Dear Steve:

Enclosed is one copy of the Operable Unit 3 – Interim Operation, Maintenance, and Monitoring Report and Startup Summary for February 2008 to June 2008, Former Grumman Settling Ponds, Bethpage, New York, NYSDEC Site #1-30-003A on CD.

In general, the system is operating as designed. As you recall, the Operable Unit 3 Soil Gas Interim Remedial Measure is equipped with a single 10,000 lb vapor phase granular activated carbon (VPGAC) unit to remove volatile organic compounds (VOCs [primarily trichloroethylene]) from the recovered soil-gas prior to discharge to the atmosphere. The VPGAC unit was provided for in the system design based on the results of initial air modeling that indicated treatment of the collected soil gas (specifically treatment of trichloroethylene) would be required to meet applicable discharge criteria during system startup based on the assumed design variables. However, it was anticipated that the concentrations in the collected soil gas would drop down to levels below applicable discharge criteria within a short time period. Furthermore, it was recommended in the approved 95% Design Report that the temporary VPGAC unit be taken off-line upon confirmation (through laboratory analytical results for the influent vapor stream) that the actual influent concentration of VOCs were below applicable standards.

Total influent vapor analytical data collected during the initial 28-day and extended startup periods are consistent with the design values presented in the Operable Unit 3 Soil Gas Interim Remedial Measure 95% Design Report. In addition, as expected, the concentration of trichloroethylene decreased significantly during the operating period. Specifically, the concentration of trichloroethylene decreased by greater than

90-percent between February 18, 2008 and June 2, 2008. To determine the current regulatory status of influent vapor quality (e.g., the regulatory status of emissions prior to treatment), influent laboratory analytical results were compared to a site-specific annual maximum allowable stack concentration. The annual maximum allowable stack concentration (MASC) was calculated during each monitoring event for individual compounds using the output from a United States Environmental Protection Agency (USEPA) Screen 3 model in conjunction with the NYSDEC DAR-1 Annual Guideline Concentrations (AGCs). A detailed summary of the model inputs and outputs is provided in the attached monitoring report. A summary of the instantaneous percent (e.g., not time-weighted) of the site-specific annual MASC for detected compounds is provided in Attachment A-1. A summary of the cumulative percent (e.g., time-weighted) of the site-specific MASC for detected compounds is also provided on Attachment A-1. As shown in Attachment A-1, the instantaneous percent (e.g., not time-weighted) of the site-specific annual MASC for each of the detected compounds was less than 10-percent of their respective MASCs during the last three monitoring events. Likewise, the time-weighted site-specific cumulative percent of the annual MASC is well below the calculated discharge criteria. It is expected that influent vapor concentrations will continue to be stable to declining based on engineering experience at similar sites. Specifically, this trend is typical for depressurization systems due to continuous flushing/recovery of the pore vapors and generation of ambient air flow paths into the subsurface as a result of the negative pressure gradient established through depressurization.

Based on the analysis provided, Northrop Grumman Systems Corporation (NGC) requests approval to remove the temporary VPGAC unit. As a conservative measure, the VPGAC would be taken offline and removed in a phased approach. Specifically, it is proposed to take the VPGAC offline (e.g., bypassed) by no later than August 29, 2008. The VPGAC unit would remain on-site as a contingent measure for an additional three (3) months. If laboratory analytical data from the November 2008 monitoring event continue to indicate stable to decreasing analytical trends, the VPGAC would be removed from the site during December 2008.

If you have any questions, please do not hesitate to contact us at any time.

Sincerely,

ARCADIS

1. Introduction

This Operable Unit 3 (OU3) Soil Gas Interim Remedial Measure (soil gas IRM) Interim Operation, Maintenance, and Monitoring Report and Startup Summary were prepared by ARCADIS of New York, Inc. (ARCADIS) on behalf of Northrop Grumman Systems Corporation (Northrop Grumman). This report is being submitted pursuant to the Order On Consent (Consent Order or CO) Index # W1-0018-04-01 that was executed by the New York State Department of Environmental Conservation (NYSDEC) and Northrop Grumman, effective July 4, 2005 (NYSDEC 2005). The present day Bethpage Community Park property (Park), which the NYSDEC has termed the "Former Grumman Settling Ponds Area" and designated as OU3, is referred to herein as the Site. A site location map is provided on Figure 1.

This report summarizes the startup/shakedown, troubleshooting, and routine operation, maintenance and monitoring (OM&M) activities for the soil gas IRM performed from January 28 through June 2, 2008. System startup/shakedown was completed between January 28, 2008 and May 19, 2008 in accordance with the System Startup Plan, which was provided to the NYSDEC on February 8, 2008 as Attachment C-2 of the Soil Gas Interim Remedial Measure Sampling and Analysis Plan (ARCADIS 2008). The Sampling and Analysis Plan was provided to the NYSDEC as Appendix C of the Soil Gas Interim Remedial Measure 95% Design Report and Design Drawings dated September 7, 2007 (ARCADIS 2007). The Sampling and Analysis Plan was approved by the NYSDEC in a letter dated August 1, 2008 (NYSDEC 2008). In addition, this report provides a brief summary of the soil management activities and analytical results that were completed during the construction of the soil gas IRM. The Soil Management Plan and addendums were approved by the NYSDEC on November 16, 2007, December 7, 2007, and January 7, 2008 in accordance with the Soil Management Plan dated November 9, 2007, as amended by letters to NYSDEC dated November 27, 2007 and January 4, 2008.

A description of the soil gas IRM system startup/shakedown and OM&M activities completed during the reporting period is provided below.

2. Soil Gas Interim Remedial Measure System Description

The OU3 soil gas IRM was constructed in accordance with the Soil Gas Interim Remedial Measure 95% Design Report and Design Drawings which was approved by the NYSDEC on September 19, 2007. A general site plan that shows the major process equipment, depressurization, and monitoring well locations is provided on

Figure 2. A process flow diagram that shows sampling and monitoring locations is provided on Figure 3. A complete set of as-built drawings will be provided, under separate cover, as part of the Operation, Maintenance and Monitoring Manual.

In summary, the soil gas IRM consists of the following major components:

- 18 depressurization wells and 47 associated induced vacuum monitoring wells at the locations shown on Figure 2.
- Two (2) "dry-van" type storage containers, which contain the following equipment:
  - Three (3) 52-gallon moisture separators to remove condensate from the influent vapor stream;
  - Two (2) 20-horsepower(hp) and one (1) 30-hp regenerative type depressurization blowers;
  - A programmable logic controller (PLC) based control system;
  - An autodialer;
  - Associated piping, valves, sample ports, gauges, electrical equipment, and other devices necessary to safely control, operate, and monitor the system.
- One (1) heat exchanger to condition the effluent vapor stream prior to treatment; and,
- One (1) 10,000 pound (lb) vapor phase granular activated carbon bed (VPGAC).

A detailed description of the system will be provided in the Operations, Maintenance, and Monitoring Manual to be provided to the NYSDEC under separate cover. A description of the soil gas IRM system startup/shakedown and OM&M activities completed during the current reporting period is provided below.

3. Operation and Maintenance Activities

The following section provides a summary of the operation and maintenance activities completed during the referenced reporting period. A summary of the system startup/shakedown methodology and results is also provided.

3.1 System Mechanical Startup/Shakedown

System mechanical startup/shakedown was completed, in accordance with the System Startup Plan (ARCADIS 2008), during the weeks of January 28, 2008 and February 4, 2008. In summary, system mechanical startup/shakedown consisted of the following major components:

- Off-site testing of all major mechanical equipment, alarms, interlocks, and controls to ensure proper operation and motor rotation (in accordance with the specifications and manufacturer's requirements); this initial testing was completed by the equipment supplier within their construction yard prior to shipment to the Site;

- On-site testing of all major mechanical equipment, alarms, interlocks, and controls to ensure proper operation and motor rotation (in accordance with the specifications and manufacturer's requirements) prior to connecting the system to the depressurization wells;

- On-site testing of all electrical controls (i.e., level switches, transmitters, alarms etc.) to ensure proper operation (in accordance with the specifications and manufacturer's requirements) prior to connecting the system to the depressurization wells; and

- Final on-site troubleshooting and shakedown of the Main Control Panel (MCP).

A copy of the completed mechanical startup/shakedown testing forms will be provided in the Operation, Maintenance and Monitoring Plan to be provided under separate cover. In summary, the offsite and onsite mechanical startup/shakedown testing described above confirmed that the system mechanical and electrical components, including system alarms, were constructed and operated as designed.

The final phase of the mechanical startup/shakedown period was completed on February 6, 2008 and consisted of a brief operating period with the depressurization

wells connected to the system. During this final phase of mechanical startup/shakedown, the depressurization wells were balanced for vacuum and flow in accordance with their initial design parameters provided in the 95% Design Report (ARCADIS 2007). Full time system operation began on February 18, 2008.

During the first two months of system operation, it was observed that the system performance was exceeding the design objectives. Specifically, induced vacuum monitoring data indicated that the combined capture zone of individual depressurization wells was far greater than anticipated based on the results of the pneumatic conductivity testing. The extended capture zone resulted in the recovery of vinyl chloride (VC) from areas outside of the design/target area. To evaluate the situation, ARCADIS petitioned the NYSDEC to extend the startup/troubleshooting period and NYSDEC granted approval. Accordingly, ARCADIS conducted a series of "extended" startup/troubleshooting OM&M site visits between March 18, 2008 and May 19, 2008 to troubleshoot and rebalance the depressurization wells in accordance with design objectives. The final depressurization well set points were established on April 10, 2008. The adjusted depressurization well capture zones resulted in an immediate decline in the recovery of VC. Furthermore, because the depressurization wells operated more efficiently than anticipated, the design capture zone was achieved through operation of 20 hp Blower BL-300 only. Accordingly, Blowers BL-200 and BL-400 were put on standby and have been offline since April 10, 2008.

Discussion of the system startup monitoring program and results is provided in subsequent sections of this report.

3.2 Routine Operation and Maintenance

The soil gas IRM operated continuously during the reporting period with only brief system shutdowns to perform routine maintenance or troubleshooting activities. Routine O&M activities were completed on a monthly basis following full time system operation on February 18, 2008. Routine O&M activities included inspection of all piping, appurtenances, and mechanical equipment for leaks, defects, or other problems and maintenance of equipment in accordance with the manufacturers' specifications.

Discussion of the routine OM&M program and results is provided in the subsequent sections of this report.

4. Monitoring Activities

The following sections summarize the methodology used for system startup/shakedown monitoring, routine performance monitoring, and routine compliance monitoring during the current reporting period.

4.1 System Startup/Shakedown Monitoring

System startup/shakedown monitoring was completed in accordance with the System Startup Plan, which was provided as Attachment C-2 of the Soil Gas Interim Remedial Measure Sampling and Analysis Plan dated February 8, 2008 (ARCADIS 2008). A discussion of deviations from the methodology described in the System Startup Plan, including the extended startup monitoring period for system rebalancing, is provided below.

4.1.1 System Operating Parameters

System operating parameters were collected in accordance with Table C-1.1 and Attachments C-1.1 through C-1.3 of the System Startup Plan. The primary deviation from the methodology described for the first 28 days of system startup was that due to time restraints caused by troubleshooting activities, system operating parameters were only collected once during Day 1 of startup.

Extended system startup operating parameter collection events were conducted on April 16 and May 19, 2008 to evaluate and confirm the system rebalancing troubleshooting activities described previously. Operating parameters were generally collected in accordance with the same criteria referenced in Attachments C-1.1 through C-1.3 of the System Startup Plan.

4.1.2 Vapor Samples

System vapor samples were collected in accordance with Table C-1.1 of the System Startup Plan for both qualitative (photoionization detector [PID]) and quantitative analysis (laboratory analysis). The primary deviation of the methodology described for the first 28 days of system startup was that, due to a sampling error, the Depressurization Well DW-3S sample for laboratory analysis was collected on February 25 instead of during Day 1 of startup (i.e., February 18, 2008).

Extended system vapor sample collection events were conducted on April 16 and May 19, 2008 to evaluate and confirm the system rebalancing troubleshooting activities described previously. Similar to the first 28 days of startup, the additional sampling included the collection of vapor samples for both qualitative and quantitative analysis. Specifically, qualitative samples were collected from the individual depressurization wells and from the total influent and total effluent from the VPGAC. Total influent (VSP-601) and total effluent (VSP-602) vapor samples were submitted for laboratory analysis of site related constituents of concern (COCs) using EPA Method TO-15+, as outlined in the Sampling and Analysis Plan. In addition, vapor samples were collected and submitted for laboratory analysis from individual Depressurization Wells DW-3S, DW-7S, DW-4D, and DW-3D. These four samples were submitted to Air Toxics, Ltd. located in Folsom, California and analyzed for VOCs using their proprietary-modified EPA Method TO-15.

4.1.3 Condensate Samples

System condensate samples were collected from Moisture Separators KO-200 and KO-300 and Condensate Storage Tank ST-510 on March 17, 2008 in accordance with Table C-1.1 of the System Startup Plan. A condensate sample could not be collected from Moisture Separator KO-400 due to the lack of water generation during the reporting period.

4.2 Routine Performance Monitoring

Routine performance monitoring was completed on June 2, 2008, in accordance with Table C-1 of the Sampling and Analysis Plan. A brief discussion of the routine performance monitoring methodology and/or deviations from the methodology described in the Sampling and Analysis Plan is provided below.

4.2.1 System Operating Parameters

System operating parameters that fall under the performance monitoring program include the parameters listed in Attachments C-3.2 and C-3.3 of the Sampling and Analysis Plan. There were no significant deviations from the recording of these parameters during the routine monitoring event.

4.2.2 Vapor Samples

One (1) routine performance monitoring vapor sample was collected for laboratory analysis from the total influent sample location (VSP-601) during the June 2, 2008 monitoring event. The sample was collected and submitted to the laboratory in accordance with the requirements set forth in the Sampling and Analysis Plan. In addition, supplemental performance monitoring vapor samples were collected from all individual depressurization wells for quantitative analysis using a PID.

4.3 Routine Compliance Monitoring

Routine compliance monitoring was completed on June 2, 2008 in accordance with Table C-1 of the Sampling and Analysis Plan. A brief discussion of the routine compliance monitoring methodology and/or deviations from the methodology described in the Sampling and Analysis Plan is provided below.

4.3.1 System Operating Parameters

System operating parameters that fall under the compliance monitoring program include the compliance related induced vacuum measurements listed in Attachments C-3.1 of the Sampling and Analysis Plan. There were no significant deviations from the recording of these parameters during the routine monitoring event.

4.3.2 Vapor Samples

One (1) routine compliance monitoring vapor sample was collected for laboratory analysis from the total effluent sample location (VSP-602) during the June 2, 2008 monitoring event. The sample was collected and submitted for laboratory analysis in accordance with the requirements set forth in the Sampling and Analysis Plan.

4.3.3 Condensate Samples

A compliance monitoring condensate sample was not collected for laboratory analysis between May 19, 2008 and June 2, 2008 due to a lack of water generation. However, the system startup/shakedown sample that was collected on March 17, 2008 from Storage Tank ST-510 will be used to satisfy the requirements set forth in the County of Nassau Department of Public Works discharge approval letter dated October 16, 2007 (County of Nassau, 2007). The sample was collected and submitted to the laboratory in accordance with the requirements set forth in the Sampling and Analysis Plan.

5. Monitoring Results and Discussion

The following sections summarize and briefly discuss the results for system startup/shakedown monitoring, routine performance monitoring, and routine compliance monitoring during the current reporting period.

5.1 System Startup/Shakedown Monitoring

This following section summarizes the results of the system startup/shakedown monitoring program.

5.1.1 System Operating Parameters

A summary of the system performance monitoring startup/shakedown operating parameters and water-level measurements for February 18, 2008 through May 19, 2008 is provided in Table 1. A summary of the system startup/shakedown induced vacuum measurements is provided in Table 2.

Except as described below, the system generally operated as anticipated and designed during the initial 28-day startup period (i.e., February 18, 2008 through March 17, 2008 [see Tables 1 and 2]). The primary deviation from the 95% design assumptions observed during the initial 28-day startup period was that the depressurization well network operated significantly more efficient (i.e., larger capture zones with a lower required flowrate and wellhead vacuum) than anticipated. This observation, combined with the observation of VC at elevated levels in the influent vapor stream (discussed further in Section 5.1.2), prompted rebalancing of the depressurization wells during the extended startup period, as previously discussed. Key data and observations are as follows:

- The observed wellhead vacuum and extraction flowrate at deep Depressurization Wells DW-7D, DW-3D, DW-5D, DW-6D, DW-1D, and DW-2D were similar to their design parameters during the initial 28-day startup period.

- The observed wellhead vacuum at deep Depressurization Well DW-4D was lower than anticipated during the initial 28-day startup period. Specifically, the design wellhead vacuum was -33.5 inches of water column (iwc) whereas the actual observed vacuum ranged from -3 iwc to -1.5 iwc.

- The observed wellhead vacuum and extraction flowrate at shallow Depressurization Wells DW-1S, DW-2S, DW-3S, DW-4S, DW-6S, DW-7S, DW-8S, DW-9S, DW-10S, and DW-11S were similar to their design parameters during the initial 28-day startup period.

- The observed extraction flowrate at shallow Depressurization Well DW-5S was generally lower than anticipated during the initial 28-day startup period. Specifically, the design flowrate was 150 standard cubic feet per minute (scfm) at -3.9 iwc whereas the actual observed parameters were typically 20 scfm at -2.5 iwc to -1.5 iwc.

- The average induced vacuum reading for compliance-related monitoring points (for discussion purposes herein, compliance-related monitoring points are those monitoring points that are located the furthest lateral distance away from a respective depressurization well and include Monitoring Wells VMWC-3A, 3B, 3C, 3D, 7A, 7B, 11B, 12D, 13D, 14A, 14B, 14D, 15A, 15B, 15D, 16A, 16B, 16D, 17D, 18A, and 18B) measured during the initial 28-day startup period was approximately -0.317 iwc. This value is higher than the design induced vacuum of -0.1 iwc.

- The average induced vacuum reading at non-compliance monitoring points (non-compliance monitoring points include all monitoring points that are not designated as compliance monitoring points) measured during the initial 28-day startup period, was approximately -0.64 iwc.

- The average induced vacuum reading for compliance-related monitoring points measured during the extended startup period was approximately -0.137 iwc.

- The average induced vacuum reading at non-compliance related monitoring points measured during the extended startup period was approximately -0.35 iwc.

- The depressurization blowers operated in accordance with their respective blower curves based on their respective total influent vacuum, total effluent pressure, and total extraction flowrates.

- Condensate water was generated at a rate lower than the anticipated design generation rate. Specifically, approximately 178 gallons of condensate water was generated from Condensate Knockout Tanks KO-200 (99 gallons), KO-300

(79 gallons), and KO-400 (0-gallons), respectively during the initial and extended startup/shakedown period.

- Perched water was not encountered in induced vacuum monitoring wells VMWC-1C or VMWC-5B.

- The heat exchanger influent temperature was lower than the design influent temperature of 150 degrees Fahrenheit (deg F) during the initial and extended startup period and ranged from 104 deg F to 85 deg F. The lower observed temperature is the direct result of more efficient system operation (e.g., lower required vacuum, flowrate, and pressure to achieve the design capture zone). Specifically, the depressurization blowers operate lower on their respective blower curves resulting in less motor heat generation and transfer. Accordingly, the heat exchanger was put on standby (e.g., not operational) because the vapor stream required no additional conditioning prior to entering the VPGAC unit.

A summary of system startup vapor and condensate sample field and laboratory analytical results is provided below.

5.1.2 Vapor Samples

A summary of the system startup/shakedown qualitative vapor sample analytical results (i.e., PID readings) is provided in Table 1. A summary of the system startup/shakedown individual depressurization well vapor sample laboratory analytical results for detected compounds is provided in Table 3. A summary of the system startup/shakedown total influent and total effluent vapor sample laboratory analytical results for detected compounds is provided in Table 4. A summary of all vapor sample analytical results (including detected, non-detect, and tentatively identified compounds [TICs]) is provided in Appendix A.

In general, depending on the specific location sampled, the individual depressurization well influent quantitative and qualitative volatile organic compound (VOC) analytical results varied (i.e., higher or lower) compared to their respective design concentrations. However, the overall combined total influent concentration was generally consistent with the design concentrations during the initial and extended startup/shakedown period. As discussed previously, VC was unexpectedly observed at elevated concentrations beginning with the March 2, 2008 startup monitoring event and ending with the May 19, 2008 extended startup monitoring event. The decrease in VC observed during the May 19, 2008 event is attributed to the system

troubleshooting/rebalancing activities completed during the extended startup period. Specific observations from applicable laboratory analytical data are as follows:

- Total VOCs (TVOC) concentrations for Depressurization Wells DW-7S (44,510 micrograms per meter cubed [ug/m3]), DW-7D (137,380 ug/m3), DW-3S (3,844 ug/m3), and DW-1D (1,907 ug/m3) were higher than their respective design concentrations.

- TVOC concentrations for Depressurization Wells DW-3D (74,448 ug/m3), DW-5S (471 ug/m3) , DW-5D (1,676 ug/m3), DW-6S (674 ug/m3), DW-6D (1,994 ug/m3), DW-8S (1,189 ug/m3), DW-9S (349 ug/m3), DW-10S (214 ug/m3), and DW-11S (282 ug/m3) were lower than their respective design concentrations.

- TVOC concentrations for Depressurization Wells DW-1S (778 ug/m3), DW-4S (1,669 ug/m3), DW-4D (1,832 ug/m3), DW-2S (1,328 ug/m3), and DW-2D (987 ug/m3) were consistent with their respective design concentrations.

- The TVOC concentration for the total influent sampling location (i.e., VSP-601) was slightly higher than its' respective design concentration for Day 1 of system startup/shakedown (20,622 ug/m3) but steadily declined to below its' respective design concentration thereafter. Specifically, the TVOC concentration was 2,118 ug/m3 during the final monitoring event (May 19, 2008) conducted during the extended startup period. This trend is typical for depressurization systems due to continuous flushing/recovery of the pore vapors and generation of ambient air flow paths into the subsurface as a result of the negative pressure gradient established through depressurization.

- The TVOC concentration for the total effluent sampling location (i.e., VSP-602 – located after treatment through the VPGAC unit) was as expected and ranged from below the limits of detection during Day 1 of system startup to a maximum of 920 ug/m3 observed during the March 17, 2008 monitoring event. The increase in TVOCs during the March 17, 2008 monitoring event was a direct result of the capture of VC discussed above. However, the concentration of VC dropped significantly as a result of the system troubleshooting/rebalancing activities completed during the extended startup period. Specifically, the concentration of VC was 65 ug/m3 during the May 19, 2008 monitoring event. Despite the presence of VC in the effluent air stream, the cumulative air emissions for VC is still significantly lower than its respective emissions limit. A

description of the air emissions modeling results are provided in Section 6 of this report.

- Several TICs were detected in individual depressurization wells with cumene being detected most consistently.

- Several TICs were also identified in the total influent and total effluent vapor samples. Currently, ARCADIS does not believe that further investigation is warranted based on the TIC data. However, TICs will continue to be evaluated in future monitoring events. It should be noted that cumene was not detected in the total influent and total effluent vapor samples.

A summary of system startup condensate sample laboratory analytical results is provided below.

5.1.3 Condensate Samples

A summary of the system startup/shakedown condensate sample laboratory analytical results for detected compounds is provided in Table 5. A summary of laboratory analytical results for all compounds (including detected, non-detect, and TICs) is provided in Appendix B.

Except as described below, condensate sample laboratory analytical results were as anticipated and contained generally low levels of site-related VOCs. 2-Butanone (MEK) was detected at a comparatively elevated concentration of 1 milligrams per liter (mg/L) and 1.3 mg/L for Moisture Separators KO-200 and KO-300, respectively. It is unclear if the presence of this compound is the result of system construction activities (e.g., PVC glue/primer, etc.) or if it is a site-related COC.

Laboratory analytical results for Storage Tank ST-510 (i.e., sample ID WSP-510) generally contained the same suite of compounds observed within individual Moisture Separators KO-200 and KO-300 but at comparatively lower concentrations. The lower concentration observed in the storage tank is likely the result of volatilization.

Several TICs were identified in the condensate samples. Currently, ARCADIS does not believe that the data warrant additional investigation at this time. ARCADIS will continue to monitor TIC data during future sampling events.

5.2 Routine Performance Monitoring

This following section summarizes the results of the routine system performance monitoring event completed on June 2, 2008.

5.2.1 System Operating Parameters

A summary of the performance monitoring system operating parameters for the June 2, 2008 monitoring event is provided in Table 1. A summary of non-compliance (e.g., performance monitoring) induced vacuum measurements is provided in Table 2.

As shown in Table 1, system operating parameters recorded in June 2008 remained consistent with operating parameters recorded during the final extended startup/shakedown monitoring event conducted in May 2008. These data suggest that the system is running as designed and is maintaining a negative pressure curtain along the southern and western property boundaries. Additional key data and observations are as follows:

- The observed wellhead vacuum and extraction flowrate remained generally consistent in all depressurization wells when comparing May 19, 2008 to June 2, 2008 monitoring data.
- The average induced vacuum reading at non-compliance monitoring points was approximately-0.312 iwc for all monitoring points measured during the June 2008 monitoring event.
- Condensate water was not generated between May 19, 2008 and June 2, 2008.
- Perched water was not encountered in induced vacuum monitoring wells VMWC-1C or VMWC-5B.
- The heat exchanger influent temperature (85 deg F) remained lower than the design influent temperature of 150 degrees. Accordingly, the heat exchanger was kept on standby between May 19, 2008 and June 2, 2008.

5.2.2 Vapor Samples

A summary of the June 2008 qualitative vapor sample analytical results is provided in Table 1. A summary of the June 2008 total influent vapor sample laboratory analytical

results for detected compounds is provided in Table 4. A summary of all vapor sample analytical results (including detected, non-detect, and tentatively identified compounds [TICs]) is provided in Appendix A.

Qualitative vapor analyses (e.g., PID) were consistent with startup/shakedown data and were generally below the limits of detection for all samples collected. Total influent (VSP-601) laboratory analytical results for the June 2, 2008 monitoring event were consistent with analytical results from May 19, 2008. Specifically, TVOC concentrations were 2,232 ug/m3) during the June 2008 monitoring event. VC concentration was below the limits of detection.

Chlorodifluoromethane and an unknown CFC were reported as TICSs by the laboratory during the June 2008 monitoring event. However, ARCADIS does not believe that further investigation is warranted at this time.

5.3 Routine Compliance Monitoring

This following section summarizes the results of the routine system compliance monitoring event completed on June 2, 2008.

5.3.1 Induced Vacuum Measurements

Induced vacuum measurements collected during the June 2, 2008 monitoring event are summarized in Table 2. As referenced in the 95% Design Report, the soil gas IRM was designed to maintain a negative pressure of -0.1 iwc on a time-weighted rolling average within all monitoring points. Accordingly, the time-weighted rolling average for all induced vacuum monitoring points has been provided in Table 2. As shown on Table 2, the rolling average for all individual monitoring points was greater than -0.1 iwc as of June 2, 2008. Specifically, the average induced vacuum for compliance monitoring wells during the June 2, 2008 monitoring event was -0.146 iwc which indicate that the soil gas IRM is operating as designed.

5.3.2 Vapor Samples

A summary of the June 2008 qualitative vapor sample analytical results is provided in Table 1. A summary of the June 2008 total effluent vapor sample laboratory analytical results for detected compounds is provided in Table 4. A summary of all vapor sample analytical results (including detected, non-detect, and tentatively identified compounds [TICs]) is provided in Appendix A.

Qualitative vapor analyses (e.g., PID) were consistent with startup/shakedown data and were below the limits of detection. Total effluent (VSP-602) laboratory analytical results for the June 2, 2008 monitoring event were consistent with analytical results from May 19, 2008. Specifically, the TVOC concentration was 274 ug/m3 during the June 2008 monitoring event. VC detected at a concentration (13 ug/m3) that is slightly above the limits of detection. A summary of the air emissions model completed to confirm compliance with applicable air discharge standards is provided in Section 6.

5.3.3 Condensate Samples

As discussed previously, laboratory analytical results for Storage Tank ST-510 collected on March 17, 2008 will be used for compliance monitoring purposes during the current reporting period. TVOC were detected at a concentration of 0.515 mg/L, which is below the discharge standard of 1 mg/L set forth by the Town of Oyster Bay.

6. Air Emissions Model

Effluent vapor laboratory analytical results were compared to the NYSDEC Division of Air Resources Air Guide-1 (DAR-1) Short-term Guideline Concentrations (SGCs). In addition, effluent vapor laboratory analytical results were compared to a site-specific modeled annual maximum allowable stack concentration. The annual maximum allowable stack concentration (MASC) was calculated during each monitoring event for individual compounds using the output from a United States Environmental Protection Agency (USEPA) Screen 3 model in conjunction with the NYSDEC DAR-1 Annual Guideline Concentrations (AGCs). Specifically, a scaling factor was calculated using the SCREEN3 model with site-specific physical layout (e.g., building dimension, stack height, terrain, etc.) and operating data (e.g., discharge flowrate, temperature, etc.) inputs for each monitoring event. The scaling factor was then used to adjust (scale) the NYSDEC DAR-1 AGC to a site-specific annual MASC. A summary of the instantaneous percent (e.g., not time-weighted) of the site-specific annual MASC for detected compounds is provided in Table 6. A summary of the cumulative annual percent (e.g., time-weighted) of the site-specific MASC for detected compounds is also provided on Table 6. A summary of the model input, outputs, and backup calculations is provided in Appendix C.

In summary, the soil gas IRM effluent vapor met applicable air discharge criteria based on the following:

- The actual concentrations of individual VOCs in the vapor effluent did not exceed their respective SGCs during all monitoring events (Table 3). It should also be noted that all influent (e.g., prior to treatment) individual VOC concentrations were also below their respective SGCs.

- The actual concentration of individual VOCs in the vapor effluent did not exceed their respective instantaneous MASCs as calculated using the USEPA SCREEN 3 Model (Table 6). Similarly, the time-weighted rolling average for all detected compounds is currently well below the MASCs. It should be noted that the instantaneous percent of the site-specific annual MASC for all detected compounds was less than 1-percent during the June 2008 monitoring event and has been declining since the March 17, 2008 monitoring event. It is anticipated that this trend will continue based on the system rebalancing/troubleshooting activities described previously.

7. System Construction Soil Management Summary

As discussed in Section 1 of this report, soils containing constituent concentrations (e.g., VOCs, metals, and polychlorinated biphenyls [PCBs]) above applicable cleanup standards were encountered and managed during the construction of the soil gas IRM. Soils were managed in accordance with the NYSDEC approved Soil Management Plan. A summary of the laboratory analytical results (i.e., waste profile) and waste manifests has been provided in Appendix D. Additionally, a summary of analytical results and delivery tickets for imported recycled concrete aggregate (RCA) and backfill that was used as structural fill during system construction has also been provided.

8. Conclusions and Recommendations

Based on the information provided herein, ARCADIS makes the following conclusions:

8.1 Conclusions

- The off-site and on-site mechanical soil gas IRM system startup/shakedown testing confirmed that the system mechanical and electrical components, including system alarms, were constructed and operate as designed.

- System startup operating parameters collected during the initial 28-day system startup period indicate that the depressurization wells operate more efficiently

than anticipated resulting in large capture zones that exceeded design parameters. This resulted in the recovery of VC from on-site locations outside of the design capture zone. Accordingly, the system startup period was extended and additional troubleshooting/well rebalancing was performed.

- Induced vacuum measurements and influent vapor analytical data collected during the extended system startup period indicated that the rebalancing efforts were successful in achieving its' objectives. Specifically, the capture zones were lowered to their respective design values. To achieve the reduced recovery rates, Blowers BL-200 and BL-400 were taken offline and the depressurization well flowrates were rebalanced.

- VPGAC influent temperature data indicate that the heat exchanger is currently not required to condition the air prior to treatment. Accordingly, the heat exchanger was taken offline and is currently on standby.

- VPGAC effluent data indicate that the VPGAC unit is removing trichloroethylene from the influent vapor stream as designed.

- Condensate water analytical data from Storage Tank ST-510 indicate that the condensate water is in compliance with the discharge requirements set forth by the Town of Oyster Bay POTW.

- June 2008 compliance monitoring results indicate that the system continues to operate as designed. Specifically, a time-weight average induced vacuum of greater than -0.1 iwc was achieved in all induced vacuum monitoring points.

- The actual concentrations of individual VOCs in the vapor effluent did not exceed their respective SGCs during the reporting period.

- The actual concentration of individual VOCs in the vapor effluent did not exceed their respective MASCs as calculated using the USEPA SCREEN 3 model. In addition, the instantaneous percent of the site-specific annual MASC for all detected compounds was less than 1-percent during the June 2008 monitoring event.

8.2 Recommendations

Based on the information provided herein, ARCADIS makes the following recommendations:

- Continue operating the system in accordance with system operating parameters implemented during the extended system startup period.

- Continue to collect system operational data and influent and effluent vapor samples for laboratory analysis on a monthly basis for the next two operating months (e.g., July and August 2008). If data is favorable and continue to indicate a stable trend for all operating parameters and vapor analytical data, perform performance and compliance monitoring on a quarterly basis thereafter.

- Collect induced vacuum measurements from the list of compliance related induced vacuum monitoring wells only during future monitoring events. Non-compliance related induced vacuum monitoring data shall only be collected when system troubleshooting is required, based on the results of compliance related induced vacuum data.

Notes and Abbreviations:

°F - Degrees Fahrenheit
DW- Depressurization well
ft bmp - Feet below measuring point
iwc - Inches of water column
NM -Not measured
scfm - Standard cubic feet per minute
ppmv - Parts per million by voulme
VMWC - Vapor monitoring well cluster

1. Flow rate at manifold on associated dates quantified using venturi flow meter and associated flow chart. Remaining flow rates measured with a hotwire anemometer and calculated to standard conditions using the formula below.
2. Access point covered by insulation no measurement taken during this round.
3. Blowers BL-200 and BL-400 were taken off-line on April 10th during system rebalancing.
4. Field recording error suspected.

Standard Conditions Calculation:

scfm = Flowrate*Area*(Ts/Tm)*(Pm/Ps)

Flowrate in feet per minute
Area in square feet
Ts - Standard Temperature in Rankine
Tm - Measured Temperature in Rankine
Pm - Measured Pressure in pounds per square inch
Ps - Standard Pressure in pounds per square inch

Table 4. Summary of Total Influent and Effluent Vapor Sample Analytical Results, Northrop Grumman Operable Unit 3 Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York [2].

Notes and Abbreviations:

Bold	Compound detected above method detection limit
CAS No.	Chemical abstracts service list number
D	Compound detected at a secondary dilution
NS	Guideline concentrations not specified in the NYSDEC DAR-1 AGC/SGC tables revised December 22, 2005.
SGC	Short-term guideline concentrations specified in the NYSDEC DAR-1 AGC/SGC tables revised December 22, 2005.
TVOC	Total volatile organic compounds
ug/m^3	Micrograms per cubic meter

1. An SGC was not provided in the DAR-1 AGC/SGC Tables, dated December 22, 2003. An interim SGC was developed based on guidance provided in Section IV.A.2.b.1 of the New York State DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants, 1991 edition. Specifically for cis-1,2 dichloroethene, which is not defined as a high-toxicity compound, the interim SGC = (smaller of Time Weighted Average [TWA] =- threshold Limit Value or TWA - Recommended Exposure Limit)/4.2 or 793,000 ug/m3 / 4.2 = 190,000 ug/m3.
2. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Simi Valley, CA or Rochester, NY locations) for VOC analyses using USEPA Method TO-15 modified in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.
3. Table summarizes detected compounds only.

Notes:

1. Compounds listed include all compounds detected in the system effluent vapor stream.
2. AGC refers to the compound-specific annual guideline concentration per the NYSDEC DAR-1 AGC/SGC tables, revised December 22, 2003. NYSDEC DAR-1 AGCs were scaled using the results of a site-specific annual USEPA SCREEN 3 model to calculate the annual maximum allowable stack concentraction (MASC) per monitoring event.
3. Percent of AGC was calculated by dividing the actual effluent concentration by the site-specific annual MASC. Detailed calculations are included in Appendix C.
4. Cumulative percent of the MASC was calculated using a time-weighted average of the percent MASC per event.

$\mu g/m^3$ - Micrograms per cubic meter.

AGC - Annual guideline concentration.

Appendix A-1. Summary of System Startup Vapor Sample Analytical Results,Northrop Grumman Operable Unit 3
Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York[3].

Notes and Abbreviations:

Bold - Compound detected above method detection limit
CAS No. - Chemical abstracts service list number
TVOC - Total volatile organic compounds
ug/m^3 - Micrograms per cubic meter

1. Total Volatile organic compounds determined by summing the individual detections and rounding to the nearest whole number.
2. Depressurization well 3S analytical sample was collected on 2/25 instead of 2/18 due to a sampling error.
3. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Simi Valley,CA or Rochester, NY locations) for VOC analyses using USEPA Method TO-15 modified in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.

Notes and Abbreviations:

--	Not Reported during this sampling event.
NF	Compound was searched for, but not found.
ug/m^3	micrograms per cubic meter

1. Tentatively Identified Compounds (TICs) are identified based on review of mass spectrometry results via a comprehensive library search of all organic compounds.
2. Depressurization well 3S analytical sample was collected on 2/25 instead of 2/18 due to a sampling error.
3. All results are estimated.
4. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Simi Valley, CA or Rochester, NY locations) for VOC analyses using USEPA Method TO-15 modified in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.

Appendix A-4. Summary of Total Influent and Effluent Vapor Sample Analytical Results, Tentatively Identified Compounds, Northrop Grumman Operable Unit 3, Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York(2).

Notes and Abbbreviations:

–	Not Reported during this sampling event.
NF	Compound was searched for, but not found.
ppbv	Parts per billion by volume.

1. Possible laboratory artifact.
2. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Simi Valley,CA or Rochester, NY locations) for VOC analyses using USEPA Method TO-15 modified in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.
3. Tentatively Identified Compounds (TICs) are identified based on review of mass spectrometry results via a comprehensive library search of all organic compounds.
4. All results are estimated.
5. ± = Analyte was detected, but cannot be calculated to ppbv because molecular weight is unknown.
6. Compounds identified in an analysis at a secondary dilution factor.

AN ENVIRONMENTAL ANALYTICAL LABORATORY

Air Toxics Ltd. Introduces the Electronic Report

Thank you for choosing Air Toxics Ltd. To better serve our customers, we are providing your report by e-mail. This document is provided in Portable Document Format which can be viewed with Acrobat Reader by Adobe.

This electronic report includes the following:

- Work order Summary;
- Laboratory Narrative;
- Results; and
- Chain of Custody (copy).

180 BLUE RAVINE ROAD, SUITE B FOLSOM, CA - 95630

LABORATORY NARRATIVE
Modified TO-15 Soil Gas
ARCADIS, Inc.
Workorder# 0804388

Four 1 Liter Tedlar Bag samples were received on April 17, 2008. The laboratory performed analysis via modified EPA Method TO-15 using GC/MS in the full scan mode. The method involves concentrating up to 50 mLs of air. The concentrated aliquot is then flash vaporized and swept through a water management system to remove water vapor. Following dehumidification, the sample passes directly into the GC/MS for analysis.

This workorder was independently validated prior to submittal using 'USEPA National Functional Guidelines' as generally applied to the analysis of volatile organic compounds in air. A rules-based, logic driven, independent validation engine was employed to assess completeness, evaluate pass/fail of relevant project quality control requirements and verification of all quantified amounts.

Method modifications taken to run these samples are summarized in the table below. Specific project requirements may over-ride the ATL modifications.

Requirement	*TO-15*	*ATL Modifications*
Daily CCV	+- 30% Difference	</= 30% Difference with two allowed out up to </=40%.; flag and narrate outliers
Sample collection media	Summa canister	ATL recommends use of summa canisters to insure data defensibility, but will report results from Tedlar bags at client request
Method Detection Limit	Follow 40CFR Pt.136 App. B	The MDL met all relevant requirements in Method TO-15 (statistical MDL less than the LOQ). The concentration of the spiked replicate may have exceeded 10X the calculated MDL in some cases

Receiving Notes

There were no receiving discrepancies.

Analytical Notes

There were no analytical discrepancies.

Definition of Data Qualifying Flags

Eight qualifiers may have been used on the data analysis sheets and indicates as follows:

B - Compound present in laboratory blank greater than reporting limit (background subtraction not performed).

J - Estimated value.

E - Exceeds instrument calibration range.

S - Saturated peak.

Q - Exceeds quality control limits.

U - Compound analyzed for but not detected above the reporting limit.
UJ- Non-detected compound associated with low bias in the CCV
N - The identification is based on presumptive evidence.

File extensions may have been used on the data analysis sheets and indicates as follows:
a-File was requantified
b-File was quantified by a second column and detector
r1-File was requantified for the purpose of reissue

Appendix B-1. Summary of Condensate Sample Analytical Results, Northrop Grumman Operable Unit 3 Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York [2].

Notes and Abbreviations:

Bold	Compound detected above method detection limit
CAS No.	Chemical abstracts service list number
D	Compound detected at a secondary dilution
TVOC	Total volatile organic compounds
ug/L	Micorgrams per liter

1. Total volatile organic compounds determined by summing individual detections and rounding to the nearest whole number.
2. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Rochester, NY) for VOC analyses using Method 8260 in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.

Appendix B-2. Summary of Condensate Sample Analytical Results, Tentatively Identified Compounds (TICs), Northrop Grumman Operable Unit 3 Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York[2].

Tentatively Identified Compound (units in ug/L)	Sample ID: / Date:	WSP-200 3/17/2008	WSP-300 3/17/2008	WSP-510 3/17/2008
Unknown		--	--	**21 J**
Ethanol		--	--	**1200 JN**
Furan, tetrahydro-		**130 JN**	**140 JN**	**73 JN**
Unknown alcohol		--	**14 J**	**21 J**
Cyclohexanone		**17 JN**	**13 JN**	--
Isoproply Alcohol		--	**22 JN**	--
Butanal		--	**5 JN**	--
Heptanal		--	**9 JN**	--
1-Hexanol, 2-ethyl-		--	**14 JN**	--

Notes and Abbreviations:

--	Not Reported
Bold	Detected
J	Estimated value
N	Presumptive evidence of this constituent. Calibrations were not run for these constituents; therefore, the results should be used for qualitative purposes only.
ug/L	Micorgrams per liter

1. TICs are identified based on review of mass spectrometry results via a comprehensive library search of all organic compounds.
2. Samples were collected by O&M personnel on the dates shown and submitted to Columbia Analytical Services Laboratory (Rochester, NY) for VOC analyses using Method 8260 in accordance with the project Sampling and Analysis Plan (ARCADIS,2008) . Data presented in this table corresponds to the period February - June 2008.

Average Annual Concentration at Receptor Height (ug/m^3) [7]		47.7	55.9	51.1	49.8	50.2	103.4	102.2	96
Distance To Max Concentration (m) [8]		66	61	64	64	64	45	45	47

See notes last page.

Table C-1. Summary of SCREEN3 Model Input and Outputs, Northrop Grumman Operable Unit 3 Soil Gas Interim Remedial Measure, Former Grumman Settling Ponds, Bethpage, New York.

Notes

1. The stack air flow rate (in scfm) and temperature were measured using a handheld thermo-anemometer. Values were measured immediately prior to where the effluent air stream enters the vapor-phase carbon unit.
2. The stack air flow rate at the stack temperature (in acfm) was calculated by dividing the stack air flow rate in scfm by the ratio of the standard temperature to the actual stack gas exit temperature.
3. The ambient temperature was recorded from the weather.newday.com website for Islip, New York. The mean actual temperature from the website was used in model calculation.
4. The receptor height corresponds to the average inhalation level.
5. SCREEN3 calculated constituent concentration at listed conditions at the specified inhalation level.
6. A USEPA time averaging conversion factor of 1/0.08 was used to convert the 1-hour maximum concentration output to an annual average.
7. Average annual constituent concentration at the receptor height was calculated by multiplying the one hour maximum concentration by the annualization factor.
8. SCREEN3 calculated distance to the 1-hour maximum concentration.

g/s - Grams per second
ft - Feet
m - Meters
scfm - Standard cubic feet per minute
acfm - Actual cubic feet per minute
K - Kelvin
$\mu g/m^3$ - Micrograms per cubic meter

trans-1,2-Dichloroethene	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%

Notes:

1. Actual effluent concentrations are analytical results from air samples collected on the dates shown.
2. AGC refers to the compound-specific annual guideline concentration per the NYSDEC DAR-1 AGC/SGC tables, revised December 22, 2003.
3. Annual maximum allowable stack concentrations were calculated by dividing the product of the annual guideline concentration of a constituent and the ratio of the SCREEN3 gas emission rate and the SCREEN 3 average annual concentration at receptor height by the air flow rate at the stack temperature and multiplying by the appropriate conversion factors.
4. Percent of MASC was calculated by dividing the actual effluent concentration by the MASC for a given monitoring event.

$\mu g/m^3$ - Micrograms per cubic meter

AGC - Annual guideline concentration

NY001464.1907

Subject:
Soil Management Summary
Operable Unit 3 Soil Gas Interim Remedial Measure Construction
Former Grumman Settling Ponds, Bethpage New York

This memorandum has been prepared to provide a summary of soils exported and material imported during the construction of the Soil Gas Interim Remedial Measure (IRM) for Operable Unit Three (OU3) at the Former Grumman Settling Ponds in Bethpage, New York. In general there were three different waste streams that were exported from the site and two different import materials that were imported to the site. The three different waste streams exported from the site are as follows:

- Pre-construction characterized polychlorinated biphenyls (PCB) impacted soils.
- Volatile organic compound (VOC) and chromium impacted soils; and,
- PCB impacted soils discovered during construction.

The two different import material imported to the site are as follows:

- Common backfill; and
- Recycled concrete aggregate (RCA).

Pre-Construction Characterized Impacted Soils

Prior to mobilization for construction, a pre-characterization program was completed to identify soils that would require off-site disposal from the areas within or just adjacent to the proposed trench alignment. The pre-characterization sample locations, analytical results, and estimated extent of soils removed are identified on Figures D1 and D2. In general these included:

- A zero to four foot excavation within the area where the western leg and southern leg meet.
- A zero to ten foot excavation within the area around boring PC-3-2.
- A zero to eight foot excavation within the area around boring PC-03; and,
- A zero to four foot excavation with the area from approximately B-16W10 to DW-11S.

These soils were shipped to CWM Chemical Services, Inc. Model City Landfill under approved Waste Profile NY296605. Summary tables that present the analytical results for pre-construction laboratory analytical data is provided in Tables D1, D2, D3 and D4. Summary tables that quantify all PCB containing material sent to CWM Chemical Services, Inc. Model City Landfill under Waste Profile NY296605 is provided in Table D1. Copies of manifests for waste transported to CWM Chemical Services, Inc. Model City Landfill are also attached herein.

VOC and Chrome Impacted Soils

On December 17, 2007, during excavation of the trench for the OU3 soil gas IRM, the excavation contractor observed what he characterized as visibly-stained soils along the western leg of the trench. As excavation continued, the visibly-stained soils were removed from the trench and stockpiled. However, shortly after uncovering the visibly-stained materials, the contractor reported an odor that he compared to VOCs. Simultaneous, the community air monitoring equipment used to monitor for VOCs down wind of the excavation indicated the presences of VOCs above the Community Air Monitoring Plan (ARCADIS, March 2006) (CAMP) action level of 5 parts per million (ppm), based on a fifteen minute time-weighted average (TWA). In accordance with the CAMP, excavation activities were halted, the contractor removed equipment from the area, and covered the stock pile and excavation area with polyethylene sheeting.

Soil Sampling Activities

To identify the constituents of constituents of concern (COCs) causing the VOC vapors, ARCADIS collected samples of the staged, visibly-stained soils on December 18, 2007. A back hoe was used to dig approximately one foot into the visibly-stained staged soil pile. The uncovered soil from one location was then placed into a stainless steel bowl. The VOC sample was taken directly from the bowl using a

stainless steel spoon. The remaining soil was then homogenized and used to fill containers for additional sample analyses (i.e., semi volatile organic compounds [SVOCs], PCBs, Toxicity Characteristic Leaching Procedure [TCLP], and Metals). Samples were packaged and sent to Columbia Analytical Services, Inc. of Rochester, New York (Columbia) for laboratory analysis.

Analytical results obtained from the soil sample collected on December 18, 2007 are presented in Tables D6, D7, D8, D9, and D10. Results are summarized below:

- No VOCs, SVOCs, PCBs or Metals were detected in the characterization soil sample at concentrations above the Industrial Soil Cleanup Standards presented in New York State Department of Environmental Conservation (NYSDEC) Part 375.

- No TCLP VOCs were detected in the characterization soil sample.

Response

Based on the results of the characterization sample, excavation activities in connection with the Soil Gas IRM continued. Visibly-stained material were removed (where encountered) to the depth of the trench excavation proposed for the respective area. Visibly-stained material were segregated and staged adjacent to the excavation and covered for off-site transportation.

Disposal

On February 7, 2008 waste characterization samples were collected to provide the required information to prepare a profile for off-site disposal of the impacted soils. Samples indicated elevated levels of VOCs and chromium. As a result, a new profile for disposal of these soils were required due the difference in constituents identified from the original profile prepared for the site. These soils were shipped to CWM Chemical Services, Inc. Model City Landfill during on April 1 and 4, 2008 under approved Waste Profile NY296709. A summary table that quantifies the disposal volume of these soils sent to CWM Chemical Services, Inc. Model City Landfill under Waste Profile NY296709 is provided in Table D11. Copies of manifests for waste transported to CWM Chemical Services, Inc. Model City Landfill are also attached herein.

PCB Impacted Soils Discovered during Construction

In a November 16, 2007 letter from the New York State Department of Environmental Conservation (NYSDEC), the NYSDEC provided acceptance of the approach for soil management provided in the November 9, 2007 soil management plan submittal. The NYSDEC requested the uppermost interval of the post-compacted back fill materials be sampled at the rate of one sample for every 2,000 yards for SVOCs, PCBs, TAL metals and cyanide. Accordingly, soil samples were collected from a stockpile that

was to be used for backfill from the zero to two feet below grade surface (bgs) and were analyzed in accordance with the November 16, 2007 letter from the NYSDEC. On January 9, 2008, a soil sample collected from the zero to two feet bgs stockpile indicated the presence of PCBs at 290 parts per million (ppm) within the stockpile approximately 510 feet west of the fence adjacent to Stewart Avenue. This stockpile had a definitive end at approximately 475 feet west of the fence adjacent to Stewart Avenue. To better define the extent of impacted soils, additional samples were collected on January 16, 2008. Samples were collected and analyzed from this stockpile at approximately 510 feet, 580 feet, 650 feet, and 720 feet west of the fence adjacent to Stewart Avenue. Analytical results indicated that no more than 110 feet of this stock pile were impacted with PCBs greater than 1 ppm. As such, 110 feet of this stockpile were identified for removal from the site as PCB impacted soils. These soils were shipped to CWM Chemical Services, Inc. Model City Landfill during the weeks of March 17 and March 24, 2008 under approved Waste Profile NY296605. A summary table that quantifies all PCB impacted soils sent to CWM Chemical Services, Inc. Model City Landfill under Waste Profile NY296605 provided in Table D1. Copies of manifests for waste transported to CWM Chemical Services, Inc. Model City Landfill is also attached. Tables D6, D7, D8, D9, and D10 summarize the laboratory analytical results for impacted soils encountered during construction.

Common Backfill

As required, common backfill and pipe bedding were imported to the site from 110 Sand Company located in Melville, New York. 110 Sand Company is a New York State Department of Transportation approved aggregate source. On February 20, 2008 a sample of the 110 Sand aggregate was submitted for analysis for VOCs, SVOCs, PCBs, Pesticides, and TAL Metals. Analytical results indicated that there were no exceedences to the industrial standards for all compounds. During the construction a total of approximately 1,086 tons of aggregate was imported to the site from 110 Sand Company. A summary of the imported material quantities from 110 Sand Company is attached to this memo in Table D12. A summary of the analytical data for common backfill is provided in Attachment D-2.

Recycled Concrete Aggregate

During construction of the soil gas IRM a substitution of RCA was made for Dense Graded Aggregate (DGA) due to the limited availability of DGA. In addition, this substitution was made to reduce cost and maintain schedule. The RCA was used in areas as indicated on the contract drawings and within the road crossing areas. The RCA was imported from South Island Industries, Inc. (South Island) of Inwood, New York. South Island is a NYSDOT approved source for Type 2 material and a New York State Department of Environmental Conservation (NYSDEC) approved recycling facility. Samples of the RCA were collected on March 10, 2008 from six locations within a stockpile identified for the soil gas IRM. Samples were analyzed for VOCs, SVOCs, PCBs, Pesticides, TAL Metals, and % moisture. Sample results indicated that there were no exceedences to the industrial standards for those analysis completed. During the construction a total of 280 cubic yards of RCA was imported to the site from South Island Industries,

Inc. A summary of the imported material quantities from South Island Industries, Inc. is attached to this memo in Table D13. A summary of the analytical data for RCA is provided in Attachment D-2.

Notes:
1. Criterion/objective applies to total PCBs.
2. All samples analyzed on a dry weight basis.

ft bls	feet below land surface
IRM	Interim Remedial Mesure
mg/kg	milligrams per kilogram
PCB	polychlorinated biphenyls
TSCA	Toxic Substances Control Act

Table D-5. Transportation and Disposal Summary of PCB Containing Soils Profile NY296605, Operable Unit 3, Soil Gas IRM, Former Grumman Settling Ponds, Bethpage, New York.

LIMIT OF EXCAVATION FOR OFF-SITE DISPOSAL 2 FT BLS

LIMIT OF EXCAVATION FOR OFF-SITE DISPOSAL 10 FT BLS

LIMIT OF EXCAVATION FOR OFF-SITE DISPOSAL 8 FT BLS

LIMIT OF EXCAVATION FOR OFF-SITE DISPOSAL 4 FT BLS

EXPLANATION:

- NORTHROP GRUMMAN PROPERTY LINE
- FENCE
- APPROXIMATE LIMITS OF OU–3 SOIL GAS INTERIM REMEDIAL MEASURE TRENCH
- PHASE 1 SOIL BORING
- PHASE 2 SOIL BORING (ADVANCED TO A DEPTH OF 3.5 FT BLS)
- PHASE 2 SOIL BORING (ADVANCED TO A DEPTH OF 7.5 FT BLS)
- PHASE 3 SOIL BORING (ADVANCED TO A DEPTH OF 4.5 FT BLS)
- PHASE 3 SOIL BORING (ADVANCED TO A DEPTH OF 5.5 FT BLS)
- PHASE 4 SOIL BORING (ADVANCED TO A DEPTH OF 5.5 FT BLS)
- PHASE 5 SOIL BORING (ADVANCED TO A DEPTH OF 5.5 FT BLS)
- PHASE 6 SOIL BORING (ADVANCED TO A DEPTH OF 5.5 FT BLS)
- PHASE 6 SOIL BORING (ADVANCED TO A DEPTH OF 7.5 FT BLS)
- OU–3 RI SOIL BORING
- PC-02 COMPLETED OU–3 IRM PRE–CONSTRUCTION BORING (SEPTEMBER, 2007 BY ARCADIS)
- OFF–SITE DISPOSAL, TSCA
- OFF–SITE DISPOSAL, NON–TSCA

NOTES:

1. PHASE 1 TO 6 SOIL BORING LOCATIONS ARE APPROXIMATE (DVIRKA & BARTILUCCI PCB INVESTIGATION/DELINEATION PROGRAM, JULY 2001).
2. SAMPLE RESULTS DEEPER THEN 8 FEET FOR LOCATIONS PC–03 TO PC–3–8 SHOWN IN TABLE 4.
3. HIGHEST CONCENTRATION BETWEEN 0 TO 0.2 FT AND 0.2 TO 2 FT BLS IS SHOWN.
4. PHASE 1 TO 6 SOIL BORINGS PROVIDED IN JULY 2007 REPORT, PREPARED BY DVIRKA & BARTILUCCI.
5. SOILS IN REMAINDER OF TRENCH AREA WILL BE STOCKPILED AND RE–USED AS BACKFILL.
