Re: Phase II Site Assessment
North Runway-Parcel L1
Bethpage, NY
D&BES No. 1383-110

Dear Mr. Ohlmann:

Enclosed please find six copies of the document entitled:

"Phase II Site Assessment
North Runway-Parcel L1
Bethpage, New York"

If you have any questions and/or comments regarding this matter, please do not hesitate to contact me at (516) 496-7712.

Very truly yours,

Richard M. Walka

1.0 INTRODUCTION

This report presents the findings of a Phase II Site Assessment undertaken at the Northrop Grumman Corporation (NGC) property known as "North Runway - Parcel L1". The site is located to the east of the South Oyster Bay Road Extension, immediately south of the Long Island Railroad (LIRR) tracks in Bethpage, New York. A site location map is presented on Figure 1-1.

D&B Environmental Services, Inc. (D&BES) was retained by NGC to undertake a Phase II Site Assessment at the North Runway - Parcel L1 site in order to investigate the presence of any soil contamination and to delineate the extent of soil contamination, if present, for the purpose of remediation. Dvirka and Bartilucci Consulting Engineers of Woodbury, New York provided engineering services in connection with the field investigations, oversight of subcontractors and preparation of this report.

The objective of this report is to document and present the results of a Phase II Site Assessment which was comprised of a five-phase field program that included the investigation, confirmation and delineation of surficial and subsurface soil contamination, as well as a dry well remediation and endpoint soil/sediment sampling program. The presentation of the analytical results of soil and sediment samples, along with a comparison of these results to appropriate soil cleanup objectives and conclusions and recommendations are also provided.

A description of the site and other background information is presented in Section 2 of this report. The technical scope of work for each of the Phase II field programs and the dry well remediation and endpoint soil/sediment sampling program is described in Section 3. The procedures followed throughout the course of each Phase II field program, as well as the dry well remediation and endpoint soil/sediment sampling program are described Section 4. Section 5 presents the analytical results of the soil and sediment samples and the findings of the Phase II field programs and the dry well remediation and endpoint soil/sediment sampling program.

Based on the findings of the investigation and remediation program, conclusions and recommendations regarding additional investigation activities and/or remedial actions are provided in Section 6.

Section 2

2.0 SITE DESCRIPTION/BACKGROUND

Site Description

A site plan of the North Runway - Parcel L1 site is presented on Figure 2-1. As shown on Figure 2-1, the site is located along the east side of the South Oyster Bay Road Extension, adjacent to the entrance to the NGC Bethpage Facility at Hazel Street, and immediately south of the Long Island Railroad (LIRR) tracks. The site is located within an area zoned Industrial H. Industrial and commercial properties are located to the north, east, south and west.

The North Runway - Parcel L1 property encompasses approximately 7.5 acres and, other than the presence of the former runway and associated support roadways and tarmac areas, is currently undeveloped. Historically, the site was utilized as a runway for aircraft designed, developed, manufactured and tested by NGC. The site was utilized as the northern end of a runway between approximately 1955 and 1990, at which time the runway was "closed." All aircraft maintenance and deicing procedures took place off-site further south in the vicinity of NGC Plant 4. The end of the runway included aircraft landing guidance and lighting systems, as well as thrust deflectors which were used to provide controlled deflection of jet exhaust. In addition to the site being used as a runway until its closure, the southwestern portion of the property was utilized for vehicle parking.

The North Runway - Parcel L1 site is currently inactive and the majority of the runway fixtures (i.e., thrust deflectors) have been removed. In addition, recently, the concrete portion of the runway was excavated and removed by NGC.

The North Runway - Parcel L1 property is generally level with topography gradually sloping away from the runway to facilitate storm water drainage. Ground elevation (grade) is approximately 120 feet above mean sea level. The depth to groundwater beneath the site is approximately 55 feet below grade. The major portion of the site was covered by asphalt,

concrete or other impervious building material with most of the remaining portions of the property being covered by grassy areas, as well as sparsely wooded areas in the northwest and southwest corners of the site.

NGC Quadrangle maps of the North Runway - Parcel L1 site indicate that underground water supply, sanitary sewer, electrical and telephone lines are located beneath the site, as well as several dry wells with interconnecting piping for storm water conveyance and management.

Background

A Phase I Site Assessment for the North Runway - Parcel L1 property was conducted by Dvirka and Bartilucci Consulting Engineers in April 1996. Based on the findings of the Phase I Site Assessment, there were no on-site indicators of contamination noted. However, the locations of the former thrust deflectors were identified as potential areas of environmental concern. According to the Phase I Site Assessment report, thrust deflectors were previously located on the north, west and east sides of the end of the runway to provide for controlled deflection of jet exhaust. It was concluded that constituents of concern contained in the exhaust from the incomplete combustion of jet fuel may have accumulated over a 35-year period in the soil adjacent to the thrust deflectors. Therefore, the areas around the former thrust deflectors were identified as potential areas of environmental concern, and it was recommended that soil samples be collected for laboratory analysis in the vicinity of the former thrust deflectors.

The Phase I Site Assessment report also identified the North Runway - Parcel L1 site as being located downgradient of known sources of groundwater contamination. Previous investigations have documented groundwater contamination in the vicinity of and beneath the site. However, based on the findings of the Phase I Site Assessment report, there did not appear to be any on-site sources of groundwater contamination. Previous and ongoing investigations have documented the sources of groundwater contamination to be from off-site, upgradient locations. Therefore, due to the lack of any apparent evidence of on-site sources of groundwater

contamination, the Phase I Site Assessment report did not recommend further investigation and/or monitoring of groundwater.

The Phase I Site Assessment report also supplemented a prior assessment undertaken in support of a Delisting Petition, which included the North Runway - Parcel L1 property, that was prepared by Dvirka and Bartilucci Consulting Engineers in February 1993, entitled "New York State Site Registry Delisting Petition - Site 6 (Runway)." In response to the Delisting Petition, on September 30, 1994, the New York State Department of Environmental Conservation (NYSDEC) removed the North Runway - Parcel L1 property from the Registry of Inactive Hazardous Waste Disposal Sites in New York.

Subsequent to the preparation of the Phase I Site Assessment report, NGC determined that herbicides and rodenticides were used for vegetation (weed) control and vector control, respectively, along the north end of the runway. In addition, NGC determined that the thrust deflectors were constructed of treated wood which was routinely painted with a wood preservative and other pigmented coatings. Although herbicides that were more recently used on a limited basis included USEPA registered, commercially available products, herbicides used in past applications were believed to have included arsenic compounds. Arsenic compounds have a variety of uses. Arsenates and arsenites are commonly used as herbicides, insecticides, larvicides and pesticides, and arsenic is present in rodenticides. In addition, the thrust deflectors were reportedly constructed of "CCA" treated wood which contains arsenic.

Section 3

3.0 SCOPE OF WORK

This section provides an overview of the recommended technical scope of work for each of the Phase II field programs and dry well remediation and soil/sediment sampling program.

3.1 Phase II Field Programs

The Phase II Site Assessment included a five-phase field program which provided for the investigation, confirmation and delineation of surface and subsurface soil contamination at the site. The following subsections provide a brief description of the recommended technical scope of work for each field program.

3.1.1 Phase 1 Field Program

Based on the findings and conclusions of the Phase I Site Assessment, a detailed scope of work was developed to investigate the thrust deflectors as potential areas of environmental concern and determine whether soil in the vicinity of the former thrust deflectors had been impacted by the byproducts of incomplete combustion of jet fuel. The following is an outline of the scope of work for initial surface soil sampling activities conducted as part of the Phase 1 Field Program:

Former Thrust Deflectors

- Collect surface soil samples at three locations on the east, west and north sides of the end of the runway at the locations of the former thrust deflectors. One surface soil sample was obtained at each location. Each sample was collected at a depth of 0 to 3 inches below the vegetative surface.

- Laboratory analysis of the three surface soil samples for priority pollutant metals by USEPA Methods 6010 and 7470, fuel-related constituents by New York State Department of Health (NYSDOH) Method 310-13 and semivolatile organic compounds (SVOCs) by USEPA Method 8270.

3.1.2 Phase 2 Field Program

Based on the results of the Phase 1 Field Program, elevated levels of SVOCs and priority pollutant metals were detected in surface soil samples in the vicinity of the former thrust deflectors. As a result, a detailed scope of work for a Phase 2 Field Program was developed to further investigate and delineate additional areas of environmental concern. The following is an outline of the scope of work for the Phase 2 Field Program:

- Collection of surface soil samples from 15 boring locations along the north, east and west sides of the end of the runway in the vicinity of the former thrust deflectors. The sample locations were spaced at 100-foot intervals. Eight borings were located approximately 5 feet outward from the edge of the runway at the locations of the former thrust deflectors, and seven borings were staggered approximately 15 feet outward from the edge of the runway. Two soil samples were obtained at each location (total of 30 soil samples). One soil sample was collected at a depth of 4 to 6 inches from grade (below the vegetation or soil surface), and the other sample was obtained at a depth of 10 to 12 inches from grade.

- Collection of one surface soil sample at two separate locations approximately 75 feet north and east of the runway at a depth of 4 to 6 inches from grade (total of 2 samples).

- Laboratory analysis of the 32 surface soil samples for: volatile organic compounds (VOCs) and SVOCs listed in Table 2 of Appendix B in NYSDEC's Spill Technology and Remediation Series (STARS) Memo #1, Petroleum-Contaminated Soil Guidance Policy (STARS Table 2), glycols (glycol scan) by NYSDEC Method 89-9; and priority pollutant metals (Methods 6010 and 7470).

3.1.3 Phase 3 Field Program

Based on the results of Phase 2 Field Program, a Phase 3 Field Program was conducted to confirm the presence of soil contamination and further delineate the horizontal and vertical extent of contamination in the areas of environmental concern. The following is an outline of the scope of work for the Phase 3 Field Program:

Confirmatory Soil Sampling

- Advance borings immediately adjacent to four previous sample locations (NR2, NR3, NR11 and NR14) utilizing a stainless steel hand auger, and collect soil samples at depths of 4 to 6 inches and 10 to 12 inches from grade (below the vegetation or soil surface) at each location.

- All soil samples will be split and analyzed by two independent laboratories.

- Analyze each soil sample (total of 8 samples) for arsenic utilizing USEPA Method 7060-A (graphite furnace) and mercury using USEPA Method 7471-A.

Soil Characterization for Disposal

- Collect fifteen surface soil samples immediately adjacent to fifteen previous sample locations (NR1 through NR15) using polyethylene scoops. Submit all fifteen samples to the analytical laboratory for compositing into a single representative sample.

- Analyze single representative composite soil sample for eight RCRA metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) by Toxicity Characteristic Leaching Procedure (TCLP), total polychlorinated biphenyls (PCBs) by USEPA Method 8080 and total petroleum hydrocarbons (TPHC) by USEPA Method 418.1.

Delineation Borings and Soil Sampling at 5 to 15 Feet from Edge of Runway

- Advance borings immediately adjacent to eight previous sample locations between 5 to 15 feet from the edge of the runway (NR1, NR2, NR3, NR5, NR6, NR9, NR11 and NR14) using a drilling rig and collect split spoon soil samples at depths of 12 to 24 inches, 24 to 36 inches, 36 to 48 inches and 48 to 60 inches below grade at each location.

- Analyze each soil sample (total of 32 samples) for priority pollutant metals (Methods 6010/7470) and the SVOCs listed in STARS Table 2.

Delineation Borings and Soil Sampling at 30 Feet from Edge of Runway

- Advance borings at eight locations 30 feet from the edge of the runway using a drilling rig, and collect split spoon soil samples at depths of 0 to 12 inches, 12 to 24 inches, 24 to 36 inches and 36 to 48 inches below grade at each location.

- Analyze each soil sample (total of 32 samples) for priority pollutant metals (Methods 6010/7470) and the SVOCs listed in STARS Table 2.

3.1.4 Phase 4 Field Program

Based on the results of the Phase 2 and 3 Field Programs, a Phase 4 Field Program was conducted to further delineate the vertical extent of areas of soil contamination at the site. In addition, the Phase 4 Field Program was undertaken to investigate areas of potential environmental concern along the perimeter of the property and beneath the runway tarmac and former taxiway, as well as to determine the horizontal and vertical extent of contamination, if present, in these areas.

The following is an outline of the scope of work for the Phase 4 Field Program:

Delineation Borings and Soil Sampling at Select Previous Sample Locations

- Advance borings immediately adjacent to seven previous sample locations (NRSB1, NRSB2, NR11, NR19, NR21, NR22 and NR23) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-1.

- At locations NRSB1, NR11, NR19, NR21, NR22 and NR23, analyze each soil sample (total of 23 samples) for arsenic, mercury and zinc. The sample analyses are summarized on Table 3-1.

- At location NRSB2, analyze select soil samples (total of 3 samples) for the VOCs and SVOCs listed in STARS Table 2 and for priority pollutant metals in accordance with Table 3-1.

Delineation Borings and Soil Sampling at Perimeter of Property

- Advance borings at eleven locations along the perimeter of the property (NR24 through NR34) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-1.

- At locations NR24, NR25, NR27, NR29 and NR31, analyze select soil samples (total of 24 samples) for arsenic, mercury and zinc. The sample analyses are summarized on Table 3-1.

- At locations NR26, NR28, NR30, NR32, NR33 and NR34, analyze select soil samples (total of 29 samples) for the VOCs and SVOCs listed in STARS Table 2, and for priority pollutant metals in accordance with Table 3-1.

Delineation Borings and Soil Sampling Beneath Runway

- Advance borings beneath runway tarmac and former taxiway at seven locations (NR35 through NR41) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-1.

- At locations NR35, NR36 and NR38 through NR41, analyze select soil samples (total of 27 samples) for arsenic, mercury and zinc. The sample analyses are summarized on Table 3-1.

- At location NR37, analyze select soil samples (total of 7 samples) for the VOCs and SVOCs listed in STARS Table 2, and for priority pollutant metals in accordance with Table 3-1.

Concrete Core Sampling

- Collect concrete core samples from the runway at three locations (NR35, NR37 and NR40).

- Analyze each concrete core sample (total of 3 samples) for Toxicity Characteristic Leaching Procedure (TCLP) metals, VOCs and SVOCs and pesticides/herbicides. The sample analyses are summarized on Table 3-1.

3.1.5 Phase 5 Field Program

Based on the results of the Phase 4 Field Program, a fifth phase was undertaken to further delineate the horizontal and vertical extent of soil contamination for the purposes of remediation. The Phase 5 Field Program consisted of soil sampling activities along the perimeter of the site, within the parking areas on the property and beneath the tarmac and former taxiway. In addition, a grid survey was conducted to establish the location of the soil borings and to delineate areas across the entire site by quadrants where soil remediation/excavation would be required.

The following is an outline of the scope of work for the Phase 5 Field Program:

Grid Survey and Location of Borings

- Survey a grid comprised of 50-foot by 50-foot and 100-foot by 100-foot quadrants.
- Survey locations of the soil borings.

Delineation Borings and Soil Sampling in Perimeter Area

- Advance borings at 24 new locations along the perimeter of the property (NR42 through NR65) and at two existing locations (NR32 and NR33) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-2.
- At new locations NR42 through NR65, analyze select soil samples (total of 80 samples) for priority pollutant metals. The sample analyses are summarized on Table 3-2.
- At new locations NR42, NR43, NR46, NR48, NR51, NR53, NR55, NR57, NR59, NR63 and NR65, also analyze select soil samples (total of 22 samples) for the SVOCs listed in STARS Table 2 in accordance with Table 3-2.
- At existing locations NR32 and NR33, analyze soil samples (total of 4 samples) for priority pollutant metals.

Delineation Borings and Soil Sampling in Parking Area

- Advance borings at 13 new locations within the parking area on the property (NR66 through NR70 and NR82 through NR89) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-2.

- At new locations NR66 through NR70 and NR82 through NR89, analyze select soil samples (total of 39 samples) for priority pollutant metals. The sample analyses are summarized on Table 3-2.

- At new locations NR66, NR67 and NR69, analyze select soil samples (total of 6 samples) for the SVOCs listed in STARS Table 2 in accordance with Table 3-2.

Delineation Borings and Soil Sampling in Runway Area

- Advance borings beneath runway tarmac and former taxiway at 11 new locations (NR71 through NR81) and at two existing locations (NR35 and NR38) using a drilling rig, and collect split spoon soil samples for laboratory analysis at each location. The depths at which soil samples were collected for laboratory analysis at each location are summarized on Table 3-2.

- At all new locations NR71 through NR81, analyze select soil samples (total of 40 samples) for priority pollutant metals. The sample analyses are summarized on Table 3-2.

- At all new locations NR71 through NR81, analyze select soil samples (total of 26 samples) for the SVOCs listed in STARS Table 2 in accordance with Table 3-2.

- At existing locations NR35 and NR38, analyze soil samples (total of 4 samples) for priority pollutant metals.

3.2 Dry Well Remediation and Soil/Sediment Sampling Program

Prior to the commencement of the Phase 2 Field Program, it was recommended that three on-site dry wells be cleaned out and sampled. The remediation and endpoint soil/sediment sampling of three dry wells located in the vicinity of the runway was undertaken concurrently with the activities conducted during the Phase 2 Field Program. The following is an outline of the scope of work for the dry well remediation and endpoint sampling program:

Pump out and Disposal of Dry Well Liquid

- Pump out liquid present in each dry well.
- Transport and disposal of all dry well liquid at NGC's Industrial Wastewater Treatment Plant (IWTP).

Removal and Containment of Dry Well Sludge

- Vacuum/pump out sludge present at bottom of each dry well.
- Containment of dry well sludges in 55-gallon drums.

Removal and Containment of Dry Well Soil

- Excavation of approximately two feet of soil/sediment from bottom of each dry well.
- Containment of excavated soil in roll-off container(s) and/or 55-gallon drums.

Subsequent to the completion of the remediation efforts described above, the collection of soil/sediment endpoint samples were collected as follows:

Endpoint Soil/Sediment Sampling

- Collection of soil/sediment samples from the bottom of each dry well. Two soil/ sediment samples were obtained from each dry well (total of 6 samples). Soil/sediment samples were collected at depths of 0 to 2 feet and 2 to 4 feet from the bottom of each dry well.
- Laboratory analysis of the six soil/sediment samples for: VOCs and SVOCs listed in STARS Table 2, glycols (Method 89-9) and priority pollutant metals (Methods 6010/7470).

Section 4

4.0 FIELD ACTIVITIES

This section provides a brief description of the field activities conducted in support of the Phase II Site Assessment at the North Runway - Parcel L1 site. Daily field activity reports, which are available in the project file, provide documentation of each of the five Phase II field programs and the dry well remediation and soil/sediment endpoint sampling program.

4.1 Phase II Field Programs

As discussed in Section 3, a five-phased field program was conducted as part of the Phase II Site Assessment at the North Runway - Parcel L1 site. These field programs provided for the investigation, confirmation and delineation of surface and subsurface soil contamination at the site.

Figure 4-1 illustrates the approximate locations of the soil borings and dry wells and the soil samples collected as part of the Phase II Site Assessment.

4.1.1 Phase 1 Field Program

Based upon the recommended scope of work for the Phase 1 Field Program, three surface soil samples, identified on Figure 4-1 as NRSSE, NRSSN and NRSSW, were collected along the north, east and west sides of the end of the runway at locations of the former thrust deflectors. Each surface soil sample was collected utilizing disposable polyethylene scoops.

Surface soil samples were collected at a depth of 0 to 3 inches below the ground surface (or beneath surface vegetation, if present) and analyzed for priority pollutant metals (Methods 6010 and 7470), fuel-related constituents (Method 310-13) and semivolatile organic compounds (Method 8270).

FIGURE 4-1

4.1.2 Phase 2 Field Program

Based upon the recommended scope of work for the Phase 2 Field Program, surface soil samples were collected at 100-foot intervals at locations NR1 through NR15, along the north, east and west sides of the end of the runway in the vicinity of the former thrust deflectors. A 3-1/4 inch diameter stainless steel hand auger was utilized to collect each soil sample. Of the 15 soil sampling locations, eight were located approximately 5 feet outward from the edge of the runway at locations of the former thrust deflectors. These are identified on Figure 4-1 as NR1, NR3, NR5, NR7, NR9, NR11, NR13 and NR15. The remaining seven sampling locations were located at staggered intervals approximately 15 feet outward from the edge of the runway. These sampling locations are identified on Figure 4-1 as NR2, NR4, NR6, NR8, NR10, NR12 and NR14.

Two soil samples were collected at each sampling location. The first sample was collected at a depth of 4 to 6 inches below grade (beneath the vegetation or ground surface) and designated by the letter "A". The second sample was collected at a depth of 10 to 12 inches below grade and designated by the letter "B". A total of 30 soil samples (i.e., two samples per location) were collected and analyzed for the volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs) listed in Table 2 of Appendix B in NYSDEC's Spill Technology and Remediation Series (STARS) Memo #1, Petroleum-Contaminated Soil Guidance Policy (STARS Table 2), glycols (Method 89-9) and priority pollutant metals (Methods 6010 and 7470).

Surface soil samples were also collected at locations NRSB1 and NRSB2 approximately 75 feet north and east of the runway, respectively. One soil sample was collected at each location at a depth of 4 to 6 inches below grade (beneath the vegetation or ground surface) utilizing a 3-1/4 inch diameter hand auger. These soil samples were analyzed for the VOCs and SVOCs listed in STARS Table 2, glycols (Method 89-9) and priority pollutant metals (Methods 6010 and 7470).

The stainless steel hand auger utilized for the collection of all soil samples was decontaminated between sample collection and sample locations. Decontamination procedures consisted of an external alconox wash, a tap water rinse followed by a distilled/deionized water rinse. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

4.1.3 Phase 3 Field Program

Based upon the recommended scope of work for the Phase 3 Field Program, surface soil sampling, soil boring sampling and soil characterization sampling activities were conducted at the site. A description of each of these activities is provided below.

4.1.3.1 - Surface Soil Sampling

Confirmatory surface soil samples were collected immediately adjacent to soil boring locations NR2, NR3, NR11 and NR14. The confirmatory surface soil samples were identified as CNR2, CNR3, CNR11 and CNR14. A 3-1/4 inch diameter stainless steel hand auger was utilized for the collection of these soil samples. Two soil samples were collected at each location. The first sample was collected at a depth of 4 to 6 inches below grade (beneath the vegetation or ground surface) and designated by the letter "A". The second sample was collected at a depth of 10 to 12 inches below grade and designated by the letter "B". A total of eight soil samples (i.e., two samples per location) were collected, split and analyzed by two independent laboratories for arsenic (Method 7060-A), mercury (Method 7471-A) and zinc (Method 7951).

The stainless steel hand auger utilized for the collection of all soil samples was decontaminated between sample collection and sample locations. Decontamination procedures consisted of an external alconox wash, followed by a tap water rinse and final distilled/deionized water rinse. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

4.1.3.2 - Soil Boring Sampling

A soil boring sampling program was conducted utilizing a 4-1/4 inch hollow stem auger and 2 inch diameter split spoon sampler. Eight soil borings were advanced immediately adjacent to eight previous soil borings and identified as 2NR1, 2NR2, 2NR3, 2NR5, 2NR6, 2NR9, 2NR11 and 2NR14. Split spoon sampling was conducted at each location from 1 to 2 feet, 2 to 3 feet, 3 to 4 feet and 4 to 5 feet below grade, and each sample was identified by the letter "A", "B", "C" or "D", respectively. A total of 32 soil samples were collected (i.e., four samples per location) and analyzed for priority pollutant metals (Methods 6010 and 7470) and the SVOCs listed in STARS Table 2.

Also, eight additional soil borings were advanced 30 feet from the edge of the runway. These are identified on Figure 4-1 as NR16, NR17, NR18, NR19, NR20, NR21, NR22 and NR23. Split spoon sampling was conducted at each location from 0 to 1 foot, 1 to 2 feet, 2 to 3 feet and 3 to 4 feet below grade, and each sample was identified by the letter "A", "B", "C" or "D", respectively. A total of 32 soil samples were collected (i.e., four samples per location) and analyzed for priority pollutant metals (Methods 6010 and 7470) and the SVOCs listed in STARS Table 2.

Upon retrieval of each soil sample, the sample was screened for volatile organic compounds utilizing a photoionization detector (PID). Sample screening results are presented on the boring logs included in Appendix A. In addition, each soil sample was physically and visually characterized and inspected for the presence of staining or discoloration. This information is also included on the boring logs.

All soil boring and sampling equipment, including the 4-1/4 inch hollow stem auger(s) and 2 inch diameter split spoon sampler(s), was decontaminated between sample collection and sample locations by using a high pressure steam cleaner. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

4.1.3.3 - Soil Characterization Sampling

For waste characterization and disposal purposes, fifteen surface soil samples were collected immediately adjacent to the surface soil samples collected during the Phase 2 Field Program. The samples were collected utilizing a disposable polyethylene scoop at a depth of 0 to 6 inches below grade (beneath the vegetation or ground surface). All fifteen surface soil samples were submitted to the analytical laboratory for compositing into a single representative sample and subsequently analyzed for the eight RCRA metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) by Toxicity Characteristic Leaching Procedure (TCLP), total polychlorinated biphenyls (PCBs) by Method 8080 and total petroleum hydrocarbons (TPHCs) by Method 418.1.

4.1.4 Phase 4 Field Program

Based upon the recommended scope of work for the Phase 4 Field Program, soil boring sampling activities were conducted at select previous sample locations, along the perimeter of the site and beneath the runway tarmac and former taxiway. Concrete core samples were also collected from the runway. A description of each activity is provided below.

4.1.4.1 - Soil Boring Sampling

Seven soil borings were advanced immediately adjacent to previous sample locations NRSB1, NRSB2, NR11, NR19, NR21, NR2 and NR23 utilizing a 4-1/4 inch hollow stem auger. Soil samples were collected at each location utilizing a 2 inch diameter split spoon sampler. Table 4-1 presents a summary of the Phase 4 Field Program soil boring sampling activities.

Soil boring sampling activities were also conducted along the perimeter of the site. Eleven soil borings, identified on Figure 4-1 as NR24 through NR34, were advanced utilizing a 4-1/4 inch hollow stem auger. Soil samples were collected at each location utilizing a 2 inch diameter split spoon sampler.

In addition, seven soil borings, identified on Figure 4-1 as NR35 through NR41, were advanced beneath the runway tarmac and former taxiway. Soil samples were collected at each location utilizing a 2 inch diameter split spoon sampler.

Upon retrieval of each soil sample, the sample was screened for volatile organic compounds utilizing a photoionization detector (PID). Sample screening results are presented on the boring logs included in Appendix A. In addition, each soil sample was physically and visually characterized and inspected for the presence of staining or discoloration. This information is also included on the boring logs.

All soil boring and sampling equipment, including the 4-1/4 inch hollow stem auger(s) and 2 inch diameter split spoon sampler(s), was decontaminated between sample collection and sample locations utilizing a high pressure steam cleaner. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

4.1.4.2 - Concrete Core Sampling

Three concrete core samples, identified on Figure 4-1 as NR35 (Core), NR37 (Core) and NR40 (Core), were collected from the runway and analyzed for the eight RCRA metals, VOCs, SVOCs and pesticides/herbicides by TCLP. Table 4-1 presents a summary of the concrete core sampling activities.

4.1.5 Phase 5 Field Program

Based upon the recommended scope of work for the Phase 5 Field Program, soil boring sampling activities were conducted along the perimeter of the property, within the parking areas on the property and beneath the runway tarmac and former taxiway. In addition, a grid survey was performed across the entire site. A description of each activity is provided below.

4.1.5.1 - Grid Survey and Location of Borings

A survey was conducted to establish 50-foot by 50-foot and 100-foot by 100-foot quadrants across the entire North Runway - Parcel L1 property. In addition, the soil borings advanced during each field program were located with respect to this grid.

4.1.5.2 - Soil Boring Sampling

Twenty-four soil borings, identified on Figure 4-1 as NR42 through NR65, were advanced along the perimeter area of the site utilizing a 4-1/4 inch hollow stem auger. In addition, two soil borings were advanced immediately adjacent to two previous sampling locations (NR32 and NR33). Soil samples were collected at each location utilizing a 2 inch diameter split spoon sampler. Table 4-2 presents a summary of the soil boring sampling activities.

Soil boring sampling activities were also conducted within the parking area on the property and in a grassy area at the southwest corner of the site, near the Hazel Street entrance to the NGC Bethpage Facility. Thirteen soil borings, identified on Figure 4-1 as NR66 through NR70 and NR82 through NR89, were advanced utilizing a 4-1/4 diameter inch hollow stem auger. Soil samples were collected at each location utilizing a 2 inch diameter split spoon sampler.

Soil boring sampling activities were also conducted beneath the runway tarmac and former taxiway. Eleven soil borings, identified on Figure 4-1 as NR71 through NR81, were advanced utilizing a 4-1/4 inch diameter hollow stem auger. In addition, two soil borings were advanced immediately adjacent to two previous sampling locations (NR35 and NR38). Soil samples were collected utilizing a 2 inch diameter split spoon sampler.

Upon retrieval of each soil sample, the sample was screened for volatile organic compounds utilizing a photoionization detector (PID). Sample screening results are presented on the boring logs included in Appendix A. In addition, each soil sample was physically and visually characterized and inspected for the presence of staining or discoloration. This information is also included on the boring logs.

All soil boring and sampling equipment, including the 4-1/4 inch hollow stem auger(s) and 2 inch diameter split spoon sampler(s), was decontaminated between sample collection and sample locations utilizing a high pressure steam cleaner. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

4.1.6 Air Monitoring Activities

During the advancement of the soil borings, monitoring for volatile organic vapors was conducted in the workers' breathing zone and at the boring holes utilizing a photoionization detector (PID). Air monitoring results are documented in the project log book. Prior to use, the PID, a Photovac Microtip, was calibrated utilizing a 100 ppm concentration of isobutylene gas. The PID was also utilized to screen the soil samples that were collected. The soil sample screening results are documented on boring logs, which are presented in Appendix A. Other sample information records are available in the project log book for the North Runway - Parcel L1 site.

4.2 Dry Well Remediation and Soil/Sediment Sampling Program

Three dry wells, identified on Figure 4-1 as NRDW1, NRDW2 and NRDW3, are located in the vicinity of the runway. These dry wells were utilized to collect storm water runoff from the runway, taxiway, perimeter roadway and adjacent areas on the site. Specific remediation efforts for each dry well included the removal/pump out of liquid utilizing a high pressure vacuum truck. The liquids removed from each dry well were transported and disposed of at the NGC Industrial Wastewater Treatment Plant (IWTP). Sludges that were present at the bottom of

each dry well were also removed using a high pressure vacuum truck and containerized in 55-gallon drums for proper disposal by NGC. Following the removal of sludge, approximately two feet of soil material was removed from the bottom of each dry well utilizing a "clam shell" excavator and containerized in 55-gallon drums for proper disposal by NGC.

Subsequent to the removal of approximately 2 feet of soil from the bottom of each dry well, endpoint soil/sediment samples were collected utilizing a 4-1/4 inch diameter hollow stem auger and 2 inch diameter split spoon sampler. Two soil/sediment samples were collected at depths of 0 to 2 feet and 2 to 4 feet from the bottom of each dry well. A total of six soil/sediment samples were collected and analyzed for the VOCs and SVOCs listed in STARS Table 2, glycols (Method 89-9) and priority pollutant metals (Methods 6010 and 7470).

Upon retrieving each soil/sediment sample, the sample was screened for volatile organic compounds utilizing a photoionization detector (PID). Sample screening results are documented on boring logs presented in Appendix A. In addition, each soil sample was physically and visually characterized and inspected for the presence of staining or discoloration. This information, if pertinent, is also included on the boring logs.

All soil/sediment sampling equipment, including the 4-1/4 inch diameter hollow stem auger(s) and 2-inch diameter split spoon sampler(s), was decontaminated between sample collection and sample locations utilizing a high pressure steam cleaner. All decontamination water was contained in 55-gallon drums for proper disposal by NGC.

Section 5

5.0 FINDINGS

This section presents the findings of the Phase II Site Assessment including a summary of the analytical results of the soil samples obtained during each of the five Phase II field programs, as well as the dry well remediation and soil/sediment sampling program. Soil sample results are compared to the criteria included in Appendix A of the New York State Department of Environmental Conservation (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) No. 4046 (referred to in this document as "NYSDEC TAGM criteria"), as well as the typical Eastern USA background soil contaminant concentration ranges included in the TAGM (referred to in this document as "Eastern USA background levels").

5.1 Surface and Subsurface Soil Sampling

As previously discussed in Section 4.1, five field programs were conducted in a phased approach as part of the Phase II Site Assessment for the North Runway-Parcel L1 site. Surface and subsurface soil samples were collected during these field programs. The analytical results of these samples are presented on Tables B-1 through B-8 in Appendix B.

5.1.1 Volatile Organic Compounds

The results of the surface and subsurface soil samples analyzed for volatile organic compounds (VOCs) listed in NYSDEC STARS Table 2 are presented on Table B-1 in Appendix B. A total of 56 soil samples were analyzed for STARS Table 2 VOCs. As indicated in Table B-1, several VOCs were detected in soil samples NR33 (0-2'), NR33 (4'-6'), NR34 (0-2'), NR37 (0-2') and NR37 (12'-14'). However, the concentrations detected were below the NYSDEC TAGM criteria.

5.1.2 Semivolatile Organic Compounds

The results of the surface soil samples analyzed for semivolatile organic compounds (SVOCs) by USEPA Method 8270 and the surface and subsurface soil samples analyzed for the SVOCs listed in STARS Table 2 are presented on Tables B-2 and B-3 in Appendix B, respectively. As Tables B-2 and B-3 indicate, three surface soil samples were analyzed for SVOCs by USEPA Method 8270 and 174 surface and subsurface soil samples were analyzed for STARS Table 2 SVOCs. Numerous SVOCs were detected in these soil samples; however, many of the SVOCs were detected at concentrations that were below the NYSDEC TAGM criteria. The SVOCs detected were the polycyclic aromatic hydrocarbons (PAHs) including several carcinogenic PAHs (CaPAHs).

As shown in Tables B-2 and B-3, only four of the samples, NRSSE (0-3"), NRSSN (0-3"), NR3A (4-6") and NR5A (4-6"), contained concentrations of total PAHs in excess of the NYSDEC TAGM criterion for total PAHs of 100,000 ug/kg. The concentrations of total PAHs ranged from 115,300 ug/kg in NRSSN (0-3") to 286,900 ug/kg in NRSSE (0-3"). In addition, Tables B-2 and B-3 indicate that 17 samples contained concentrations of total CaPAHs in excess of the criterion of 10,000 ug/kg. The concentrations of total CaPAHs ranged from 10,250 ug/kg in sample NR11A (4-6") to 117,000 ug/kg in sample NRSSE (0-3"). Table 5-1 presents a summary of individual SVOCs and total PAHs and CaPAHs which exceeded the NYSDEC TAGM criteria.

5.1.3 Fuel-Related Constituents

The results of the surface soil samples analyzed for fuel-related constituents are presented on Table B-4 in Appendix B. Three surface soil samples were analyzed for fuel-related constituents. As indicated on Table B-4, it appears that petroleum hydrocarbons as 10W40 oil were detected in all three samples at concentrations ranging from 67 mg/kg to 400 mg/kg.

Table 5-1

SVOCs EXCEEDING NYSDEC TAGM 4046 CRITERIA

Soil Sample (Depth)	SVOCs Exceeding NYSDEC TAGM 4046 Criteria	
	Individual SVOCs	Total PAHs and/or CaPAHs
NRSSE (0 - 3")	fluoranthene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene and indeno(1,2,3-cd)pyrene.	PAHs and CaPAHs.
NRSSN (0 - 3")	benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene and indeno(1,2,3-cd)pyrene.	PAHs and CaPAHs.
NRSSW (0 - 3")	benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene and benzo(a)pyrene.	CaPAHs.
NR1A (4" - 6")	benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene and benzo(a)pyrene	CaPAHs.

5.1.4 Glycols

The results of the surface soil samples analyzed for glycols are presented on Table B-5 in Appendix B. A total of 32 surface soil samples were analyzed for glycols. As indicated on Table B-5, glycols were detected at concentrations ranging from <0.57 mg/kg to 6.48 mg/kg. Although there is no NYSDEC TAGM criteria for glycols (i.e. ethylene glycol and propylene glycol), recent discussions with NYSDEC representatives indicate that a level of 50 mg/kg has been utilized.

5.1.5 Priority Pollutant Metals

The results of the surface and subsurface soil samples analyzed for priority pollutant metals are presented on Table B-6 in Appendix B. A total of 395 soil samples were analyzed for priority pollutant metals. As Table B-6 indicates, priority pollutant metals were detected in all of the 395 soil samples collected.

Several priority pollutant metals were detected in the soil samples at concentrations that exceeded Eastern USA background levels. Table 5-2 presents a summary of the individual metals that were detected at concentrations above the Eastern USA background levels. Additionally, as noted, values for cadmium and chromium were compared to the proposed revised criteria listed in Appendix A of NYSDEC TAGM 4046. As indicated in Table B-6 and Table 5-2, arsenic was detected at concentrations in excess of the Eastern USA background level of 12 mg/kg in 105 of the samples; mercury was detected at concentrations exceeding the Eastern USA background level of 0.2 mg/kg in 50 of the samples; and zinc was found at concentrations in excess of the Eastern USA background level of 50 mg/kg in 45 of the samples. Other metals found less frequently in excess of Eastern USA background levels were chromium (in five samples), copper (in eight samples), lead (in one sample), nickel (in one sample) and selenium (in one sample).

NRSB1 (4' - 6')	zinc.

*Values for cadmium and chromium were compared to the proposed revised criteria listed in TAGM 4046.

5.2 Concrete Core Sampling

As previously discussed in Section 4.1.4.2, three concrete core samples were collected from the runway and analyzed for the eight RCRA metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver), VOCs, SVOCs and pesticides/herbicides by the Toxicity Characteristic Leaching Procedure (TCLP). The analytical results of these concrete core samples are presented on Table B-7 in Appendix B.

As indicated on Table B-7, barium and chromium were detected at concentrations well below the regulatory level in all three concrete core samples. Benzene was detected in concrete core sample NR37 and pyridine and gamma-BHC (Lindane) were detected in concrete core sample NR40 at estimated concentrations that were well below regulatory levels. No other TCLP metal, VOC, SVOC and/or pesticide/herbicide was detected.

Therefore, based on the analyses, the concrete portion of the runway is not considered to be hazardous and could be removed from the site as a nonhazardous material.

5.3 Soil Characterization Sampling

As discussed in Section 4.1.3.3, fifteen surface soil samples were collected around the perimeter of the runway for waste characterization purposes during the Phase 3 Field Program. All fifteen surface soil samples were submitted to the analytical laboratory and composited into a single representative sample and subsequently analyzed for the eight RCRA metals including arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver by TCLP, total PCBs and total petroleum hydrocarbons. Table B-8 in Appendix B presents the results of the soil characterization sample.

As Table B-8 indicates, based on the results of the analyses, the soil is not considered to be hazardous, and can be removed from the site as nonhazardous material.

5.4 Dry Well Soil/Sediment Sampling

As previously discussed in Section 4.2, liquids, sludge and approximately 2 feet of soil/sediment was removed from dry wells NRDW1, NRDW2 and NRDW3 during the Phase II Site Assessment field activities. Liquids were removed from the dry wells and disposed of at the NGC IWTP. Sludge and soil/sediment were contained in 55-gallon drums for proper disposal by NGC. Subsequent to the removal of approximately 2 feet of soil from the bottom of each dry well, two endpoint soil/sediment samples were collected at depths of 0 to 2 feet and 2 feet to 4 feet from the bottom of each dry well. A total of six soil/sediment samples were collected and analyzed for the VOCs and SVOCs listed in STARS Table 2, glycols and priority pollutant metals. The analytical results are presented on Tables B-9 through B-12 in Appendix B.

5.4.1 Volatile Organic Compounds

The results of the dry well endpoint soil/sediment samples analyzed for STARS Table 2 VOCs are presented on Table B-9. Six soil/sediment samples were analyzed for STARS Table 2 VOCs. As indicated in Table B-9, three VOCs were detected in soil sample NRDW1 (0-2'). However, the estimated concentrations detected were well below the NYSDEC TAGM criteria.

5.4.2 Semivolatile Organic Compounds

The results of the dry well endpoint soil/sediment samples analyzed for STARS Table 2 SVOCs are presented on Table B-10. Six sediment/soil samples were collected and analyzed for STARS Table 2 SVOCs. As indicated on Table B-10, several SVOCs were detected in soil/sediment samples NRDW1 (0-2'), NRDW1 (2'-4'), NRDW2 (0-2') and NRDW2 (2'-4'). However, many of the SVOCs were detected at concentrations that were below the NYSDEC TAGM criteria.

The following SVOCs were detected at levels that exceeded the individual NYSDEC TAGM criteria:

Soil Samples	SVOCs
NRDW1 (0'-2')	benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene and benzo(a)pyrene.
NRDW1 (2'-4')	benzo(a)anthracene, chrysene and benzo(a)pyrene.
NRDW2 (0'-2')	benzo(a)pyrene.

However, it should be noted that the total concentrations of PAHs and CaPAHs in the samples did not exceed the NYSDEC TAGM criteria for total PAHs and total CaPAHs.

5.4.3 Glycols

The results of the dry well endpoint soil/sediment samples analyzed for glycols are presented on Table B-11. Six soil/sediment samples were analyzed for glycols. As indicated on Table B-11, glycols were detected at concentrations ranging from <0.61 mg/kg to 2.59 mg/kg. Although there is no NYSDEC TAGM criteria for glycols (i.e. ethylene glycol and propylene glycol), recent discussions with NYSDEC representatives indicate that a level of 50 mg/kg has been utilized.

5.4.4 Priority Pollutant Metals

The results of the dry well endpoint soil/sediment samples analyzed for priority pollutant metals are presented on Table B-12. Six soil/sediment samples were analyzed for priority pollutant metals. As Table B-12 indicates, priority pollutant metals were detected in all six dry well soil/sediment samples. However, none of the priority pollutant metals were detected in samples at concentrations in excess of the Eastern USA background levels, with the exception of sample NRDW1 (0'-2').

Six priority pollutant metals, including arsenic, cadmium, chromium, lead, mercury and zinc were detected in soil/sediment sample NRDW1 (0'-2') at concentrations that exceeded

Eastern USA background levels. However, cadmium and chromium were not detected at concentrations in excess of the proposed revised criteria in NYSDEC TAGM 4046.

5.5 Data Validation

Environmental samples were collected from the North Runway - Parcel L1 site during several field investigations conducted from May 1996 through October 1996. The samples were analyzed for a variety of parameters depending upon sample location. The parameters included (VOCs), (SVOCs), priority pollutant metals, glycols, total petroleum hydrocarbons, fuel-related constituents, PCBs and Toxicity Characteristic Leaching Procedure (TCLP) metals, VOCs, SVOCs and pesticides/herbicides. Analyses were performed by three laboratories: IEA, Inc. - New Jersey; IEA, Inc., - Connecticut; and Nytest Environmental, Inc. (NEI), all subcontractors to D&B Environmental Services, Inc. (D&BES).

Validation was performed on 20 percent of the sample data and all quality control data (i.e., standards, calibrations, etc.) yielding a "20% validation." The validation process was in accordance with NYSDEC quality assurance/quality control (QA/QC) requirements. Sample analysis was performed in accordance with USEPA SW846 methodologies while adhering to NYSDEC Analytical Services Protocol (ASP) QA/QC requirements. Matrix spike and matrix spike duplicates were analyzed at the appropriate frequency.

Sample analysis was performed in accordance with the specified method and within the required holding times.

Instrument calibrations (initial and continuing) were analyzed at the appropriate frequency and met QC requirements.

All data is deemed valid and usable for environmental assessment.

Section 6

6.0 CONCLUSIONS AND RECOMMENDATIONS

Based upon the findings of the Phase II Site Assessment field programs discussed in Section 5.0, conclusions are presented in this section, and recommendations are provided regarding remedial actions at the North Runway - Parcel L1 site.

In support of providing conclusions and technical recommendations with regard to the level and degree to which remediation of the property is required, we have relied on the revised Technical and Administrative Guidance Memorandum (TAGM) No. 4046 - Determination of Soil Cleanup Objectives and Cleanup Levels dated January 24, 1994 published by the New York State Department of Environmental Conservation (NYSDEC).

As discussed in the introduction of the TAGM, the document is designed to provide a technical basis for NYSDEC Project Managers at "... individual Federal Superfund, State Superfund, 1986 EQBA Title 3 and Responsible Party (RP) sites..." to determine soil cleanup levels. The TAGM provides a number of methods to determine the degree to which these properties are cleaned up including published recommended soil cleanup objectives (NYSDEC TAGM criteria) and Eastern USA background concentrations.

The North Runway - Parcel L1 property is not a Federal Superfund or State Superfund site nor is it an RP or 1986 EQBA Title 3 property. In addition, the Phase I Site Assessment did not identify any industrial or process operations being conducted at the property in the past that would have required permitted or unpermitted discharges.

Accordingly, we believe it is reasonable to establish the Eastern USA background levels for metals as presented in the TAGM for the purpose of initial comparison, and as the cleanup levels for the principal metals of concern (i.e. arsenic and mercury) across the site. In addition, for evaluating chromium (as well as other metals that were not the principal metals of concern) for the purpose of potential remediation, the soil screening levels published by the United States

Environmental Protection Agency (USEPA) were utilized for both species of chromium (III and VI), as well as for total chromium.

In the absence of published Eastern USA background levels, such as is the case for volatile organic compounds and semivolatile organic compounds, we have elected to utilize the NYSDEC TAGM criteria for these compounds for the purposes of comparison and potential remediation at the site.

6.1 Surface and Subsurface Soil Sampling

Conclusions

As discussed in Section 5.1, a five-phased field program was conducted as part of the Phase II Site Assessment. Surface and subsurface soil samples were collected and analyzed for volatile organic compounds, semivolatile organic compounds, fuel-related constituents, glycols and priority pollutant metals. The analytical results of the surface and subsurface soil samples indicated that none of the samples contained VOCs at levels exceeding the NYSDEC TAGM criteria. However, several SVOCs were detected at concentrations that exceeded the NYSDEC TAGM criteria, and TPHCs were found to be associated with fuel-related constituents identified as 10W40 motor oil. Glycols were also detected in surface soil samples; however, the levels of glycols detected were not in excess of the acceptable limit utilized by NYSDEC. Most importantly, several priority pollutant metals were detected at concentrations that exceeded Eastern USA background levels.

The SVOCs detected in the surface and subsurface soil samples at concentrations exceeding the NYSDEC TAGM criteria were polycyclic aromatic hydrocarbons (PAHs) and carcinogenic PAHs (CaPAHs). The CaPAHs include benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, chrysene, dibenzo(a,h)anthracene and indeno(1,2,3-cd)pyrene. The priority pollutant metals detected in the surface and subsurface soil samples at

concentrations exceeding the Eastern USA background levels or proposed revised TAGM criteria included arsenic, chromium, copper, lead, mercury, nickel, selenium and zinc.

In order to understand the horizontal and vertical extent of impacted soil across the site, Table 6-1 presents a matrix of exceedances, by sample location, including the depth at which each sample was collected and the groups of constituents of concern including total PAHs, total CaPAHs and priority pollutant metals that were detected at concentrations that exceeded the NYSDEC TAGM criteria for PAHs and CaPAHs, Eastern USA background levels for priority pollutant metals and proposed revised NYSDEC TAGM criteria for cadmium and chromium.

As Table 6-1 indicates, total PAHs were detected above the NYSDEC TAGM criteria in soil samples NRSSE (0-3"), NRSSN (0-3"), NR3 (4"-6") and NR5 (4"-6"). In addition, total CaPAHs were detected above the NYSDEC TAGM criteria in soil samples NRSSE (0-3"), NRSSN (0-3") and NRSSW (0-3"), NR1 (4"-6", 10"-12" and 4'-5'), NR3 (4"-6", 10"-12" and 2'-3'), NR5 (4"-6" and 10"-12"), NR7 (4"-6"), NR8 (4"-6"), NR11 (4"-6"), NR15 (10"-12") and NR72 (0-1').

The priority pollutant metals detected at concentrations exceeding Eastern USA background levels include arsenic, chromium, copper, lead, mercury, nickel, selenium and zinc. As Table 6-1 indicates, arsenic, mercury and zinc appear to be the most common contaminants of concern found at the site at concentrations exceeding Eastern USA background levels. Whereas, the presence and exceedances for chromium, copper, lead, nickel and selenium appear to be isolated and are not uniform or continuous in nature. Accordingly, arsenic, mercury and/or zinc were detected at concentrations exceeding Eastern USA background levels at the following depths and corresponding sample locations:

Sample Depth	Sample Location
0 to 3"	NRSSE, NRSSN and NRSSW.
4" to 6"	NR1 through NR15, NRSB1 and NRSB2.
10" to 12"	NR1, NR2, NR3 and NR6 through NR15.

Sample Depth	Sample Location
0 to 1 ft.	NR17 through NR22, NR33, NR42, NR43, NR46, NR48, NR49, NR51, NR53, NR56, NR60 through NR66, NR68, NR74, NR82 through NR86 and NR88.
1 ft. to 2 ft.	NR2, NR3, NR11, NR17, NR18, NR19, NR21, NR22, NR42, NR46, NR47, NR49, NR50, NR51, NR53, NR60, NR62, NR64, NR65, NR66, NR70, NR82, NR83, NR84, NR86 and NR89.
0 to 2 ft.	NR32 through NR35 and NR38.
2 ft. to 3 ft.	NR2, NR11, NR22 and NR23.
3 ft. to 4 ft.	NR20, NR22 and NR23.
2 ft. to 4 ft.	NR24, NR42, NR43, NR60, NR62, NR64, NR66, NR70, NR89 and NRSB1.
4 ft. to 5 ft.	NR1, NR6 and NR11.
4 ft. to 6 ft.	NR26, NR40 and NRSB1.
6 ft. to 8 ft.	NR22
8 ft. to 10 ft.	NR27
12 ft. to 14 ft.	NR35

As indicated above, a majority of the arsenic, mercury and/or zinc exceedances were observed in the soil samples collected from 0 to 4 feet below grade. However, arsenic, mercury and/or zinc exceedances were also detected in soil samples collected greater than 4 feet below grade at sample locations NR1, NR6, NR11, NR22, NR26, NR27, NR35, NR40 and NRSB1. Accordingly, arsenic exceedances were detected in samples NR1 (4'-5'), NR6 (4'-5'), NR22 (6'-8'), NR27 (8'-10') and NR40 (4'-6'); mercury exceedances in samples NR6 (4'-5') and NR11 (4'-5'); and zinc exceedances in samples NR26 (4'-6'), NR35 (12'-14'), NR40 (4'-6') and NRSB1 (4'-6').

However, the exceedances for arsenic, mercury and zinc at depths greater than 4 feet all appear to be isolated. The exceedances for arsenic in samples NR1 (4'-5'), NR6 (4'-5') and

NR27 (8'-10'), and mercury in samples NR6 (4'-5') and NR11 (4'-5') appear to be isolated since the soil samples from at least three sample intervals directly above these samples did not contain levels of arsenic or mercury in excess of the Eastern USA background level for these metals. Also, the exceedance for arsenic in sample NR22 (6'-8') appears to be isolated since the soil sample from the interval directly above this sample did not contain arsenic at a concentration in excess of the Eastern USA background level and the concentration found at 6'-8' was only slightly above this background level. In addition, the exceedance for arsenic in sample NR40 (4'-6') also appears to be isolated since the sample intervals directly above and below 4'-6' did not contain levels of arsenic in excess of the Eastern USA background level. The exceedance for zinc in sample NR26 (4'-6') appears to be isolated since the soil samples from the two sample intervals above 4'-6' and the five intervals below 4'-6' do not contain zinc at concentrations exceeding the Eastern USA background level for this metal. For sample NR35 (12'-14'), zinc is not present at concentrations exceeding the Eastern USA background level in the four sample intervals above 12'-14'. For NR40 (4'-6'), zinc is not detected at a concentration in excess of the Eastern USA background level in the sample intervals directly above and below 4'-6'. Furthermore, it is important to note that zinc is not listed as a hazardous constituent in Appendix 23 of 6NYCRR Part 371.

Recommendations

Based upon the analytical results of the surface and subsurface soil samples collected during the Phase II Site Assessment field programs, it has been determined that CaPAHs, PAHs and arsenic and mercury (and zinc to a limited extent) are the primary contaminants of concern found at the site. Therefore, soil remediation is recommended at the North Runway - Parcel L1 site.

Figure 6-1 presents the areas where soil remediation is recommended across the entire site by utilizing 50 foot by 50 foot quadrants. A 50 foot by 50 foot grid was developed in order to provide a reasonable and conservative approach to delineating areas where soil remediation would be necessary and facilitating complete coverage of the site.

FIGURE 6-1

Accordingly, as shown on Figure 6-1, it is recommended that soils in the vicinity of sample locations NR1, NR6, NR7, NR20, NR22, NR23, NR24, NR60, NR62 and NR64 be excavated to a minimum depth of 4 feet below grade for remediation. A minimum depth of 4 feet was selected based upon the detection of constituents of concern including PAHs, CaPAHs and metals to a depth of 4 feet at concentrations that exceeded NYSDEC TAGM criteria and Eastern USA background levels. These exceedances included CaPAHs, arsenic and mercury at NR1 and NR7; arsenic and mercury at NR6, NR20, NR22, NR23, NR24 and NR60; and arsenic at NR62 and NR64.

In addition, as shown on Figure 6-1, it is recommended that soils in the vicinity of sample locations NRSSE, NR2, NR3, NR11, NR42 and NR43 be excavated to a minimum depth of 3 feet below grade for remediation. A minimum depth of 3 feet was chosen based upon the detection of constituents of concern including PAHs, CaPAHs and metals to a depth of 3 feet at concentrations that exceeded NYSDEC TAGM criteria and Eastern USA background levels. These exceedances included PAHs, CaPAHs, arsenic and mercury at NRSSE and NR3; arsenic and mercury at NR2 and NR42; CaPAHs, arsenic and mercury at NR11; and arsenic at NR43.

Figure 6-1 also indicates that it is recommended that the soil in the vicinity of sample locations NR18, NR19, NR21, NR46, NR47, NR49, NR50, NR51, NR53 and NR65 be excavated to a minimum depth of 2 feet below grade for remediation. This depth is based upon the detection of constituents of concern including metals to a depth of 2 feet at concentrations that exceeded Eastern USA background levels. These exceedances included arsenic and mercury at sample locations NR18, NR19, NR21, NR49 and NR53; and arsenic in the samples collected at sample locations NR46, NR47, NR50, NR51 and NR65.

In addition, Figure 6-1 indicates that it is recommended that the soil in the vicinity of sample locations NRSSN, NRSSW, NR4, NR5, NR8, NR9, NR10, NR12, NR13, NR14, NR15, NR17, NR32, NR33, NR48, NR56, NR61, NR63, NR68, NR72, NRSB1, NRSB2, NR82, NR83 and NR85 be excavated to a minimum depth of 1 foot below grade for remediation. This depth is based upon the detection of constituents of concern including PAHs, CaPAHs and metals to a

depth of 1 foot at concentrations that exceeded the NYSDEC TAGM criteria and Eastern USA background levels. These exceedances included: PAHs, CaPAHs and arsenic and mercury at NRSSN; CaPAHs, arsenic and mercury at NRSSW, NR8 and NR15; PAHs, CaPAHs and mercury at NR5; CaPAHs at NR72; arsenic and mercury at NR4, NR9, NR10, NR13, NR14, NR32, NR33, NR68, NR82, NR83 and NR85; and arsenic at NR12, NR17, NR48, NR56, NR61, NR63, NRSB1 and NRSB2.

Based on the analytical data, there were no exceedances observed in the soil samples collected at sample locations NR16, NR25, NR28, NR29, NR31, NR36, NR37, NR39, NR41, NR44, NR45, NR52, NR54, NR55, NR57, NR58, NR59, NR69, NR71, NR73 and NR75 through NR81. Therefore, as Figure 6-1 indicates, soil remediation activities are not warranted in these areas.

In addition, the exceedances of arsenic, chromium, copper or zinc observed in the soil samples collected at sample locations NR26, NR27, NR30, NR34, NR35, NR38, NR66, NR67, NR70 and NR86 through NR89 appear isolated and not uniform or continuous in nature. Therefore, as Figure 6-1 indicates, no soil remediation activities are recommended in these areas.

As was stated in Sections 1 and 2 of this report, the overall goal of the investigation program, which would ultimately translate to the remediation component of the project, was to identify constituents of concern in "higher probability" areas of concern across the site with the intent to at least initially compare analytical results to published Eastern USA background levels. "Higher probability" areas of concern were basically defined as locations beneath and immediately adjacent to the thrust deflectors, the perimeter of the concrete runway, and storm water dry wells at the site.

Having completed that, a remedial excavation program has been designed to remove the principal constituents of concern via excavation. These principal constituents of concern included primarily arsenic, mercury, zinc (to a limited extent) and certain semivolatile organic compounds.

The analytical results of the principal constituents identified indicate a seemingly understandable trend of low level contaminants at areas generally located at the perimeter of the runway and adjacent to the thrust deflectors. Virtually all these areas were addressed by excavation. Two exceptions to this are as follows.

First, there are a number of areas where soil samples either isolated at depth or from specific points across the site detected low level contamination. Since these samples were not located in the typical "higher probability" areas of concern which were identified across the site, nor were they associated with any industrial process operations, chemical storage areas, tank systems and/or known chemical spills, we have characterized these "isolated" areas with limited horizontal or vertical extent as not requiring excavation.

Secondly, there were a number of sampling points which were identified as containing total chromium at concentrations ranging from 51.9 mg/kg to 100 mg/kg. These sample locations include NR67 at a depth of 1-2 feet, NR30 at a depth of 0-2 feet, NR88 at a depth of 0-1 feet and NR87 at a depth of 1-2 feet. Since chromium was not originally within the suite of compounds identified as "of concern", and since the location of the samples in the southeastern portion of the site in the asphalt parking area appeared to be somewhat isolated, the following analysis was made to evaluate the impact of these findings at the site.

As was mentioned above, while there were no process operations, tanks or known chemical spills that could have resulted in chromium as an environmental contaminant, it was detected in four samples from the southeastern portion of the property. In evaluating chromium as a newly identified chemical species, we relied on the soil screening levels recently published by the United States Environmental Protection Agency (USEPA) in 1996. The merits of utilizing this guidance is important since, for the first time, it identifies and evaluates each of the two species of chromium, as well as total chromium, with regard to environmental impact due to ingestion. The USEPA document basically establishes a level of 390 mg/kg for chromium (total) and chromium (VI) and a level of 78,000 mg/kg for chromium (III). This is an important

departure from the values provided in the NYSDEC TAGM as either soil cleanup objectives or Eastern USA background levels. The important differentiation is that the most recent work published by the USEPA identifies not only total chromium, which the TAGM addresses, but also each of the two species of chromium that can exist (in theory) in the environment and assigns a specific, calculated soil screening level based on its risk model. The TAGM does not address chromium in this specific manner and is therefore overly conservative with respect to the risk it assigns to chromium as total, as elaborated on below.

While the chromium results which are reported for the southeastern portion of the property are chromium (total), the following is noteworthy. Chromium (VI) is the most toxic species of chromium and is the reason that USEPA assigned a soil screening level of 390 mg/kg. Standard contract laboratory protocol imposes a maximum 24-hour holding time on any sample being analyzed for chromium (VI). The reason for this very stringent holding time, as opposed to 6 months for either chromium (total) or chromium (III) is quite simple. Chromium (VI) is a species of chromium which exists in an "excited" ionic state and is therefore relatively unstable and increasingly reactive. Therefore, the chromium (VI) species will either react with other compatible species in the environment or possibly transform to chromium (III). As a result, the general thinking is that it is likely that the dominant species found in the environment, particularly if it has had the benefit of being present in the environment over a longer period of time, is chromium (III). This fact is generally recognized by the scientific community and the laboratory industry.

That being the case, the following findings/conclusions are presented.

- The samples collected and analyzed from the southeast portion of the site detected total chromium ranging from 51.9 mg/kg to 100 mg/kg.
- While the NYSDEC TAGM criteria and Eastern USA background levels were utilized for comparison with regard to the "principal constituents of concern" (arsenic, mercury, zinc [to a limited extent] and certain semivolatile compounds), we have utilized USEPA's recently published Soil Screening Levels (SSLs) in lieu of Eastern USA background levels in an effort to evaluate the impact of chromium results on the site.

- The reason that USEPA's SSL are unique from a risk assessment perspective is that for the first time each of the two species of chromium (III and VI), as well as total chromium, have a separate and distinct calculated threshold level for risk management decision making. We believe intuitively that this methodology of identifying individual species and calculating a separate risk assessment for each provides for a more sound and accurate measure of the impact of chromium to environmental receptors.
- While the results reported for chromium detected in the southeast portion of the site were *total* chromium, we believe that it is likely that the major species present in the sample would likely have been chromium (III) for reasons stated above.
- In any case, all of the chromium values detected in soil samples obtained from the southeastern portion of the site are below the most stringent published USEPA soil screening level values for chromium.

With regard to the inorganic constituents copper and zinc, which were detected in soil samples at certain locations across the site, we offer the following. First and foremost, neither copper nor zinc are classified as RCRA metals, that is, metals which in elevated concentrations could classify a waste material as a hazardous waste. In addition, neither elemental copper nor zinc are identified as hazardous constituents in Appendix 23 of the NYSDEC's regulations found at 6 NYCRR Part 371. This being the case, we do not believe that these constituents warrant further investigation.

Furthermore, by way of reference to USEPA's recently published soil screening levels, we believe it is worthy to note that the action level for zinc is 23,000 mg/kg, while copper is not even included on the list of inorganic constituents as a metal of concern.

The remediation technique selected for the North Runway - Parcel L1 site includes excavation of nonhazardous, contaminated soil with off-site transportation and disposal by recycling as a component in the production of asphalt.

Inherent in virtually all excavation programs is the fact that, short of completing a topographic survey of each grid before and after excavation, the horizontal and vertical extent of the excavation can only be approximate. The ability to remove soil, in either the horizontal or vertical direction, in exact accordance with the dimensions identified in this report (as shown on

Figure 6-1) is further limited due to the type and typically large size of the mechanical excavation equipment that will be utilized in the field. To address this concern, more specifically to ensure that, at a minimum, the specified volume of material will be excavated, and to compensate for any questions that might arise regarding the accuracy of the excavation program, in all cases the excavation contractor will be instructed to advance the vertical and horizontal components of the excavation of each grid area deeper and wider than that which is denoted on the excavation plan shown on Figure 6-1.

In addition to the general field procedure addressing "over excavation" discussed above, personnel from Dvirka and Bartilucci Consulting Engineers will be present at all times throughout the excavation program. Among other responsibilities, these field representatives will provide continuous oversight to assure that the excavation program proceeds in accordance with the recommendations of this report. In addition, field personnel will be provided with the authority from NGC to require additional excavation, for either the vertical or horizontal component of any grid in the event that there is any visible evidence of an anomalous soil horizon with respect to color, texture, grain size, odor, etc.

6.2 Concrete Core Sampling

Conclusions

As discussed in Section 5.2, three concrete core samples were collected from the runway and analyzed for the eight RCRA metals, volatile organic compounds, semivolatile organic compounds and pesticides/herbicides by Toxicity Characteristic Leaching Procedure (TCLP). The analytical results of the concrete core samples indicated that barium and chromium were detected well below regulatory levels. In addition, benzene was detected in the concrete core sample collected at location NR37 and pyridine and gamma-BHC were detected in the concrete core sample collected at location NR40 in concentrations well below regulatory levels. No other TCLP metals, VOCs, SVOCs and/or pesticides/herbicides were detected in the concrete core

samples collected from the runway. Therefore, the concrete portion of the runway is not considered to be hazardous and could be removed from the site as nonhazardous material.

Subsequent to the collection of concrete core samples from the runway and receiving the analytical results of these samples, the concrete portion of the runway on the North Runway - Parcel L1 site was removed and properly disposed of by NGC.

Recommendations

Based on the analytical results of the concrete core samples and the subsequent removal of the concrete portion of the runway on the North Runway - Parcel L1 site described above, no further investigation and/or remediation activities are warranted.

6.3 Soil Characterization Sampling

Conclusions

As discussed in Section 5.3, 15 surface soil samples were collected around the perimeter of the runway for waste characterization purposes. All 15 samples were submitted to the analytical laboratory and composited into a single representative sample and analyzed for the eight RCRA metals by TCLP, total PCBs and total petroleum hydrocarbons. The analytical results of the composite sample indicated that the soil is not considered to be hazardous.

Recommendations

Based upon the analytical results of the composite soil sample, the soil is not considered to be hazardous, and can be removed from the site and disposed of properly as a nonhazardous material.

6.4 Dry Well Soil/Sediment Sampling

Conclusions

As discussed in Section 5.4, liquids, sludge and approximately 2 feet of soil/sediment was removed from the bottom of three on-site dry wells during the Phase II Site Assessment field activities and properly disposed of by NGC. Two endpoint soil/sediment samples were collected from the bottom of each dry well at depths from 0 to 2 feet and 2 feet to 4 feet and analyzed for the VOCs and SVOCs listed in STARS Table 2, glycols and priority pollutant metals.

The analytical results of the dry well soil/sediment samples indicated that several VOCs were detected in the shallow (0-2') soil/sediment sample collected at dry well NRDW1 at estimated concentrations that were below the NYSDEC TAGM criteria. However, SVOCs were detected in the shallow (0-2') and deeper (2'-4') soil/sediment samples at concentrations exceeding the individual NYSDEC TAGM criteria for several PAHs including benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene and chrysene. It should be noted that the NYSDEC TAGM criteria for total PAHs and total CaPAHs were not exceeded. Several priority pollutant metals, including arsenic, cadmium, chromium, lead, mercury and zinc were detected in the shallow (0-2') soil/sediment sample collected at dry well NRDW1 at concentrations exceeding Eastern USA background levels; however, cadmium and chromium were not detected at concentrations in excess of the proposed revised criteria in NYSDEC TAGM 4046.

Recommendations

Based on the presence of SVOCs and priority pollutant metals at levels exceeding the NSYDEC TAGM criteria and Eastern USA background levels in the soil/sediment samples collected at dry well NRDW1, it is recommended that additional remedial actions be conducted at this dry well. Therefore, it is recommended that the following remedial activities be undertaken at dry well NRDW1: removal of the concrete dry well cover for access to its interior;

removal and proper disposal of liquids present in the dry well; excavation, transportation and proper disposal of additional (minimum of 2 feet) soil/sediment material from the bottom of the dry well to expose clean native sand, if possible; collection of composite samples of the excavated material and laboratory analysis for VOCs, TCLP metals, total petroleum hydrocarbons and flash point for waste characterization and disposal purposes; and backfilling of the dry well to grade with clean sand.

QUALIFIERS
U: Compound analyzed for but not detected.
ND: Not detected.

NOTES
*: The peaks present in the samples are present in the 10W40 retention time range. However, the peak pattern does not match the pattern.

QUALIFIERS:
U: Compound analyzed for but not detected.
B: Compound concentration is less than the CRDL but greater than the IDL.

NOTES:
: Value exceeds TAGM 4046 criteria for cadmium or chromium or Eastern USA Background Levels for all other metals.
* : New York State Background.
** : Background for metropolitan or suburban areas.
*** : Proposed revised criteria for cadmium and chromium in TAGM 4046 Appendix A.
