1.0 INTRODUCTION

H&S Environmental, Inc. (H&S) has prepared this Quarterly Operations Report for the Third Quarter 2012 for the Soil Vapor Extraction Containment System (SVECS) at Site 1, Former Drum Marshalling Area, at the Naval Weapons Industrial Reserve Plant (NWIRP) in Bethpage, New York. This report has been prepared for the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC), Mid-Atlantic, under Contract No. N40085-10-D-9409, Contract Task Order (CTO) No. 0005. This Third Quarter 2012 Operations Report details activities that occurred from June 2012 to September 2012. Data was collected and operational activities were performed by H&S in accordance with the following documents:

- *Final Operation & Maintenance Plan for Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant Bethpage, New York* prepared by Tetra Tech EC, Inc. (TtEC) in 2010, hereafter referred to as the "O&M Manual."

- *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by Tetra Tech NUS, Inc. (TtNUS) in 2012.

1.1 Site Location

NWIRP Bethpage is located in east central Nassau County, Long Island, New York, approximately 30 miles east of New York City. The Navy's property totaled approximately 109.5 acres and was formerly a Government Owned Contractor-Operated (GOCO) facility that was operated by the Northrop Grumman Corporation (NGC) until September 1998. NWIRP Bethpage is bordered on the north, west, and south by property owned, or formerly owned, by NGC that covered approximately 605 acres, and on the east by a residential neighborhood. Site 1 lies within the fenced area of NWIRP Bethpage and is located east of Plant No. 3, west of 11th Street, and north of Plant 17 South (**Figures 1 and 2**).

1.2 Background

NWIRP Bethpage was established in 1941. Since inception, the primary mission of the facility has been the research, prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. Historical operations that resulted in hazardous material generation at the facility included metal finishing processes, maintenance operations, painting of aircraft and components, and other activities that involve aircraft manufacturing. Wastes generated by plant operations were disposed of directly into drainage sumps, dry wells, and/or on the ground surface, resulting in the disposal of a number of hazardous wastes, including volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and inorganic analytes (chromium and cadmium) at the site. Some of these contaminants have migrated from the source area to surrounding areas, including the soils at these sites and the groundwater beneath and downgradient of the NWIRP Bethpage property. NWIRP Bethpage is currently listed by the New York State Department of Environmental Conservation (NYSDEC) as an "inactive hazardous waste site" (#1-30-003B).

Soils at Site 1 consist mainly of unconsolidated sediments that overlie crystalline bedrock. A clay unit is present near the groundwater table (50 feet below ground surface [bgs]) at the southeast corner of the site. This clay unit is suspected to be a source of chlorinated solvents that are migrating into the overlying soil gas and the source of offsite VOCs in soil vapor (TtEC 2010).

Chlorinated solvents including trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (TCA) have been identified as the VOCs of interest in soil gas at the site. Concentrations greater than 1,000 $\mu g/m^3$ (micrograms per cubic meter) of soil vapor have been directly associated with Site 1 activities and historical environmental data, and based on preliminary screening, exceed guidelines established by the New York Department of Health (NYDOH) for subslab soil vapor concentrations. Of these compounds, TCE is the primary VOC of concern. Mitigation of TCE contamination in accordance with NYDOH guidance is expected to mitigate other VOCs associated with the site. PCBs, cadmium, and chromium have also been identified in site soils at concentrations requiring remediation. The majority of these chemicals has been detected in the central portion of Site 1 and will be addressed via a separate remediation (TtEC 2010).

Prior to implementation of the SVECS, the mean concentrations of VOCs in soil gas samples collected along the eastern fence-line were 41,128 $\mu g/m^3$ of TCE, 381 $\mu g/m^3$ of PCE, and 20,634 $\mu g/m^3$ of 1,1,1-TCA. The maximum concentrations of VOCs in the soil gas samples were 180,000 $\mu g/m^3$ of TCE, 1,200 $\mu g/m^3$ of PCE, and 90,000 $\mu g/m^3$ of 1,1,1-TCA (TtEC 2010).

1.3 Project Overview and Objective

The remedial objective for this project is to use an on-site soil vapor extraction system to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture contaminated soil vapor with a TCE concentration greater than 250 $\mu g/m^3$. A secondary objective of this project is to address soil vapor with a TCE concentration greater than 5 $\mu g/m^3$. The SVECS is an interim action intended to address migration of VOCs in contaminated soil vapors and has been designed for a four-year operational life; it is expected to operate continuously 24 hours/day, seven days/week, with the exception of maintenance and adjustment periods (TtEC 2010).

1.4 SVECS Overview

The SVECS consists of soil vapor extraction, soil vapor monitoring, and soil vapor treatment. Twelve SVE wells (SVEWs) are located along the eastern boundary of Site 1 in six clusters, each consisting of one intermediate well and one deep well. Intermediate wells SVE-101I, SVE-102I, SVE-103I, SVE-104I, SVE-105I, and SVE-106I have a screened interval between 25 and 35 ft bgs. Deep wells SVE-101D, SVE-102D, SVE-103D, SVE-104D, SVE-105D, and SVE-106D have a screened interval between 40 and 60 ft bgs. The groundwater table fluctuates between approximately 50 and 55 feet bgs. Each SVEW is operated at a flow rate such that the combined total flow rate is approximately 400 standard cubic feet per minute (scfm) of soil vapor. Each intermediate depth SVEW requires a minimum vacuum of 4 inches of water column (i.w.) and each deep SVEW requires a minimum vacuum of 20 i.w. in order to extract the targeted flow rates. These twelve SVEWs have been piped below the ground to the Flow Monitoring Station (FMS), where flow, vacuum, and vapor quality are monitored. Within the FMS, the discharges

from the individual SVEWs have been equipped with a 2-inch flow control butterfly valve, a vacuum gauge, and a sampling port. The sampling port is utilized to measure the flow rate from an individual well using a portable velocity meter and to collect vapor samples. All the SVE lines collect into a single manifold within the FMS and from this location a single underground pipeline has been routed approximately 1,400 linear feet to the Treatment Building (Building 03-35). Five additional SVEWs (SV-107D, SV-108D, SV-109D, SV-110D, and SV-11D) were installed in October 2011 to address potential VOCs under Plant No. 3 and the South Warehouse. A site plan depicting well locations is included as **Figure 3**.

The SVECS is housed within the Treatment Building, an existing and unoccupied building also known as Building 03-35. The treatment system consists of a moisture separator, two SVE blowers, and a 5,000-lb vapor-phase granular activated carbon (VGAC) unit for removal of chlorinated VOCs from the off-gas. Soil vapor that enters the Treatment Building first passes through the moisture separator tank where any condensate is separated and removed by a portable pump into 55-gallon drums and then disposed of onsite to the County's sanitary sewer system when necessary. The vapor is then passed through an air filter and SVE blower and then treated in the VGAC unit. The treated vapor is discharged from the VGAC via an exhaust stack. The SVECS has a control panel comprised of mechanical interlocks and relays for local operation. A System Layout Plan is presented in **Figure 4**, which also illustrates the design flow rates through the soil vapor extraction and treatment process.

The off-gas from the SVECS is monitored for chlorinated VOCs as identified in the NYSDEC Division of Air Resources (DAR) permit equivalent effluent limitations (**Appendix A**) and monitoring requirements (TtEC 2010). Samples are submitted to a National Environmental Laboratory Accreditation Conference (NELAC)-accredited, Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory, Air Toxics, Inc. located in Folsom, CA, for analysis of target compound list (TCL) VOCs, including PCE, 1,1,1-TCA, and TCE , by modified method TO-15.

A total of 18 soil vapor pressure monitor (SVPM) / soil gas monitoring points have been installed in the neighborhood east of Site 1 at NWIRP Bethpage. These off-site monitoring points consist of eight previously existing SVPMs as well as 10 recently installed SVPMs, as described below. Pressure readings from the SVPMs are used to evaluate the SVECS vacuum field, and along with analytical results of vapor samples collected from these locations, to further evaluate the SVECS operation.

2.0 SVECS OPERATION AND MAINTENANCE

While designed to run autonomously, the SVECS requires regular visits by an operator to record and adjust operational parameters and to perform scheduled maintenance. The SVECS is equipped with telemetry that will alert an on-call operator in the event of a plant shutdown.

2.1 Routine Maintenance Activities

Routine maintenance activities at the SVECS were performed during the operator's weekly visits during this reporting period. These activities include general site inspections (of the grounds, buildings, doors and locks), collection of operational data (vapor flowrates, pressures, vacuums, temperature and photoionization detector [PID] readings), adjustment of system valves, collection of vapor samples (on a monthly and quarterly basis), collection/disposal of condensate if needed, cleaning of filters, switching of lead/lag blower assignments, and preventive maintenance of system equipment.

2.2 Non-routine Maintenance / Site Activities

The following non-routine activities were performed during this reporting period:

- On 5 September and 6 September, ten additional SVPMs were installed along 10th Avenue, 11th Avenue, and Sycamore Street and one SVPM was decommissioned in place, bringing the total number of off-site SVPMs to 18. Details of these installation activities have been provided under separate cover. Quarterly monitoring of all 18 locations was performed in the Third Quarter, after installation of the 10 additional SVPMs was complete.

- On 5 September, blower motor B-1A failed and the system continued to operate using the second blower motor, B-1B. Blower motor B-1B subsequently failed on 24 September, and the system was down while procurement of two replacement blower motors occurred. Two new blower motors were installed on 3 October, and the system resumed operation. Adjustments were made to the system to limit the system flow rate to 400 scfm in order to avoid overloading the motor.

3.0 SVECS MONITORING

Several process vapor samples are collected on a monthly basis to monitor SVECS effectiveness. These samples consist of an influent sample (as well as a duplicate sample), located immediately prior to the VGAC unit, and an effluent sample, located after the VGAC unit and before the exhaust stack. Vapor samples are also collected from the 12 original SVEWs on a quarterly basis to determine the effectiveness of the remediation activities and monitor the capture of the contaminated soil vapor by the SVEWs. In addition, quarterly pressure measurements are collected from the SVEWs and SVPMs to monitor the SVECS vacuum field, and soil gas sampling for SVPMs is conducted annually (generally in the winter time-frame).

3.1 Monthly Air Quality Monitoring

Analysis of influent and effluent vapor sample locations is performed to evaluate VOC mass removal and the effectiveness of the VGAC adsorption unit. Composite vapor samples are collected using 6-L summa canisters with 30-minute flow regulators.

Treated off-gas discharged at the exhaust stack is subject to emissions limitations and associated calculations approved by the NYSDEC DAR in February 2010. A copy of the NYSDEC approved calculations is presented in the Air Permit Equivalent included as **Appendix A**.

A summary of monthly vapor sampling results collected in July, August, and September (Third Quarter) is presented in **Tables 1, 2, and 3**, respectively. Emission rate calculations for both the influent stream (prior to VGAC treatment) and effluent stream (following VGAC treatment) and estimated monthly mass recoveries are also presented. Emission rates of the influent stream are calculated to monitor progress and determine when influent concentrations have reached levels at which vapor treatment via carbon adsorption is no longer required. The data presented in **Tables 1, 2, and 3** demonstrate that all constituents were within the effluent emission rates (**Appendix A)**. Raw analytical data is provided under a separate cover.

3.2 Quarterly Air Quality Monitoring

Composite vapor samples are collected quarterly using 6-L summa canisters with 30-minute flow regulators at six intermediate and six deep SVE wells. The samples are collected for the purpose of tracking and documenting the performance of the SVECS at maintaining hydraulic containment and capturing the contaminated soil vapors (TtEC 2010).

Quarterly vapor samples were collected on 11 September from the 12 SVEWs. A summary of detected compounds is included as **Table 4**. Analytical results of select VOCs (1,1,1-TCA, PCE, and TCE) detected at the 12 SVEWs during the Third Quarter monitoring event are presented graphically as **Figure 5**. Raw analytical data is provided under a separate cover.

3.3 Quarterly Off-site Vapor Monitoring

Vacuum readings are collected quarterly from the 12 SVEWs and 18 SVPMs in order to monitor the SVECS vacuum field. Valve positions of the SVEWs are also recorded at this time. Results of the Third Quarter vapor monitoring are presented in **Table 5**.

3.4 Air Quality Concentration Trends

Historical vapor analytical results through the Third Quarter are presented in **Table 6**. In addition, concentration trends of select VOCs over time for the SVECS combined influent (1,1,1-TCA, PCE, TCE, and total VOCs) and each of the 12 SVEWs (1,1,1-TCA, PCE, and TCE) are presented in **Appendix B**. Concentration trends observed through the Third Quarter are discussed below. In general, unless otherwise indicated, concentrations of 1,1,1-TCA, PCE, and TCE exhibited similar trends at each given location.

- Combined Influent: Overall VOC concentrations in the combined influent remained relatively consistent throughout the beginning of the Third Quarter, and then increased slightly at the end of the quarter with total VOC concentrations of 2,223 µg/L 2,330 µg/L, and 2,892 µg/L in July, August, and September, respectively. Combined influent VOC concentrations had increased in August 2011 (2,820 µg/L) and then gradually leveled off prior to the observed increase in September 2012. Overall concentrations remain well below baseline concentrations observed in December 2009 when a total VOC concentration of 63,650 µg/L was observed.

- SV-101I: Concentrations observed at this location decreased overall throughout 2010 and 2011 with minor fluctuations. Concentrations increased throughout 2012 reaching concentrations of 7,200 µg/L TCE, 93 µg/L PCE, and 3,200 µg/L 1,1,1-TCA in the Third Quarter 2012, with PCE exhibiting the greatest increase. All concentrations remain well below baseline concentrations observed in December 2009 (180,000 µg/L TCE, 1,700 µg/L PCE, and 51,000 µg/L 1,1,1-TCA).

- SV-101D: No overall trend is discernible. Concentrations decreased through 2010, increased in the Third Quarter 2011, and then decreased in the Fourth Quarter 2011 reaching non-detectable levels in the First Quarter 2012. Concentrations again increased through the Third Quarter 2012 (400 µg/L TCE, 150 µg/L PCE, and 9.9 µg/L 1,1,1-TCA). All concentrations remain well below baseline concentrations observed in December 2009 (100,000 µg/L TCE, 3,200 µg/L PCE, and 26,000 µg/L 1,1,1-TCA).

- SV-102I: No overall trend is discernible. Peak concentrations were observed in June 2010 (300 µg/L TCE, 17 µg/L PCE, and 13 µg/L 1,1,1-TCE) with concentrations decreasing throughout the remainder of 2010. Concentrations increased slightly and then decreased again during 2011. Concentrations again increased through 2012, reaching concentrations of 99 µg/L TCE, 6.4 µg/L PCE, and 3.3 µg/L 1,1,1-TCA in the Third Quarter 2012. Though these concentrations are above baseline concentrations observed in December 2009 (5.6 µg/L TCE, 2.4 µg/L PCE, and non-detectable 1,1,1-TCA), they are below peak concentrations observed in June 2010.

- SV-102D: Concentrations observed at this location decreased overall throughout 2010. Concentrations generally increased throughout 2011 but remained below baseline concentrations observed in December 2009 (440 µg/L TCE, 10 µg/L PCE, and 130 µg/L 1,1,1-TCA). Overall concentrations decreased in the First Quarter 2012, then increased through the Third Quarter 2012 (170 µg/L TCE, 24 µg/L PCE, and 3.9 µg/L 1,1,1-TCA). Concentration of TCE and PCE remain well below baseline concentrations observed in December 2009, and concentrations of 1,1,1-TCA, though above baseline concentrations, remain below the peak concentration observed in October 2011 (39 µg/L).

- SV-103I: Concentrations observed at this location have decreased from baseline concentrations observed in December 2009 (900 µg/L TCE, 580 µg/L PCE, and 900 µg/L 1,1,1-TCA), remaining at low or non-detectable levels through the first half of 2011. Concentration increased in the latter half of 2011, decreased in the beginning of 2012, then increased again, reaching concentrations of 130 µg/L TCE, 430 µg/L PCE, and 9.2 µg/L 1,1,1-TCA in the Third Quarter 2012. All concentrations remain below baseline concentrations observed in December 2009.

- SV-103D: Concentrations observed at this location have decreased from peak concentrations observed in December 2009 (3,100 µg/L TCE and 3,000 µg/L 1,1,1-TCA) and March 2010 (28,000 µg/L PCE), decreasing to low or non-detectable levels through the first half of 2011. Concentrations increased in the latter half of 2011, decreased in the beginning of 2012, then increased again, reaching concentrations of 480 µg/L TCE, 4,700 µg/L PCE, and 22 µg/L 1,1,1-TCA in the Third Quarter 2012. All concentrations remain below baseline concentrations observed in December 2009.

- SV-104I: Concentrations observed at this location have decreased from baseline concentrations observed in December 2009 (710 µg/L TCE, 3,100 µg/L PCE, and 730 µg/L 1,1,1-TCA), decreasing through the first half of 2011. Concentrations increased in the Third Quarter 2011, and then decreased through the Second Quarter 2012. Concentrations again increased in the Third Quarter 2012 (73 µg/L TCE, 86 µg/L PCE, and 8.3 µg/L 1,1,1-TCA). All concentrations remain well below baseline concentrations observed in December 2009.

- SV-104D: Concentrations observed at this location have decreased from peak concentrations observed in December 2009 (3,600 µg/L 1,1,1-TCA) and March 2010 (6,000 µg/L TCE and 39,000 µg/L PCE), and continue to decrease through the Third Quarter 2010. Concentrations have varied since then, with concentrations of 1,700 µg/L TCE, 4,600 µg/L PCE, and 620 µg/L 1,1,1-TCA observed in the Third Quarter 2012. All concentrations remain below baseline concentrations observed in December 2009.

- SV-105I: No overall trend is discernible. Peak concentrations were observed in June 2010 for TCE (370 µg/L) and PCE (240 µg/L) and October 2011 for 1,1,1-TCA (29 µg/L) with concentrations of TCE and PCE decreasing throughout the remainder of 2010 and into 2011. Concentrations increased during the latter half of 2011, decreased in early 2012, and then increased somewhat reaching concentrations of 260 µg/L TCE, 100 µg/L PCE, and 26 µg/L 1,1,1-TCA in the Third Quarter 2012. Though these concentrations are above baseline

concentrations observed in December 2009 (76 µg/L TCE, 70 µg/L PCE, and 9.9 µg/L 1,1,1-TCA), they are below peak concentrations observed in June 2010 and October 2011.

- SV-105D: No overall trend is discernible. Peak concentrations were observed for TCE in December 2011 (7,000 µg/L), PCE in December 2009 (2,100 µg/L), and 1,1,1-TCA in September 2010 (1,000 µg/L). Concentrations observed in Third Quarter 2012 (2,200 µg/L TCE, 270 µg/L PCE, and 270 µg/L 1,1,1-TCA) were below baseline concentrations observed in October 2009 for PCE (2,100 µg/L) and 1,1,1-TCA (550 µg/L) and above baseline concentrations for TCE (1,700 µg/L). Concentrations observed in Third Quarter 2012 remain below peak concentrations observed for all three analytes.

- SV-106I: Concentrations observed at this location have decreased from baseline concentrations observed in December 2009 (1,900 µg/L TCE, 390 µg/L PCE, and 220 µg/L 1,1,1-TCA), which were also the peak concentrations observed to date. Concentrations have varied over time, but those observed in the Third Quarter 2012 (260 µg/L TCE, 27 µg/L PCE, and 11 µg/L 1,1,1-TCA) remain well below baseline / peak concentrations.

- SV-106D: Concentrations observed at this location have decreased from baseline concentrations observed in December 2009 (3,900 µg/L TCE, 390 µg/L PCE, and 220 µg/L 1,1,1-TCA), which were also the peak concentrations observed to date. Concentrations have varied over time, but those observed in the Third Quarter 2012 (380 µg/L TCE, 62 µg/L PCE, and 26 µg/L 1,1,1-TCA) remain well below baseline / peak concentrations.

4.0 CONCLUSIONS AND RECOMMENDATIONS

As stated previously, the intent of the Site 1 SVECS is to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture soil vapor with elevated TCE concentrations. The removal of VOCs by the SVECS indicates that progress is being made toward these goals. Influent vapor analytical data with concentrations of TCE consistently greater than 250 µg/L indicate that the SVECS should continue to be operated on a full-time basis to achieve continued capture of contaminated soil vapor. Monthly monitoring of the combined influent and effluent as well as quarterly monitoring of individual SVEWs should continue, as well as quarterly and annual monitoring of the SVPMs. Ongoing optimization activities should be performed in order to improve system performance.

Notes:
i.w. = inches of water column
SVEW = soil vapor extraction well
SVPM = soil vapor pressure monitor
Vacuum readings for the SVPMs were measured using a portable Magnehelic® Differential Pressure Gauge 2000-0, with a range of 0-0.50 i.w. Vacuum readings for SVEWs were recorded from dedicated in-line pressure gauges.
Third Quarter 2012 Monitoring was performed in Oct 2012 as the gauge was not reading accurately when performed in Sept 2012.

PROCESS EQUIPMENT LIST		
ITEM NUMBER	NUMBER REQUIRED	NAME/DESCRIPTION
M-1	1	MOISTURE SEPARATOR -CONFIGURATION: VERTICAL, CYLINDRICAL -MATERIAL OF CONSTRUCTION: CARBON STEEL, EPOXY INTERIOR COATING, PAINT EXTERIOR COATING -CAPACITY: 400 GALLON CONDENSATE COLLECTION -DIMENSIONS: 5 FT DIA X 6 FEET HT, 718 GALLON
F-1	1	MAKE-UP AIR FILTER -CONFIGURATION: INTAKE FILTER/SILENCER COMBINATION HOUSING -MATERIAL OF CONSTRUCTION: CARBON STEEL, CORROSION RESISTANCE COATING -CAPACITY: 500 CFM AT 20 IW, 4 INCH FLANGED CONNECTION
F-2	1	BLOWER AIR FILTER -CONFIGURATION: INLINE VACUUM SERVICE FILTER -MATERIAL OF CONSTRUCTION: CARBON STEEL, CORROSION RESISTANCE COATING -CAPACITY: 1,200 CFM AT 35 IW, 10 INCH FLANGED CONNECTION
B-1A, B-1B	2	SOIL VAPOR EXTRACTION BLOWER -CONFIGURATION: HORIZONTAL CENTRIFUGAL -RATING: 600 CFM AT 40 IW -MOTOR: 7.5 HP, 460V, 3PH, 60HZ, ODP
VGAC-1	1	VAPOR-PHASE GRANULAR ACTIVATED CARBON -CONFIGURATION: RECTANGULAR TANK -MATERIAL OF CONSTRUCTION: CARBON STEEL, EPOXY INTERIOR COATING, EPOXY EXTERIOR COATING -RATING: 1,600 CFM AT 3 IW, 2,000 CFM AT 6 IW -CAPACITY: 5,000 LBS CARBON -DIMENSIONS: 6' X 8' FOOTPRINT, 6' 8" HT

Naval Facilities Engineering Command-Midlant
9742 Maryland Avenue
Norfolk, VA 23511-3095

RE: Naval Weapons Industrial Research Plant(NWIRP)
Site-Bethpage, NYSDEC No. 1-30-003B.

Dear Ms. Fly:

Tetra Tech FW, on behalf of the Department of the Navy (Navy), has submitted the enclosed New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR) Air Permit Application as a permit equivalent. This DAR Air permit equivalent is for the soil vapor extraction system at Site 1 of Plant 3 of the former Naval Weapons Industrial Reserve Plant (NWIRP) site in Bethpage, NY. The NYSDEC Division of Environmental Remediation (DER) has reviewed the permit equivalent and, by means of this letter approves the Site 1 remedy air discharge for immediate operation.

The NWIRP Site 1 SVE system utilizes the reasonably available control technology (RACT) with activated carbon. The air discharge will be periodically monitored at start up and will be added for routine monitoring in the operation, maintenance and monitoring (OMM) plan, to be submitted shortly for Departmental review.

If you have any questions, please contact me at your earliest convenience at (518)402-9620.

Sincerely,

Steven M. Scharf, P.E.
Project Engineer
Division of Environmental Remediation
Bureau of Remedial Action A

Facility Description ☐ Continuation Sheet(s)

Soil vapor remediation by SVE followed by vapor phase GAC

Compliance Statements (Title V Only) N/A

I certify that as of the date of this application the facility is in compliance with all applicable requirements: ☐ YES ☐ NO

If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at this facility that are operating in compliance with all applicable requirements complete the following:

- ☐ This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those units referenced in the compliance plan portion of Section IV of this application.
- ☐ For all emission units, subject to any applicable requirements that will become effective during the term of the permit, this facility will meet all such requirements on a timely basis.
- ☐ Compliance certification reports will be submitted at least once a year. Each report will certify compliance status with respect to each requirement, and the method used to determine the status.

Facility Applicable Federal Requirements N/A ☐ Continuation Sheet(s)

Process Information

❑ Continuation Sheet(s)

EMISSION UNIT 1-00EU1 PROCESS SVE

Description

The Soil Vapor Extraction System will consist of 12 SVE wells (6 intermediate and 6 deep), a moisture separator, and 2 soil vapor extraction blowers (BL-1 and BL-2) which both vent to a vapor phase granular activated carbon unit for treatment prior to discharge from stack 00STA. The VGAC unit will be a 5,000 pound unit, filled with Tetrasolv Virgin Carbon. The VGAC unit has been designed to operate nominally at 600 cfm, with a maximum of 1,000 cfm.
