2009 Annual Groundwater Monitoring Report

Operable Unit 2
Northrop Grumman Systems Corporation,
Bethpage, New York
NYSDEC Site #s 1-30-0003A & B

1. Introduction

This groundwater monitoring report was prepared to document the operation, maintenance, and monitoring (OM&M) activities for the Operable Unit 2 (OU2) groundwater remedy at the Northrop Grumman Systems Corporation (Northrop Grumman) Bethpage, New York facility. These activities are currently being conducted by Northrop Grumman, in accordance with the New York State Department of Environmental Conservation (NYSDEC)-approved OU2 Groundwater Monitoring Plan (ARCADIS Geraghty & Miller, Inc. 2001), as modified in June 2006 (ARCADIS G&M, Inc. 2006) and the Public Water Supply Contingency Plan (PWSCP) (ARCADIS G&M Inc. 2003a) collectively to meet the remedial objectives set forth in the March 2001 OU2 Record of Decision (ROD) (NYSDEC 2001).

This report describes the performance and effectiveness monitoring of the on-site portion of the OU2 groundwater remedy for the period from September 30, 2009 through January 4, 2010, which is referred to in this report as the Fourth Quarter 2009 report period, or the current period. This report also constitutes the 2009 Annual Report, and compares the current data to Year 2009 data and to longer-term data trends, as applicable.

The monitoring program, as well as the findings, conclusions, and recommendations will be re-evaluated, as additional data become available. The complete description of the on-site portion of the OU2 groundwater remedy, the monitoring program, and rationale/basis for collection and evaluation of data can be found in the NYSDEC-approved OU2 Groundwater Monitoring Plan (ARCADIS Geraghty & Miller, Inc. 2001), as modified in June 2006 (ARCADIS G&M, Inc. 2006) and the PWSCP (ARCADIS G&M Inc. 2003a).

2. Monitoring Program

The results obtained from monitoring activities conducted during this reporting period are provided in Tables 1 through 10 and are described and discussed in the following report sections: Remedial System Operational Performance (Section 3), Groundwater Flow (Section 4), and Groundwater Quality (Section 5).

Except as described in Tables 1 through 10 and in Sections 3, 4, and 5 of this report, the procedures, methodologies, and monitoring network utilized for the subject period are consistent with procedures and methodologies used previously (ARCADIS Geraghty & Miller, Inc. 2001; ARCADIS G&M, Inc. 2003a). The complete description

of the procedures to collect groundwater samples from outpost wells and evaluate and document the results is provided in the PWSCP (ARCADIS G&M, Inc. 2003a).

The locations of the Northrop Grumman site, the OU2 on-site groundwater remedy, the neighboring properties (i.e., the former Naval Weapons Industrial Reserve Plant [NWIRP] and former Occidental Chemical Corporation [OCC]/RUCO Polymer Corporation sites), and existing wells utilized in the monitoring programs are shown on Figure 1. Appendix A of this report contains the field documentation for monitoring activities performed during 2009 by ARCADIS (i.e., groundwater sampling logs and chain-of-custody records).

3. Remedial System Performance Monitoring

This report section summarizes the routine performance monitoring conducted during the Fourth Quarter 2009 and Year 2009 for the on-site portion of the OU2 groundwater remedy, which included the following:

(1) remedial well water quality monitoring, remedial treatment systems effluent water quality monitoring, remedial treatment systems efficiency monitoring, and determination of volatile organic compound (VOC) mass removal, and

(2) monitoring of remedial well pumpage and remedial treatment systems treated effluent discharge to on-site recharge basins.

Also summarized in this report section are the remedial treatment system and remedial well troubleshooting as well as non-routine maintenance activities performed by ARCADIS and Northrop Grumman during the Fourth Quarter 2009.

As stated in previous reports, the on-site remedial wells and remedial treatment systems will be referred to by names that are consistent with Northrop Grumman nomenclature, as summarized in the following table. All monitoring activities will utilize the revised nomenclature.

Former Nomenclature	Revised Nomenclature
Remedial Wells	
GP-1	Well 1
GP-3	Well 3
ONCT-1	Well 17
ONCT-2	Well 18
ONCT-3	Well 19
Remedial Treatment Systems	
GP-1	Tower 96
ONCT	Tower 102

3.1 Water Quality, Treatment Efficiencies, and Mass Removal

Tables 1 and 7 provide the total VOC (TVOC) concentrations detected in the remedial wells. Table 1 provides remedial well TVOC concentrations and treatment efficiencies for the Tower 96 and Tower 102 remedial treatment system air strippers for the current period, VOC mass removed by the remedial wells for the current period and Year 2009, and cumulative TVOC mass removed since Tower 102 remedial system startup.

TVOC concentrations from the remedial wells ranged from 117 micrograms per liter (µg/L) (Well 18) to 2,707 µg/L (Well 3) this period. The discussion of water quality data and trends for the remedial wells is provided in Section 5.1.4 of this report.

A total of approximately 3,196 pounds of VOCs were removed from the aquifer by the remedial wells and treated during the current period. For Year 2009, approximately 12,967 lbs of VOC mass were removed from the aquifer and treated by the OU2 remedial systems. Since full-time startup of the Tower 102 remedial system in November 1998, approximately 146,911 lbs of VOCs have been removed from the aquifer and treated by the Tower 96 and Tower 102 remedial systems.

Northrop Grumman's State Pollutant Discharge Elimination System (SPDES) discharge monitoring results (Permit No. NY0096792) are representative of treated water quality and are used in calculating remedial system treatment efficiency and determining the quality of water returned to the aquifer. SPDES discharge monitoring data are documented on a monthly basis by Northrop Grumman to NYSDEC under separate cover in Discharge Monitoring Reports (DMRs). Northrop Grumman Outfalls 006 and 005, respectively, represent the termini of the Tower 102 and Tower 96 systems effluent water (i.e., inlets to the South Recharge Basins and West Recharge

Basins), respectively. Based on VOC concentrations in the remedial wells and the SPDES discharge this period, the efficiencies of the Tower 96 and Tower 102 remedial treatment systems for the current period were calculated to be greater than 99.9 percent and 99.9 percent, respectively.

3.2 Remedial System Pumpage and Discharge

Table 1 summarizes the remedial well pumpage (with comparison to design criteria) for the current period and Year 2009. For the current period, Remedial Wells 1, 3, 17, 18, and 19 collectively pumped approximately 531 million gallons (MG) of groundwater, which is equivalent to slightly greater than 100 percent of the design remedial well pumpage volume (525 MG). For Year 2009, the remedial system pumped approximately 2,022 MG, equivalent to greater than 99 percent of the total design remedial well pumpage volume (2,030 MG).

Based on measurements collected by ARCADIS, the South Recharge Basins collectively received the treated effluent discharge from the Tower 102 remedial treatment system along with incidental stormwater runoff and contribution from the Tower 96 remedial system for a total average of approximately 2,982 gpm, equivalent to 412.2 MG, during the current period.

As discussed in previous reports, a portion of the treated water from the Tower 96 remedial treatment system is provided on demand to the Calpine Energy facility for consumptive use. The demand rate is controlled by a “Cla-Val” located within a subsurface transmission pipeline between Tower 96 and the Calpine Energy facility. Based on raw water consumption information provided by Calpine Energy to Northrop Grumman the weighted average facility demand by Calpine for this period was 208 gpm, indicating that the West Recharge Basins received an average discharge rate from the Tower 96 remedial system of approximately 687 gpm this period, equivalent to 95 MG.

Based on water-level and pumping data presented in Table 3, with the exception of Well 18 which could not be measured this period, OU2 remedial well specific capacities remain above the minimum required to sustain the design pumping rates, as such no maintenance was needed on remedial wells this period.

3.3 Troubleshooting/Maintenance Activities

Only minor short-term repairs, testing of new component systems, and temporary power outages were noted pertaining to the on-site portion of the OU2 Groundwater Remedy in 2009, no non-routine shut down activities took place.

4. Groundwater Flow

Hydraulic monitoring was performed semi-annually in Year 2009, on March 27 and August 4, 2009. Tables 2 and 3 provide the spring and fall water-level measurement data from the semi-annual events, respectively. Table 4 provides the comparison of vertical hydraulic gradients (calculated from August 2009 water-level measurements) to model-predicted gradients for key monitoring well pairs. Figures 2, 3, and 4 depict groundwater elevations and flow directions in the shallow (water table), intermediate, and deep2 zones, respectively.

Based on the hydraulic monitoring results obtained from the 2009 semi-annual events, groundwater flow conditions are consistent with prior years during which the OU2 remedial system was determined to be providing hydraulic containment of VOCs in groundwater on the Northrop Grumman and NWIRP sites. Specifically, the data indicate vertical hydraulic gradients in the shallow-intermediate wells pairs are oriented downward and are close to or greater than model predicted values (Table 4). As shown on Figures 2 and 3, mounding of the water table and potentiometric surface exists in the shallow and intermediate zones, respectively, extending beneath the South Recharge Basins and across the Northrop Grumman site southern boundary. Downward vertical gradients were also present in the intermediate-deep and deep-deep2 well pairs, supporting the conclusion that groundwater is flowing in a predominantly vertical direction in the deep zone along the Northrop Grumman site southern boundary. Data obtained in Year 2009 indicates that the combination of shallow recharge at the South Recharge Basins coupled with pumpage of the remedial wells in the D2 zone forms a hydraulic barrier to groundwater flow that is preventing the off-site migration of VOC-impacted groundwater. The capture zone formed by the combined pumpage of OU2 remedial wells extended approximately 600 feet downgradient of Well 17 (Figure 4).

5. Groundwater Quality

This report section describes the analytical results of the various groundwater quality monitoring activities for the Fourth Quarter 2009 that are specified in the NYSDEC-

approved Groundwater Monitoring Plan (ARCADIS G&M, Inc., 2001; ARCADIS G&M, Inc. 2006) and the PWSCP (ARCADIS G&M Inc., 2003b). Analytical results are summarized in Tables 5 through 10.

5.1 Volatile Organic Compounds

The evaluation of VOC concentrations is presented herein in consideration of the following factors: (1) proximity to the hydraulic barrier formed by the on-site portion of the OU2 groundwater remedy (i.e., upgradient, along the Northrop Grumman site southern boundary, and downgradient of the hydraulic barrier), (2) hydrogeologic zone (i.e., shallow, intermediate, deep, and D2 zones), and (3) NYSDEC Standards, Criteria, and Guidance (SCGs) Values.

Tables 5 through 10 provide the complete analytical results of samples collected for VOC analysis from monitoring wells, remedial wells, outpost wells, and remedial treatment systems for this period. Time-concentration graphs depicting the long-term VOC concentration trends are shown on Figures 5 through 11.

5.1.1 Shallow Zone

The analytical results of monitoring in the shallow zone in 2009 are provided in prior reports (ARCADIS of New York, Inc. 2009a; b, and c) and these data are incorporated herein by reference. Shallow wells sampled during the Third Quarter 2009 (GM-15S, GM-21S, GM-78S, HN-40S, and HN-42S) exhibited no detections of VOCs with one exception. Trichloroethene (TCE) has been detected in well GM-15S in both the First and Third Quarters at concentrations above NYSDEC SCGs. This monitoring well is within the capture zone of the remedial wells; therefore, groundwater in this area is hydraulically contained and over time will be extracted and treated.

Wells located near or immediately downgradient of the Northrop Grumman site southern boundary (GM-21S and GM-78S) continue to exhibit results similar to data collected since the start up of the OU2 Groundwater Remedy in November 1998, confirming that the operation of the on-site portion of the OU2 groundwater remedy has formed an effective hydraulic barrier that prevents the off-site migration of VOC-impacted groundwater in the shallow zone.

5.1.2 Intermediate Zone

Analytical data for intermediate monitoring wells are provided in Table 5. Intermediate wells sampled during this period (GM-20I, GM-21I, and GM-79I) are located immediately downgradient of the Northrop Grumman site southern boundary.

Laboratory results indicated no detections of VOCs along the Northrop Grumman site southern boundary during this period or Year 2009. These analytical results confirm that the operation of the on-site portion of the OU2 groundwater remedy has formed an effective hydraulic barrier that prevents the off-site migration of VOC-impacted groundwater in the intermediate zone.

5.1.3 Deep Zone

Groundwater monitoring data from the deep zone for the Fourth Quarter 2009 is summarized in Table 6 and key data trends are shown in Figures 6, 7, 8, 10, and 11. Data trend graphs include key wells with detectable concentrations of VOCs that were sampled in Year 2009.

Well GM-13D (most recently sampled in the Third Quarter 2009 [(ARCADIS of New York, Inc. 2009c]), located upgradient of the OU2 Groundwater Remedy, continued to exhibit a downward trend in TVOC concentrations with a decrease in TVOC concentrations of 84 percent since year 2000 (Figure 7).

Well GM-74D, located upgradient of the remedial wells, did not exhibit detections in the Year 2009. The other four deep monitoring wells (i.e., GM-39D_A, GM-39D_B, and GM-73D) located on-site, along the Northrop Grumman site southern boundary, and upgradient of the remedial wells (Figure 1), exhibited SCG exceedances in the Year 2009. These monitoring wells are within the capture zone of the remedial wells; therefore, groundwater in this area is hydraulically contained and over time will be extracted and treated.

Groundwater quality data from wells immediately downgradient of the Northrop Grumman site (Wells GM-20D and GM-21D) exhibited no VOC detections during this period and Year 2009. Well GM-79D continues to exhibit a downward trend (Figure 8).

Wells located further downgradient of the hydraulic barrier exhibited TVOC concentrations consistent with the expected concentrations in the portions of the groundwater VOC plume not actively remediated. The deep well located at the GM-

75D2 Area (Well GM-34D) historically exhibited VOCs exceeding SCGs and VOC concentrations that have exhibited a decrease trend since December 2006 (Figure 10). Well GM-34D is located south of Well GM-75D2 (Figure 1 – see Section 5.1.4 for additional detail). The Navy completed drilling of vertical profile borings as part of an additional investigation of the GM75D2 Area. The report has been submitted separately to NYSDEC.

In the GM-38 Area, southeast of the Site, Well GM-38D continues to exhibit VOC concentrations consistent with the long-term trend (Figure 11). The Navy completed construction of the GM-38 Area Groundwater Remedy and system startup occurred in September 2009. Refer to reports prepared by the Navy for additional details on the OM&M of the GM-38 Groundwater Remedy.

Groundwater quality data continues to support the conclusion that the expected bifurcation of the VOC plume is occurring along the Northrop Grumman site southern boundary, as shown by no detections in wells located within the capture zone immediately off site. SCG exceedances continue to persist in wells screened in the portion of the groundwater VOC plume not actively remediated.

In general, the water quality data from the deep wells sampled during the current period and Year 2009 continue to support the interpretation of the hydraulic data and confirm that the operation of the on-site portion of the OU2 groundwater remedy has formed an effective hydraulic barrier that prevents the off-site migration of VOC-impacted groundwater in the deep zone.

5.1.4 Deep2 Zone and Remedial Wells

Groundwater monitoring data from the D2 zone are summarized in Table 7 and data trends are presented on Figures 5, 6, 9, 10, and 11. The data trend graphs presented in this report include key wells with detectable concentrations of VOCs that were sampled this period.

Well GM-33D2 (Figure 5), located along the southwestern boundary of the Northrop Grumman site, exhibited three VOCs (Freon 113, TCE, and tetrachloroethene) that exceeded SCGs in this period, with similar exceedances detected the first three quarters of Year 2009. The trend in TVOC concentrations in Well GM-33D2 remains downward, consistent with the long-term trend. Well GM-73D2 (Figure 5) exhibits a stable trend with VOC concentrations at or close to 100 ug/l. The other Northrop Grumman site boundary D2 wells (GM-15D2 and GM-74D2 – Figure 6) continue to

exhibit stable VOC concentrations less than 50 µg/L. Wells GM-15D2, GM-33D2, GM-73D2, and GM-74D2 are located within the capture zone of the remedial wells (which are screened in the D2 zone) and therefore groundwater in this area is hydraulically contained and over time will be extracted and treated by the on-site portion of the OU2 groundwater remedy.

For the GM-75D2 Area, off-site Wells GM-34D2, GM-35D2 and GM-75D2 had one or more SCG exceedances each during this period, with TVOC concentrations of 229 µg/L, 215 µg/L and 117 µg/L, respectively. These data are consistent with concentrations expected in the off-site portion of the VOC plume not actively remediated. TVOC concentrations in Well GM-75D2 (Figure 10) have shown a decreasing trend since the Year 2002. The data indicate that TVOC concentrations in Well GM-35D2 (Figure 10) exhibit a slight downward trend since 2002. Section 5.1.3 of this report provides information on Navy activity in the GM-75D2 Area.

The GM-38 Area monitoring results during Year 2009 were provided in prior reports (ARCADIS of New York, Inc. 2009 a; b, c). TVOC concentrations in Well GM-38D2 have decreased since Year 2002 (Figure 11). Section 5.1.3 of this report provides information on Navy activity in the GM-38 Area.

The other off-site D2 zone monitoring wells continue to exhibit stable to decreasing TVOC concentration trends.

For the remedial wells, TVOC concentrations ranged from 117.4 µg/L (Well 18) to 2,707 µg/L (Well 3). With the exception of Well 19, the remedial wells exhibit overall stable to decreasing trends since mid-2006. Well 3 continues to exhibit the highest TVOC concentrations. Refer to Section 3 of this report for a discussion of remedial well performance and VOC mass removed. Well 19 has exhibited an increase trend for the period of record.

In general, the water quality data from the D2 wells sampled during the current period and Year 2009 continue to support the interpretation of the hydraulic data and confirm that the operation of the on-site portion of the OU2 groundwater remedy has formed an effective hydraulic barrier that prevents the off-site migration of VOC-impacted groundwater in the D2 zone.

5.2 Outpost Monitoring

The results of the current outpost well monitoring round are provided in Table 8. The complete description of the procedures to collect groundwater samples from the outpost wells and evaluate and document the results is provided in the PWSCP (ARCADIS G&M, Inc., 2003b).

VOCs were not detected in Outpost Wells OW1-2, OW3-1, OW3-2, and OW4-2 during this period and the period of record. Outpost Wells OW1-1 and OW1-3, exhibited detections of site-related VOCs below their respective SCGs, but above the TVOC outpost trigger values this period. Wells OW2-1 and OW2-2 were not monitored during Year 2009 due to on-going Navy activities related to detections of benzene and MTBE. Freon 113 was detected in Well 4-1 but at a concentration less than its respective SCG and trigger value. As no new exceedances of outpost trigger values occurred in Year 2009, the requirements for notification/reporting of the initial trigger value exceedances, as outlined in the PWSCP (ARCADIS G&M, Inc., 2003b), have already been met.

Based on information provided by Aqua New York, TCE was detected in two public supply wells in the Aqua New York Seaman's Neck Road well field (downgradient of Outpost Wells 3-1 and 3-2). Specifically TCE was detected in Supply Well 3S at 0.64 µg/L in September 2006 and in Supply Well 4S at 0.5 µg/L in February 2007. A field investigation to delineate TCE in groundwater near the Aqua New York Seaman's Neck Road well field was completed by the Navy. The report of findings has been submitted to the NSYDEC by the Navy.

5.3 Vinyl Chloride Monomer

Vinyl chloride monomer (VCM) was detected in Well 3 during this period and the Year 2009, but was not detected in the other remedial wells or monitoring wells sampled this period. Implementation of remediation of groundwater to address VCM upgradient (northwest) of Well 3 is currently underway by Occidental Chemical Corporation (OCC) under USEPA oversight.

5.4 Cadmium and Chromium

Cadmium and chromium analytical results for Year 2009 are provided in prior reports (ARCADIS of New York, Inc. 2009a and 2009c). Trend analyses of cadmium trends are shown on Figure 12. While chromium in wells monitored are provided on Figures

13 and 14. No cadmium exceedances were detected in Wells N-10631, GM-78S and GM-78I, downgradient of former Northrop Grumman Plant 2 in 2009.

Chromium concentrations for the wells near former Northrop Grumman Plant 2 (MW-01GF and MW-02GF) continued to be below the SCG (Figure 13), with one exception. Well MW-02GF did have a detection of chromium that exceeded the SCG in the First Quarter; however the concentration decreased to below SCG (22 µg/L) in the Third Quarter, to a concentration consistent with the long-term trend.

Since 2006, the chromium concentration trends in the wells near former Northrop Grumman Plant 1 have been stable to decreasing over time. Notably, the Cr concentration in Well MW-05 has decreased by a factor of three since late 2005 (Figure 14).

5.5 Tentatively Identified Compounds

Tentatively Identified Compounds (TICs) detected during Year 2009 are provided in Table 9. One TIC was detected in four of the rinsate samples collected during Year 2009. A review of the cumulative TIC data shows no discernable trends in concentrations or consistency in TIC detections.

5.6 QA/QC Samples and Data Validation

The results of analysis of QA/QC(field blank and trip blank) samples from the current period are provided in Table 10.

ARCADIS performed validation of all groundwater quality data collected (including TICs) by following the contract laboratory program national functional guidelines for organic and inorganic data review (USEPA 1999). The quality of the data is considered acceptable with the qualifications indicated on Tables 5 through 10.

6. Annual Groundwater Model Update Evaluation

Currently, ARCADIS is updating information such as public water purveyors' well pumpage and water quality data on a regional scale, as well as water quality data collected by ARCADIS and Northrop Grumman from the current groundwater monitoring network (including monitoring well and vertical profile boring data) within the regional model. A comparison of these data with data currently incorporated in both

the conceptual site model and the numerical groundwater model will be performed and evaluated in 2010.

7. Summary and Conclusions

1. The following data indicate that the OU2 groundwater remedy continues to meet remedial performance goals for Year 2009.

    a. During the current period, the OU2 remedial wells pumped 525 MG, or slightly greater than 100 percent of the design volume of groundwater, while the recharge basins received a collective total of 507 MG of treated groundwater, or 165 percent of the design value. For the Year 2009, the OU2 remedial wells pumped 2,022 MG, or slightly greater than 99 percent of the design volume of groundwater, while the recharge basins received approximately 1,753 MG of treated groundwater, or 147 percent of the design value.

    b. Based on data presented in prior reports, OU2 remedial well specific capacities remain above the minimum required to sustain the design pumping rates.

    c. Approximately 3,196 lbs of VOCs were removed from the aquifer and treated by the on-site portion of the OU2 groundwater remedy during the current period. In Year 2009, approximately 12,967 lbs of VOCs were removed from the aquifer and treated, and approximately 146,911 lbs of VOCs were removed and treated since full-time system startup in November 1998.

    d. The treatment efficiencies of both groundwater treatment systems remain above 99 percent for the current period.

2. The following data indicate that the OU2 groundwater remedy continues to meet remedial effectiveness goals for Year 2009.

    a. The hydraulic data indicate that hydraulic containment continues in a manner consistent with previous years.

    b. Water quality data from wells immediately downgradient of the hydraulic barrier show no or trace VOC concentrations or decreasing VOC concentration trends. Groundwater quality data indicates that bifurcation of the VOC plume is continuing in the deep and D2 zones south of the hydraulic barrier.

3. Other significant findings and conclusions with respect to groundwater for Year 2009 are summarized as follows:

   a. Based on data for Year 2009, in the shallow, intermediate, and deep zones, the majority of wells located along the Northrop Grumman site perimeter showed trace or non-detectable concentrations of VOCs.

   b. The majority of D2 wells located along and immediately downgradient of the Northrop Grumman site southern boundary exhibit stable or decreasing concentrations of VOCs. Such wells are located within the capture zone of the remedial wells. Wells located in areas not actively remediated (further downgradient of the Northrop Grumman site) exhibit concentrations indicative of expected VOC plume heterogeneity. The Navy completed drilling of vertical profile borings as part of an additional investigation of groundwater in the GM-75D2 Area and has submitted a report to NYSDEC. The Navy has completed the construction of the Groundwater Remedy in the GM-38 Area and system startup occurred in September 2009.

   c. Site-related VOCs were detected in Outpost Wells OW1-1, OW1-3 and OW4-1. The remaining outpost wells currently monitored exhibited no VOC detections. Aqua New York Seaman's Neck Road well field (downgradient of Wells OW3-1 and OW3-2) has exhibited trace TCE concentrations in the two supply wells. These detections were investigated concurrent to the GM-75D2 Area by the Navy and the GM-75D2 Area report has been submitted to the NSYDEC.

   d. The Cd/Cr analytical results from groundwater monitoring wells around and downgradient of former Plant 2 indicated Cd below the SCG. Cr concentrations continue to be below the SCG. Based on these data, the requirements to terminate post-closure Cd/Cr monitoring of former Plant 2 have been met.

   e. Cr concentrations near former Plant 1 continue to exhibit stable to declining trends.

8. Recommendations

Based on the results included in this report, ARCADIS recommends the following:

1. The groundwater monitoring of wells at former Plant 2 for Cd/Cr can be discontinued.

2. The current model should be evaluated in 2010, per the provisions in the PWSCP.

Table 1. Operational Summary for the On-Site Portion of the Operable Unit 2 Groundwater Remedy, Fourth Quarter 2009, Year 2009, and Period of Record, Northrop Grumman Systems Corporation, Bethpage, New York.

(a) - Design remedial well pumping rates based on computer modeling (ARCADIS G& M, Inc. 2003c). Acceptable design recharge rates based on computer modeling (ARCADIS G&M, Inc. 2004b). Design pumping and recharge rates were modified in April, 2005. Recharge includes remedial well pumpage (minus Calpine demand, Oxy biosparge system demand, incidental irrigation use, and pipe loss), plus incidental runoff from precipitation. Current average recharge rates have been determined using the entire 96-day span of time as opposed to current average pumping rates, which account for varying amounts of downtime, as indicated below.

(b) - OU2 wells were operational during the Fourth Quarter 2009, at the following percentages: Well-1 (98.6%), Well-3 (99.3%); Well-17 (99%), Well-18 (99%), and Well-19 (98%). The Actual Average Pumping Rates and rate of treated water sent to Calpine are for when the wells are pumping. "Cumulative" represents data obtained since system startup in November 2008.

(c) - The TVOC concentration for each well was calculated based on Fourth Quarter 2009 groundwater monitoring data (Table 7).

(d) - TVOC mass removed is based on the TVOC data given above and the following formula:

$$\text{(TVOC concentration in ug/L) X (gallons pumped) X (3.785 L/gal) X } (1 \times 10^{-6}\ \text{g/ug}) \text{ X } (2.2 \times 10^{-3}\ \text{lb/g})$$

(e) Air Stripping Efficiency calculated from values above and in Table 2 using the following formula:

$$1 - \left[\left(\frac{\text{Average SPDES TVOC Concentration at Outfall}}{\frac{[(\text{TVOC}_{\text{Well 1}} \text{ X } Q_{\text{Well 1}}) + (\text{TVOC}_{\text{Well 2}} \text{ X } Q_{\text{Well 2}}) \text{ etc...}]}{(Q_{\text{Well 1}} + Q_{\text{Well 2}} \text{ etc..})}} \right) \right]$$

-When non-detectable levels of VOCs are found in the effluent, a value of zero is used to estimate the efficiency of the air stripper.

(f) -Towers 102 and 96 outfalls are identified as Outfalls 005 and 006, respectively (commonly known as the South Recharge Basins and Plant 5 Recharge Basins, respectively). Complete SPDES reporting provided to NYSDEC by NGC under separate cover.

(g) -Cumulative Year-to-Date Actual Total Pumpage for Treated Water to Calpine includes adjustment from 37 MG to 59.2 MG in Quarter 3 2009 based on revised totalizer readings obtained from NGC.

(h) -Cumulative Year-to-Date Actual Total Pumpage for Treated Water to West recharge basins includes adjustment from 145.2 MG to 124.8 MG in Quarter 3 2009 due to based on revised totalizer readings (obtained from NGC) for Calpine consumption, see note (g).

BPOW4-2	67.18	23.50	43.68

(1) Wells GM-39_A and GM-39_B are screened at the approximate midpoint and basal portion of the deep zone, respectively.

(2) Water level was measured by inflating airline set at 119 ft bmp (gauge at wellhead) and subtracting the reading on the gauge from 120 to obtain the depth to water in ft bmp.

(3) Water level was measured by inflating an airline set at 150 ft bmp (gauge at well head) and subtracting the reading on the gauge from 150 to obtain the depth to water in ft bmp.

(4) Water level was measured by inflating airline set at 110 ft bmp (gauge at wellhead) and subtracting the reading on the gauge from 110 to obtain the depth to water in ft bmp.

(5) A replacement pump (submersible-type) was installed in Well 18 in December 2008. A new port to measure water levels is currenlty being installed. When the port is installed, measurements will be collected on the current semi-annual schedule.

Well 19	63.68	49.13	14.55	721	49.55

(1) Wells GM-39$_A$ and GM-39$_B$ are screened at the approximate midpoint and basal portion of the deep zone, respectively.

(2) Water level was measured by inflating airline set at 119 ft bmp (gauge at wellhead) and subtracting the reading on the gauge from 120 to obtain the depth to water in ft bmp.

(3) Water level was measured by inflating an airline set at 150 ft bmp (gauge at well head) and subtracting the reading on the gauge from 150 to obtain the depth to water in ft bmp.

(4) Water level was measured by inflating airline set at 110 ft bmp (gauge at wellhead) and subtracting the reading on the gauge from 110 to obtain the depth to water in ft bmp.

(5) A replacement pump (submersible-type) was installed in Well 18 in December 2008. A new port to measure water levels is currenlty being installed. When the port is installed, measurements will be collected on the current semi-annual schedule.

(6) Specific capacity values are qualitative in nature, due to fluctuations in static water levels. Sharp declines in specific capacity could indicate the need for well redevelopment.

(7) For Wells 17, 18, and 19 baseline static depth to water measurements were collected in 1997 prior to OU2 system start-up; baseline pumping depth to water and rate measurements (not shown) used with baseline static depth to water measurements to calculate baseline specific capacities, were collected in 1999 during OU2 system operation.
For Well 1, baseline static depth to water and specific capacity measurements were collected in 2001, during pump replacement.
For Well 3, baseline static depth to water and specific capacity measurements were collected in March-April 2005, during re-development activities.

(8) Pumping rate determined at time of pumping depth to water measurement.

Notes

(1) Wells GM-39D$_A$ and GM-39D$_B$ are screened at the approximate midpoint and basal portion of the deep zone, respectively.

(2) Vertical hydraulic gradients are calculated as follows:

$$\frac{(\text{Water-Level Elevation}_1 - \text{Water-Level Elevation}_2)}{(\text{Screen Midpoint Elevation}_1 - \text{Screen Midpoint Elevation}_2)}$$

$_1$ - Shallower well of pairing

$_2$ - Deeper well of pairing

A positive "+" gradient value indicates a downward hydraulic gradient.

A negative "-" gradient value indicates an upward hydraulic gradient.

ft msl feet relative to mean sea level

Table 9. Concentration of Tentatively Identified Compounds (TICs) Detectected in Groundwater Samples in Year 2009
Operable Unit 2, Northrop Grumman Systems Corporation, Bethpage, New York.

Well Identification (units in ug/L)	Constituent: Sample Date	Hexanal
FB081409	8/14/2009	**9 JN**
FB081709	8/17/2009	**5.8 JN**
FB081909	8/19/2009	**6.6 JN**
FB082009	8/20/2009	**5.5 JN**

Notes

TICs are identified based on the review of mass spectrometry results via a comprehensive library search of all organic compounds

ug/L Micrograms per liter

N Presumptive evidence of this constituent. Calibration was not ran for this constituent; therefore the results should be used for qualitative purposes only.

J Estimated value

Low-Flow Groundwater Sampling Log

Project: NORTHROP-GRUMMAN
Project Number: NY001492.0409.0002
Site Location: Bethpage, NY
Well ID: GM-39A (GM-3 D
Date: 8-11-09
Sampled By: Gary Williams
Sampling Time: 3:20 pm
Recorded By: Gary Williams
Weather:
Coded Replicate No.: NA

Instrument Identification
Water Quality Meter(s):
Serial #:

Casing Material: PVC
Purge Method: dedicated bladder.
Casing Diameter: 4"
Screen Interval (ft bmp): Top 262 Bottom 282
Sounded Depth (ft bmp): 282
Pump Intake Depth (ft bmp): 272
Depth to Water (ft bmp): 36.35
Purge Time: Start 2:20 pm Finish 3:20 pm.

Field Parameter Measurements During Purging

Time	Minutes Elasped	Flow Rate (mL/min)	Volume Purged	Temp (°C)	pH (s.u.)	Conductivity (umhos or mS/cm) 1)	ORP (mV)	DO (mg/L)	Turbidity (NTU)	Depth to Water (ft bmp)
2:20				26.7	5.57	118.0	206	11.31		36.35
2:25				22.3	5.48	119.6	225	11.90
