds continued to increase so did the dust. The contractor did not have a water truck on site or anyway to control the dust. At 12:20pm, we shut down the trucks which almost completely stopped the dust.

(Use attached sheet for additional work description)

Problems/Observations Noted:

Health and Safety Monitoring:
Excessive dust. Shut down hauling at 12:30pm.

Dear Mr. Morreale:

Town of Tonawanda Landfill, #15S29
Alternate Grading Material (AGM) Request
Pilgrim Village Phase-1 Family
Waste Approval #22-3344-09T

This is in response to your letter dated January 21, 2022, requesting approval to accept non-hazardous soil generated at the above referenced site located at 1100 Michigan Avenue in Buffalo, New York. The material is proposed for use as AGM at the Town of Tonawanda landfill, and you have estimated that 35,000 tons will be delivered under this profile. This approval expires on July 1, 2023.

Your letter provided analytical data for the material to be removed from this site. I have reviewed the information provided in your letter and the Department hereby approves this material to be accepted at the Town of Tonawanda landfill for use as alternate grading material. Placement and handling of the material must be in accordance with the Operations and Maintenance Manual, revised May 2001, prepared by EnSol, Inc.

Additionally, the Department's approval for the use of the above referenced material as AGM at the Town of Tonawanda landfill does not relieve the Town from having to comply with any other applicable local, state and/or federal requirements.

If you have any questions regarding this matter, please call me at 851-7220.

Sincerely,

Method 8081B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 480-610766, 480-610864 and 480-610864 and analytical batch 480-610920 recovered outside control limits for the following analytes: gamma-BHC (Lindane), Heptachlor and Heptachlor epoxide. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8081B: The laboratory control sample duplicate (LCSD) for preparation batch 480-610905 and 480-611078 and analytical batch 480-611164 recovered outside control limits for the following analytes: Heptachlor epoxide. These analytes were biased high in the LCSD and were not detected in the associated samples; therefore, the data have been reported.

Method 8081B: Surrogate recovery for the following samples were outside the upper control limit: PF25 (480-193838-25), PF26 (480-193838-26), PF27 (480-193838-27), PF29 (480-193838-29), PF31 (480-193838-31), PF32 (480-193838-32), PF33 (480-193838-33), PF34 (480-193838-34), PF35 (480-193838-35), PF36 (480-193838-36) and (LB 480-610936/1-E). This sample did not contain any target analytes; therefore, re-extraction and/or re-analysis was not performed.

Method 8081B: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 480-610936 and 480-611409 and analytical batch 480-611440 recovered outside control limits for the following analytes: Heptachlor epoxide. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8082A: The following samples are associated with a continuing calibration verification (CCV 480-610755/55) that had recoveries for the surrogate Decachlorobiphenyl that were above acceptance limits: PF4 (480-193838-4), PF5 (480-193838-5), PF6 (480-193838-6), PF7 (480-193838-7), PF8 (480-193838-8), PF9 (480-193838-9), PF10 (480-193838-10) and PF11 (480-193838-11). The secondary surrogate Tetrachloro-m-xylene is within limits. Therefore, the data has been reported.

Method 8151A: Surrogate recovery for the following samples were outside control limits: PF1 (480-193838-1), PF2 (480-193838-2), PF3 (480-193838-3), PF4 (480-193838-4), PF5 (480-193838-5) and (LB 480-610766/1-F). This is routine for TCLP herbicides, due to the pH effects created during the leaching process, inhibiting the herbicide derivatization of the free acid components.

Method 8151A: The laboratory control sample duplicate (LCSD) for preparation batch 480-610943 and analytical batch 480-611060 recovered outside control limits for the following analytes: 2,4-Dichlorophenylacetic acid. This is most likely due to the surrogate accidentally being added twice; therefore, the data have been reported.

Method 8151A: Surrogate recovery for the following samples were outside control limits: PF6 (480-193838-6), PF7 (480-193838-7), PF8 (480-193838-8), PF9 (480-193838-9), PF10 (480-193838-10), PF11 (480-193838-11), PF12 (480-193838-12), PF13 (480-193838-13), PF14 (480-193838-14), PF15 (480-193838-15), PF16 (480-193838-16), PF17 (480-193838-17), PF18 (480-193838-18), PF19 (480-193838-19), PF20 (480-193838-20), PF21 (480-193838-21), PF22 (480-193838-22) and (LB 480-610905/1-D). TRANSFORMER REMOVAL DATA

BRYDGES ENGINEERING
IN ENVIRONMENT AND ENERGY, DPC

From: Montesano, Lisa
To: Jason Brydges; Marty Cerny
Cc: Mike McCowan
Subject: Pilgrim Village - National Grid Retired Equipment
Date: Monday, March 14, 2022 11:13:18 AM

CAUTION: This email originated from outside of the organization.

Good morning. National Grid removed ten pad-mounted transformers and two electrical junction boxes from locations throughout the Pilgrim Village site in Buffalo, NY. Transformers contain mineral oil dielectric fluid; and junction boxes do not contain mineral oil dielectric fluid. The equipment was transported to National Grid's Buffalo transformer shop, cataloged, inspected, and shipped for off-site recycling as surplus electrical equipment in accordance with our environmental procedures. The transformers were inspected and documented to be intact and non-leaking.

I trust this information satisfies your needs. If you should have additional questions, please contact me.

Thank you, Lisa

EMPTY TANK CERTIFICATION

I hereby certify that this tank is "empty" as that term is defined in the national Environmental Protection Agency regulations, 40 CFR 261.7*, and that they have been properly prepared for transportation under the regulations of the U.S. Department of Transportation, 49 CFR 173.29**.

*With regard to most regulated residues, EPA's 40 CFR 261.7 says:

"A container ....is empty if:

(i) All wastes have been removed that can be removed using the practices commonly employed to remove materials from that type of container, e.g., pouring, pumping and aspirating, and

(ii) No more than 2.5 centimeters (1 inch) of residue remain on the bottom of the container...."

EPA has explained this rule, saying that "one inch of waste material is an overriding constraint and may remain in an empty container only if it cannot be removed by normal means. The rationale for this provision is that there are certain tars and other extremely viscous materials that will remain in the container even after the container is emptied by normal means.

For residues of products specifically listed by name in 40 CFR 261.33 (e), EPA says the container is empty only "if the container...has been tripled rinsed using a solvent capable of removing" the product, or has been cleaned by another method shown to achieve equivalent removal.

**DOT's 49 CFR 173.29 says that all openings on the empty container must be closed, and that all markings and labels must be in place as if the tank was full of its original contents. A DOT shipping paper is not required for transportation of a tank for reconditioning via contract or private motor carrier. DOT placarding is not required for vehicles carrying empty containers.

(ii) No more than 2.5 centimeters (1 inch) of residue remain on the bottom of the container...."

EPA has explained this rule, saying that "one inch of waste material is an overriding constraint and may remain in an empty container only if it cannot be removed by normal means. The rationale for this provision is that there are certain tars and other extremely viscous materials that will remain in the container even after the container is emptied by normal means.

For residues of products specifically listed by name in 40 CFR 261.33 (e), EPA says the container is empty only "if the container...has been tripled rinsed using a solvent capable of removing" the product, or has been cleaned by another method shown to achieve equivalent removal.

**DOT's 49 CFR 173.29 says that all openings on the empty container must be closed, and that all markings and labels must be in place as if the tank was full of its original contents. A DOT shipping paper is not required for transportation of a tank for reconditioning via contract or private motor carrier. DOT placarding is not required for vehicles carrying empty containers.

Hi Jason,

For the side wall confirmatory sampling, your proposal as presented in your email

1. [Sidewall remediation confirmatory samples – we are going to follow the sample number from the RAWP if we excavate to the property line; however, if we excavate PAST the property line we can significantly reduce the sample quantity (e.g., 2 or 3 for east and north walls each). Reasoning is that we know offsite soil is likely impacted urban backfill.]

is acceptable.

For the Tanks Removal and Spill Documentation, please follow Francine's guidance.

Thanks,

Jaspal

Hi Jaspal.

Talked with Libby and I know she had a conversation with you. Just wanted to get confirmation in writing.

1. Sidewall remediation confirmatory samples – we are going to follow the sample number from the RAWP if we excavate to the property line; however, if we excavate PAST the property line

we can significantly reduce the sample quantity (e.g., 2 or 3 for east and north walls each). Reasoning is that we know offsite soil is likely impacted urban backfill.

2. Tank yank confirmatory samples – there were 4 tanks found on site. Two tanks were in same excavation, and therefore there were only 3 excavations total. The excavation that housed the small oil tank was 'consumed' by remedial activities except for 1 sidewall. Since this remaining wall borders the property line, please confirm that we can 'count' this sample as a sidewall remediation confirmatory sample. Reasoning is that this sample is likely not going to pass CP-51 due to impacted urban fill offsite. Other 2 excavations have no issues and will be sampled with typical protocol (i.e., 1 bottom and 4 sidewalls).
3. Spill documentation – since this is a BCP site, please confirm that our daily reporting that includes photos and text, and the sample confirmation data listed above will be sufficient to "close out" these tank yanks/spills. If so, then this documentation will be presented in the FER.

Libby/John, let me know if I missed anything.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

GC/MS Semi VOA

Qualifier	Qualifier Description

J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Receipt
The samples were received on 7/7/2022 4:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.2º C.

GC/MS VOA
Method 8260C: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for analytical batch 480-632921 recovered outside control limits for the following analyte(s): 4-Methyl-2-pentanone (MIBK). 4-Methyl-2-pentanone (MIBK) has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. The associated samples are impacted: REM-2 (480-199605-1), REM-22 (480-199605-2), REM-3 (480-199605-3) and TRIP BLANK (480-199605-4).

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-632921 recovered above the upper control limit for Trichlorofluoromethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: REM-2 (480-199605-1), REM-22 (480-199605-2), REM-3 (480-199605-3) and TRIP BLANK (480-199605-4).

Method 8260C: The following sample(s) was collected in a properly preserved vial; however, the pH was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: REM-3 (480-199605-3). pH is 7.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 480-633068 and analytical batch 480-633204 recovered outside control limits for multiple analytes.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010C: The recovery of post spike, (480-199605-A-2-A PDS), associated with batch 480-633242, exhibited results outside quality control limits for Total Sodium and Antimony. However, the serial dilution (SD) of this sample was compliant, therefore no corrective action was necessary.

Methods 245.1, 7470A: Due to interference with the sample matrix, the standard mercury preparation procedure was inadequate for the following samples(s): REM-3 (480-199605-3). This was demonstrated when the potassium permanganate reagent was added and the characteristic purple color faded rapidly. This loss of color indicates oxidizing conditions were not maintained. The sample(s) was prepared and analyzed at a 1/2 dilution, which maintained the purple color during digestion.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
Method 3510C: During pH adjustment, the following samples required 5 mL of base to reach the desired pH: REM-2 (480-199605-1) and REM-22 (480-199605-2). Most samples take less than 2 mL to reach the desired range.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

No additional comments.

Receipt
The samples were received on 9/20/2022 2:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.6º C.

GC/MS VOA
Method 8260C: The laboratory control sample and/or the laboratory control sample duplicate (LCS/LCSD) for analytical batch 480-642412 recovered outside control limits for the following analyte(s): Chloroethane. Chloroethane has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed. These results have been reported and qualified. The associated sample is impacted: MW-R1 (480-201789-1).

Method 8260C: The following volatiles sample was diluted due to foaming at the time of purging during the original sample analysis: MW-R1 (480-201789-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
Method 8270D: The laboratory control sample (LCS) for preparation batch 480-642157 and analytical batch 480-642346 recovered outside control limits for the following analytes: 4-Nitroaniline and Carbazole. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GENERAL NOTES:

- COORDINATE ALL SYSTEM REQUIREMENTS AND SPECIFICATIONS WITH "BUILDING RADON OUT" DESIGN HANDBOOK.
- FOR SLAB AREAS LESS THAN 2,000 SQFT USE 3" DIAMETER PIPE AND FOR SLABS BETWEEN 2,000 AND 4,000 SQFT USE 4" DIAMETER PIPE. ALL PIPES NEED TO BE A MIN. 12" FROM THE INSIDE OF THE EXTERIOR PERIMETER FOUNDATION WALL WITH A MINIMUM 1" COVER AND BE PROVIDED WITH GEOTEXTILE CLOTH.
- ALL UNDERSLAB PIPING TO BE FLEXIBLE PERFORATED CORRUGATED.
- USE ONLY 45 DEGREE ELBOWS FOR HORIZONTAL CHANGES IN THE VENT PIPE.
- PROVIDE MIN 4" LAYER OF COMPACTED, CLEAN, COARSE GRAVEL (1/2" - 3/4" IN SIZE) UNDER SLAB, AS A GAS PERMEABLE LAYER. USE OF A SMALLER DIAMETER STONE WILL RESTRICT AIR MOVEMENT UNDER THE SLAB.
- PROVIDE A MINIMUM 6-MIL (OR 3-MIL CROSS LAMINATED) POLYETHYLENE SHEATHING OR EQUIVALENT FLEXIBLE SHEETING MATERIAL ON TOP OF GAS-PERMEABLE LAYER. SEPARATE SECTIONS SHOULD BE OVERLAPPED A MINIMUM OF 12".
- RADON VENT DISCHARGE LOCATION SHALL BE A MIN. OF 12" ABOVE THE SURFACE OF THE ROOF AND A MIN. 10'-0" AWAY FROM ANY WINDOWS OR OTHER OPENINGS.
- ALL SLAB PENETRATIONS TO BE SEALED WITH A POLYURETHANE CAULK.
- ALL EXPOSED PORTIONS OF THE RADON VENT SYSTEM SHALL BE LABELED DURING CONSTRUCTION IN A CONSPICUOUS LOCATION ON EACH FLOOR LEVEL SO AS TO NOT CONFUSE THEM WITH THE SEWER SYSTEM PIPING.
- PROVIDE A 1/4" MESH SCREEN ON THE DISCHARGE PIPE TO PREVENT BIRDS FROM NESTING IN THE PIPE.
- SUPPORT PIPING WITH PLUMBERS STRAPPING EVERY 6' HORIZONTALLY AND EVERY 8' VERTICALLY.
- PROVIDE PIPE INSULATION WHERE PIPE IS ROUTED THROUGH UNHEATED SPACES.
- ALL POSITIVELY PRESSURED PORTIONS OF THE VENT PIPE AND FAN SHALL BE LOCATED OUTSIDE THE HABITABLE SPACE OF THE BUILDING.
- SUB-SLAB DEPRESSURIZATION SYSTEM TO BE INCORPORATED INTO THE BUILDING IN ACCORDANCE WITH ASTM 1465-08a STANDARD PRACTICE FOR RADON CONTROL OPTIONS FOR THE DESIGN AND CONSTRUCTION OF NEW LOW-RISE RESIDENTIAL BUILDINGS.
- LOCATE JUNCTION BOX IN ATTIC FOR POSSIBLE FUTURE RADON FAN.

REVIEWER'S NARRATIVE
BE3 SDG J194653-1: Pilgrim Village Family

The data associated with this Sample Delivery Group (SDG) J194653-1, analyzed by Eurofins Buffalo, Buffalo, NY have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data.

All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, “R”. Results qualified as estimated “J”, or as non-detects, “U”, are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that have been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).

Two facts should be noted by all data users. First, the “R” qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an “R” should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

2.0 INTRODUCTION

This data usability summary report (DUSR) was prepared in accordance with guidance provided by the New York State Department of Environmental Conservation (NYSDEC). The DUSR is based on a review and evaluation of the laboratory analytical data package. Specifically, the NYSDEC guidance recommends review and evaluation of the following elements of the data package:

- Completeness of the data package as defined under the requirements of the NYSDEC Analytical Services Protocols (ASP) Category B or the United States Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) deliverables,
- Compliance with established analyte holding times,
- Adherence to quality control (QC) limits and specifications for blanks, instrument tuning and calibration, surrogate recoveries, spike recoveries, laboratory duplicate analyses, and other QC criteria,
- Adherence to established analytical protocols,
- Conformance of data summary sheets with raw analytical data, and
- Use of correct data qualifiers.

Data deficiencies, analytical protocol deviations, and quality control problems identified using the review criteria above and their effect on the analytical results are discussed in this report.

3.0 SAMPLE AND ANALYSIS SUMMARY

The data package consists of analytical results for one soil sample collected on February 02, 2022. This sample was analyzed for Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Metals.

All analyses were performed by Eurofins Buffalo, Buffalo, NY and analyzed as SDG J194653-1. The analytical results were provided in NYSDEC ASP Category B format, which includes all raw analytical data and laboratory QC data.

4.0 GUIDANCE DOCUMENTS AND DATA REVIEW CRITERIA

The guidance documents appropriate for reviewing laboratory quality control (QC) data and assigning data qualifiers (flags) to analytical results were selected from those listed in Table 4-1. The QC limits established in the documents applicable to this data review were used to assess the quality of the analytical results. In some cases, however, QC limits established internally by the laboratory were taken into account to determine data quality.

The QC criteria considered for assessing the usability of the reported analytical results provided for each analyte type (i.e. VOCs, SVOCs, metals, etc.) are listed in Table 4-2. These criteria may vary with the analytical method utilized by the laboratory. These criteria comply with the guidance recommended in Section 2.0 above.

5.0 DATA VALIDATION QUALIFIERS

The letter qualifiers (flags) used to define data usability are described briefly below. These letters are assigned by the data validator to analytical results having questionable accuracy and/or precision as determined by reviewing the laboratory QC data associated with the analytical results.

The laboratory may also use various letters and symbols to flag analytical results generated when QC limits were exceeded. The meanings of these flags may differ from those used by the independent data validator. Those used by the laboratory are provided with the analytical results.

NOTE: The assignment of data qualifiers by the data reviewer (validator) to laboratory analytical results should not necessarily be interpreted by the data user as a measure of laboratory ability or proficiency. Rather, the qualifiers are intended to provide a measure of data accuracy and precision to the data user, which, for example, may provide a level of confidence in determining whether or not standards or cleanup objectives have been met.

U The analyte was analyzed for but was not detected at or above the sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the *approximate* concentration of the analyte in the sample. (The magnitude of any ± value associated with the result is not determined by data validation).

J+ The result is an estimated quantity and may be biased high.

J- The result is an estimated quantity and may be biased low.

UJ The analyte was analyzed for but not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.

R The sample result is rejected (i.e., is unusable) due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

The validated analytical results are attached to this report. Validation qualifiers (flags) are indicated in red print. Data sheets having qualified data are signed and dated by the data reviewer.

6.0 RESULTS OF THE DATA REVIEW

The results of the data review are summarized in Tables 6-1 through 6-3. The tables list the samples where QC criteria were found to exceed acceptable limits and the actions taken to qualify the associated analytical results.

7.0 TOTAL USABLE DATA

For SDG J194653-1, one sample was analyzed and results were reported for 120 analytes. Even though some results were flagged with a "J" as estimated, all results (100 %) are considered usable. See the summary table for the analyses that have rejected/qualified and the corresponding QC reasons.

NOTE: 1) As noted by the laboratory, the soil samples were not collected following SW846 5035A protocol. This adds an element of uncertainty to the analytical results for volatile organic analytes (VOAs). Although not specifically indicated on the final data sheets with a "J" flag, the VOA analytical results should be considered estimated, but usable.

Receipt
The sample was received on 2/2/2022 at 2:18 PM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 10.0º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCVIS) associated with batch 480-613663 recovered above the upper control limit for Benzene, Tetrachloroethene, Trichloroethene, Ethylbenzene, and 1,2-Dichloropropane. The samples associated with this CCVIS were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: B-1 (480-194653-1).

Method 8260C: The laboratory control sample (LCS) for preparation batch 480-613723 and analytical batch 480-613663 recovered outside control limits for the following analytes: 1,1,1-Trichloroethane, cis-1,2-Dichloroethene and cis-1,3-Dichloropropene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The associated sample is: B-1 (480-194653-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 7471B: The method blank for preparation batch 480-614413 and analytical batch 480-614619 contained mercury above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

REVIEWER'S NARRATIVE
BE3 SDG J194959-1: Pilgrim Village Family

The data associated with this Sample Delivery Group (SDG) J194959-1, analyzed by Eurofins Buffalo, Buffalo, NY have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data.

All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, “R”. Results qualified as estimated “J”, or as non-detects, “U”, are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that have been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).

Two facts should be noted by all data users. First, the “R” qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an “R” should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

2.0 INTRODUCTION

This data usability summary report (DUSR) was prepared in accordance with guidance provided by the New York State Department of Environmental Conservation (NYSDEC). The DUSR is based on a review and evaluation of the laboratory analytical data package. Specifically, the NYSDEC guidance recommends review and evaluation of the following elements of the data package:

- Completeness of the data package as defined under the requirements of the NYSDEC Analytical Services Protocols (ASP) Category B or the United States Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) deliverables,
- Compliance with established analyte holding times,
- Adherence to quality control (QC) limits and specifications for blanks, instrument tuning and calibration, surrogate recoveries, spike recoveries, laboratory duplicate analyses, and other QC criteria,
- Adherence to established analytical protocols,
- Conformance of data summary sheets with raw analytical data, and
- Use of correct data qualifiers.

Data deficiencies, analytical protocol deviations, and quality control problems identified using the review criteria above and their effect on the analytical results are discussed in this report.

3.0 SAMPLE AND ANALYSIS SUMMARY

The data package consists of analytical results for one soil sample collected on February 10, 2022. This sample was analyzed for Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Metals.

All analyses were performed by Eurofins Buffalo, Buffalo, NY and analyzed as SDG J194959-1. The analytical results were provided in NYSDEC ASP Category B format, which includes all raw analytical data and laboratory QC data.

4.0 GUIDANCE DOCUMENTS AND DATA REVIEW CRITERIA

The guidance documents appropriate for reviewing laboratory quality control (QC) data and assigning data qualifiers (flags) to analytical results were selected from those listed in Table 4-1. The QC limits established in the documents applicable to this data review were used to assess the quality of the analytical results. In some cases, however, QC limits established internally by the laboratory were taken into account to determine data quality.

The QC criteria considered for assessing the usability of the reported analytical results provided for each analyte type (i.e. VOCs, SVOCs, metals, etc.) are listed in Table 4-2. These criteria may vary with the analytical method utilized by the laboratory. These criteria comply with the guidance recommended in Section 2.0 above.

5.0 DATA VALIDATION QUALIFIERS

The letter qualifiers (flags) used to define data usability are described briefly below. These letters are assigned by the data validator to analytical results having questionable accuracy and/or precision as determined by reviewing the laboratory QC data associated with the analytical results.

The laboratory may also use various letters and symbols to flag analytical results generated when QC limits were exceeded. The meanings of these flags may differ from those used by the independent data validator. Those used by the laboratory are provided with the analytical results.

NOTE: The assignment of data qualifiers by the data reviewer (validator) to laboratory analytical results should not necessarily be interpreted by the data user as a measure of laboratory ability or proficiency. Rather, the qualifiers are intended to provide a measure of data accuracy and precision to the data user, which, for example, may provide a level of confidence in determining whether or not standards or cleanup objectives have been met.

U The analyte was analyzed for but was not detected at or above the sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the *approximate* concentration of the analyte in the sample. (The magnitude of any ± value associated with the result is not determined by data validation).

J+ The result is an estimated quantity and may be biased high.

J- The result is an estimated quantity and may be biased low.

UJ The analyte was analyzed for but not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.

R The sample result is rejected (i.e., is unusable) due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

The validated analytical results are attached to this report. Validation qualifiers (flags) are indicated in red print. Data sheets having qualified data are signed and dated by the data reviewer.

6.0 RESULTS OF THE DATA REVIEW

The results of the data review are summarized in Tables 6-1 through 6-3. The tables list the samples where QC criteria were found to exceed acceptable limits and the actions taken to qualify the associated analytical results.

7.0 TOTAL USABLE DATA

For SDG J194959-1, one sample was analyzed and results were reported for 120 analytes. Even though some results were flagged with a "J" as estimated, all results (100 %) are considered usable. See the summary table for the analyses that have rejected/qualified and the corresponding QC reasons.

NOTE: 1) As noted by the laboratory, the soil samples were not collected following SW846 5035A protocol. This adds an element of uncertainty to the analytical results for volatile organic analytes (VOAs). Although not specifically indicated on the final data sheets with a "J" flag, the VOA analytical results should be considered estimated, but usable.

Receipt
The sample was received on 2/10/2022 4:11 PM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 10.6º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 480-614798 recovered above the upper control limit for 1,1,1-Trichloroethane, Cyclohexane, Methylcyclohexane, Trichlorofluoromethane and Vinyl chloride. The samples associated with this CCV were non-detects above the reporting limits for the affected analytes; therefore, the data have been reported. REVIEWER'S NARRATIVE
BE3 SDG J195526-1: Pilgrim Village Family

The data associated with this Sample Delivery Group (SDG) J195526-1, analyzed by Eurofins Buffalo, Buffalo, NY have been reviewed in accordance with assessment criteria provided by the New York State Department of Environmental Conservation following the review procedures provided in the USEPA Functional Guidelines for evaluating organic and inorganic data.

All analytical results reported by the laboratory are considered valid and acceptable except results that have been qualified as rejected, “R”. Results qualified as estimated “J”, or as non-detects, “U”, are considered usable for the purpose of evaluating water and/or soil quality. However, these qualifiers indicate that the accuracy and/or precision of the analytical result is questionable. A summary of all data that have been qualified and the reasons for qualification are provided in the following data usability summary report (DUSR).

Two facts should be noted by all data users. First, the “R” qualifier means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the analyte is present or not. Values qualified with an “R” should not appear on the final data tables because they cannot be relied upon, even as the last resort. Second, no analyte concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data, but any value potentially contains error.

2.0 INTRODUCTION

This data usability summary report (DUSR) was prepared in accordance with guidance provided by the New York State Department of Environmental Conservation (NYSDEC). The DUSR is based on a review and evaluation of the laboratory analytical data package. Specifically, the NYSDEC guidance recommends review and evaluation of the following elements of the data package:

- Completeness of the data package as defined under the requirements of the NYSDEC Analytical Services Protocols (ASP) Category B or the United States Environmental Protection Agency (USEPA) Contract Laboratory Program (CLP) deliverables,
- Compliance with established analyte holding times,
- Adherence to quality control (QC) limits and specifications for blanks, instrument tuning and calibration, surrogate recoveries, spike recoveries, laboratory duplicate analyses, and other QC criteria,
- Adherence to established analytical protocols,
- Conformance of data summary sheets with raw analytical data, and
- Use of correct data qualifiers.

Data deficiencies, analytical protocol deviations, and quality control problems identified using the review criteria above and their effect on the analytical results are discussed in this report.

3.0 SAMPLE AND ANALYSIS SUMMARY

The data package consists of analytical results for eight soil samples collected on March 04, 2022. These samples were analyzed for Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Metals.

All analyses were performed by Eurofins Buffalo, Buffalo, NY and analyzed as SDG J195526-1. The analytical results were provided in NYSDEC ASP Category B format, which includes all raw analytical data and laboratory QC data.

4.0 GUIDANCE DOCUMENTS AND DATA REVIEW CRITERIA

The guidance documents appropriate for reviewing laboratory quality control (QC) data and assigning data qualifiers (flags) to analytical results were selected from those listed in Table 4-1. The QC limits established in the documents applicable to this data review were used to assess the quality of the analytical results. In some cases, however, QC limits established internally by the laboratory were taken into account to determine data quality.

The QC criteria considered for assessing the usability of the reported analytical results provided for each analyte type (i.e. VOCs, SVOCs, metals, etc.) are listed in Table 4-2. These criteria may vary with the analytical method utilized by the laboratory. These criteria comply with the guidance recommended in Section 2.0 above.

5.0 DATA VALIDATION QUALIFIERS

The letter qualifiers (flags) used to define data usability are described briefly below. These letters are assigned by the data validator to analytical results having questionable accuracy and/or precision as determined by reviewing the laboratory QC data associated with the analytical results.

The laboratory may also use various letters and symbols to flag analytical results generated when QC limits were exceeded. The meanings of these flags may differ from those used by the independent data validator. Those used by the laboratory are provided with the analytical results.

NOTE: The assignment of data qualifiers by the data reviewer (validator) to laboratory analytical results should not necessarily be interpreted by the data user as a measure of laboratory ability or proficiency. Rather, the qualifiers are intended to provide a measure of data accuracy and precision to the data user, which, for example, may provide a level of confidence in determining whether or not standards or cleanup objectives have been met.

U The analyte was analyzed for but was not detected at or above the sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the *approximate* concentration of the analyte in the sample. (The magnitude of any ± value associated with the result is not determined by data validation).

J+ The result is an estimated quantity and may be biased high.

J- The result is an estimated quantity and may be biased low.

UJ The analyte was analyzed for but not detected. The reported quantitation limit is approximate and may inaccurate or imprecise.

R The sample result is rejected (i.e., is unusable) due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

The validated analytical results are attached to this report. Validation qualifiers (flags) are indicated in red print. Data sheets having qualified data are signed and dated by the data reviewer.

6.0 RESULTS OF THE DATA REVIEW

The results of the data review are summarized in Tables 6-1 through 6-3. The tables list the samples where QC criteria were found to exceed acceptable limits and the actions taken to qualify the associated analytical results.

7.0 TOTAL USABLE DATA

For SDG J195526-1, eight samples were analyzed and results were reported for 1104 analytes. Even though some results were flagged with a "J" as estimated, all results (100 %) are considered usable. See the summary table for the analyses that have rejected/qualified and the corresponding QC reasons.

NOTE: 1) As noted by the laboratory, the soil samples were not collected following SW846 5035A protocol. This adds an element of uncertainty to the analytical results for volatile organic analytes (VOAs). Although not specifically indicated on the final data sheets with a "J" flag, the VOA analytical results should be considered estimated, but usable.

Receipt
The samples were received on 3/4/2022 5:40 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 17.6º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 480-617043 recovered above the upper control limit for Trichlorofluoromethane and Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: GSB-2 (480-195526-1), GSB-3 (480-195526-2), GSB-4 (480-195526-3), B-33 (480-195526-4), B-34 (480-195526-5), B-35 (480-195526-6), B-37 (480-195526-7) and B-38 (480-195526-8).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 6010C: The serial dilution (480-195526-A-4-E SD ^5) associated with batch 480-617725, exhibited results outside the quality control limits for Total Calcium. However, the post digestion spike (PDS) was compliant, therefore no corrective action was necessary.

Method 6010C: The serial dilution and post spike (480-195526-A-4-E PDS) and (480-195526-A-4-E SD ^5), associated with batch 480-617468, exceeded the quality control limits for Total Iron. Sample matrix is suspected, therefore, no corrective action was necessary.

Method 6010C: The recovery of post spike, (480-195526-A-4-E PDS), associated with batch 480-617725, exhibited results outside quality control limits for Total Silver, Arsenic, Barium, Beryllium, Cadmium, Cobalt, Chromium, Copper, Magnesium, Manganese, Nickel, Lead, Antimony, Selenium, Thallium, and Vanadium. However, the serial dilution (SD) of this sample was compliant, therefore no corrective action was necessary.

Method 6010C: The serial dilution (480-195526-A-4-E SD ^5) associated with batch 480-618053, exhibited a result outside the quality control limits for Total Zinc. However, the post digestion spike (PDS) was compliant, therefore no corrective action was necessary.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
