Subject: Hydrogeologic Evaluation of RE117D1 and Hydraulic Connectivity to BPOW-6 Series Outpost Wells

Date: 27 September 2019

Purpose and Background

The purpose of this technical memorandum is to provide a hydrogeologic evaluation of the hydraulic connectivity between well RE117D1 and the BPOW6 series outpost wells at Bethpage New York. This connection is important in that the BPOW6 series wells provide early warning of contaminant migration to Massapequa Water District (MWD) wells 6442 and 6443 (MWD 4 and 5, respectively), and have previously been shown to exhibit a hydraulic connection with MWD 4 and 5 wells (Resolution, 2016, *Technical Memorandum - Aquifer Connectivity Between Massapequa Supply Wells #4 and #5 and BPOW Series 6 Wells, NWIRP Bethpage*). Figure 1 shows the location of RE117D1, the BPOW6 series wells, and the MWD 4 and 5 wells.

Recent sampling of well RE117D1 has yielded trichloroethene (TCE) concentrations as high as 47.4 parts per billion (ppb) (Tetra Tech, 2019). Mann Kendall analysis and projection calculation of first order change rates of the time series data indicate that the TCE in well RE117D1 is increasing at a 90% confidence level, and that, assuming a constant linear source term with no active remediation, will reach 111 ppb 10 years into the future. The Mann-Kendall analysis and concentration projection analyses are presented in Attachment A.

Previous hydrogeologic analysis concluded there is a hydraulic connection between the BPOW6 outpost wells and the MWD wells 4 and 5 (Resolution, 2016). This is important, because if a hydraulic connection between outpost wells BPOW6 and RE117D1 can be demonstrated, then a hydraulic connection between RE117D1 and the MWD wells 4 and 5 may also be inferred.

Hydraulic Influence from the MWD Wells

RE117D1 is located approximately 6,000 feet to the northwest and upgradient of MWD wells 4 and 5, and 3,500 feet (ft) upgradient of BPOW6 series wells (see Figure 1). Table 1 presents the construction details (depth and screen lengths) of the wells of interest. Although there have been no detections of TCE (used as the primary indicator for tracking of the Operable Unit 2 [OU2] offsite plume) in the BPOW6 series wells and MWD wells 4 and 5, it is important to note that pumping of the MWD wells is expected to increase the natural hydraulic gradient towards them from the area near RE117D1.

Table 1. Well Construction Details

| Well | Total Depth | Screen Interval (ft bgs) |
|-------------|--------------------|---------------------------------|
| BPOW6-1 | 580 | 550-575 |
| BPOW6-2 | 785 | 750-780 |
| BPOW6-3 | 780 | 750-775 |
| BPOW6-4 | 575 | 545-570 |
| BPOW6-5 | 555 | 525-550 |
| BPOW6-6 | 800 | 770-795 |
| RE117D1 | 760 | 730-755 |
| MWD-4 | 552 | 511-552 |
| MWD-5 | 837 | 757-837 |

ft bgs = feet below ground surface

Analysis of Connectivity between BPOW6 Series Wells and RE117D1

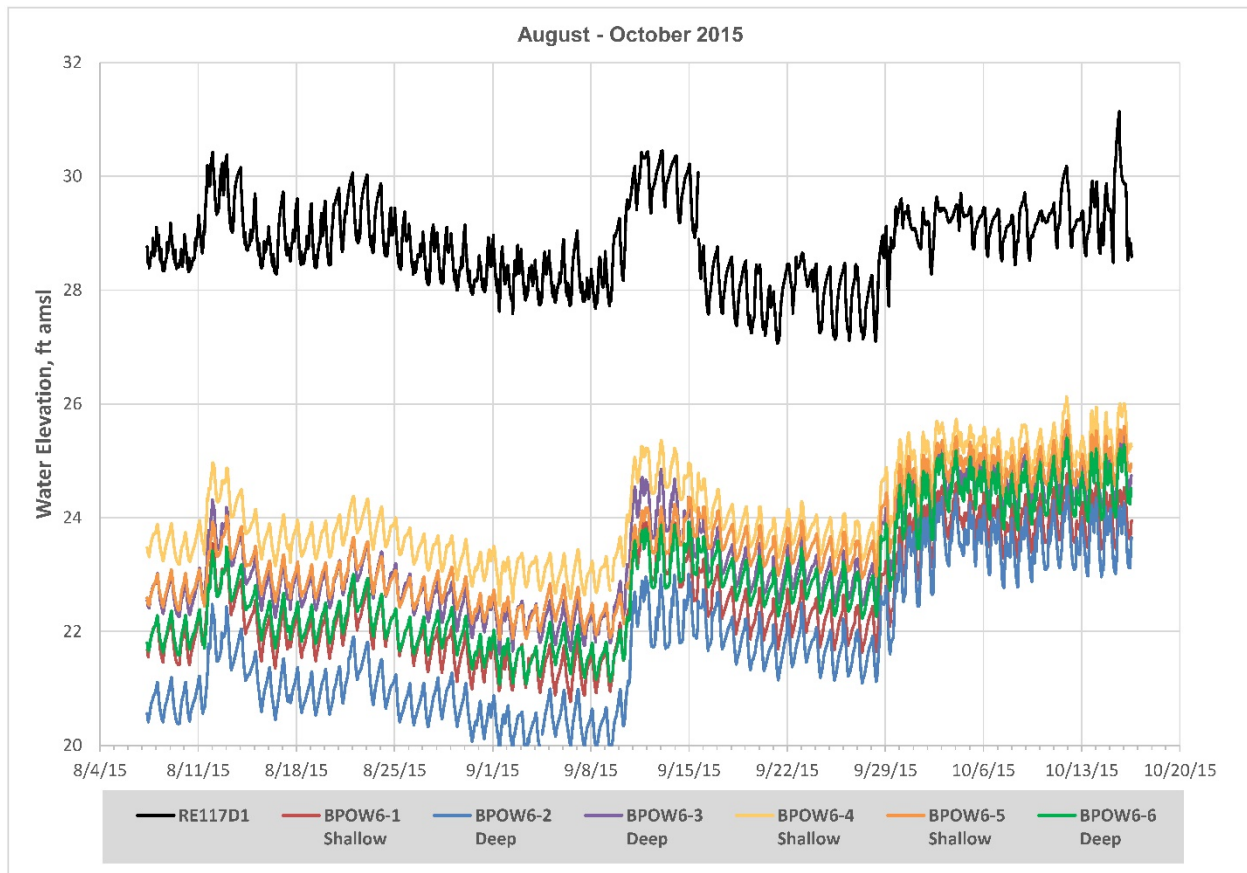

A study was performed to determine the hydraulic connectivity between the MWD wells 4 and 5 and the BPOW6 series outpost wells (Resolution, 2016). The BPOW6 series wells were installed to serve as outpost wells that are designed to provide early warning of TCE migration towards the MWD wells and should allow sufficient time (5 years) to provide wellhead treatment protection to the MWD wells. The 2016 study concluded that the BPOW6 series wells all exhibited a strong hydraulic connectivity to the MWD wells 4 and 5 (Resolution, 2016).

The data provided by MWD to the Navy in support of the 2016 hydraulic connectivity study was limited to pumping data for MWD wells 4 and 5 and did not include actual water levels in those wells normalized to mean sea level. Therefore, this hydrogeologic evaluation consists of comparison of the water levels in RE117D1 and the BPOW6 series wells, and by inference, serve as an indirect indicator of a hydraulic connection between RE117D1 and MWD wells 4 and 5.

The data used for this analysis is from data loggers placed in RE117D1, and BPOW6 outpost wells BPOW6-1, BPOW6-2, BPOW6-3, BPOW6-4, BPOW6-5, and BPOW6-6. Attachment B contains all the available data used in this analysis of connectivity with the BPOW6 series wells; the time period spans August 7, 2015 through October 16, 2015, with water levels recorded every five (5) minutes, resulting in a dataset of 20,203 points for each well. Datalogger readings from this date range were chosen as they also encompassed the dates of known active

pumping stresses from the MWD wells 4 and 5. Figure 2 shows a hydrograph time series of the water levels in RE117D1 and the BPOW6 series wells. A qualitative analysis of this figure indicates that a) RE117D1 responds to stresses in an essentially identical pattern to the BPOW6 series wells with slightly less magnitude, and b) that the water level in RE117D1 is about seven (7) feet, on average, higher than the BPOW6 series wells. This seven (7) feet difference is consistent with the potentiometric surface historically measured in these wells (Resolution, 2019; March 2018 Groundwater Sampling Data Summary Report).

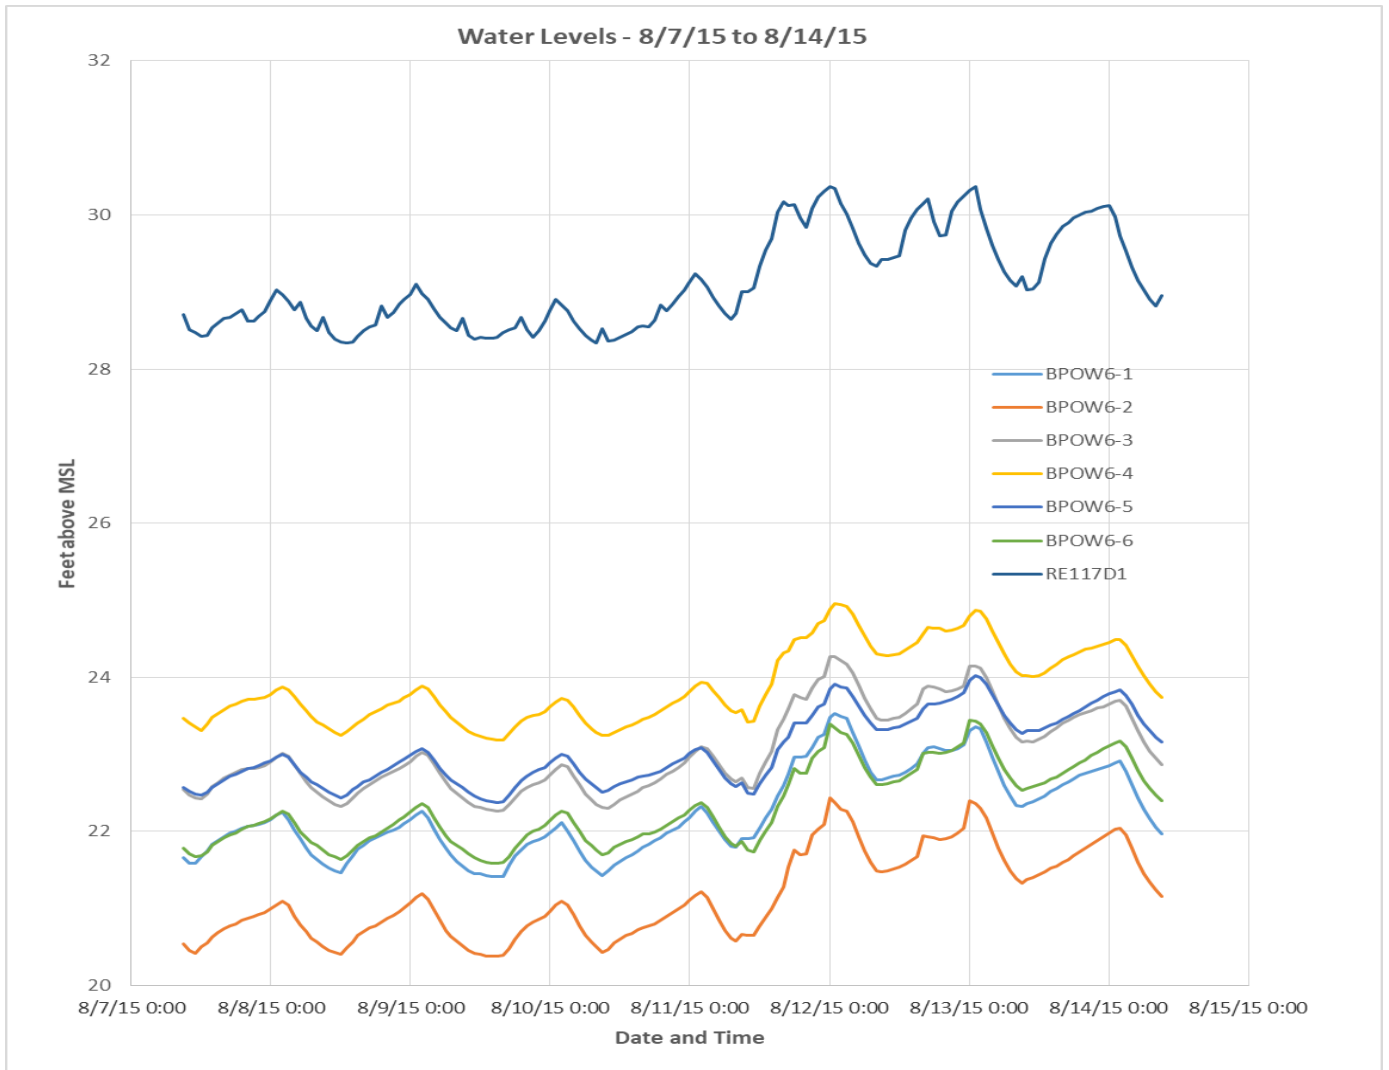

Figure 2. Time Series Hydrograph of Water Levels in the RE117D1 and BPOW6 Series Wells.

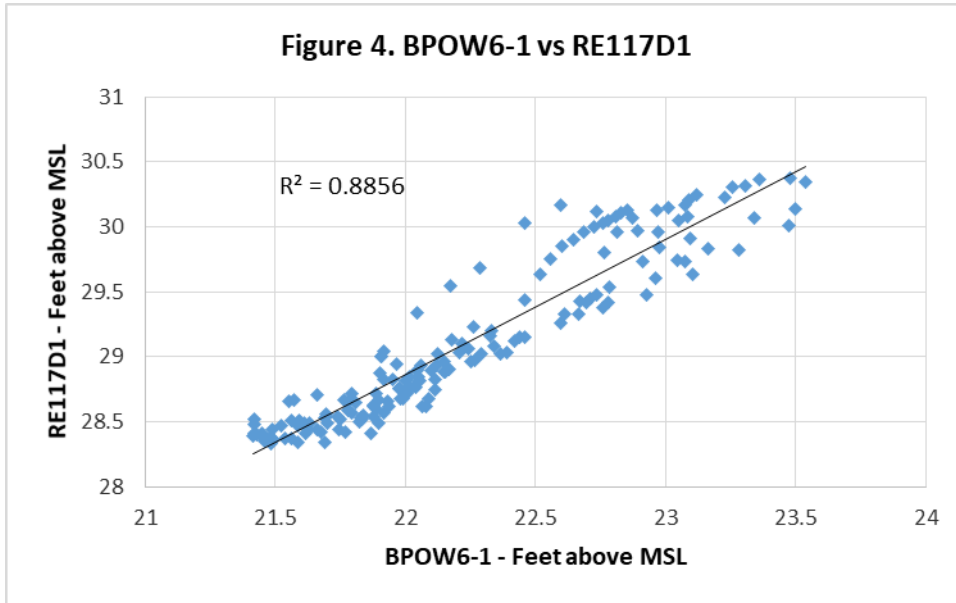

In order to quantify a correlation between water levels in RE117D1, BPOW6 series wells, and by inference MWD wells 4 and 5, a period of one (1) week's data was randomly chosen and examined to determine that pumping stresses from MWD wells 4 and 5 were adequately represented in that week's data. This focused data range was from August 7, 2015 0900 to August 14, 2015 0900. The data was further reduced to one (1) reading per hour, which provides for an easier visual comparison of the data but does not change the determination of statistical correlations and quantifying the strength of those correlations. This resulted in a focused data range of 169 data points; Figure 3 shows the time series hydrograph of water levels in the BPOW6 wells and RE117D1 for this focused data range, and the dataset is

presented in Attachment C. Of note in this figure is that low and high elevation peaks between the BPOW6 wells and RE117D1 occur essentially simultaneously; smaller perturbations seen in RE117D1 likely represent effects from the nearby upgradient New York American Water wells that are actively pumping on an as-needed basis. The focused data was then subjected to a linear regression analysis to determine the direction and strength of correlation between the BPOW6 wells and RE117D1. Non-transformed linear regression (data is non-transformed and represents raw data values) evaluates the changes in an independent and dependent variable (BPOW6 series wells water levels and RE117D1 water levels, respectively) to determine the coefficient of determination. The coefficient of determination denoted R^2 or r^2 (herein referred to as R-squared) is the proportion of the variance in the dependent variable that is predictable from the independent variable(s). The R-squared value reflects the strength of correlation (ability to predict variance) between the dependent and independent variables, and ranges from 0 to 1, with 1 being an exact one to one relationship.

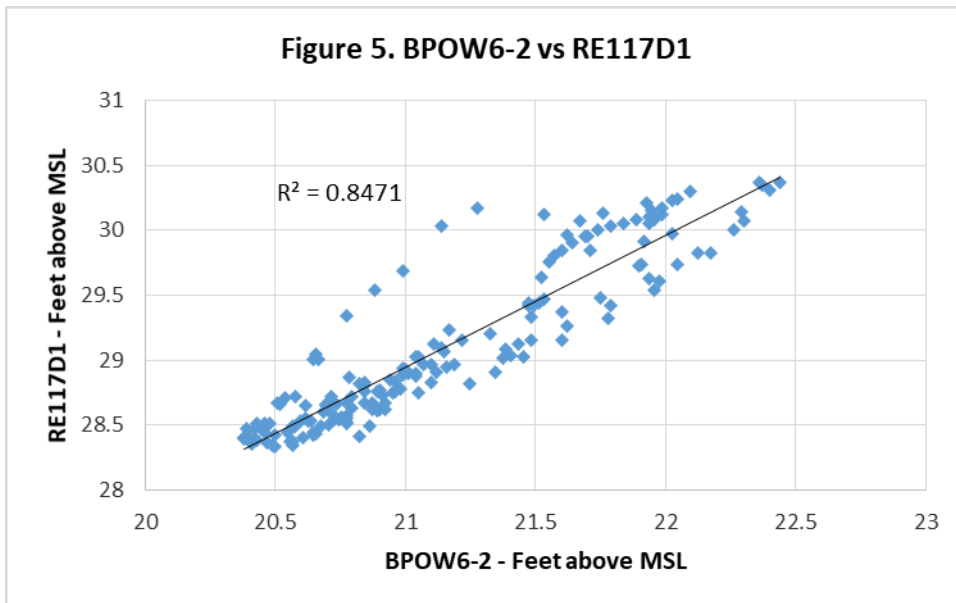

Figure 3. Time Series Hydrograph of Water Levels in RE117D1 and BPOW6 Wells – Focused Range

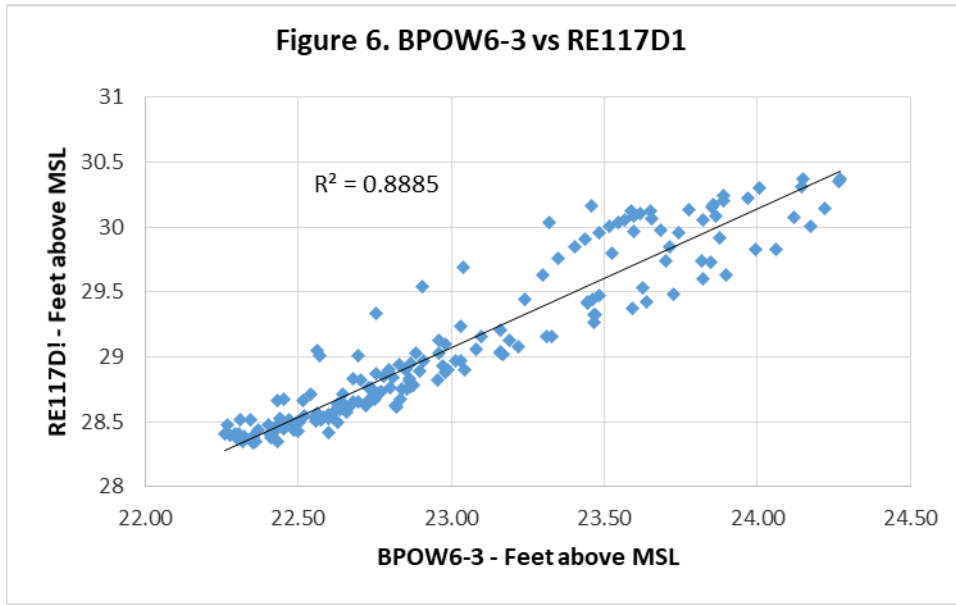

Figures 4 through 9 illustrate the linear regression and R-squared values for the water levels in RE117D1 and each of the BPOW6 series wells. Table 2 details the R-squared value, well depths, and inter-well distances for comparison.

Table 2. Water Level R-Squared Values of BPOW6 Wells Water Levels With Respect to RE117D1 Water Levels – Depth Below Ground Surface and Distance

| Well | Water Level R-Squared | Well Depth (ft bgs) | Distance from RE117D1 (ft) |
|---------|-----------------------|---------------------|----------------------------|
| BPOW6-1 | 0.8856 | 575 | 3,555 |
| BPOW6-2 | 0.8471 | 780 | 3,526 |
| BPOW6-3 | 0.8885 | 775 | 3,266 |
| BPOW6-4 | 0.884 | 570 | 3,250 |
| BPOW6-5 | 0.8037 | 550 | 3,743 |
| BPOW6-6 | 0.8226 | 795 | 3,732 |
| RE117D1 | | 755 | |

ft = feet
ft bgs = feet below ground surface

Examination of the R-squared values for water levels between the BPOW6 wells and RE117D1 indicates they range from approximately 0.80 to 0.89, with the strongest correlation between RE117D1 and BPOW6-3, which is the closest well to RE117D1 and is similar in depth. Overall, these R-squared values indicate a very strong positive inter-well water level correlation between RE117D1 and the BPOW6 series wells, indicative of a strong hydraulic connectivity between RE117D1 and the BPOW6 series wells, and by inference, between RE117D1 and MWD wells 4 and 5.

Figures 10 and 11 illustrate the relationships between the water level R-squared values and the depth and distances of the BPOW6 wells and RE117D1.

Figure 10. Relationship Between the Water Level R-Squared Values and Well Depths

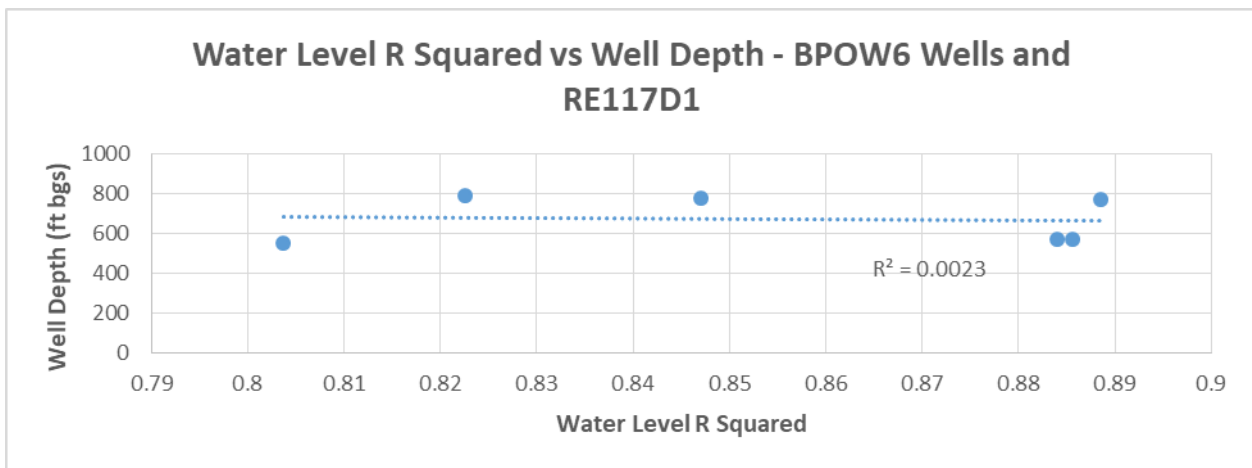

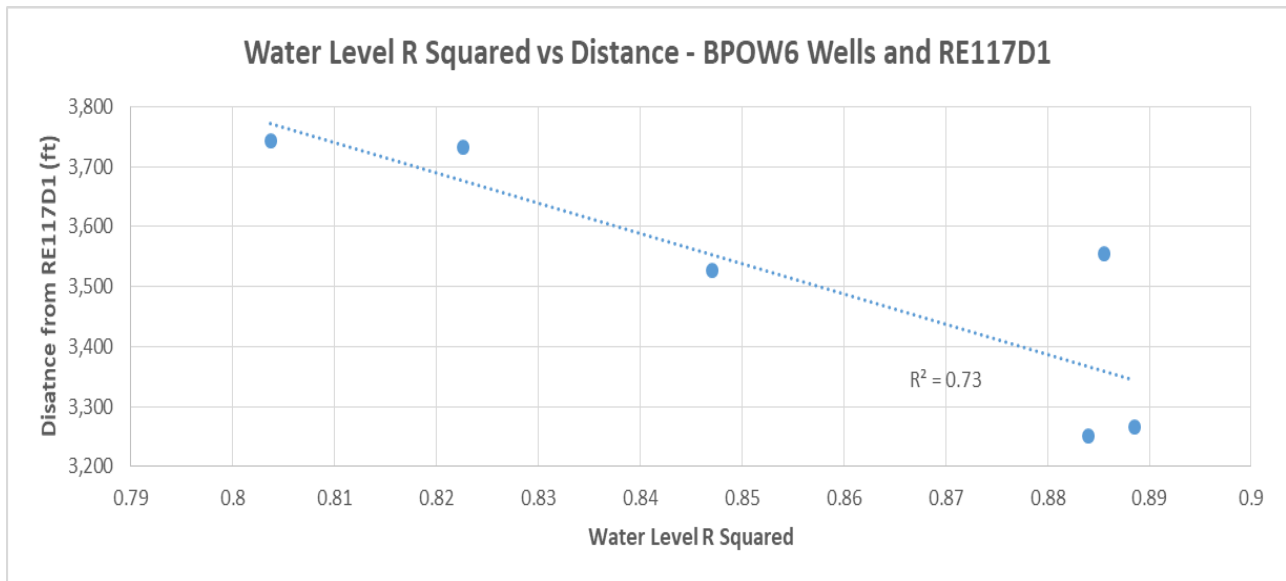

Figure 11. Relationship Between the Water Level R-Squared Values and Distance From RE117D1

These two figures indicate that screen depth is of lesser importance in correlation between the BPOW6 wells and RE117D1 than distance from a pumping well in the Magothy; this is because there is no significant confining unit between wells screened at these depths, and the pressure induced by pumping in the Magothy is easily translated vertically within the aquifer.

Relationship between RE117D1 Water Levels and TCE Concentrations

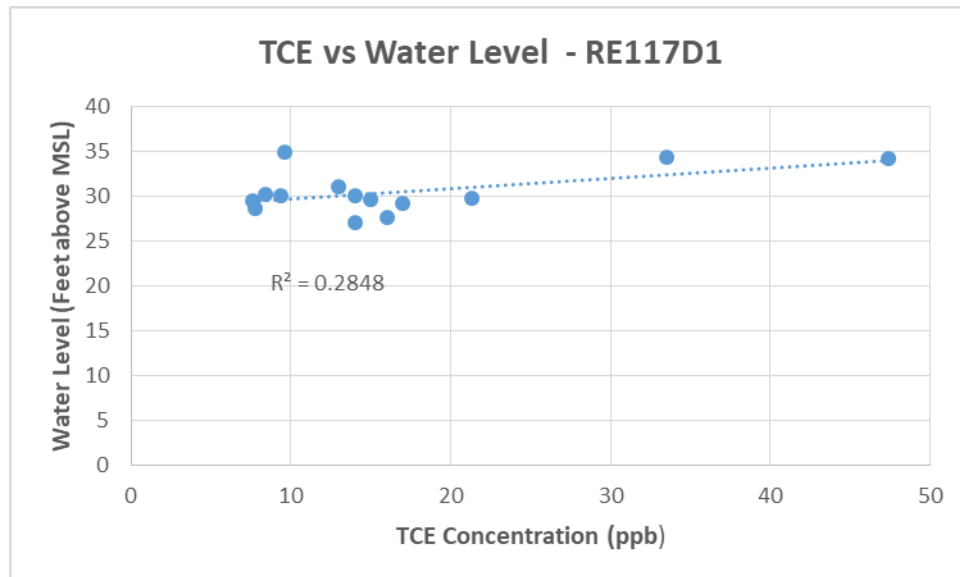

As demonstrated in Resolution (2016) and in the analysis above, pumping of the MWD wells 4 and 5 exert a very quick response in the BPOW6 wells and RE117D1, which could lead to the possibility that lower water levels in these wells, due to the increased gradient towards the southeast, could result in higher TCE concentrations in RE117D1 during MWD pumping stresses. Notably, TCE has been non-detect in the BPOW6 series wells, so this evaluation focuses on RE117D1. In order to evaluate and quantify the possible relationship between TCE concentrations and water levels in RE117D1, a simple linear regression was performed. Table 3 presents the time series of water levels and TCE concentration in samples collected at the same time as the water levels, and Figure 12 presents the regression analysis. The conclusion to be made from this evaluation is that the correlation between water levels and TCE is poor, with an R-squared value of 0.28.

Table 3. Time Series TCE Concentrations and Water Levels in RE117D1

| Date | TCE (ppb) | Water level elevation (ft msl) |
|------------|-----------|--------------------------------|
| 5/20/2015 | 8.4 | 30.24 |
| 6/9/2015 | 7.6 | 29.41 |
| 6/25/2015 | 7.8 | 28.67 |

Figure 12. Relationship Between Water Level and TCE Concentration – RE117D1

Conclusions

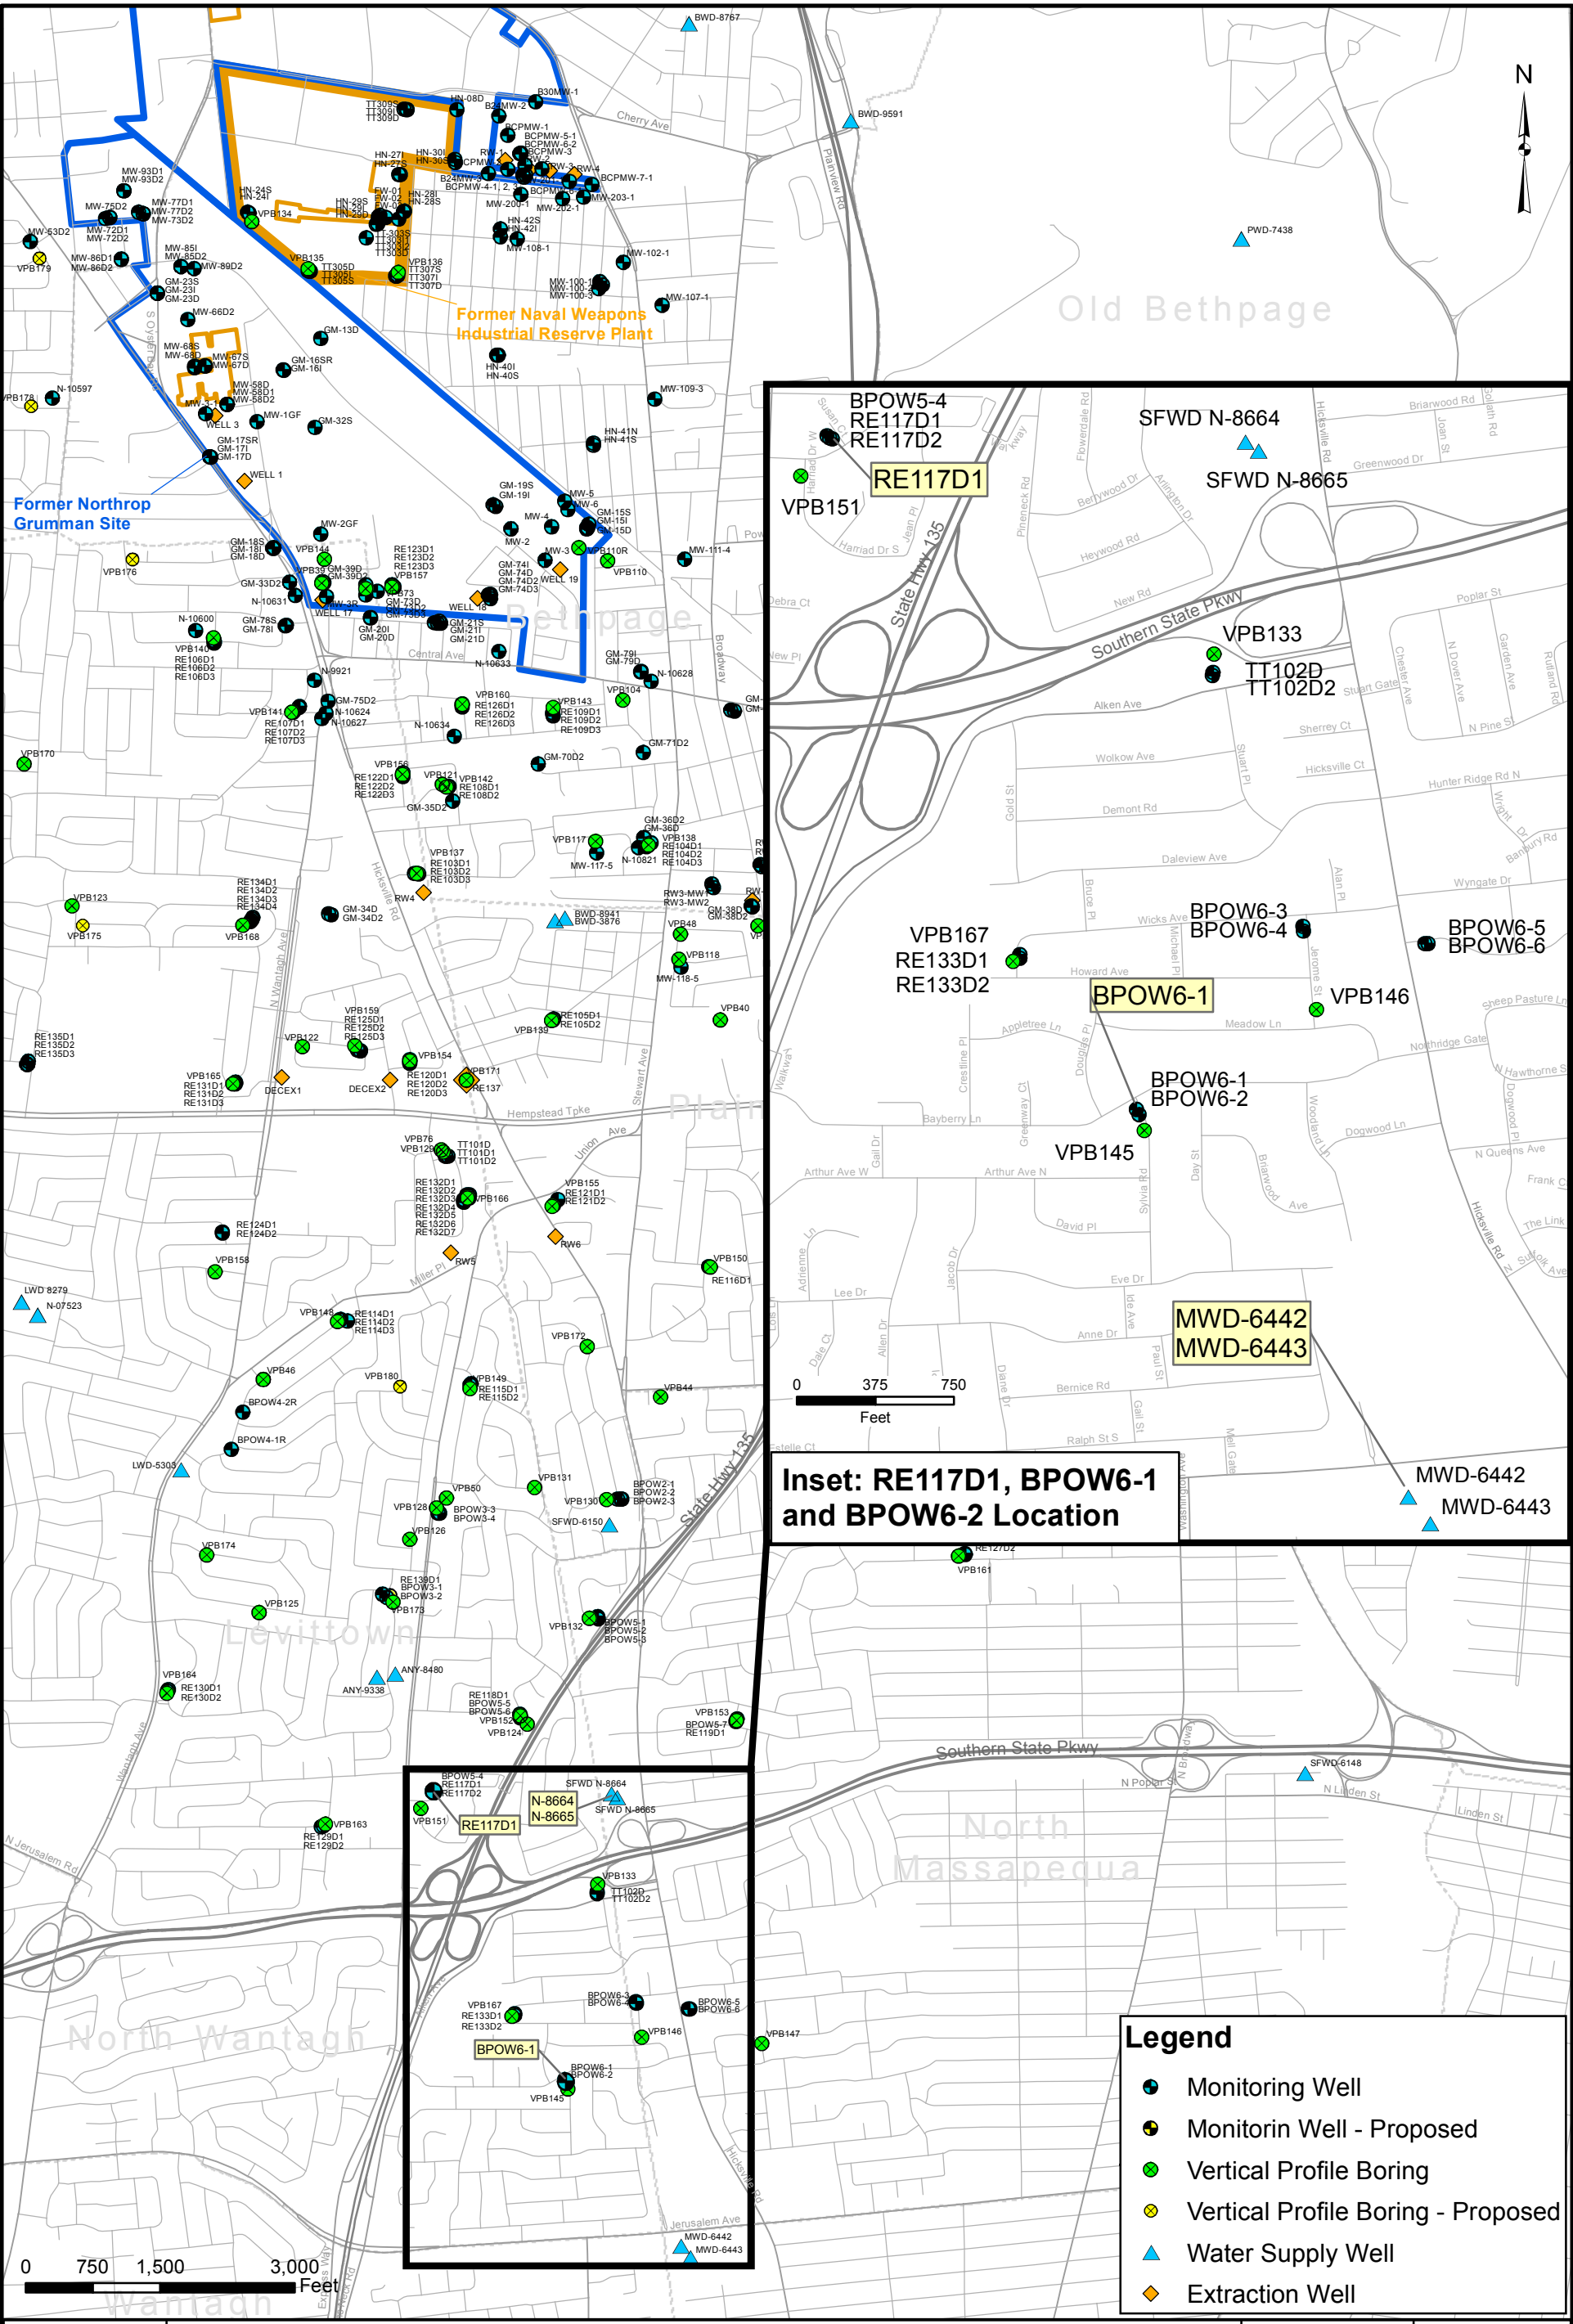

Two major lines of evidence may be applied to make conclusions regarding hydraulic conductivity between RE117D1 and the BPOW6 wells: 1) that the responses of the BPOW6 wells to MWD wells pumping stresses (Resolution, 2016) and the responses of RE117D1 to the BPOW6 wells coincide when the MWD wells are pumping is indicative of a connection, and 2) the high R-squared values between the BPOW6 wells and RE117D1 when responding to the MWD wells 4 and 5 pumping, are indicative of a strong correlation of causal and effect that MWD wells 4 and 5 induce a pressure response in RE117D1 and therefore a hydraulic connectivity. This is also indicative of the lack of flow-inhibiting factors such as a local clay layer pinch-out or a regional confining unit that would hydraulically separate these. The hydrogeologic evaluations indicate: 1) there is not a strong correlation between water level and TCE concentration in RE117D1, and 2) screen depth is of lesser importance in correlation between the BPOW6 wells and RE117D1 than distance from a pumping well in the Magothy; this is because there is no significant confining unit between wells screened at these depths, and the pressure induced by pumping in the Magothy is easily translated vertically within the aquifer. The most important conclusion is that there is a hydraulic connection between the BPOW6 series wells and RE117D1, and therefore a hydraulic connection between the MWD wells 4 and 5 and RE117D1 can be reliably inferred.
