1.0 INTRODUCTION

KOMAN Government Solutions, LLC (KGS) has prepared this 2018 Annual Operations Report for the Soil Vapor Extraction Containment System (SVECS) at Site 1, Former Drum Marshalling Area, at the Naval Weapons Industrial Reserve Plant (NWIRP) in Bethpage, New York. This report has been prepared for the U.S. Department of the Navy (Navy), Naval Facilities Engineering Command (NAVFAC), Mid-Atlantic, under Contract No. N40085-16-D-2288, Contract Task Order (CTO) No. N4008517F4042. This 2018 Annual Operations Report summarizes operations performed in 2018 and details activities that occurred during the Fourth Quarter from October 2018 to December 2018. Data was collected, and operational activities were performed by KGS in accordance with the following documents:

- *Final Operation & Maintenance Plan for Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant Bethpage, New York* prepared by Tetra Tech EC, Inc. (TtEC) in 2010, hereafter referred to as the "O&M Manual."

- *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by Tetra Tech NUS, Inc. (TtNUS) in 2012.

The following quarterly reports, along with data collected during the Fourth Quarter (October through December), are used as a basis for this 2018 Annual Operations Report:

- *Quarterly Operations Report, First Quarter 2018, Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard, Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by KGS in May 2018.
- *Quarterly Operations Report, Second Quarter 2018, Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard, Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by KGS in August 2018.
- *Quarterly Operations Report, Third Quarter 2018, Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard, Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by KGS in December 2018.

1.1 Site Location

NWIRP Bethpage is located in east central Nassau County, Long Island, New York, approximately 30 miles east of New York City. In the late 1990s, the Navy's property totaled approximately 109.5 acres and was formerly a Government Owned Contractor-Operated (GOCO) facility that was operated by Northrop Grumman (NG) until September 1998. NWIRP Bethpage was bordered on the north, west, and south by property owned, or formerly owned, by NG that covered approximately 550 acres, and on the east by a residential neighborhood. The Navy currently retains approximately nine acres of the former NWIRP, including Site 1, which lies within the fenced area of NWIRP Bethpage and is located east of Plant No. 3, west of 11th Street, and north of Plant 17 South (**Figures 1 and 2**).

1.2 Background

NWIRP Bethpage was established in 1943. Since inception, the primary mission of the facility was the research, prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. Historical operations that resulted in hazardous material generation at the facility included metal finishing processes, maintenance operations, painting of aircraft and components, and other activities that involve aircraft manufacturing. Wastes generated by plant operations were disposed of directly into drainage sumps, dry wells, and/or on the ground surface, resulting in the disposal of a number of hazardous wastes, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and inorganic analytes (chromium and cadmium) at the site. Some of these contaminants have migrated from the source area to surrounding areas, including the soils at these sites and the groundwater beneath and downgradient of the NWIRP Bethpage property. NWIRP Bethpage is currently listed by the New York State Department of Environmental Conservation (NYSDEC) as an "inactive hazardous waste site" (#1-30-003B).

Soils at Site 1 consist mainly of unconsolidated sediments that overlie crystalline bedrock. A clay unit is present near the groundwater table (50 feet below ground surface [bgs]) at the southeast corner of the site. This clay unit is suspected to be a source of chlorinated solvents that are migrating into the overlying soil gas and the source of off-site VOCs in soil vapor (TtEC 2010).

Chlorinated solvents including trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (TCA) have been identified as the VOCs of interest in soil gas at the site. Concentrations greater than 1,000 micrograms per cubic meter ($\mu g/m^3$) of soil vapor have been directly associated with Site 1 activities and historical environmental data, and based on preliminary screening, exceed guidelines established by the New York State Department of Health (NYSDOH) for sub-slab soil vapor concentrations at the time. Of these compounds, TCE is the primary VOC of concern. Mitigation of TCE contamination in accordance with NYSDOH guidance is expected to remediate other VOCs associated with the site. PCBs, cadmium, and chromium have also been identified in site soils at concentrations requiring remediation. The majority of these chemicals has been detected in the central portion of Site 1 and will be addressed via a separate remediation (TtEC 2010).

Prior to implementation of the SVECS, the mean concentrations of VOCs in soil gas samples collected along the eastern fence-line were 41,128 $\mu g/m^3$ of TCE, 381 $\mu g/m^3$ of PCE, and 20,634 $\mu g/m^3$ of 1,1,1-TCA. The maximum concentrations of VOCs in the soil gas samples were 180,000 $\mu g/m^3$ of TCE, 1,200 $\mu g/m^3$ of PCE, and 90,000 $\mu g/m^3$ of 1,1,1-TCA (TtEC 2010).

1.3 Project Overview and Objective

The remedial objective for this project is to use an on-site soil vapor extraction system to prevent further off-site migration of VOC-contaminated soil vapor and to the extent practical, capture contaminated soil vapor with a TCE concentration greater than 250 $\mu g/m^3$. A secondary objective of this project is to address soil vapor with a TCE concentration greater than 5 $\mu g/m^3$. The SVECS is an interim action intended to address migration of VOCs in contaminated soil vapors. It is expected to operate

continuously 24 hours/day, seven days/week, with the exception of maintenance and adjustment periods, until the remedial objectives are met (TtEC 2010).

1.4 SVECS Overview

The SVECS consists of soil vapor extraction, soil vapor monitoring, and soil vapor treatment. Twelve SVE wells (SVEWs) are located along the eastern boundary of Site 1 in six clusters, each consisting of one intermediate well and one deep well. Intermediate wells SVE-101I, SVE-102I, SVE-103I, SVE-104I, SVE-105I, and SVE-106I have a screened interval between 25 and 35 ft bgs. Deep wells SVE-101D, SVE-102D, SVE-103D, SVE-104D, SVE-105D, and SVE-106D have a screened interval between 40 and 60 ft bgs. The groundwater table fluctuates between approximately 50 and 55 feet bgs. Each SVEW is operated at a flow rate such that the combined total flow rate is approximately 300-400 standard cubic feet per minute (scfm) of soil vapor. Each intermediate depth SVEW requires an approximate vacuum of 4 inches of water column (i.w.) and each deep SVEW requires a vacuum of up to 20 i.w. in order to extract the targeted flow rates. These 12 SVEWs have been piped below the ground to the Flow Monitoring Station (FMS), where flow, vacuum, and vapor quality are monitored. Within the FMS, the discharges from the individual SVEWs have been equipped with a 2-inch flow control butterfly valve, a vacuum gauge, and a sampling port. The sampling port is utilized to measure the flow rate from an individual well using a portable velocity meter and to collect vapor samples. All the SVE lines collect into a single manifold within the FMS and from this location a single underground pipeline has been routed approximately 1,400 linear feet to the Treatment Building (Building 03-35). Five additional SVEWs (SV-107D, SV-108D, SV-109D, SV-110D, and SV-111D) were installed in October 2011 to address potential VOCs under Plant No. 3 and the South Warehouse. A site plan depicting well locations is included as **Figure 3**.

The SVECS is housed within the Treatment Building, an existing and unoccupied building also known as Building 03-35. The treatment system consists of a moisture separator, two SVE blowers, and a 5,000-pound vapor-phase granular activated carbon (VGAC) unit for removal of chlorinated VOCs from the off-gas. Soil vapor that enters the Treatment Building first passes through the moisture separator tank where any condensate is separated. To date, no condensate has formed in this tank. The vapor is then passed through an air filter and SVE blower and then treated in the VGAC unit. The treated vapor is discharged from the VGAC via an exhaust stack. The SVECS has a control panel comprised of mechanical interlocks and relays for local operation. A System Layout Plan is presented in **Figure 4**, which also illustrates the design flow rates through the soil vapor extraction and treatment process.

The off-gas from the SVECS is monitored for chlorinated VOCs as identified in the NYSDEC Division of Air Resources (DAR) permit equivalent effluent limitations and updated approval documentation (**Appendix A**) and monitoring requirements (TtEC 2010). Samples are submitted to a National Environmental Laboratory Accreditation Conference (NELAC)-accredited, Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory, Air Toxics, Inc. located in Folsom, CA, for analysis of VOCs by modified method TO-15. Prior to January 2014, samples were analyzed for target compound list (TCL) VOCs. As of January 2014, upon approval by NYSDEC and NYSDOH, samples are analyzed for site-specific VOCs. The site-specific VOCs are: 1,1,1-TCA,

1,1-dichloroethane (DCA), 1,1-dichloroethene (DCE), 1,2-DCA, cis-1,2-DCE, PCE, trans-1,2-DCE, TCE, and vinyl chloride (VC).

A total of 18 soil vapor pressure monitor (SVPM) / soil gas monitoring points have been installed in the neighborhood east of Site 1 at NWIRP Bethpage (**Figure 3**). These off-site monitoring points consist of eight previously existing SVPMs as well as 10 SVPMs installed in September 2012. Soil vapor pressure readings from the SVPMs are collected quarterly and used to evaluate the SVECS vacuum field. In addition, analytical results of vapor samples collected annually from these locations and the soil vapor pressure readings are used to further evaluate the SVECS operation and the potential for vapor intrusion.

2.0 SVECS OPERATION AND MAINTENANCE

While designed to run autonomously, the SVECS requires regular visits by an operator to record and adjust operational parameters and to perform scheduled maintenance. The SVECS is equipped with telemetry that will alert an on-call operator in the event of a plant shutdown.

2.1 Routine Maintenance Activities

Routine maintenance activities at the SVECS were performed during the operator's weekly visits during this reporting period. These activities include general site inspections (of the grounds, buildings, doors and locks), collection of operational data (vapor flowrates, pressures, vacuums, temperature and photoionization detector [PID] readings), adjustment of system valves, collection of vapor samples (on a monthly and quarterly basis), collection/disposal of condensate if needed, cleaning of filters, switching of lead/lag blower assignments, and preventive maintenance of system equipment.

2.2 Non-routine Maintenance / Site Activities

The following non-routine activities / repair activities occurred at the SVECS during the 2018 reporting period:

- On 16 January, F&M Mechanical was on site to install two new heating units to replace the defective units in the small office building.
- On 19 January, F&M Mechanical was on site to perform temporary repair of the leaking roof of the small office building. Permanent roof repair will be scheduled at a later date when weather permits. During the site visit, F&M Mechanical also replaced 12 light bulbs inside the SVE building.
- On 6 December, F&M Mechanical was on site to repair the overhead door in front of the SVE blower building. The door opener mechanism needed a new belt and the tension was readjusted for proper opening and closing.

3.0 SVECS MONITORING

Several process vapor samples are collected on a monthly basis to monitor the SVECS operation. These samples consist of an influent sample (as well as a duplicate sample), located immediately prior to the VGAC unit, and an effluent sample, located after the VGAC unit and before the exhaust stack. Vapor samples are also collected from the 12 original SVEWs on a quarterly basis to monitor the capture of the contaminated soil vapor by the SVEWs. In addition, quarterly pressure measurements are collected from the 12 SVEWs and the 18 SVPMs to monitor the SVECS vacuum field, and soil gas sampling from the 18 SVPMs is conducted annually (generally in the winter time-frame) to evaluate the effectiveness of the SVECS. The first annual soil gas sampling event was conducted in the winter 2012-2013. The sixth annual sampling event was conducted in February 2018.

3.1 Monthly Air Quality Monitoring

Analysis of influent and effluent vapor sample locations is performed to evaluate VOC mass removal and the effectiveness of the VGAC adsorption unit. Time-integrated vapor samples are collected using 6-liter summa canisters with 30-minute flow regulators.

Treated off-gas discharged at the exhaust stack is subject to emissions limitations. Initially, discharge goals were derived from calculations submitted by the Navy and accepted by the NYSDEC in its February 2010 DAR permit equivalent application. In September 2011, the Navy submitted an evaluation proposing revised discharge goals (TtNUS 2011), which NYSDEC agreed to in October 2011. A copy of this documentation is included as **Appendix A**.

3.1.1 Fourth Quarter 2018 Summary

A summary of monthly vapor sampling results collected in October, November, and December (Fourth Quarter) is presented in **Tables 1, 2, and 3**, respectively. Emission rate calculations for both the influent stream (prior to VGAC treatment) and effluent stream (following VGAC treatment) and the computed monthly mass recoveries are also presented. Emission rates of the influent stream as well as mass recovery are calculated to monitor progress and determine when influent concentrations have reached levels at which vapor treatment via carbon adsorption is no longer required. The data presented in **Tables 1, 2, and 3** demonstrate that all constituents were within the effluent emission rate guidelines (**Appendix A)**. Raw analytical data is provided under a separate cover.

Monthly emission rate calculations for January – September 2018 are included in previously submitted quarterly operations reports as indicated in Section 1.0. Pressure readings from the 18 SVPMs are presented graphically in **Figure 6**.

3.1.2 2018 Annual Summary

Emissions

Table 4 summarizes annual air emissions based on monthly emissions during 2018. Approximately 2.51 lbs of total VOCs were emitted. Annual emissions of reported constituents were within the discharge guidelines as indicated on **Table 4**.

Mass Recovery

Contaminant mass recovery was calculated based on monthly influent concentrations combined with monthly influent flow totals. During 2018, approximately 24.87 lbs of VOCs were removed by the SVECS, for an average monthly mass recovery rate of approximately 2.07 lbs per month. Monthly and annual mass recovery calculations for 2018, are summarized in **Table 4**.

3.2 Quarterly Air Quality Monitoring of SVEWs

Time-integrated vapor samples are collected quarterly using 6-liter summa canisters with 30-minute flow regulators at six intermediate and six deep SVEWs. The samples are collected for the purpose of tracking and documenting the performance of the SVECS (TtEC 2010).

3.2.1 Fourth Quarter 2018 Summary

Quarterly vapor samples were collected on 5 November from the 12 SVEWs. A summary of detected compounds is included as **Table 5**. Raw analytical data is provided under a separate cover.

3.2.2 2018 Annual Summary

Analytical results of select VOCs (1,1,1-TCA, PCE, and TCE) detected at the 12 SVEWs during 2018 are presented graphically in **Figure 5**. Historical analytical results of quarterly vapor samples collected from December 2009 through the Fourth Quarter 2018 are presented in **Table 6**. Concentration trends are discussed below in Section 3.5.

3.3 Quarterly Soil Vapor Pressure Monitoring of SVEWs and Off-site SVPMs

The quarterly vapor pressure readings are collected with the current fourth quarter results presented in Section 3.3.1 and the annual observations are presented in Section 3.3.2.

3.3.1 Fourth Quarter 2018 Summary

Soil vapor pressure readings are collected quarterly from the 12 SVEWs and 18 SVPMs to monitor the SVECS vacuum field. Soil vapor pressure readings from the 12 SVEWs and 18 SVPMs were collected on 5 November. The vapor pressure readings collected from the SVEWs ranged between -2.0 to -13.5 i.w. indicating that a vacuum has been established along the fence line. The vapor pressure readings collected from the SVPMs ranged between -0.01 to -0.19 i.w. indicating that a vacuum has been established in the residential neighborhood. Results of the Fourth Quarter vapor monitoring are presented in **Table 7**.

3.3.2 2018 Annual Summary

The vapor pressure readings collected from the SVPMs ranged between -0.01 to -0.19 i.w. indicating that a vacuum has been established in the residential neighborhood. Pressure readings collected from the 18 SVPMs in 2018 are presented graphically as **Figure 6**. As indicated, the greatest vacuums are typically observed at the SVPM-2001 and SVPM-2002 well clusters. Geographically, these two well clusters are located closest to the row of 12 SVEWs and the FMS.

3.4 Annual Vapor Quality Monitoring of Off-site SVPMs

Time-integrated vapor samples are collected annually using 6-liter summa canisters with 30-minute flow regulators at 18 SVPM locations. The 2018 SVPM analytical results were included in the *Quarterly Operations Report First Quarter 2018*

3.4.1 2018 Vapor Quality Results

Annual vapor samples were collected on 5 February from the 18 SVPM locations. Validated analytical results of samples collected in February 2018 are summarized in **Table 8**.

As shown on **Table 8**, 1,1,1-TCA was detected at an estimated value of 0.95 J µg/m^3 at well SVPM-2007D. PCE was detected at 6 of the 18 locations, with concentrations ranging from 1.0 J µg/m^3 at SVPM-2002D to 4.3 J µg/m^3 at SVPM-2001D. TCE was detected at 7 of 18 locations, with concentrations ranging from 0.43 J µg/m^3 at SVPM-2003D to 68 µg/m^3 at SVPM-2006D. All detected concentrations were well below the NYSDOH sub-slab screening values of 1,000 µg/m^3 for 1,1,1-TCA, 1,000 µg/m^3 for PCE, and 250 µg/m^3 for TCE, as outlined in the *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* (NYSDOH 2006).

Results of quality assurance /quality control (QA/QC) samples, data validation report, and a validated analytical data summary from the January 2018 sampling event are presented in the *Quarterly Operations Report, First Quarter 2018* (KGS 2018).

3.4.2 Historical Vapor Quality Results

Table 9 presents historical vapor quality analytical results collected from the 18 SVPM locations, beginning in October 2008 and including the most recent results obtained in February 2018. As indicated, concentrations observed in February 2018 have dropped substantially from initial concentrations observed in October 2008, and were generally similar to those observed in January 2017 with the following exceptions:

- The concentration of TCE at SVPM-2001D increased from 2.2 J µg/m^3 to 4.6 µg/m^3 but is still below the baseline concentration of 1,500 µg/m^3 in October 2008. Likewise, the concentration of PCE at this location increased from 1.9 J µg/m^3 to 4.3 J µg/m^3 but is still below the baseline concentration of 720 µg/m^3 in October 2008.
- The concentration of TCE at SVPM-2002I increased from 2.4 J µg/m^3 to 4.5 µg/m^3, this is below the baseline concentration observed in October 2008 of 89,000 µg/m^3.
- The concentration of TCE at SVPM-2002D increased from 20 µg/m^3 to 42 µg/m^3, this is below the baseline concentration observed in October 2008 of 26,000 µg/m^3. However, the concentration of PCE at SVPM-2002D decreased from 7.3 µg/m^3 to 1.0 J µg/m^3
- The concentrations of cis-1,2-DCE, trans-1,2-DCE, and TCE at SVPM-2006D decreased from 400 µg/m^3 to 310 J µg/m^3 for cis-1,2-DCE, decreased from 4.7 µg/m^3 to 2.4 J µg/m^3 for trans-1,2-DCE, and increased from 59 µg/m^3 to 68 µg/m^3 for TCE. The concentrations of cis-1,2-DCE,

trans-1,2-DCE, and TCE exceeded their baseline concentrations observed in October 2008 and the concentration of TCE is the highest observed to date.

- 1,1,1-TCA was detected for the first time since 2016 at location, SVPM-2007D, at a concentration of 0.95 J µg/m^3. This is similar to prior detection for this location, and well below the baseline concentration of 870 µg/m^3 observed in October 2008.

In 2008, TCE was detected at all 18 locations, with concentrations ranging from 1.0 µg/m^3 (SVPM-2004S) to 89,000 µg/m^3 (SVPM-2002I); concentrations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3 at nine locations (SVPM-2001S, SVPM-2001I, SVPM-2001D, SVPM-2002S, SVPM-2002I, SVPM-2002D, SVPM-2003D, SVPM-2004I, and SVPM-2004D). In 2013, TCE concentrations ranged from non-detectable levels at 12 locations to 47 µg/m^3 (SVPM-2006I), and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3. In 2014, TCE was detected at nine of the 18 locations, with concentrations ranging from 0.73 J µg/m^3 at SVPM-2003I to 3.7 J µg/m^3 at SVPM-2004I and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3. In 2015, TCE was detected at two of the 18 locations, with concentrations ranging from 1.5 J µg/m^3 at SVPM-2004D to 30 µg/m3 at SVPM-2006D, and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3. In 2016, TCE was detected at 17 of the 18 locations, with concentrations ranging from 1.8 J µg/m^3 at SVPM-2001S to 61 J µg/m3 at SVPM-2006D, and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3. In 2017, TCE was detected at 7 of 18 locations, with concentrations ranging from 0.78 J µg/m^3 at SVPM-2001I to 44 µg/m^3 at SVPM-2006I, and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3. In 2018, TCE was detected at 7 of the 18 locations, with concentrations ranging from 0.43 J µg/m^3 at SVPM-2003D to 68 µg/m^3 at SVPM-2006D, and no locations exceeded the NYSDOH sub-slab screening value of 250 µg/m^3.

In 2008, PCE was detected at all 18 locations, with concentrations ranging from 1.8 µg/m^3 (SVPM-2004S) to 5,000 µg/m^3 (SVPM-2001I); concentrations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3 at two locations (SVPM-2001S and SVPM-2001I). In 2013, PCE concentrations ranged from non-detectable levels at seven locations to 2.3 J µg/m^3 (SVPM-2004D), and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2014, PCE was detected at 15 of the 18 locations, with concentrations ranging from 0.53 J µg/m^3 at SVPM-2001D to 2.9 J µg/m^3 at SVPM-2004I, and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2015, PCE was detected at three of the 18 locations, with concentrations ranging from 1.7 J µg/m^3 at SVPM-2006D to 7.1 µg/m^3 at SVPM-2004D, and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2016, PCE was detected at 15 of the 18 locations, with concentrations ranging from 0.94 J µg/m^3 at SVPM-2002S to 6.8 µg/m^3 at SVPM-2007S, and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2017, PCE was detected at 11 of the 18 locations, with concentrations ranging from 0.59 J µg/m^3 at SVPM-2003I to 7.3 µg/m^3 at SVPM-2002D, and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2018, PCE was detected at 6 of the 18 locations, with concentrations ranging from 1.0 J µg/m^3 at SVPM-2002D to 4.3 J µg/m^3 at SVPM-2001D, and no locations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3.

In 2008, 1,1,1-TCA was detected at all 18 locations, with concentrations ranging from 1.4 µg/m^3 (SVPM-2004S) to 52,000 µg/m^3 (SVPM-2002I); concentrations exceeded the NYSDOH sub-slab screening value of 1,000 µg/m^3 at six locations (SVPM-2001S, SVPM-2001I, SVPM-2001D, SVPM-2002S, SVPM-

2002I, SVPM-2002D). In 2013, 1,1,1-TCA was detected at only one location, SVPM-2007D, at a concentration of 1.3 J µg/m^3, well below the NYSDOH sub-slab screening value of 1,000 µg/m^3. In 2014 and 2015, 1,1,1-TCA was not detected at any location. In 2016, 1,1,1-TCA was only detected in SVPM-2006D at a concentration of 0.59 J µg/m^3. In 2017, 1,1,1-TCA was not detected at any of the SVPM locations. In 2018, 1,1,1-TCA was detected at only one location, SVPM-2007D, at a concentration of 0.95 J µg/m^3, well below the NYSDOH sub-slab screening value of 1,000 µg/m^3.

3.5 Soil Vapor Quality Concentration Trends

Historical vapor analytical results for the 12 SVEWs through the Fourth Quarter are presented in **Table 6**. In addition, concentration trends of select VOCs for the SVECS combined influent (1,1,1-TCA, PCE, TCE, and total VOCs) and each of the 12 SVEWs (1,1,1-TCA, PCE, and TCE) are presented in **Appendix B**. Concentration trends observed in the 12 SVEWs through the Fourth Quarter are discussed below.

- Combined Influent: Overall VOC concentrations in the combined influent during the Fourth Quarter 2018 were consistent with past observations, with total VOC concentrations of 3,472 µg/m^3, 3,334 µg/m^3, and 2,966 µg/m^3 in October, November, and December, respectively. Overall, TCE, PCE and 1,1,1-TCA concentrations remain below baseline concentrations observed in December 2009 (42,000 µg/m^3 TCE, 7,900 µg/m^3 PCE, and 13,000 µg/m^3 1,1,1-TCA).

- SV-101I: Concentrations observed at this location (7,500 µg/m^3 TCE, 91 µg/m^3 PCE, and 2,500 µg/m^3 1,1,1-TCA) increased in the Fourth Quarter from concentrations observed in the Third Quarter 2018, however lower than concentrations observed in the Fourth Quarter 2017. All concentrations remain below baseline concentrations observed in December 2009 (180,000 µg/m^3 TCE, 1,700 µg/m^3 PCE, and 51,000 µg/m^3 1,1,1-TCA).

- SV-101D: Concentrations observed at this location (700 µg/m^3 TCE, 190 µg/m^3 PCE, and 9.8 µg/m^3 1,1,1-TCA) were higher in the Fourth Quarter from the non-detected concentrations reported in the Third Quarter 2018. The Third Quarter concentrations were most likely erroneous due to a faulty summa cannister. All concentrations remain below baseline concentrations observed in December 2009 (100,000 µg/m^3, 3,200 µg/m^3, and 26,000 µg/m^3, respectively).

- SV-102I: Concentrations observed at this location (24 µg/m^3 TCE, 3.4 J µg/m^3 PCE, and 1.8 J µg/m^3 1,1,1-TCA) decreased in the Fourth Quarter from the Third Quarter 2018. The concentrations of TCE, PCE, and 1,1,1-TCA are above baseline concentrations observed in December 2009, but below the maximum observed (300 µg/m^3 TCE, 17 µg/m^3 PCE, and 13 µg/m^3 1,1,1-TCA) in June 2010.

- SV-102D: Concentrations observed at this location (54 µg/m^3 TCE, 13 µg/m^3 PCE, and 2.2 J µg/m^3 1,1,1-TCA) are similar to concentrations observed in the Third Quarter 2018. Concentrations remain below baseline concentrations observed in December 2009 for TCE and 1,1,1-TCA (440 µg/m^3 TCE and 130 µg/m^3 1,1,1-TCA). The concentration of PCE is above the baseline concentration observed in December 2009 (10 µg/m^3 PCE) but below the maximum observed in September 2016 (51 µg/m^3).

- SV-103I: Concentrations observed at this location (36 µg/m^3 TCE, 120 µg/m^3 PCE, and 2.4 J µg/m^3 1,1,1-TCA) decreased in the Fourth Quarter from concentrations observed in the Third Quarter 2018. Concentrations remain below baseline concentrations observed in December 2009 (900 µg/m^3 TCE, 580 µg/m^3 PCE, and 900 µg/m^3 1,1,1-TCA).

- SV-103D: Concentrations observed at this location (460 µg/m^3 TCE, 12,000 µg/m^3 PCE, and 33 J µg/m^3 1,1,1-TCA) increased for TCE and PCE during the Fourth Quarter from concentrations in the Third Quarter 2018, while concentration of 1,1,1-TCA decreased in the Fourth Quarter 2018. All concentrations remain below baseline concentrations observed in December 2009 (3,100 µg/m^3 TCE, 20,000 µg/m^3 PCE, and 3,000 µg/m^3 1,1,1-TCA).

- SV-104I: Concentrations observed at this location (33 µg/m^3 TCE, 76 µg/m^3 PCE, and 3.1 J µg/m^3 1,1,1-TCA) decreased in the Fourth Quarter from concentrations observed in Third Quarter 2018. All concentrations remain below baseline concentrations observed in December 2009 (710 µg/m^3 TCE, 3,100 µg/m^3 PCE, and 730 µg/m^3 1,1,1-TCA).

- SV-104D: Concentrations observed at this location (210 µg/m^3 TCE, 1,500 µg/m^3 PCE, and 100 µg/m^3 1,1,1-TCA) decreased during the Fourth Quarter from concentrations observed in the Third Quarter 2018. All concentrations remain below baseline concentrations observed in December 2009 (4,600 µg/m^3 TCE, 20,000 µg/m^3 PCE, and 3,600 µg/m^3 1,1,1-TCA).

- SV-105I: Concentrations observed at this location (110 µg/m^3 TCE, 46 µg/m^3 PCE, and 10 µg/m^3 1,1,1-TCA) increased in the Fourth Quarter from concentrations observed in the Third Quarter 2018. The concentrations for 1,1,1-TCA and TCE are above baseline concentrations observed in December 2009 (76 µg/m^3 TCE and 9.9 µg/m^3 1,1,1-TCA), but remain below the maximum concentrations recorded in June 2010 (29 µg/m^3 TCE and 370 µg/m^3 1,1,1-TCA, respectively. The concentration of PCE remains below the baseline concentration observed in December 2009 of 70 µg/m^3.

- SV-105D: Concentrations observed at this location (140 µg/m^3 TCE, 140 µg/m^3 PCE, and 27 µg/m^3 1,1,1-TCA) were higher in the Fourth Quarter from the non-detected concentrations reported in the Third Quarter 2018. The Third Quarter concentrations were most likely erroneous due to a faulty summa cannister. These concentrations are below baseline concentrations observed in December 2009 (1,700 µg/m^3 TCE, 2,100 µg/m^3 PCE, and 550 µg/m^3 1,1,1-TCA).

- SV-106I: Concentrations observed at this location (79 µg/m^3 TCE, 9.9 µg/m^3 PCE, and 4.2 µg/m^3 1,1,1-TCA) decreased in the Fourth Quarter from concentrations observed in the Third Quarter 2018. These concentrations are below baseline concentrations observed in December 2009 (1,900 µg/m^3 TCE, 390 µg/m^3 PCE, and 220 µg/m^3 1,1,1-TCA).

- SV-106D: Concentrations observed at this location (220 µg/m^3 TCE, 37 µg/m^3 PCE, and 12 µg/m^3 1,1,1-TCA) increased in the Fourth Quarter for TCE and PCE from concentrations observed in the Third Quarter 2018, while concentration of 1,1,1-TCA decreased in the Fourth Quarter 2018. These concentrations are below baseline concentrations observed in December 2009 (3,400 µg/m3 TCE, 720 µg/m3 PCE, and 340 µg/m3 1,1,1-TCA).

4.0 CONCLUSIONS AND RECOMMENDATIONS

The intent of the Site 1 SVECS is to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture soil vapor with elevated TCE concentrations. Based on the presence of a vacuum field and the reduction of VOC concentrations to less than the screening values in the off-property area, the SVECS is functioning as designed. Influent vapor analytical data with concentrations of TCE above the project action level (greater than 250 µg/m^3) indicates that the SVECS should continue to be operated on a full-time basis to achieve continued capture of contaminated soil vapor. Monthly monitoring of the combined influent and effluent as well as quarterly monitoring of individual SVEWs should continue. Quarterly and annual monitoring of the SVPMs should also continue in order to ensure that a measurable vacuum field is being established and that the area is being effectively treated. Additional investigations are currently undergoing by others to further evaluate recent increasing TCE concentration trends in SVPM-2002D and SVPM-2006D and to determine if another source of VOCs in soil vapor is present.

Discharge Goal (lb/yr) [2]	**NA**	**NA**	**NA**	**350**	**1,971,000**	**175**	**---**	
2018 Totals (lb/yr)	**0.13**	**0.03**	**2.02**	**0.01**	**0.28**	**0.01**	**2.51**	**24.87**

Notes:

lb/hr = pounds per hour
lb/mo = pounds per month
lb/yr = pounds per year
PCE = tetrachloroethene
TCA = trichloroethane
TCE = trichloroethene
NA = Not Applicable

Emission Rate (per hr) = average flowrate (scfm) * (0.3048^3)m^3/ft^3 * Eff conc (ug/m3) * (lb/454000000ug) * 60 min/hr * operational time (hrs)

Monthly Mass Recovery = average flowrate (scfm) * (0.3048^3)m^3/ft^3 * Inf avg conc (ug/m^3) * (lb/454000000ug) * 60 min/hr * operational time (hrs)

(1) Discharge Goal (lb/hr) as presented in the *Modification to Existing Soil Vapor Extraction Containment System at Site 1 - Former Drum Marshalling Area, Installation of Soil Vapor Extraction Wells SVE-107D to -11D, NWIRP Bethpage, Bethpage, NY* (Tetra Tech NUS, 2011) and approved via email by NYDEC on 6 October 2011.
(2) Discharge Goal (lb/yr) = Discharge Goal (lb/hr) x 8760 hr/yr.

Notes:
i.w. = inches of water column
SVEW = soil vapor extraction well
SVPM = soil vapor pressure monitor

Pressure readings for the SVPMs were measured using a portable Magnehelic® Differential Pressure Gauge 2000-0, with a range of 0-0.50 i.w. Vacuum readings for SVEWs were recorded from dedicated in-line pressure gauges.

J = Estimated value

ND = Not detected above laboratory method detection limit (MDL)

SVPM = soil vapor pressure monitor

Bolded value indicates detected analyte.

All samples were analyzed for site-specific VOCs by modified method TO-15. Site specific compound specified in the *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System Site 1 – Former Drum Marshalling Area, NWIRP Bethpage, New York* (Tetra Tech 2012).

(1) Screening Value is the New York State Department of Health (NYSDOH) air guideline value for subslab.

APPENDIX A

NYSDEC AIR DISCHARGE LIMIT DOCUMENTATION

From: Steven Scharf [mailto:sxscharf@gw.dec.state.ny.us]
Sent: Thursday, October 06, 2011 11:57 AM
To: Fly, Lora B CIV NAVFAC MIDLANT, IPTNE
Cc: John Swartwout; Walter Parish; Steven Karpinski; John cofman; klumpe@steelequities.com; David.Brayack@ttnus.com
Subject: NWIRP Plant 3 Site 1 SVE Modification Plan

Lora,

The New York State Department of Environmental Conservation (NYSDEC), in conjunction with the New York State Department of Health (NYSDOH), have reviewed the Navy Submittal entitled:

" Modification to existing Soil vapor Extraction (SVE) Containment System At Site 1-Former Drum Marshaling Area, Installation of Soil Vapor Extraction Wells SVE-107D to 111D, NWIRP Bethpage, September 2011."

Based on this Departmental review, and the follow up October 6, 2011 tele-conference,.this modification work plan is acceptable and can be used for immediate implementation. The NWIRP Site 1 SVE system has redundant blowers and overcapacity, even with the additional SVE wells being added. should the Navy and the new property owner, Steel Equities Inc., for the former Plant 3 complex come to agreement to add SVE piping from the former Plant 3, this would be acceptable. Appropriate plans, consistent with the covenants and restrictions to the deed, should be submitted accordingly.

A letter will not follow this e-mail. If you have any questions, please contact me directly.

4.0 PROPOSED REVISIONS TO VAPOR DISCHARGE GOALS

To determine the continued need for off gas treatment, the quality of the influent vapor stream was initially estimated based on soil gas results and compared to discharge goals. Vapor phase treatment was initially installed for the system based on projected relatively high concentrations of several chemicals including 1,1,1-trichloroethane (TCA), trichloroethene (TCE), and tetrachloroethene (PCE). Since the December 2009 startup, VOC concentrations in the extracted vapors have decreased by approximately 98.3 percent and it is uncertain as to whether vapor phase treatment is still required. Presented below are the December 2009 and March 2011 influent (untreated) VOC concentrations and loadings and current discharge goals.

Parameter	December 2009 Influent VOCs		March 2011 Influent VOCs ($\mu g/m^3$)		Current Discharge Goal (pound/hour)[3]
	Concentration ($\mu g/m^3$)[1]	Loading (pound/ hour)[1]	Concentration ($\mu g/m^3$)	Loading (pound/ hour)[2]	
TCA	13,000	0.074	150	0.00023	0.13
TCE	42,000	0.26	460	0.00069	0.07
PCE	7,900	0.029	440	0.00066	0.0009

(1) Initial VOC Loading Rates are from baseline data taken in December 2009. The flow meter was not yet installed when this data was taken, so a value of 385 CFM (flow rate in January 2010) was used to estimate system loading.
(2) Calculated using a flow rate of 400 CFM.
(3) Current discharge goals were based on calculated VOC concentrations using soil gas data from the fence line investigation, a flow rate of 600 CFM, and an assumed treatment efficiency for each VOC of 80 to 90 percent. Based on this evaluation, the existing treatment is no longer required to meet discharge goals.

A DAR-1 Model Analysis was then conducted using the August 2010 influent vapor concentrations of TCA, TCE, and PCE at a flow rate of 500 CFM. The calculated results were then used to back calculate proposed discharge goals based on an allowance of 100% of the annual guideline concentrations (see Appendix E). The following table provides a summary of the proposed discharge goals.

Parameter	August 2010 Influent VOCs (370 CFM – Actual)		Percent AGC Using August 2010 Data	Proposed Discharge Goals	
	Concentration ($\mu g/m^3$)	Loading (pounds/ hour)		Concentration at 500 CFM ($\mu g/m^3$)	Loading (pounds/ hour)
TCA	868	0.0009	0.0004	None[1]	225
TCE	4,170	0.0039	19.4	11,000	0.02
PCE	5,780	0.0057	14.2	22,000	0.04

(1) Greater than 100,000 $\mu g/m^3$.

RE: Naval Weapons Industrial Research Plant(NWIRP)
Site-Bethpage, NYSDEC No. 1-30-003B.

Dear Ms. Fly:

Tetra Tech FW, on behalf of the Department of the Navy (Navy), has submitted the enclosed New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR) Air Permit Application as a permit equivalent. This DAR Air permit equivalent is for the soil vapor extraction system at Site 1 of Plant 3 of the former Naval Weapons Industrial Reserve Plant (NWIRP) site in Bethpage, NY. The NYSDEC Division of Environmental Remediation (DER) has reviewed the permit equivalent and, by means of this letter approves the Site 1 remedy air discharge for immediate operation.

The NWIRP Site 1 SVE system utilizes the reasonably available control technology (RACT) with activated carbon. The air discharge will be periodically monitored at start up and will be added for routine monitoring in the operation, maintenance and monitoring (OMM) plan, to be submitted shortly for Departmental review.

If you have any questions, please contact me at your earliest convenience at (518)402-9620.

Sincerely,

Steven M. Scharf, P.E.
Project Engineer

Facility Description ☐ Continuation Sheet(s)

Soil vapor remediation by SVE followed by vapor phase GAC

Compliance Statements (Title V Only) N/A

I certify that as of the date of this application the facility is in compliance with all applicable requirements: ☐ YES ☐ NO

If one or more emission units at the facility are not in compliance with all applicable requirements at the time of signing this application (the 'NO' box must be checked), the noncomplying units must be identified in the "Compliance Plan" block on page 8 of this form along with the compliance plan information required. For all emission units at this facility that are operating in compliance with all applicable requirements complete the following:

- ☐ This facility will continue to be operated and maintained in such a manner as to assure compliance for the duration of the permit, except those units referenced in the compliance plan portion of Section IV of this application.
- ☐ For all emission units, subject to any applicable requirements that will become effective during the term of the permit, this facility will meet all such requirements on a timely basis.
- ☐ Compliance certification reports will be submitted at least once a year. Each report will certify compliance status with respect to each requirement, and the method used to determine the status.

Facility Applicable Federal Requirements N/A ☐ Continuation Sheet(s)

EMISSION UNIT 1-00EU1 PROCESS SVE

Description

The Soil Vapor Extraction System will consist of 12 SVE wells (6 intermediate and 6 deep), a moisture separator, and 2 soil vapor extraction blowers (BL-1 and BL-2) which both vent to a vapor phase granular activated carbon unit for treatment prior to discharge from stack 00STA. The VGAC unit will be a 5,000 pound unit, filled with Tetrasolv Virgin Carbon. The VGAC unit has been designed to operate nominally at 600 cfm, with a maximum of 1,000 cfm.
