Outpost Monitoring Well Installation Summary Report
NWIRP Bethpage, New York

Dear Mr. Colter:

Appendix N and the subject report, including Appendix N, were distributed as per your attached transmittal letters.

If you have questions or need additional information, please call me at (412) 921- 8375.

Sincerely,

David D. Brayack
Project Manager

Albany, NY 12233-7015

Dear Steve:

Subj: Appendix N to the Final Outpost Monitoring Well Installation Summary Report - Operable Unit 2 - Groundwater at NWIRP Bethpage and Northrop Grumman Corporation, New York
NYS Registry #1-30-003 A & B

Enclosed, please find a copy of Appendix N - Geologic Cross Sections which is being submitted as an addendum to the Final Outpost Well Installation Summary Report dated March 2004.

These Geologic Cross Sections were developed on behalf of the Navy by ARCADIS and were created using previously collected data and more recent lithologic data collected during the installation of the outpost monitoring wells.

If you have any questions regarding the enclosed document, please give me a call at (610) 595-0567, extension 163.

Sincerely,

JAMES L. COLTER
Remedial Project Manager
By direction of the
Commanding Officer

05 MAY 2004

Mr. Jim McBride
RAB Community Co-Chair
P.O. Box 133
Bethpage, NY 11804

Dear Jim:

Subj: Final Outpost Monitoring Well Installation Summary Report - Operable Unit 2 - Groundwater at NWIRP Bethpage and Northrop Grumman Corporation, New York; NYS Registry #1-30-003 A & B

As requested at the last Restoration Advisory Board (RAB) meeting held on April 14, 2004, the Navy is forwarding a copy of the subject document to each of the community RAB members. As explained during the meeting, this report documents the efforts undertaken by the Navy over the last several months to install nine (9) outpost monitoring wells in accordance with the Outpost Well Installation Workplan attached as Appendix B to the Public Water Supply Contingency Plan (PWSCP) dated July 2003.

Appendix L to this Summary Report shows the analytical results from groundwater samples collected upon successful development of each of the outpost wells. As evidenced by Appendix L, analytical results for Outpost Well BPOW 1-1 shows the presence of several site-related VOCs.

However, these results are screening level quality only. Based on these results, the Navy has purchased dedicated sampling pumps and ARCADIS is currently installing these pumps into each of the outpost wells. Upon completion of the pump installation, the Northrop Grumman Corporation will then collect groundwater samples in accordance with the procedures outlined in the PWSCP.

If you have any questions regarding the enclosed document, please give me a call at (610) 595-0567, extension 163.

Sincerely,

JAMES L. COLTER
Remedial Project Manager
By direction of the
Commanding Officer

Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO: **D. BRAYACK** **DATE:** **OCTOBER 20, 2003**

FROM: **BERNARD F SPADA III** **COPIES:** **DV FILE**

SUBJECT: **ORGANIC DATA VALIDATION- VOC**
CTO 812, NWIRP BETHPAGE
SDG 120361

SAMPLES: 5/Aqueous

BP-BPOW2-1-DEV	BP-BPOW2-2-DEV	BP-IDW-A201-091103
BP-IDW-A224-091103	BP-TB-091003	

OVERVIEW

The sample set for CTO 812, NWIRP Bethpage, SDG 120361 consists of two (2) environmental aqueous samples, two (2) interim derived waste samples, and one (1) trip blank. All samples were analyzed for volatile organic compounds (VOC).

The samples were collected by Tetra Tech NUS on September 10 and 11, 2003 and analyzed by Severn Trent Laboratories. All analyses were conducted in accordance with Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 Method 8260B analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

*	•	Data completeness
*	•	Holding times
	•	Initial and continuing calibration
*	•	Blank results
*	•	Surrogate spike recoveries
*	•	Internal standard recoveries
*	•	Blank Spike/Blank Spike Duplicate Results
*	•	Matrix Spike/Matrix Spike Duplicate Results
*	•	Field Duplicate Results
*	•	Detection Limits
*	•	Compound Quantitation
*	•	Compound Identification

The symbol (*) indicates that all quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix C. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B.

VOC

The initial calibration performed on August 27 exceeded the 30% relative standard deviation (RSD) quality control criteria for 2-hexanone. The results for 2-hexanone were qualified as estimated (UJ) in all samples.

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Qualifications were made based on calibration non-compliance.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99), EPA Region II Guidelines (1/92), and the NFESC guidelines. The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO: **D. BRAYACK** **DATE: DECEMBER 12, 2003**

FROM: **SETH C. STAFFEN** **CC: DV FILE**

SUBJECT: **ORGANIC DATA VALIDATION – VOA**
CTO 812, NWIRP BETHPAGE
SDG: C3J230178

SAMPLES: 5 / Aqueous / VOA

BP-BPOW3-1-DEV BP-BPOW3-2-DEV BP-IDW-A201-102203*
BP-IDW-A224-102203* BP-TB-102103

OVERVIEW

The sample set for CTO 812, NWIRP Bethpage, SDG C3J230178, consisted of two (2) aqueous environmental samples, two (2) interim derived waste samples (IDW), and one (1) trip blank. The samples were analyzed for TCL volatile organic compounds. The IDW samples did not undergo a data validation review (*). The remaining samples did undergo a full data validation review. No field duplicate pairs were included in this SDG.

The samples were collected by Tetra Tech NUS, Inc. on October 21st and 22nd, 2003, and analyzed by Severn Trent Laboratories. The samples were analyzed under Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 Method 8260 analytical and reporting protocols.

The data was evaluated according to the following parameters:

* • Data completeness
* • Holding Times
* • Laboratory method and field quality control blank results
• Initial and continuing calibrations
* • Surrogate spike recoveries
* • Blank Spike recoveries
* • Laboratory duplicates
* • Compound identification
* • Compound quantitation
* • Detection Limits

The symbol (*) indicates that all quality control criteria were met for this parameter. Qualified analytical results are presented in Appendix A, results as reported by the laboratory are presented in Appendix B, Region II data validation forms are presented in Appendix C, and supporting documentation is presented in Appendix D.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (October 1999), USEPA Region II Standard Operating Procedures for the Validation of Organic Data (January 1992), and the NFESC guidelines "Navy IRCDQM" (September 1999).

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP).

Tetra Tech NUS **INTERNAL CORRESPONDENCE**

TO:	**D. BRAYACK**	**DATE:**	**DECEMBER 31, 2003**
FROM:	**BERNARD F SPADA III**	**COPIES:**	**DV FILE**
SUBJECT:	**ORGANIC DATA VALIDATION- VOC CTO 812, NWIRP BETHPAGE SDG 100416**		
SAMPLES:	3/Aqueous		
	BPOW2-1-100903	BP-RB-100903	BP-TB-100803

OVERVIEW

The sample set for CTO 812, NWIRP Bethpage, SDG 100416 consists of one (1) environmental aqueous sample, one (1) rinse blank, and one (1) trip blank. All samples were analyzed for volatile organic compounds (VOC). Please note that samples BP-IDW-SB-0042, BP-IDW-SB-0312, BP-IDW-SB-9523, and BP-IDW-SB-9544 were collected by the field personnel and analyzed by the laboratory but did not require validation.

The samples were collected by Tetra Tech NUS on October 8 and 9, 2003 and analyzed by Severn Trent Laboratories. All analyses were conducted in accordance with Naval Facilities Engineering Service Center (NFESC) Quality Assurance/Quality Control (QA/QC) criteria using SW-846 Method 8260B analytical and reporting protocols. The data contained in this SDG were validated with regard to the following parameters:

*	•	Data completeness
*	•	Holding times
	•	Initial and continuing calibration
*	•	Blank results
*	•	Surrogate spike recoveries
*	•	Internal standard recoveries
*	•	Blank Spike/Blank Spike Duplicate Results
	•	Matrix Spike/Matrix Spike Duplicate Results
*	•	Detection Limits
*	•	Compound Quantitation
*	•	Compound Identification

The symbol (*) indicates that all quality control criteria were met for this parameter. Problems affecting data quality are discussed below; documentation supporting these findings is presented in Appendix D. Qualified Analytical results are presented in Appendix A. Results as reported by the laboratory are presented in Appendix B. Region II data validation forms are presented in Appendix C.

VOC

Positive results below the reporting limit were qualified as estimated (J) due to uncertainty near the detection limit.

The continuing calibration performed on October 14 at 06:21 exceeded the 25% difference quality control criteria for 2-hexanone. The non-detected results for 2-hexanone were qualified as estimated in samples BPOW2-1-100903, BP-RB-100903, and BP-TB-100803.

The percent recoveries of 1,1-dichloroethene exceeded the relative percent difference (RPD) quality control criteria in the MS/MSD. No qualifications were made on this basis because both percent recoveries were compliant.

EXECUTIVE SUMMARY

Laboratory Performance Issues: Qualifications were made based on calibration non-compliances.

Other Factors Affecting Data Quality: None.

The data for these analyses were reviewed with reference to the EPA Functional Guidelines for Organic Data Validation (10/99) and the NFESC guidelines. The text of this report has been formulated to address only those problem areas affecting data quality.

"I attest that the data referenced herein were validated according to the agreed upon validation criteria as specified in the NFESC guidelines and the Quality Assurance Project Plan (QAPP)."

3. Appendix C - Support Documentation

APPENDIX A

QUALIFIED ANALYTICAL RESULTS

Qualifier Codes:

A = Lab Blank Contamination
B = Field Blank Contamination
C = Calibration Noncompliance (i.e., % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)
C01 = GC/MS Tuning Noncompliance
D = MS/MSD Recovery Noncompliance
E = LCS/LCSD Recovery Noncompliance
F = Lab Duplicate Imprecision
G = Field Duplicate Imprecision
H = Holding Time Exceedance
I = ICP Serial Dilution Noncompliance
J = GFAA PDS - GFAA MSA's $r < 0.995$
K = ICP Interference - includes ICS % R Noncompliance
L = Instrument Calibration Range Exceedance
M = Sample Preservation Noncompliance
N = Internal Standard Noncompliance
N01 = Internal Standard Recovery Noncompliance Dioxins
N02 = Recovery Standard Noncompliance Dioxins
N03 = Clean-up Standard Noncompliance Dioxins
O = Poor Instrument Performance (i.e., base-time drifting)
P = Uncertainty near detection limit (< 2 x IDL for inorganics and <CRQL for organics)
Q = Other problems (can encompass a number of issues; i.e.chromatography,interferences, etc.)
R = Surrogates Recovery Noncompliance
S = Pesticide/PCB Resolution
T = % Breakdown Noncompliance for DDT and Endrin
U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC
V = Non-linear calibrations; correlation coefficient $r < 0.995$
W = EMPC result
X = Signal to noise response drop
Y = Percent solids <30%
Z = Uncertainty at 2 sigma deviation is less than sample activity

PITTSBURGH, PENNSYLVANIA

APPROVED FOR SUBMISSION BY:

JOHN J. TREPANOWSKI
PROGRAM MANAGER
KING OF PRUSSIA, PENNSYLVANIA

TABLE OF CONTENTS

1.0 INTRODUCTION

This report summarizes the installation and development of nine Outpost Monitoring Wells located south and hydraulically downgradient of the Naval Weapons Industrial Reserve Plant (NWIRP) New York. The wells were installed in support of Navy's Record of Decision for Operable Unit No. 2 (April 2003) to provide advance warning of potential contaminant impact to local public water suppliers. Tetra Tech NUS, Inc., (TtNUS) performed the work for the U.S. Navy Engineering Field Activity Northeast under Contract Task Order 0812 of Comprehensive Long-Term Environmental Action Navy (CLEAN) Contract Number N62467-94-D-0888.

1.1 SCOPE OF WORK

Nine Outpost Monitoring Wells (BPOW1-1, 1-2 and 1-3, BPOW2-1 and 2-2, BPOW3-1 and 3-2, and BPOW 4-1 and 4-2) were drilled and installed between June 2003 and December 2003. These wells were installed in accordance with the "Work Plan Addendum for Outpost Monitoring Wells Installation Program" attached as Appendix B to the "Public Water Supply Contingency Plan" dated July 2003. Figure 1-1 illustrates the approximate locations of these wells.

Target screen intervals were initially selected with the aid of an advanced regional groundwater model that accounted for the location of groundwater contamination, groundwater flow paths, and screen intervals and extraction rates for local public water supply wells. Final screen intervals were selected in the field based on actual lithology. These intervals are summarized in Table 2-1. Final well locations and well head elevations were surveyed.

1.2 REPORT FORMAT

This report presents the methodology and field logs for the installation of the Outpost Monitoring Wells. Section 1.0 provides a brief introduction and summary of the scope of work. Field methodologies for well installation are provided in Section 2.0. Monitoring well construction diagrams, boring logs, borehole geophysical logs, and well development sheets for each well are provided in the appendices. The information is organized by well, with Appendices A through I providing the data for Wells BPOW1-1 through BPOW4-2, respectively. Groundwater samples were collected at the end of well development. Chain-of-custody forms, sample log sheets, and analytical results are presented in Appendices J, K, and L, respectively. Survey drawings are provided in Appendix M.

2.0 WELL DRILLING AND INSTALLATION

This section describes the field methodologies for installation and development of nine Outpost Monitoring Wells. The work was performed in accordance with the "Work Plan Addendum for Monitoring Well Installation Program, Naval Weapons Industrial Reserve Plant, Bethpage, New York" (TtNUS, July 2003). Field work was performed from June through December 2003. Uni-Tech Drilling Company, Inc. (UTD), of Malaga, New Jersey, drilled and installed the wells under subcontract to TtNUS. Aqua Terra Geophysics, Inc., of Bellport, New York, under subcontract to UTD, performed the borehole geophysical logging.

2.1 DRILLING METHODOLOGY

Well boreholes were advanced using mud rotary techniques. Well boreholes were approximately 8 inches in diameter. In addition, boreholes for wells BPOW2-2, BPOW3-2, BPOW4-1 and BPOW4-2 were initially reamed to 10 to 12 inches in diameter to a depth of approximately 87 to 105 feet to allow for installation of permanent, polyvinyl chloride (PVC) surface casing. This casing was used to control sloughing of the upper borehole. Drilling mud consisted of potable water and polymer-free sodium bentonite. All drilling mud was contained and recirculated in a baffled, high capacity mud pan.

2.2 SOIL SAMPLING

Soil samples were collected from well borings for lithology description. The samples were collected from the deepest well at each cluster and were taken at periodic depths at the discretion of the field geologist. The samples were described and entered on the boring logs as shown in the attachments. The soil samples were used to provide a comparison to the geophysical logs that were also run on the deepest well at each cluster. The well screen placement was determined by evaluating the geophysical log for each cluster.

Soil samples were collected using 2-inch diameter split-spoon samplers according to American Standard of Test Methods (ASTM) D-1586. Depths not sampled were logged for lithology based on the drilling cuttings brought to the surface entrained in the drilling mud.

2.3 BOREHOLE GEOPHYSICAL LOGGING

Borehole geophysical logs were recorded in the deepest wells (BPOW1-3, BPOW2-2, BPOW3-2 and BPOW4-2) installed. Following advancement to the total well depth of each well boring to be logged, the drilling tools were withdrawn from the borehole. A geophysical probe was then run down the borehole and back up. The geophysical data was recorded using a Mount Sopris MGX II digital logger. The probe was

multi-function and recorded a natural gamma ray log, as well as single point resistivity, and standard potential logs. Geophysical borehole log printouts are provided for the logged wells in the appendices.

2.4 MONITORING WELL INSTALLATION

After advancement of the well borings to the appropriate depths, monitoring wells were installed to the depths indicated in Table 2-1. The mud in the screened interval was thinned to the fullest extent possible prior to well installation. Well material was then installed in the open borehole to the appropriate depth.

All of the wells were constructed of 4-inch diameter, Schedule 80, National Sanitation Foundation-approved polyvinyl chloride (PVC) well screen and riser pipe. All well screens had slot sizes of 0.010 inches. Threaded bottom caps were fitted to the bottom of each well. All pipe sections and bottom caps were flush-jointed and flush-threaded.

Primary filter packs were installed in the annuli around the well screens to the depths indicated in Table 3-1. The filter packs consisted of FilterPro #1 quartz sand installed using a tremie pipe or by allowing the filter pack to gravity fall into the annulus from the surface. Filter packs were installed to the approximate depths as follows:

- Deep (D) Wells: minimum of 10 feet above the top of the screen
- Deep 2 (D2) Wells: minimum of 20 feet above the top of the screen
- Deep 3 (D3) Wells: minimum of 25 feet above the top of the screen

Secondary filter packs of finer sand (FilterPro #0 quartz sand) than the primary filter pack were installed in the annulus around the well riser above the primary filter pack to the depths indicated in Table 3-1. The secondary filter packs were installed to the approximate depths as follows:

- Deep (D) Wells: minimum of 5 foot above the top of the primary filter pack
- Deep 2 (D2) Wells: minimum of 10 foot above the top of the primary filter pack
- Deep 3 (D3) Wells : minimum of 15 feet above the top of the primary filter pack

A 2- to 4-foot thick bentonite seal was installed above the secondary filter pack. The annulus above the bentonite seal was grouted with Volclay© high-solids bentonite slurry. Both the bentonite seal and bentonite slurry were installed using a tremie pipe.

Seven of the nine wells were completed at the surface with a 12-inch diameter steel curb box, set in a 3-foot by 3-foot by 0.5-foot thick concrete pad (BPOW1-1 to BPOW3-2). Because of limited space between

an underground utility and the curb, two of the wells were installed with a 9-inch diameter steel curb box (BPOW4-1 and BPOW4-2). The concrete pad on these two wells was the same as the other seven wells. A layer of fine sand was installed above the grout slurry and inside the curb box to allow for drainage of water from the curb box. The tops of all well risers were set approximately 8 inches below grade. Lockable gripper caps were installed on all well riser tops.

2.5 MONITORING WELL DEVELOPMENT AND SAMPLING

The monitoring wells were developed to remove drilling mud and fine formation particles from the well filter packs. Monitoring wells were developed no sooner than 24 hours after installation. Development was accomplished using two methods: airlifting, mechanical surging, and pumping with a submersible pump for all of the wells.

Monitoring wells were developed using a combination of air lifting, mechanical surging, and pumping with a submersible pump. A threaded, 2-inch diameter steel eductor pipe with a surge block assembly was installed in the wells with the surge block set at the base of the well screen. A ¾-inch diameter polyethylene airline was inserted in the eductor pipe to a depth above the top of the well screen. The deep wells were developed at 5-foot intervals in the screened interval using a combination of mechanical surging (vertical movement of the surge block by a truck-mounted mechanical device) and air lifting. Once the screened interval was completely developed using this technique, the pipe was removed from the well and development continued using a submersible pump. The submersible pump was placed approximately 50 to 75 feet below the static water level in order to remove the stagnant water from above the well screen. When the water became clear, the inside of the well casing was rinsed with water from the pump discharge, and the pump was slowly raised through the water column (with the pump running) until it was at or near the static water level. Pumping ceased and development was complete when the water level stabilized, all traces of drilling mud were removed, and the well produced clear, sediment-free water. The well cap was cleaned and rinsed with deionized water and placed back onto the well riser.

Field water quality parameters of pH, specific conductance, temperature, dissolved oxygen, and turbidity were monitored and recorded periodically throughout well development. In compliance with NYSDEC policy, all wells, (except for BPOW3-2 and BPOW4-2), were developed until turbidity was less than 50 nephelometric turbidity units (NTUs). Every effort was made to develop well BPOW3-2 and BPOW4-2 to a measured turbidity of less than 50 NTUs; however, the 50 NTU criterion was unattainable in these wells due to the lithology of the formation screened (clay and clayey/silty sand). In this case, turbidity was stabilized and development was deemed complete.

Following development of the pumping stage, the pump rate was decreased and a groundwater sample was collected from each well and was analyzed for VOC compounds. All development fluids were containerized and stored at the decontamination area for proper disposal to the POTW.

2.6 WELL REHABILITATION AND RECONSTRUCTION

Monitoring well BPOW4-1 was installed on July 17, 2003. The well screen was set from 652 to 692 feet below ground surface (bgs). During development it was determined that the 4-inch diameter well screen had been damaged and that sand had infiltrated through the screen to a depth of approximately 660 feet bgs. It is unknown how the damage occurred. Well development was terminated and the repair of this well would be conducted at a later date by Unitech Drilling Company, Inc.

On December 8, 2003 repair of this well began. A 2-inch diameter threaded steel pipe was lowered into the 4-inch schedule 80 well screen and riser using the Failing 1500 drill rig. At approximately 660 feet bgs resistance was hit, indicating the level of the sand. Once the pipe was set, a ½-inch polyethylene tubing was placed inside the 2-inch pipe to a depth of approximately 200 feet. An Atlas Copco 185 CFM air compressor was used to supply air through the tubing. As the air was introduced through the tubing, both water and sand began to exit up through the 2-inch pipe and into the mud tub that was placed over the well. This method is similar to the reverse circulation method of drilling and also similar to the air lift method of development. A constant head of water had to be introduced to the well in an effort to keep the sand from entering the well. Water was supplied by using a 2,000 gallon tank and a 2,000 gallon capacity water truck. Approximately 8,000 gallons was used during the repair operation. Approximately one full 55-gallon drum was filled with sand and debris from the damaged area of the well.

As the water, sand and pieces of well screen was evacuated from the hole, UTD began to lower the 2-inch pipe further into the well screen. The 2-inch pipe was finally lowered to a depth of approximately 692 feet bgs, indicating that all of the sand had been evacuated from the well. Material that was forced out of the well included a fine to coarse sand, fine sub-rounded gravel, traces of lignite and pieces of well screen. The sand pack used to place around the well screen was also observed in the cuttings that were evacuated.

After several minutes of making sure all debris was evacuated from the well, UTD began to pull the 2-inch pipe, which took approximately 2 hours. Once the pipe was removed, UTD assembled 4 ten feet sections of 2-inch diameter 10 slot stainless steel screen. A stainless steel pointed end cap was placed on the bottom of the screen. A ten foot section of stainless steel riser pipe was attached to the 40 feet of well screen. A "K" packer was then placed on top of the riser pipe. This packer will serve as a barrier to prevent any sand from infiltrating above the screened interval. This 50 foot section, with the riser and

packer at the top was dropped into the well and allowed to free fall, with the water acting as a floating medium, to the bottom of the cleaned out well.

In order to check the depth of the 2-inch well, UTD immediately began to re-insert the 2-inch pipe and was able to determine that the 2-inch well had successfully been installed. The 2-inch pipe hit resistance at approximately 642 feet bgs. UTD left this pipe in overnight and air lift development operations began the following day using the method described in Section 2.5.

NOTES:

All well screen and riser was schedule 80 PVC and all screen slot sizes are 0.010 inches (10 slot).
Development consisted of air lift, surging and submersible pump and all wells were drilled using the mud rotary method.

ft bgs= feet below ground surface
Blank Sect.= schedule 80 PVC riser placed between screened sections of the well
NA= not applicable. No casing was set in these wells.
Gamma log run only on deepest well in each cluster.
