

18 October 2021

Mr. Scott Sokolowski
Remedial Project Manager
Naval Facilities Engineering Command, Mid Atlantic
9324 Virginia Avenue, Building Z-144
Norfolk, VA 23511-3095

**Subject: US NAVY CONTRACT NO. N40085-16-D-2288
CONTRACT TASK ORDER NO. 4042
FIRST QUARTER 2021 SVECS OPERATIONS SUMMARY - SITE 1
NAVAL WEAPONS INDUSTRIAL RESERVE PLANT, BETHPAGE, NY**

Dear Mr. Sokolowski:

An electronic copy of the *Second Quarter 2021 Operations Report, Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard, Naval Weapons Industrial Reserve Plant, Bethpage, New York*, has been submitted to your attention.

Please contact me at rgregory@komangs.com or 610.400.0636 if you have any questions or comments regarding this submittal.

Sincerely,
KOMAN Government Solutions, LLC (KGS)

Robert G. Gregory
Project Manager

1.0 INTRODUCTION

KOMAN Government Solutions, LLC (KGS) has prepared this Second Quarter 2021 Operations Report for the Soil Vapor Extraction Containment System (SVECS) at Site 1, Former Drum Marshalling Area, at the Naval Weapons Industrial Reserve Plant (NWIRP) in Bethpage, New York. This report has been prepared for the United States Department of the Navy (Navy), Naval Facilities Engineering Systems Command (NAVFAC), Mid-Atlantic, under Contract No. N40085-16-D-2288, Contract Task Order (CTO) No. N4008517F4042. This Second Quarter 2021 Operations Report details activities that occurred from April 2021 to June 2021. Data was collected, and operational activities were performed by KGS in accordance with the following documents:

- *Final Operation & Maintenance Plan for Soil Vapor Extraction Containment System Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant Bethpage, New York* prepared by Tetra Tech EC, Inc. (TtEC) in 2010, hereafter referred to as the “O&M Manual.”
- *Final Supplemental Offsite Soil Vapor Intrusion Monitoring Plan for the Soil Vapor Extraction Containment System, Site 1, Former Drum Marshalling Yard at Naval Weapons Industrial Reserve Plant, Bethpage, New York* prepared by Tetra Tech NUS, Inc. (TtNUS) in 2012.

1.1 Site Location

NWIRP Bethpage is located in east central Nassau County, Long Island, New York, approximately 30 miles east of New York City. In the late 1990s, the Navy's property totaled approximately 109.5 acres and was formerly a Government Owned Contractor-Operated (GOCO) facility that was operated by Northrop Grumman (NG) until September 1998. NWIRP Bethpage was bordered on the north, west, and south by property owned, or formerly owned, by NG that covered approximately 550 acres, and on the east by a residential neighborhood. The Navy currently retains approximately nine acres of the former NWIRP, including Site 1, which lies within the fenced area of NWIRP Bethpage and is located east of Plant No. 3, west of 11th Street, and north of Plant 17 South (**Figures 1 and 2**).

1.2 Background

NWIRP Bethpage was established in 1943. Since inception, the primary mission of the facility was the research, prototyping, testing, design engineering, fabrication, and primary assembly of military aircraft. Historical operations that resulted in hazardous material generation at the facility included metal finishing processes, maintenance operations, painting of aircraft and components, and other activities that involve aircraft manufacturing. Wastes generated by plant operations were disposed of directly into drainage sumps, dry wells, and/or on the ground surface, resulting in the disposal of a number of hazardous wastes, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and inorganic analytes (chromium and cadmium) at the site. Some of these contaminants have migrated from the source area to surrounding areas, including the soils at these sites and the groundwater beneath and downgradient of the NWIRP Bethpage property. NWIRP Bethpage is currently listed by the New York State Department of Environmental Conservation (NYSDEC) as an “inactive hazardous waste site” (#1-30-003B).

Soils at Site 1 consist mainly of unconsolidated sediments that overlie crystalline bedrock. A clay unit is present near the groundwater table (50 feet below ground surface [bgs]) at the southeast corner of the site. This clay unit is suspected to be a source of chlorinated solvents that are migrating into the overlying soil gas and the source of off-site VOCs in soil vapor (TtEC, 2010).

Chlorinated solvents including trichloroethene (TCE), tetrachloroethene (PCE), and 1,1,1-trichloroethane (TCA) have been identified as the VOCs of interest in soil gas at the site. Concentrations greater than 1,000 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) of soil vapor have been directly associated with Site 1 activities and historical environmental data, and based on preliminary screening, exceed guidelines established by the New York State Department of Health (NYSDOH) for sub-slab soil vapor concentrations at the time. Of these compounds, TCE is the primary VOC of concern. Mitigation of TCE contamination in accordance with NYSDOH guidance is expected to remediate other VOCs associated with the site. PCBs, cadmium, and chromium have also been identified in site soils at concentrations requiring remediation. The majority of these chemicals have been detected in the central portion of Site 1 and will be addressed via a separate remediation (TtEC, 2010).

Prior to implementation of the SVECS, the mean concentrations of VOCs in soil gas samples collected along the eastern fence-line were 41,128 $\mu\text{g}/\text{m}^3$ of TCE, 381 $\mu\text{g}/\text{m}^3$ of PCE, and 20,634 $\mu\text{g}/\text{m}^3$ of 1,1,1-TCA. The maximum concentrations of VOCs in the soil gas samples were 180,000 $\mu\text{g}/\text{m}^3$ of TCE, 1,200 $\mu\text{g}/\text{m}^3$ of PCE, and 90,000 $\mu\text{g}/\text{m}^3$ of 1,1,1-TCA (TtEC, 2010).

1.3 Project Overview and Objective

The remedial objective for this project is to use an on-site soil vapor extraction (SVE) system to prevent further off-site migration of VOC-contaminated soil vapor and to the extent practical, capture contaminated soil vapor with a TCE concentration greater than 250 $\mu\text{g}/\text{m}^3$. A secondary objective of this project is to address soil vapor with a TCE concentration greater than 5 $\mu\text{g}/\text{m}^3$. The SVECS is an interim action intended to address migration of VOCs in contaminated soil vapors. It is expected to operate continuously 24 hours/day, seven days/week, with the exception of maintenance and adjustment periods, until the remedial objectives are met (TtEC, 2010).

1.4 SVECS Overview

The SVECS consists of soil vapor extraction, soil vapor monitoring, and soil vapor treatment. Twelve SVE wells (SVEWs) are located along the eastern boundary of Site 1 in six clusters, each consisting of one intermediate well and one deep well. Intermediate wells SVE-101I, SVE-102I, SVE-103I, SVE-104I, SVE-105I, and SVE-106I have a screened interval between 25 and 35 feet bgs. Deep wells SVE-101D, SVE-102D, SVE-103D, SVE-104D, SVE-105D, and SVE-106D have a screened interval between 40 and 60 feet bgs. The groundwater table fluctuates between approximately 50 and 55 feet bgs. Each SVEW is operated at a flow rate such that the combined total flow rate is approximately 300-400 standard cubic feet per minute (scfm) of soil vapor. Each intermediate depth SVEW requires an approximate vacuum of 4 inches of water column (i.w.) and each deep SVEW requires a vacuum of up to 20 i.w. in order to extract the targeted flow rates. These 12 SVEWs have been piped below the ground to the Flow Monitoring Station (FMS), where flow, vacuum, and vapor quality are monitored. Within the FMS, the discharges from the individual SVEWs have been equipped with a 2-inch flow control butterfly valve, a

vacuum gauge, and a sampling port. The sampling port is utilized to measure the flow rate from an individual well using a portable velocity meter and to collect vapor samples. All the SVE lines collect into a single manifold within the FMS and from this location a single underground pipeline has been routed approximately 1,400 linear feet to the Treatment Building (Building 03-35). Five additional SVEs (SV-107D, SV-108D, SV-109D, SV-110D, and SV-111D) were installed in October 2011 to address potential VOCs under Plant No. 3 and the South Warehouse. A site plan depicting well locations is included as **Figure 3**.

The SVECS is housed within the Treatment Building, an existing and unoccupied building also known as Building 03-35. The treatment system consists of a moisture separator, two SVE blowers, and a 5,000-pound vapor-phase granular activated carbon (VGAC) unit for removal of chlorinated VOCs from the off-gas. Soil vapor that enters the Treatment Building first passes through the moisture separator tank where any condensate is separated. To date, no condensate has formed in this tank. The vapor is then passed through an air filter and SVE blower and then treated in the VGAC unit. The treated vapor is discharged from the VGAC via an exhaust stack. The SVECS has a control panel comprised of mechanical interlocks and relays for local operation. A System Layout Plan is presented in **Figure 4**, which also illustrates the design flow rates through the soil vapor extraction and treatment process.

The off-gas from the SVECS is monitored for chlorinated VOCs as identified in the NYSDEC Division of Air Resources (DAR) permit equivalent effluent limitations and updated approval documentation (**Appendix A**) and monitoring requirements (TtEC 2010). Samples are submitted to a National Environmental Laboratory Accreditation Conference (NELAC)-accredited, Department of Defense (DoD) Environmental Laboratory Accreditation Program (ELAP)-accredited laboratory, Eurofins Air Toxics, LLC, located in Folsom, California, for analysis of VOCs by modified method TO-15. Prior to January 2014, samples were analyzed for target compound list (TCL) VOCs. As of January 2014, upon approval by NYSDEC and NYSDOH, samples are analyzed for site-specific VOCs. The site-specific VOCs are: 1,1,1-TCA, 1,1-dichloroethane (DCA), 1,1-dichloroethene (DCE), 1,2-DCA, cis-1,2-DCE, PCE, trans-1,2-DCE, TCE, and vinyl chloride (VC).

A total of 18 soil vapor pressure monitor (SVPM) / soil gas monitoring points have been installed in the residential neighborhood east of Site 1 at NWIRP Bethpage (**Figure 3**). These off-site monitoring points consist of eight previously existing SVPMs as well as 10 SVPMs installed in September 2012. Soil vapor pressure readings from the SVPMs are collected quarterly and used to evaluate the SVECS vacuum field. In addition, analytical results of vapor samples collected annually from these locations and the soil vapor pressure readings are used to further evaluate the SVECS operation and the potential for vapor intrusion.

2.0 SVECS OPERATION AND MAINTENANCE

While designed to run autonomously, the SVECS requires regular visits by an operator to record and adjust operational parameters and to perform scheduled maintenance. The SVECS is equipped with telemetry that will alert an on-call operator in the event of a plant shutdown.

2.1 Routine Maintenance Activities

Routine maintenance activities at the SVECS were performed during the operator's weekly visits during this reporting period. These activities include general site inspections (of the grounds, buildings, doors and locks), collection of operational data (vapor flowrates, pressures, vacuums, temperature and photoionization detector [PID] readings), adjustment of system valves, collection of vapor samples (on a monthly and quarterly basis), collection/disposal of condensate if needed, cleaning of filters, switching of lead/lag blower assignments, and preventive maintenance of system equipment.

2.2 Non-routine Maintenance / Site Activities

The following non-routine activities / repair activities occurred at the SVECS during the Second Quarter 2021 reporting period:

- No non-routine activities were required during the current reporting period.

3.0 SVECS MONITORING

Several process vapor samples are collected on a monthly basis to monitor the SVECS operation. These samples consist of an influent sample (as well as a duplicate sample), located immediately prior to the VGAC unit, and an effluent sample, located after the VGAC unit and before the exhaust stack. Vapor samples are also collected from the 12 original SVEWs on a quarterly basis to monitor the capture of the contaminated soil vapor by the SVEWs. In addition, quarterly pressure measurements are collected from the 12 SVEWs and the 18 SVPs to monitor the SVECS vacuum field, and soil gas sampling from the 18 SVPs is conducted annually (generally in the winter time-frame) to evaluate the effectiveness of the SVECS. The first annual soil gas sampling event was conducted in the winter 2012-2013. The ninth annual sampling event was conducted in March 2021.

3.1 Monthly Air Quality Monitoring

Analysis of influent and effluent vapor sample locations is performed to evaluate VOC mass removal and the effectiveness of the VGAC adsorption unit. Time-integrated vapor samples are collected using 6-liter summa canisters with 30-minute flow regulators.

Treated off-gas discharged at the exhaust stack is subject to emissions limitations. Initially, discharge goals were derived from calculations submitted by the Navy and accepted by the NYSDEC in the February 2010 DAR permit equivalent application. In September 2011, the Navy submitted an evaluation proposing revised discharge goals (TtNUS, 2011), which NYSDEC agreed to in October 2011. A copy of this documentation is included as **Appendix A**.

Summaries of the monthly vapor sampling results collected in April, May, and June (Second Quarter) are presented in **Tables 1, 2, and 3**, respectively. Emission rate calculations for both the influent stream (prior to VGAC treatment) and effluent stream (following VGAC treatment) and the computed monthly mass recoveries are also presented. Emission rates of the influent stream as well as mass recovery are calculated to monitor progress and determine when influent concentrations have reached levels at which vapor treatment via carbon adsorption is no longer required. The data presented in **Tables 1, 2, and 3** demonstrate that all constituents were within the effluent emission rate guidelines (**Appendix A**). Raw analytical data are provided under a separate cover.

3.2 Quarterly Air Quality Monitoring of SVEWs

Time-integrated vapor samples are collected quarterly using 6-liter summa canisters with 30-minute flow regulators at six intermediate and six deep SVEWs. The samples are collected for the purpose of tracking and documenting the performance of the SVECS (TtEC, 2010).

Quarterly vapor samples were collected on 14 May from the 12 SVEWs. A summary of detected compounds is included as **Table 4**. Raw analytical data are provided under a separate cover.

Analytical results of select VOCs (1,1,1-TCA, PCE, and TCE) detected at the 12 SVEWs during the Second Quarter monitoring event are presented graphically in **Figure 5**. Historical analytical results of

quarterly vapor samples collected from December 2009 through the Second Quarter 2021 are presented in **Table 5**.

3.3 Quarterly Soil Vapor Pressure Monitoring of SVEWs and Off-site SVPMs

Soil vapor pressure readings are collected quarterly from the 12 SVEWs and 18 SVPMs to monitor the SVECS vacuum field. Soil vapor pressure readings from the 12 SVEWs and 18 SVPMs were collected on 14 May. Results of the Second Quarter vapor monitoring are presented in **Table 6**.

The vapor pressure readings collected from the SVEWs ranged between -3.0 to -12.0 i.w., indicating that a vacuum has been established along the fence line. The vapor pressure readings collected from the SVPMs ranged between -0.03 to -1.10 i.w., indicating that a vacuum has been established in the residential neighborhood. Pressure readings from the 18 SVPMs are presented graphically in **Figure 6**.

3.4 Annual Vapor Quality Monitoring of Off-site SVPMs

Time-integrated vapor samples are collected annually using 6-liter summa canisters with 30-minute flow regulators at 18 SVPM locations. The Annual 2021 SVPM samples were collected in March 2021. Analytical results for the SVPM monitoring event will be included in the 2021 Annual Operations Report prepared during the Fourth Quarter.

3.5 Soil Vapor Quality Concentration Trends

Historical vapor analytical results for the 12 SVEWs through the Second Quarter are presented in **Table 5**. In addition, concentration trends of select VOCs for the SVECS combined influent (1,1,1-TCA, PCE, TCE, and total VOCs) and each of the 12 SVEWs (1,1,1-TCA, PCE, and TCE) are presented in **Appendix B**. Concentration trends observed in the 12 SVEWs through the Second Quarter 2021 are discussed below.

- Combined Influent: Overall VOC concentrations in the combined influent decreased slightly during the Second Quarter 2021, with a total VOC concentration 1,456 $\mu\text{g}/\text{m}^3$ in April (**Table 1**), 1,471 $\mu\text{g}/\text{m}^3$ in May (**Table 2**), and 1,276 $\mu\text{g}/\text{m}^3$ in June (**Table 3**). Overall, TCE, PCE and 1,1,1-TCA concentrations remain approximately one to three orders of magnitude below baseline concentrations measured in December 2009 (42,000 $\mu\text{g}/\text{m}^3$ TCE, 7,900 $\mu\text{g}/\text{m}^3$ PCE, and 13,000 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-101I: Concentrations measured at this location (4,200 $\mu\text{g}/\text{m}^3$ TCE, 39 $\mu\text{g}/\text{m}^3$ PCE, and 1,300 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). The measured concentrations are consistent with respect to the range in concentration variability noted over the past several years. All concentrations remain one to two orders of magnitude below baseline concentrations measured in December 2009 (180,000 $\mu\text{g}/\text{m}^3$ TCE, 1,700 $\mu\text{g}/\text{m}^3$ PCE, and 51,000 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-101D: Concentrations measured at this location (180 $\mu\text{g}/\text{m}^3$ TCE, 13 $\mu\text{g}/\text{m}^3$ PCE, and 2.2 J $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain two to four orders of magnitude

below baseline concentrations measured in December 2009 (100,000 $\mu\text{g}/\text{m}^3$ TCE, 3,200 $\mu\text{g}/\text{m}^3$ PCE, and 26,000 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).

- SV-102I: The concentration of TCE (4.1 $\mu\text{g}/\text{m}^3$ TCE) measured in the Second Quarter 2021 increased slightly relative to the concentration measured in the First Quarter 2021 (**Table 5**). Compounds previously detected most recently in 2020 (1,1,1-TCA and PCE) remained at the non-detect level as they were in the First Quarter 2021. All concentrations remain either at or below the baseline concentrations measured in December 2009 (5.6 $\mu\text{g}/\text{m}^3$ TCE, 2.4 $\mu\text{g}/\text{m}^3$ PCE, and non-detect 1,1,1-TCA).
- SV-102D: Concentrations of two compounds measured at this location (4.3 J $\mu\text{g}/\text{m}^3$ PCE, and non-detect 1,1,1-TCA) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). TCE (22 $\mu\text{g}/\text{m}^3$) increased relative to the First Quarter 2021. All concentrations remain below baseline concentrations measured in December 2009 (440 $\mu\text{g}/\text{m}^3$ TCE, 10 $\mu\text{g}/\text{m}^3$ PCE, and 130 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-103I: Concentrations measured at this location (10 $\mu\text{g}/\text{m}^3$ TCE, 88 $\mu\text{g}/\text{m}^3$ PCE, and 1.5 J $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain below baseline concentrations measured in December 2009 (900 $\mu\text{g}/\text{m}^3$ TCE, 580 $\mu\text{g}/\text{m}^3$ PCE, and 900 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-103D: Concentrations of two VOCs measured at this location (460 $\mu\text{g}/\text{m}^3$ PCE, and 5.9 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased in the Second Quarter 2021 relative to the First Quarter 2021. The concentration of TCE increased slightly (40 $\mu\text{g}/\text{m}^3$) (**Table 5**) relative to the First Quarter 2021. All concentrations remain below baseline concentrations measured in December 2009 (3,100 $\mu\text{g}/\text{m}^3$ TCE, 20,000 $\mu\text{g}/\text{m}^3$ PCE, and 3,000 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-104I: Concentrations measured at this location (17 $\mu\text{g}/\text{m}^3$ TCE, 320 $\mu\text{g}/\text{m}^3$ PCE, and 5.3 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased significantly in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). Concentrations remain below baseline concentrations measured in December 2009 (710 $\mu\text{g}/\text{m}^3$ TCE, 3,100 $\mu\text{g}/\text{m}^3$ PCE, and 730 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-104D: Concentrations measured at this location (770 $\mu\text{g}/\text{m}^3$ TCE, 4,800 $\mu\text{g}/\text{m}^3$ PCE, and 460 $\mu\text{g}/\text{m}^3$ PCE) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain below baseline concentrations measured in December 2009 (4,600 $\mu\text{g}/\text{m}^3$ TCE, 20,000 $\mu\text{g}/\text{m}^3$ PCE, and 3,600 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-105I: Concentrations measured at this location (12 $\mu\text{g}/\text{m}^3$ TCE, 15 $\mu\text{g}/\text{m}^3$ PCE, and 4.1 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) increased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain below baseline concentrations measured in December 2009 (76 $\mu\text{g}/\text{m}^3$ TCE, 70 $\mu\text{g}/\text{m}^3$ PCE, and 9.9 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-105D: Concentrations measured at this location (29 $\mu\text{g}/\text{m}^3$ TCE, 18 $\mu\text{g}/\text{m}^3$ PCE, and 8.3 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) decreased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain one to two orders of magnitude

below baseline concentrations measured in December 2009 (1,700 $\mu\text{g}/\text{m}^3$ TCE, 2,100 $\mu\text{g}/\text{m}^3$ PCE, and 550 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).

- SV-106I: Concentrations measured at this location (62 $\mu\text{g}/\text{m}^3$ TCE, 150 $\mu\text{g}/\text{m}^3$ PCE, and 4.0 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) increased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). All concentrations remain below baseline concentrations measured in December 2009 (1,900 $\mu\text{g}/\text{m}^3$ TCE, 390 $\mu\text{g}/\text{m}^3$ PCE, and 220 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).
- SV-106D: Concentrations of two VOCs measured at this location (12 $\mu\text{g}/\text{m}^3$ TCE and 1.2 J $\mu\text{g}/\text{m}^3$ 1,1,1-TCA) increased in the Second Quarter 2021 relative to concentrations measured in the First Quarter 2021 (**Table 5**). The concentration of PCE remained consistent with the previous quarter (13 $\mu\text{g}/\text{m}^3$). All concentrations remain one to three orders of magnitude below baseline concentrations measured in December 2009 (3,400 $\mu\text{g}/\text{m}^3$ TCE, 720 $\mu\text{g}/\text{m}^3$ PCE, and 340 $\mu\text{g}/\text{m}^3$ 1,1,1-TCA).

4.0 CONCLUSIONS AND RECOMMENDATIONS

As stated in Section 1.3, the objectives of the Site 1 SVECS are to prevent further off-site migration of VOC contaminated soil vapor and to the extent practical, capture soil vapor with elevated TCE concentrations. Based on the presence of a vacuum field and the reduction of VOC concentrations to less than the screening values in the off-property area, the SVECS is functioning as designed. Influent vapor analytical data with concentrations of TCE above the project action level (greater than 250 $\mu\text{g}/\text{m}^3$) indicate that the SVECS should continue to be operated on a full-time basis to achieve continued capture of contaminated soil vapor. Monthly monitoring of the combined influent and effluent as well as quarterly monitoring of individual SVEWs should continue. Quarterly and annual monitoring of the SVPMs should also continue in order to ensure that a measurable vacuum field is being established and that the area is being effectively treated.

Subject: NWIRP Plant 3 Site 1 SVE Modification Plan

Lora,

The New York State Department of Environmental Conservation (NYSDEC), in conjunction with the New York State Department of Health (NYSDOH), have reviewed the Navy Submittal entitled:

" Modification to existing Soil vapor Extraction (SVE) Containment System At Site 1-Former Drum Marshaling Area, Installation of Soil Vapor Extraction Wells SVE-107D to 111D, NWIRP Bethpage, September 2011."

Based on this Departmental review, and the follow up October 6, 2011 tele-conference, this modification work plan is acceptable and can be used for immediate implementation. The NWIRP Site 1 SVE system has redundant blowers and overcapacity, even with the additional SVE wells being added. should the Navy and the new property owner, Steel Equities Inc., for the former Plant 3 complex come to agreement to add SVE piping from the former Plant 3, this would be acceptable. Appropriate plans, consistent with the covenants and restrictions to the deed, should be submitted accordingly.

A letter will not follow this e-mail. If you have any questions, please contact me directly.

4.0 PROPOSED REVISIONS TO VAPOR DISCHARGE GOALS

To determine the continued need for off gas treatment, the quality of the influent vapor stream was initially estimated based on soil gas results and compared to discharge goals. Vapor phase treatment was initially installed for the system based on projected relatively high concentrations of several chemicals including 1,1,1-trichloroethane (TCA), trichloroethene (TCE), and tetrachloroethene (PCE). Since the December 2009 startup, VOC concentrations in the extracted vapors have decreased by approximately 98.3 percent and it is uncertain as to whether vapor phase treatment is still required. Presented below are the December 2009 and March 2011 influent (untreated) VOC concentrations and loadings and current discharge goals.

Parameter	December 2009 Influent VOCs		March 2011 Influent VOCs ($\mu\text{g}/\text{m}^3$)		Current Discharge Goal (pound/hour) ⁽³⁾
	Concentration ($\mu\text{g}/\text{m}^3$) ¹	Loading (pound/hour) ¹	Concentration ($\mu\text{g}/\text{m}^3$)	Loading (pound/hour) ⁽²⁾	
TCA	13,000	0.074	150	0.00023	0.13
TCE	42,000	0.26	460	0.00069	0.07
PCE	7,900	0.029	440	0.00066	0.0009

⁽¹⁾ Initial VOC Loading Rates are from baseline data taken in December 2009. The flow meter was not yet installed when this data was taken, so a value of 385 CFM (flow rate in January 2010) was used to estimate system loading.

⁽²⁾ Calculated using a flow rate of 400 CFM.

⁽³⁾ Current discharge goals were based on calculated VOC concentrations using soil gas data from the fence line investigation, a flow rate of 600 CFM, and an assumed treatment efficiency for each VOC of 80 to 90 percent. Based on this evaluation, the existing treatment is no longer required to meet discharge goals.

A DAR-1 Model Analysis was then conducted using the August 2010 influent vapor concentrations of TCA, TCE, and PCE at a flow rate of 500 CFM. The calculated results were then used to back calculate proposed discharge goals based on an allowance of 100% of the annual guideline concentrations (see Appendix E). The following table provides a summary of the proposed discharge goals.

Parameter	August 2010 Influent VOCs (370 CFM – Actual)		Percent AGC Using August 2010 Data	Proposed Discharge Goals	
	Concentration ($\mu\text{g}/\text{m}^3$)	Loading (pounds/ hour)		Concentration at 500 CFM ($\mu\text{g}/\text{m}^3$)	Loading (pounds/ hour)
TCA	868	0.0009	0.0004	None ¹	225
TCE	4,170	0.0039	19.4	11,000	0.02
PCE	5,780	0.0057	14.2	22,000	0.04

⁽¹⁾ Greater than 100,000 $\mu\text{g}/\text{m}^3$.

RE: Naval Weapons Industrial Research Plant(NWIRP)
Site-Bethpage, NYSDEC No. 1-30-003B.

Dear Ms. Fly:

Tetra Tech FW, on behalf of the Department of the Navy (Navy), has submitted the enclosed New York State Department of Environmental Conservation (NYSDEC) Division of Air Resources (DAR) Air Permit Application as a permit equivalent. This DAR Air permit equivalent is for the soil vapor extraction system at Site 1 of Plant 3 of the former Naval Weapons Industrial Reserve Plant (NWIRP) site in Bethpage, NY. The NYSDEC Division of Environmental Remediation (DER) has reviewed the permit equivalent and, by means of this letter approves the Site 1 remedy air discharge for immediate operation.

The NWIRP Site 1 SVE system utilizes the reasonably available control technology (RACT) with activated carbon. The air discharge will be periodically monitored at start up and will be added for routine monitoring in the operation, maintenance and monitoring (OMM) plan, to be submitted shortly for Departmental review.

If you have any questions, please contact me at your earliest convenience at (518)402-9620.

Sincerely,

A handwritten signature in cursive script, appearing to read "Steve Scharf".

Steven M. Scharf, P.E.
Project Engineer
Division of Environmental Remediation

EMISSION UNIT 4-00E01					PROCESS SVE		
Description							
The Soil Vapor Extraction System will consist of 12 SVE wells (6 intermediate and 6 deep), a moisture separator, and 2 soil vapor extraction blowers (BL-1 and BL-2) which both vent to a vapor phase granular activated carbon unit for treatment prior to discharge from stack 00ST2. The VGAC unit will be a 5,000 pound unit filled with Tetrasolv Virgin Carbon. The VGAC unit has been designed to operate nominally at 600 cfm, with a maximum of 1,000 cfm.
