Subject:
Quarterly Operation, Maintenance, and Monitoring Report for the Bethpage Park Groundwater Containment System (BPGWCS), January 1, 2015 to March 31, 2015, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York, NYSDEC Site #1-30-003A.

Date:
May 29, 2015

Dear Steve:

ARCADIS is providing the enclosed Quarterly Operation, Maintenance, and Monitoring Report for the BPGWCS for the period of January 1, 2015 to March 31, 2015, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. As we have transitioned to electronic submittals as part of ongoing sustainability and cost savings efforts, hard copies of the report can be provided on request.

If you have any questions, please do not hesitate to contact us.

Sincerely,

ARCADIS of New York, Inc.

Quarterly Operation, Maintenance, and Monitoring Report Bethpage Park Groundwater Containment System

March 2015

1. Introduction

Pursuant to the Administrative Order on Consent (AOC) Index #W1-0018-04-01 (New York State Department of Environmental Conservation [NYSDEC] 2005) and the Operable Unit 3 (OU3) Record of Decision (NYSDEC 2013), ARCADIS of New York, Inc. (ARCADIS), on behalf of Northrop Grumman Systems Corporation (Northrop Grumman), has prepared this OU3 Bethpage Park Groundwater Containment System (BPGWCS) Quarterly Operation, Maintenance, and Monitoring Report (OM&M Report) for submittal to the NYSDEC. The present-day Bethpage Community Park property (Park) and the McKay Field and Plant 24 Access Roads, which the NYSDEC has termed the "Former Grumman Settling Ponds Area" and designated as OU3, are referred to herein as the Site Area. Figure 1 provides a Site Area location map.

The BPGWCS (previously referred to as the Groundwater Interim Remedial Measure) has been operational since July 21, 2009. This quarterly OM&M Report summarizes the operation, maintenance, and monitoring (OM&M) activities performed during the first quarter of 2015 (i.e., January 1 through March 31, 2015 [the "reporting period"]). During this reporting period, Remedial System and Environmental Effectiveness Monitoring Programs were conducted in accordance with the NYSDEC-approved OU3 groundwater Interim Operation, Maintenance, and Monitoring Manual (OM&M Manual; ARCADIS 2009).

As discussed in the OU3 Site Area Remedial Investigation Report (Site Area RI) (ARCADIS 2011), Northrop Grumman does not take responsibility for certain compounds (e.g., Freon 12 and Freon 22) present in Site Area groundwater. Throughout this OM&M Report, a distinction is made between "Project" and "Non-Project" volatile organic compounds (VOCs), defined as follows:

- "Project VOCs": VOCs that may be related to former Northrop Grumman historical activities. For this OM&M Report, Project VOCs include 1,1,1-trichloroethane; 1,1-dichloroethane; 1,2-dichloroethane; 1,1-dichloroethene; tetrachloroethene; trichloroethene (TCE); vinyl chloride (VC); cis-1,2-dichloroethene (cis-1,2-DCE); trans-1,2-dichloroethene; benzene; toluene; and total xylenes.

- "Non-Project VOCs": VOCs, such as Freon 12 and Freon 22, that are understood to be unrelated to former Northrop Grumman activities but have been detected in Site Area groundwater. As noted in the Site Area RI (ARCADIS 2011), a sub-plume of Freon 22 has been identified originating from the area of the Town of

Oyster Bay's (Town's) former ice rink. Based on Town information (Zervos 2007), Freon 22 was used by the Town and released to the environment.

2. Bethpage Park Groundwater Containment System Objectives

Remedial action objectives (RAOs) for the BPGWCS are as follows:

- Mitigate the off-site migration of project-related, dissolved-phase VOCs. Specifically, the BPGWCS addresses:
  - Ø Groundwater that has total VOC concentrations greater than 5 micrograms per liter (µg/L) in the upper 20 feet of the surficial aquifer across the 1,200-foot-wide lateral extent of the Site Area southern boundary.
  - Ø Groundwater below the upper 20 feet of the surficial aquifer that has total VOC concentrations greater than 50 µg/L across the 1,200-foot-wide lateral extent of the Site Area southern boundary.
- Comply with applicable NYSDEC standards, criteria, and guidance values (SCGs) for treated water and air emissions.

A secondary benefit of the BPGWCS is the creation of a clean-water front atop downgradient groundwater, which minimizes the potential for vapor intrusion downgradient of the Site Area.

3. Bethpage Park Groundwater Containment System Description

The BPGWCS consists of:

- A "pump-and-treat system" where groundwater is:
  - Ø Extracted along the Plant 24 Access Road via four remedial wells
  - Ø Conveyed to a treatment plant at McKay Field via four underground pipelines
  - Ø Treated via air stripping to reduce concentrations of Project and Non-Project VOCs
  - Ø Filtered to remove oxidized metals

- Ø Returned to the aquifer via a discharge pipeline routed to a recharge basin located on the adjacent former Bethpage Navy Weapons Industrial Reserve Plant property

- A vapor-phase treatment system that reduces concentrations of Project VOCs in the air stripper off-gas prior to discharge to the atmosphere

- A groundwater monitoring network periodically monitored to assess environmental effectiveness of the BPGWCS

Major components of the BPGWCS are as follows:

- Four remedial wells (RW-1, RW-2, RW-3, and RW-4) with design pumping rates of 30 gallons per minute (gpm), 75 gpm, 75 gpm, and 30 gpm, respectively; for a total design influent flow rate of 210 gpm.

- One low-profile air stripper to remove VOCs from extracted groundwater prior to discharge to the recharge basins.

- Two bag filter units configured so that one is “operational” and the other is in “standby” mode. The system control logic automatically switches from the “operational” filter unit to the “standby” filter unit when the bag filter is full to prevent a system shutdown and the spent filters are then replaced.

- Four emission control units, two containing vapor-phase granular-activated carbon and two containing potassium permanganate-impregnated zeolite, to treat Project VOCs in the air stripper off-gas.

- The groundwater monitoring network, consisting of 35 monitoring locations, including 17 groundwater monitoring wells, four remedial wells, and 14 piezometers.

The OM&M Manual (ARCADIS 2009) provides additional information on the BPGWCS. Figure 2 shows the layout of the BPGWCS, and Figure 3 provides a schematic drawing. Figure 4 shows groundwater sampling locations that form the groundwater monitoring network. Appendix A provides construction details for the monitoring wells and piezometers.

4. Operation and Maintenance Activities

The following BPGWCS operation and maintenance (O&M) activities conducted during this reporting period are summarized in Table 1 and described below:

- The system was monitored either through site visits or remotely by wireless computer link-up.

- The Supervisory Control and Data Acquisition system operated as designed, and when conditions warranted (see below), the system shut down automatically and instantaneously, and notified plant operators of system advisories and alarms.

- Intentional system shutdowns were as follows (see Table 1 for more information):

  - Ø Installation of Franklin Electric Submonitors for Recovery Wells RW-2 and RW-3 (January 5, 2015).

  - Ø Non-routine system maintenance (January 20 to January 28, 2015; January 30, 3015).

  - Ø Vapor-Phase Granular Activated Carbon and Potassium Permanganate-Impregnated Zeolite change-out (March 4 to March 6, 2015).

- System shutdowns due to alarm conditions were as follows (see Table 1 for more information):

  - Ø Low pressure alarm at Remedial Well RW-2 (February 6 and 22, 2015): Problem - Pump fouling with iron, leading to performance loss and decrease in operating pressure. Solution - Restart the pump and adjust the alarm setting to account for decreased performance.

  - Ø Motor overload at Remedial Well RW-2 (February 14, 2015): Problem – Motor failure. Solution – Replace the motor (February 19, 2015).

4.1 Summary of Operation and Maintenance Conclusions

The BPGWCS operated continuously, at either full or reduced flow, during this reporting period, with the exception of shutdown periods for routine maintenance and alarm conditions.

- The BPGWCS operated at full or reduced capacity 80 out of 90 days (89% uptime) (Table 1).

- Based on groundwater volume recorded at the remedial well flow meters, remedial wells operated at average flow rates of 26 gpm (RW-1), 61 gpm (RW-2), 64 gpm (RW-3), and 26 gpm (RW-4). The observed average flow rates for all remedial wells were lower than their design flow rates due to approximately 10 days of downtime attributed to scheduled maintenance, a motor failure at remedial well RW-2, a leak at remedial well RW-4, and alarm-related treatment system downtime. Remedial wells operated at reduced instantaneous flow rates (between 87% and 99% of design) during portions of the reporting period due to iron buildup in the pumps, influent pipelines, and valves. The reduced flow rates were corrected by adjusting the manifold globe valves and performing remedial well maintenance.

5. System Monitoring Activities

The following compliance and performance monitoring activities were conducted during this reporting period (see Appendix B, Table B-1 for a summary of the compliance and performance monitoring program requirements):

- Three sampling events to collect required water samples and air samples

- Thirteen weekly site visits to monitor and record key system operational parameters

System O&M results are summarized in the following tables, graphs, and appendices:

- Operational Summary, including monitoring events, system operational days, and noteworthy site activities (Table 1)

- Summary of Influent and Effluent Water Sample Analytical Results (Tables 2 and 3, respectively). Table 3 also provides the BPGWCS treatment system removal efficiency. Appendix B includes complete validated water sample analytical results summaries for each sampling event.

- Summary of Influent and Effluent Vapor Sample Analytical Results (Tables 4 and 5, respectively). Table 5 also provides the BPGWCS treatment system removal

efficiency. Appendix C includes complete, validated vapor sample analytical results for each sampling event.

- System Parameters, including flow rates, line pressures, and temperatures (Table 6)

- Summary of Groundwater Recovered, VOC Mass Recovered, and VOC Mass Recovery Rates (Table 7). Table 7 provides a breakdown of these parameters by Remedial Well and breaks down the VOC mass recovered and VOC recovery rates into Project, Non-Project, and total VOCs.

- Air Discharge Quality Evaluation and Summary of Air Emissions Model Output (Appendix D and Table 8, respectively)

- Concentrations of VOCs and Metals in Remedial Well Groundwater Samples (Tables 9 and 10, respectively)

- Cumulative Total, Project, and Non-Project VOC Mass Removed (Figure 5)

- Remedial Well Total, Project, and Non-Project VOC Concentrations (Figures 6A, 6B, and 6C, respectively)

- Influent Total, Project, and Non-Project VOC Concentrations (Figure 7)

- Total, Project, and Non-Project VOC Mass Recovery Rates (Figures 8A, 8B, and 8C, respectively)

5.1 Summary of Monitoring Results and Conclusions

5.1.1 System Monitoring and Effectiveness

BPGWCS OM&M reporting period results and conclusions are summarized below:

- Total volume of groundwater recovered and treated (Table 7):

  - First quarter 2015: 24.1 million gallons

  - Cumulative total since system startup: 582 million gallons

- Total VOC mass recovered (Table 7 and Figure 5):
  - Ø First Quarter 2015: 18 pounds (lbs) of VOCs
  - Ø Cumulative total since system startup: 2,072 lbs of VOCs
- VOC mass recovered and mass removal rates (Table 7 and Figures 8A, 8B, and 8C):
  - Ø Majority of VOCs recovered during this reporting period were Project VOCs (80% or 14 lbs)
  - Ø Majority of Project VOCs are recovered by RW-2 (96%) and RW-3 (3.3%)
  - Ø Majority of Non-Project VOCs are recovered by RW-3 (48%), RW-4 (42%), and RW-2 (10%).
- Treatment system influent concentrations (Table 2 and Figures 6A, 6B, 6C, and 7):
  - Ø The Project VOC influent concentration, which was 55 µg/L during the reporting period, is consistent with historical values, but is below the recent peak concentration observed in 2014 (105 µg/L). Project VOC influent concentrations have generally decreased since 2010.
  - Ø The Non-Project VOC influent concentration, which was 12 µg/L during the reporting period, is consistent with historical values, but is below the recent peak concentration observed in 2014 (55 µg/L). Non-Project VOC influent concentrations have generally decreased since 2010.
  - Ø Total iron in the influent sample was detected at a level of 1,810 µg/L, which is consistent with historical values. Total iron in the effluent samples ranged from 300 µg/L to 320 µg/L which is below the total iron discharge limit of 600 µg/L.
  - Ø Mercury has not been detected in any influent or effluent sample since system startup.
- Project VOCs in Remedial Wells RW-1, RW-3, and RW-4 (Table 9) were not detected during this reporting period above applicable SCGs, while in Remedial Well RW-2, several Project VOCs (cis-1,2-DCE, toluene, TCE, and VC) continue to

be detected above applicable SCGs. Similar to total influent concentrations, Project VOC remedial well concentrations have generally decreased since 2010.

- Non-Project VOCs in all remedial wells (Table 9) were not detected above applicable SCGs during this reporting period. Similar to total influent concentrations, Non-Project VOC remedial well concentrations have generally decreased since 2010.

- Metals concentrations in remedial wells during this reporting period (Table 10) are consistent with historical metals concentrations.

- The air stripper, air stripper off-gas treatment system, and bag filter system performed within acceptable operating ranges for this reporting period, as indicated by:

  - Ø The air stripper VOC removal efficiency was greater than 99.9% for Project and Non-Project VOCs (Table 3).

  - Ø Both water and air discharges complied with applicable SCGs and discharge limits (Tables 3, 5, and 8),

5.1.2 Regulatory Status of Discharges

5.1.2.1 Air Discharge

To determine the compliance status of air discharge from the BPGWCS treatment system, the system's effluent vapor concentrations were compared to NYSDEC Division of Air Resources Air Guide-1 (DAR-1) Model Short-term Guideline Concentrations (SGCs [NYSDEC 2014]; Table 5) and the effluent vapor laboratory results were compared to a site-specific modeled annual maximum allowable stack concentration (MASC). The annual MASC was calculated during each monitoring event for individual compounds using the output from the U.S. Environmental Protection Agency (USEPA) SCREEN3 Model in conjunction with the NYSDEC DAR-1 Annual Guideline Concentrations (AGCs). A scaling factor was calculated using the SCREEN3 model with site-specific physical layout information (e.g., building dimensions, stack height, terrain) and operating data (e.g., air flow rate, temperature) inputs for each monitoring event. The scaling factor was then used to adjust (scale) the NYSDEC DAR-1 AGC to a site-specific MASC. Table 8 provides a summary of the instantaneous percent (i.e., not time-weighted) of the site-specific annual MASC for

detected Project and Non-Project VOCs, as well as a summary of the cumulative annual percent (i.e., time-weighted) of the site-specific MASC. Appendix D provides a summary of the model inputs, outputs, and backup calculations.

The BPGWCS air effluent met NYSDEC requirements throughout the reporting period, as indicated by the following:

- The measured concentrations of individual VOCs in the vapor effluent did not exceed applicable SGCs (Table 5).

- The measured concentration of individual VOCs in the vapor effluent did not exceed applicable, instantaneous MASCs, as calculated using the USEPA SCREEN 3 Model (Table 8). Similarly, the time-weighted rolling averages for the individual detected Project and Non-Project VOCs are below their respective MASCs.

5.1.2.2 Water Discharge

The BPGWCS-treated water effluent met NYSDEC regulatory requirements during the reporting period (Table 3 and Appendix B), as indicated by the following:

- The measured concentration of individual VOCs in the treated water effluent were below applicable discharge limits, per the interim State Pollutant Discharge Elimination System (SPDES) equivalency permit.

- The measured concentration of total iron and total mercury in the treated water effluent were below applicable discharge limits. In addition, total mercury continues to be non-detect and has not been detected in any treated water effluent sample since system startup.

6. Environmental Effectiveness Monitoring

BPGWCS environmental effectiveness (i.e., hydraulic monitoring and groundwater quality monitoring) activities and results for this reporting period are discussed below.

6.1 Hydraulic Monitoring

6.1.1 Activities

In accordance with OM&M Manual requirements and methodologies (ARCADIS 2009), a quarterly round of groundwater hydraulic monitoring was performed during the reporting period. Specifically, depth-to-water measurements were completed on March 13, 2015 at the 33 locations forming the approved monitoring well network (Table 11). The groundwater monitoring network site plan is provided on Figure 4.

6.2 Groundwater Quality Monitoring

6.2.1 Activities

Consistent with the OM&M Manual (ARCADIS 2009), groundwater quality monitoring was not required during this reporting period.

6.2.2 Results

Historical groundwater quality data are summarized in the following tables:

- Table 12 summarizes the results of laboratory analysis of VOCs in groundwater samples collected from the groundwater network wells to date.

- Table 13 summarizes the results of laboratory analysis of metals in groundwater samples collected from the groundwater network wells to date.

6.3 Environmental Effectiveness Monitoring Conclusions

The findings and conclusions of the on-going BPGWCS Hydraulic Effectiveness Study are forthcoming and will be used to update and/or modify future quarterly report environmental effectiveness conclusions, as necessary.

7. Recommendations

- Remove mercury from the SPDES equivalency monitoring program because mercury has not been detected in any system effluent water sample analyzed for mercury.

- Continue operating, maintaining, and monitoring the system in accordance with the OM&M Manual (ARCADIS 2009), including the current quarterly preventive maintenance program performed at Remedial Wells RW-2 and RW-3 to remove iron buildup in the wells and pipelines.

- Based on the consistent operation of the BPGWCS since July 2009, the current quarterly reporting frequency should be reduced to annual. Consistent with the NYSDEC-approved OM&M Manual (ARCADIS 2009), an annual report will be prepared to summarize system operation, performance, and monitoring data; this annual report will be prepared and submitted under the supervision of a licensed, professional engineer. Additionally, pertinent data collected for the BPGWCS will be submitted to the NYSDEC as part of the semi-annual progress reports currently completed in accordance with Section III of AOC Index #W1-0018-04-01. Upon receipt of NYSDEC approval of this recommendation, the OM&M Manual (ARCADIS 2009) will be updated to reflect this change.

Table 1. Operational Summary, Bethpage Park Groundwater Containment System, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

(1) Days in which the system was operational for the majority of the day are counted as one day.
(2) Spent bag filters are stored in DOT certified 55-gallon drums and disposed of by a subcontractor as non-hazardous waste.

First Quarter 2015

(3) The system was shut down at 10:00 am on January 5, 2015 to install Franklin Electric Submonitors for Remedial Wells RW-2 and RW-3. The system was restarted at 3:45 pm on the same day and was offline for approximately 5.8 hours.
(4) The system was shut down at 8:45 am on January 20, 2015 to clean the bag filter effluent piping and sample tap WSP-7 of iron build-up. The system was restarted at 3:50 pm on the same day and was offline for approximately 6 hours.
(5) The system was shut down at 9:10 am on January 21, 2015 to clean iron debris from the air stripper sump. The system shut down multiple time while attempting to restart later in the day, due to an air stripper sump high level. It was determined that the alarm was caused by a high amount of iron sludge remaining in the air stripper sump. A subcontractor with a vacuum truck was used to fully evacuate the sump of any sludge and debris. The sludge and debris was disposed of by the subcontractor as non-hazardous waste. Upon completion, the system was restarted at 8:37 am on January 28, 2015 and was offline for approximately 7 days.
(6) The system was shut down at approximately 12:40 pm on January 30, 2015 to install a new check valve in the effluent piping. The system was restarted at approximately 7:00 pm on the same day. The system was offline for approximately 6.3 hours.
(7) The system shut down at 2:43 am on February 6, 2015 due to a low pressure alarm at recovery well RW-2. The system was restarted at 9:09 am on the same day and was offline for approximately 6.5 hours.
(8) The system shut down at 10:21 pm on February 14, 2015 due to a motor overload condition at recovery well RW-2 . The system was restarted without RW-2 at 12:15 pm on February 15, 2015; the system was offline for approximately 14 hours. A new recovery well pump and motor was installed in RW-2 on Feburary 19, 2015 and it was brought back online at approximatly 3:17 pm the same day. Recovery well RW-2 was offline for approximately 5 days.
(9) The system shut down at 12:52 pm on February 22, 2015 due to a low pressure alarm at recovery well RW-2. The system was restarted at 1:45 pm on the same day and was offline for approximately 1 hour.
(10) The system was shut down at 2:13 pm on March 4, 2015 to change-out VPGAC and PPZ in ECUs 502 and 601, respectively. The VPGAC was transported by the subcontractor to an approved regeneration facility and the PPZ was transported to an approved receiving facility for disposal as non-hazardous waste. The system was restarted at 12:05 pm on March 6, 2015 and was offline for approximately 2 days.
(11) A leak was observed in the well vault for recovery well RW-4 at 6:56 pm on March 30, 2015. RW-4 was left offline for the remainder of the reporting period.

Table 2. Summary of Influent Water Sample Analytical Results, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1)

Notes:

(1) Water samples collected by ARCADIS on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per NYSDEC ASP 2005, Method OLM 4.3 (prior to September 1, 2014) and per USEPA Method 8260C (after September 1, 2014), for iron analyses per USEPA Method 6010C and for mercury analyses per USEPA Method 7470A. The VOC analyte list is provided in the DRAFT Groundwater IRM OM&M Manual (ARCADIS 2009). Influent water samples were collected from Water Sampling Port-5 (WSP-5); refer to Figure 3 of this OM&M Report for the schematic location of WSP-5.

(2) Only VOCs associated with the interim SPDES equivalency program, plus Toluene, Benzene, Xylenes, non-project related Freon 12 and Freon 22, Mercury and Iron are included in this table. Complete VOC and inorganic data summary tables, including VOC TICs, are provided in Appendix B. Laboratory data qualifiers are included in the Appendix B tables.

(3) "Total VOCs" represents the sum of individual concentrations of the compounds detected. The values used in calculations referenced in this report have been rounded to the nearest whole number.

(4) Influent pH samples collected and measured in the field by ARCADIS personnel on the dates listed using an Oakton Model 300 pH/conductivity meter. pH units are standard units.

Table 3. Summary of Effluent Water Sample Analytical Results, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1)

Notes:

(1) Water samples collected by ARCADIS on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per NYSDEC ASP 2005, Method OLM 4.3 (prior to September 1, 2014) and per USEPA Method 8260C (after September 1, 2014), for iron analyses per USEPA Method 6010C and for mercury analyses per USEPA Method 7470A. The VOC analyte list is provided in the DRAFT Groundwater IRM OM&M Manual (ARCADIS 2009). Effluent water samples were collected from Water Sampling Port-7 (WSP-7); refer to Figure 3 of this OM&M Report for the location of WSP-7.

(2) Only VOCs associated with the interim SPDES equivalency program, including Toluene, Benzene, Xylenes, non-project related Freon 12 and Freon 22, Mercury and Iron are included in this table. Complete VOC and inorganic data summary tables, including VOC TICs, are provided in Appendix B. Laboratory data qualifiers are included in the Appendix B tables.

(3) Discharge limits per the interim SPDES equivalency program or Division of Water Technical and Operational Guidance Series (TOGS 1.1.1) Quality Standards and Guidance Values and Groundwater Effluent Limitations, if the compound is not part of the interim SPDES equivalency program.

(4) "Total VOCs" represents the sum of individual concentrations of compounds detected. The values used in calculations referenced in this report have been rounded to the nearest whole number.

(5) Treatment efficiency was calculated by dividing the difference between the influent and effluent total VOC concentrations by the influent total VOC concentration.

(6) Effluent pH samples collected and measured in the field by ARCADIS personnel on the dates listed using an Oakton Model 300 pH/conductivity meter. pH units are standard units.

(7) The September 4, 2014 iron concentration exceeded its discharge limit of 600 µg/l. The exceedance is believed to be the result of iron precipitates in the sample tap. The follow-up sample collected on October 1, 2014 was analyzed with an expedited turnaround and total iron was below the discharge limit of 600 µg/l.

Acronyms\Key:

	Bold box indicates value is greater than discharge criterion.

Table 5. Summary of Effluent Vapor Sample Analytical Results, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1)

Notes:

(1) Vapor samples collected by ARCADIS on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per Modified USEPA Method TO-15. A VOC analyte list is provided in the DRAFT Groundwater IRM OM&M Manual (ARCADIS 2009). Effluent samples were collected at Vapor Sampling Port-5 (VSP-5); refer to Figure 3 of this OM&M Report for the location of VSP-5.

(2) Only VOCs that are associated with the interim SPDES equivalency program, Toluene, Benzene, Xylenes, and non-project related Freon 12 and Freon 22 are included in this table. Complete VOC summary tables, including VOC TICs, are provided in Appendix C. Laboratory data qualifiers are included in the Appendix C tables.

(3) Discharge limit is compound-specific SGC per the NYSDEC DAR-1 AGC/SGC tables revised Februaury 28, 2014.

(4) An SGC was not provided in the DAR-1 AGC/SGC Tables, dated February 28, 2014. An interim SGC was developed based on guidance of the New York State DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants, 1991 edition. Specifically for 1,1- dichloroethene, which is not defined as provided in Section IV.A.2.b.1 a high-toxicity compound, the Interim SGC = (smaller of Time Weighted Average [TWA] - Threshold Limit Value or TWA - Recommended Exposure Limit)/4.2. or 1,600 µg/m^3 / 4.2 = approximately 380 µg/m^3. An interim SGC was developed for this compound because it has a moderate toxicity rating, as specified in the DAR-1 AGC/SGC Tables, dated February 28, 2014.

(5) An SGC was not provided in the DAR-1 AGC/SGC Tables, dated February 28, 2014. An interim SGC was developed based on guidance provided in Section IV.A.2.b.1 of the New York State DAR-1 Guidelines for the Control of Toxic Ambient Air Contaminants, 1991 edition. Specifically for cis-1,2 dichloroethene, which is not defined as a high-toxicity compound, the interim SGC = (smaller of Time Weighted Average [TWA] - Threshold Limit Value or TWA - Recommended Exposure Limit)/4.2 or 790,000 µg/m^3 / 4.2 = approximately 190,000 µg/m^3. An interim SGC was developed for this compound because it has a moderate toxicity rating, as specified in the DAR-1 AGC/SGC Tables, dated February 28, 2014.

(6) "Total VOCs" represents the sum of individual concentrations of all compounds detected. The values used in calculations referenced in this report have been rounded to the nearest whole number.

(7) Treatment efficiency was calculated by dividing the difference between the influent and effluent Total VOC concentrations by the influent Total VOC concentration. Treatment efficiency is only calculated when there is a corresponding influent sample.

(8) Treatment efficiency was calculated by dividing the difference between the influent and effluent total Project VOC concentrations by the influent total Project VOC concentration. Treatment efficiency is only calculated when there is a corresponding influent sample.

Acronyms\Key:

Table 6. Summary of System Parameters, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York.

Notes:

(1) Operational data collected by ARCADIS on days noted. Parameters listed were typically recorded during compliance monitoring events. Data in this table correspond to approximately the past year of system operation.
(2) Instantaneous parameters obtained from the SCADA HMI: Water Flow Rate, Water Pressure, Air Flow Rate.
(3) Combined influent water-flow rate is the sum of individual well flow rates via the SCADA System.
(4) Remedial Well effluent pressure readings measured at the influent manifold within the treatment system building.
(5) Instantaneous values from field-mounted instruments
(6) Values collected on June 17, 2014 during the weekly site visit. No values collected on day of sampling.
(7) Values collected on September 30, 2014 during the weekly site visit. No values collected on day of sampling.

Acronyms\Key:

Notes:

(1) Represents operating period between consecutive monitoring events.

(2) Volume of groundwater recovered is based on individual local well totalized flow readings. Listed value is the difference between totalized flow values recorded between consecutive monitoring events. The total groundwater recovered during a given operating period is the sum of the individual well flow totals. Values shown are rounded to the nearest gallon, but should only be considered accurate to two significant figures to account for error associated with field measurements.

(3) Mass recovered per well was calculated by multiplying the Total VOC concentration from the most recent sampling event by the number of gallons extracted during the reporting period. The total amount recovered during a given operating period is the sum of masses recovered from each of the individual wells. Values less than ten pounds are presented using two significant figures and values greater than ten pounds have been rounded to the nearest whole number; however, these values should only be considered accurate to two significant figures to account for error associated with field measurements and analytical data.

(4) Mass recovery rates were calculated by dividing the total mass recovered for each well and for the system by the number of days in the respective operating period. Values are presented using two significant figures.

(5) "Total VOCs" represents the sum of individual concentrations of the VOCs detected.

(6) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-trichloroethane; 1,1-dichloroethane; 1,2-dichloroethane; 1,1-dichloroethene; tetrachloroethene; trichloroethelyene; vinyl chloride; cis-1,2-dichloroethene; trans-1,2-dichloroethene; benzene; toluene; and xylenes-o,m, p.

(7) "Non-Project VOCs" represents the difference between Total VOCs and Project VOCs.

(8) Values based on operational data recorded prior to system startup on July 21, 2009.

(9) Starting with the January 2013 site visit the totalized water flow readings are recorded from the SCADA HMI.

(10) The volume of groundwater recovered and mass recovered calculations represent the operational period between January 1, 2015 and April 1, 2015.

(11) "Total" refers to the amounts removed by the Operable Unit 3 Bethpage Park Groundwater Containment System.

Acronyms\Key:

IRM	Interim Remedial Measure.
gal	Gallons.
HMI	Human-machine interface.
lbs	Pounds.
lbs/day	Pounds per day.
--	Not applicable.

Table 8. Summary of Air Emissions Model Output, Bethpage Park Groundwater Containment System, Operable Unit 3
(Former Grumman Settling Ponds), Bethpage, New York.

Notes:

(1) Compound-specific AGC values per the NYSDEC DAR-1 AGC/SGC tables, revised February 28, 2014. NYSDEC DAR-1 AGCs were scaled using the results of a site-specific annual USEPA SCREEN 3 model to calculate the annual MASC per monitoring event.

(2) Percent of AGC (or Percent MASC) was calculated by dividing the actual effluent concentration by the site-specific annual MASC. Detailed calculations are included in Appendix D.

(3) Percent AGC is the 12-month average at the end of the reporting period. The Percent AGC was calculated by time-weighting the "Percent MASCs" for the individual sampling events over the past year. MASCs are typically calculated once per quarter, thus the MASCs for each month within a quarter are assumed to be the same.

Acronyms\Key:

AGC	Annual Guideline Concentration.
DAR-1	Division of Air Resources Air Guidance-1.
MASC	Maximum allowable stack concentration.
NYSDEC	New York State Department of Environmental Conservation.
SGC	Short-term Guideline Concentration.
USEPA	U.S. Environmental Protection Agency
VOC	Volatile organic compound
$\mu g/m^3$	micrograms per cubic meter

Table 9. Concentrations of Volatile Organic Compounds in Groundwater Samples Collected from Remedial Wells, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1)

Notes:

(1) Water samples collected by ARCADIS on the dates shown and submitted to a NYSDOH ELAP certified laboratory for VOC analyses per NYSDEC ASP 2005, Method OLM 4.3 (prior to September 1, 2014) and per USEPA Method 8260C (after September 1, 2014). Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009). See previous quarterly reports for historical analytical results.

(2) "Total VOCs" represents the sum of individual concentrations of the VOCs detected.

(3) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-trichloroethane; 1,1-dichloroethane; 1,2-dichloroethane; 1,1-dichloroethene; tetrachloroethene; trichloroethene; vinyl chloride; cis-1,2-dichloroethene; trans-1,2-dichloroethene; benzene; toluene; and xylenes-o,m, and p.

(4) Samples were collected on October 1, 2014 due to system maintenance during the third quarter of 2014.

Acronyms\Key:

Indicates an exceedance of an SCG.

Bold value indicates a detection.

ASP	Analytical services protocol.
ELAP	Environmental Laboratory Approval Program
NYSDEC	New York State Department of Environmental Conservation.
NYSDOH	New York State Department of Health
SCGs	Standards, criteria, and guidance values.
VOC	Volatile organic compound.
µg/L	Micrograms per liter.
--	Not analyzed.
NE	Not established.
D	Compound identified from secondary dilution.
J	Compound detected but below its reporting limit; the value is estimated.
< 5; <5 U	Compound not detected above its laboratory quantification limit.

Table 10. Concentrations of Metals in Groundwater Samples Collected from Remedial Wells, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1)

Notes:

(1) Water samples collected by ARCADIS on the dates shown and submitted to a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) certified laboratory for metals analysis using USEPA Method 6010 and for mercury analyses using USEPA Method 7470. Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).

(2) Beginning January 2012 metals analyses for recovery wells RW-1 and RW-4 are included with annual recovery well sampling performed in the fourth quarter of each year.

(3) Elevated RW-2 iron concentrations are believed attributed to multiple system shutdowns and re-starts due to a fouled pressure switch on March 2 and March 3, 2013. Turbulence dislodged accumulated iron deposits at the remedial well piping.

(4) Samples were collected on October 1, 2014 due to system maintenance during the third quarter of 2014.

Acronyms/Key:

	Indicates an exceedance of an SCG.
700	Bold data indicates that the analyte was detected at or above its reporting limit.
ASP	Analytical services protocol.
ELAP	Environmental Laboratory Approval Program
NYSDEC	New York State Department of Environmental Conservation.
NYSDOH	New York State Department of Health
USEPA	U.S. Environmental Protection Agency
SCGs	Standards, criteria, and guidance values.
µg/L	Micrograms per liter.
--	Not analyzed.
< 5	Compound not detected above its laboratory quantification limit.

Notes:
(1) Baseline readings were taken prior to system startup, which occurred on July 21, 2009.
(2) Measurement collected is believed to be anomalous.
(3) Well casing is broken and blockage exists at around 2 feet below top of casing.
*: RW-3 water level measurement collected on September 9, 2010.

Acronyms/Key:
ft msl feet relative to mean sea level
NM not measured

Table 12. Concentrations of Volatile Organic Compounds in Groundwater Samples Collected from Monitoring Wells, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York. (1,2)

Notes and Abbreviations:

(1) Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).

(2) Samples analyzed for the TCL VOCs using NYSDEC ASP 2005 Method OLM4.3 (prior to November 2014) and per USEPA Method 9260C (after November 2014).

(3) "Total VOCs" represents the sum of individual concentrations of the VOCs detected. TVOCs were rounded to two significant figures

(4) "Project VOCs" represents the sum of individual compound concentrations of 1,1,1-Trichloroethane; 1,1-Dichloroethane; 1,2-Dichloroethane; 1,1-Dichloroethene; Tetrachloroethene; Trichloroethene; Vinyl Chloride; cis-1,2-Dichloroethene; trans-1,2-Dichloroethene; Benzene; Toluene; and Xylenes-o,m, and p.

Indicates an exceedance of an SCG.

Bold value indicates a detection.

NYSDEC	New York State Department of Environmental Conservation.
TCL	Target compound list.
VOC	Volatile Organic Compound.
ASP	Analytical services protocol.
SCGs	Standards, criteria, and guidance values.
ug/L	Micrograms per liter.
USEPA	United State Environmental Protection Agency.
NE	Not established.
E	Concentration for the constituent exceeded the calibration range.
J	Value is estimated.
D	Constituent identified from secondary dilution.
R	Concentration for the constituent was rejected.
B	Compound detected in associated blank sample.
< 5	Compound not detected above its laboratory quantification limit.
REP	Field replicate QA/QC sample

Manganese (total)	300	--	--	--
Manganese (dissolved)	300	--	--	--

Notes:

(1) Results validated following protocols specified in Sampling and Analysis Plan in the December 2009 DRAFT OM&M Manual (ARCADIS 2009).

(2) Samples analyzed for the metals using EPA Method 6010.

(3) Samples collected with HydraSleeve™ no purge method, all other samples collected by purge (3-Volume) method.

	Indicates an exceedance of an SCG.
Bold	Indicates a detection.
RI/FS	Remedial Investigation/Feasibility Study.
NYSDEC	New York State Department of Environmental Conservation.
EPA	Environmental Protection Agency
SCGs	Standards, criteria, and guidance values.
ug/L	Micrograms per liter.
--	Not analyzed.
< 5	Compound not detected above its laboratory quantification limit.
B	Compound detected in associated blank sample.

Notes:

(1) Water samples will be collected and analyzed in accordance with the method and procedures described in the Sampling and Analysis Plan (SAP).
(2) Approximate locations of the wells and piezometers in the OU-3 Groundwater Interim Remedial Measure Monitoring Program are shown in Figure 1.
(3) Water levels will be measured in all wells/piezometers during the baseline monitoring event. Water levels will be measured in accordance with the procedures presented in the SAP.
(4) VOC: VOCs, per Table D-3 in the Quality Assurance Project Plan (QAPP), using NYSDEC ASP 2000 Method OLM 4.3.
Cd/Cr: Cadmium and Chromium using USEPA Method 6010.
Fe/Mn: Iron and Manganese using USEPA Method 6010, both total and dissolved.
(5) Semiannual wells will be monitored annually after Year 1.
(6) Some of the analyses listed here are also covered in the Remedial System Sampling Program (Table B-1) and some of the analyses and/or frequencies may be modified based on review of short-term and/or long-term testing results. (e.g. the Cd/Cr sampling frequency was changed from quarterly to annually in 2011).

Acronyms\Key:

Sch. 80 PVC	Schedule 80 polyvinyl chloride.
Sch. 40 PVC	schedule 40 polyvinyl chloride.
SS	Stainless steel.
Steel	Low carbon steel.
ft	Feet.
ft ms	Feet relative to mean sea level.
ft bls	Feet below land surface.
--	Not applicable.
VOC	Volatile organic compound.

Appendix B-1. Compliance and Performance Program Elements, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Northrop Grumman Systems Corporation, Bethpage, New York.

Notes:

(1) Refer to Figure 3 of this Operation, Maintenance, & Monitoring (OM&M) Report and Appendix E of the Groundwater IRM OM&M Manual (OM&M Manual (ARCADIS 2009)) for a diagram showing referenced sample locations and measurement points.

(2) Parameters/methods may be modified based on review of short-term and/or long-term testing results. Parameters shown in **Bold** indicate parameters that require NYSDEC notification/approval prior to change in monitoring schedule.

(3) Short-term schedule is tentative. Modification may be required/recommended based on the results of start-up and performance testing.

(4) Long-term schedule is tentative. Modification may be required/recommended based on the results of short-term testing or water quality trends.

(5) Water samples will be collected in accordance with the methods described in the Sampling and Analysis Plan, which is included as Appendix A of the OM&M Manual (ARCADIS 2009). Samples will be analyzed in accordance with the methods and procedures described in the Sampling and Analysis Plan.

(6) Per NYSDEC request, a 1-hr pilot test was performed during system shake-down. The 1-hr pilot test samples were also analyzed for Mercury (Hg).

(7) Per the interim treated effluent (water) discharge criteria provided in the NYSDEC letter dated March 19, 2009, select samples were analyzed for Mercury (Hg).

(8) As authorized by the NYSDEC, the pH monitoring frequency was reduced from weekly to monthly beginning on February 8, 2010.

(9) Air samples collected and analyzed in accordance with methods described in the Sampling and Analysis Plan, which is included as Appendix A of the OM&M Manual (ARCADIS 2009).

(10) Additional air samples will be collected to help calculate media usage rates and to help determine media changeout frequencies.

(11) Cadium and Chromium analyses are part of the Environmental Effectiveness Monitoring Program (Table A-1) and the original discharge permit application. They are included here for consistency.

Acronyms\Key:

NA	Not Applicable.
---	Not Required
ECU	Emissions control unit.
VOCs	Volatile organic compounds (refer Tables D-3 and D-5 in the Quality Assurance Project Plan (QAPP) (Appendix D of the OM&M Manual (ARCADIS 2009)) for the analyte lists for aqueous and air samples, respectively).
gal.	Gallons.
gpm	Gallons per minute.
i.w.g.	Inches water gauge.
NYSDEC	New York State Department of Environmental Conservation.
EPA	U.S. Environmental Protection Agency.
SCADA	Supervisory Control And Data Acquisition.
OM&M	Operation, maintenance and monitoring.

Receptor Height (m)(4)		1.5	1.5	1.5	1.5
Urban/Rural		Urban	Urban	Urban	Urban
Building Height (m)		2.6	2.6	2.6	2.6
Min Horizontal Bldg Dim (m)		7.9	7.9	7.9	7.9
Max Horizontal Bldg Dim (m)		9.8	9.8	9.8	9.8
Consider Bldg Downwash?		Yes	Yes	Yes	Yes
Simple/Complex Terrain Above Stack		Simple	Simple	Simple	Simple
Simple/Complex Terrain Above Stack Base		Simple	Simple	Simple	Simple
Meteorology		Full	Full	Full	Full
Automated Distances Array		Yes	Yes	Yes	Yes
Terrain Height Above Stack Base		0	0	0	0
SCREEN3 Model Output					
1-HR Max Concentration at Receptor Height ($\mu g/m^3$) (5)		2,033	2,182	2,100	2,190
Annualization Factor(6)		0.08	0.08	0.08	0.08
Average Annual Concentration at Receptor Height ($\mu g/m^3$)(7)		163	175	168	175
Distance To Max Concentration (m)(8)		8	8	8	8

See notes on last page.

Appendix D-1. Annual Summary of SCREEN3 Model Input and Outputs, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York.

Notes:

(1) The stack air flow rate (in scfm) and temperature were measured using inline instrumentation. Values were measured at the blower effluent location.

(2) The stack air flow rate at the stack temperature (in acfm) was calculated by dividing the stack air flow rate in scfm by the ratio of the standard temperature to the actual stack gas exit temperature in degrees Rankine.

(3) The ambient temperature was recorded from the weather.newsday.com and/or weather underground (www.wunderground.com) websites for Islip, New York. The mean actual temperature from the website(s) was used in model calculation.

(4) The receptor height corresponds to the average inhalation level.

(5) SCREEN3 calculated constituent concentration at listed conditions at the specified inhalation level.

(6) A USEPA time averaging conversion factor of 1/0.08 was used to convert the 1-hour maximum concentration output to an annual average.

(7) Average annual constituent concentration at the receptor height was calculated by multiplying the one hour maximum concentration by the annualization factor.

(8) SCREEN3 calculated distance to the 1-hour maximum concentration.

Acronyms\Key:

$\mu g/m^3$	Micrograms per cubic meter.
acfm	Actual cubic feet per minute.
ft	Feet.
g/s	Grams per second.
K	Kelvin.
m	Meters.
scfm	Standard cubic feet per minute.
USEPA	United States Environmental Protection Agency.

Appendix D-2. Annual Summary of Maximum Allowable Stack Concentration Calculations, Bethpage Park Groundwater Containment System, Operable Unit 3 (Former Grumman Settling Ponds), Bethpage, New York.

Compound	Actual Effluent Concentrations[(1)] (µg/m^3)

Notes/Acronyms:

(1) Actual effluent concentrations are analytical results from air samples collected on the dates shown.

(2) Compound-specific AGC values per the NYSDEC DAR-1 AGC/SGC tables, revised February 28, 2014.

(3) Maximum allowable stack concentrations were calculated by dividing the product of the annual guideline concentration of a compound and the ratio of the SCREEN3 gas emission rate and the SCREEN3 average concentration at receptor height by the air flow rate at the stack temperature and multiplying by the appropriate conversion factors.

(4) Percent of MASC was calculated by dividing the actual effluent concentration by the MASC for a given monitoring event.

$\mu g/m^3$ Micrograms per cubic meter

AGC Annual guideline concentration

MASC Maximum allowable stack concentration
