AOC 45 Interim Corrective Measure Certification Report

Date:
May 31, 2007

Dear Ms. Barraza:

Contact:
John C. Brussel, P.E.

On behalf of Bayer MaterialScience LLC (Bayer), enclosed are two copies of the AOC 45 Interim Corrective Measure Certification Report for the above-referenced site. The report summarizes the activities performed to remove soils exhibiting polychlorinated biphenyls (PCBs) at concentrations exceeding 50 parts per million (ppm) from beneath and around the former Pilot Plant sumps (Area of Concern 45).

Phone:
315.671.9441

Email:
John.Brussel@arcadis-us.com

Please do not hesitate to contact Joel Robinson of Bayer at 412.777.4871 or the undersigned at 315.671.9441 if you have any questions.

Our ref:

Certification Statement

I, Joseph Molina III, as a licensed Professional Engineer in the State of New York, to the best of my knowledge, certify that the interim corrective measure (ICM) activities performed at the Bayer MaterialScience LLC facility in Hicksville, New York to remove soils in the vicinity of Area of Concern (AOC) 45 exhibiting polychlorinated biphenyls (PCBs) at concentrations exceeding 50 parts per million (ppm) were completed in general accordance with the following:

- The work plan contained in a letter from ARCADIS of New York, Inc. (ARCADIS BBL, formerly known as Blasland, Bouck & Lee, Inc.) to the New York State Department of Environmental Conservation (NYSDEC) dated January 5, 2006 (the "AOC 45 ICM Work Plan").
- A March 9, 2006 letter from ARCADIS BBL that responds to NYSDEC comments on the AOC 45 ICM Work Plan.
- A March 27, 2006 letter from ARCADIS BBL that responds to the NYSDEC's conditional approval of both the AOC 45 ICM Work Plan and the March 9, 2006 response letter.

I also certify that, to the best of my knowledge, this ICM Certification Report accurately summarizes the work activities performed for the ICM.

Joseph Molina III, P.E.
Vice President
NY P.E. License No. 072644

Rochester, New York 14450

1. Introduction

1.1 General

This report summarizes the interim corrective measure (ICM) activities performed to remove soils exhibiting polychlorinated biphenyls (PCBs) at concentrations exceeding 50 parts per million (ppm) from beneath and around the former Pilot Plant sumps (Area of Concern [AOC] 45) at the Bayer MaterialScience LLC (Bayer) facility located in Hicksville, New York (the "site"). The AOC 45 ICM soil removal activities were performed based on the delineation provided by the pre-excavation delineation/verification soil sampling completed as part of a previous ICM, as detailed in the *Interim Corrective Measure Certification Report* prepared by ARCADIS of New York, Inc. (ARCADIS BBL, formerly known as Blasland, Bouck & Lee, Inc., November 2005) [the "2005 ICM Certification Report"].

The AOC 45 ICM soil removal activities were implemented during June and July 2006 by ARCADIS BBLES. The activities were implemented in general conformance with:

- The work plan contained in a letter from ARCADIS BBL to the New York State Department of Environmental Conservation (NYSDEC) dated January 5, 2006 (the "AOC 45 ICM Work Plan").
- A March 9, 2006 letter from ARCADIS BBL that responds to NYSDEC comments on the AOC 45 ICM Work Plan.
- A March 27, 2006 letter from ARCADIS BBL that responds to the NYSDEC's conditional approval of both the AOC 45 ICM Work Plan and the March 9, 2006 response letter.

Prior to the AOC 45 ICM soil removal activities, the concrete floor slab in the western one-third portion of the Pilot Plant was broken up as part of foundation demolition activities performed in accordance with the NYSDEC-approved *Demolition Work Plan* (ARCADIS BBL, July 2005) and follow-up correspondence. Soils extending approximately 2.3 feet below the concrete (i.e., to the surrounding grade) were also removed. The concrete and soils were stockpiled onsite (adjacent to AOC 45) for offsite transportation and disposal with the impacted soils excavated as part of the ICM.

In general, work activities completed as part of the AOC 45 ICM soil removal included:

- Installing a temporary steel sheetpile wall support system along the perimeter of an approximately 28-foot long by 28-foot wide excavation around the Pilot Plant sumps.
- Excavating approximately 670 cubic yards (CY) of PCB-impacted soils, including approximately 660 CY from the above-referenced excavation and approximately 10 CY from a smaller (25-square foot) excavation to the west of the Pilot Plant sumps.
- Transporting and disposing of the concrete from the western one-third portion of the Pilot Plant and the excavated soils (1,387 tons) as a Toxic Substances Control Act- (TSCA-) regulated PCB Waste and New York State (NYS) hazardous waste (Waste Code B007) in accordance with applicable rules and regulations.
- Backfilling the excavated areas and removing the sheetpile wall support system.

The ICM activities described in this report were a follow-up to previous PCB-impacted soil removal activities performed in the area, including the removal of approximately 3,000 tons in 1993 and approximately 320 tons as part of a supplemental action in 2001/2002. As part of those previous removal actions, soils extending beyond each side of the Pilot Plant were removed to depths ranging upwards of 10 feet below ground surface (bgs). Removal of soil beneath the Pilot Plant was not viable during those times because the facility was operational.

The organization of this report is presented below, followed by a summary of relevant background information.

1.2 Report Organization

This report is organized into the following sections:

Section	Purpose
Section 1 – Introduction	Provides an overview of the AOC 45 ICM soil removal activities, site background information, and relevant PCB soil sampling results.
Section 2 – ICM Activities Summary	Presents a detailed description of the AOC 45 ICM soil removal activities.
Section 3 – Chronology of Significant Milestone Dates	Presents a chronology of significant milestone dates for the AOC 45 ICM soil removal activities.

Section	Purpose
Section 4 – Modification to ICM Work Plan	Summarizes a field modification made to the AOC 45 ICM Work Plan.
Section 5 – Summary and Conclusions	Provides a brief summary and conclusions based on the results of the AOC 45 ICM soil removal activities.

1.3 Background Information

The site consists of a 14-acre triangular-shaped parcel located just southeast of the intersection of New South Road and Commerce Road in the City of Hicksville, New York. The site is bordered to the north by industrial properties, to the south and west by the Long Island Railroad and commercial/industrial properties, and to the east by warehouses and the Northrop Grumman Corporation (Northrop Grumman) complex. A site location map is included on Figure 1.

Aside from the Administration Building located in the northern portion of the site, all other buildings and aboveground structures formerly used in connection with site operations were demolished down to their floor slabs in 2003. The building floor slabs and foundations were broken-up and removed between December 2005 and February 2006 in accordance with the NYSDEC-approved *Demolition Work Plan* (ARCADIS BBL, July 2005) and follow-up correspondence. The location of the Administration Building, the former (demolished) buildings and structures, and the various areas of concern (AOCs) evaluated through the Resource Conservation and Recovery Act (RCRA) corrective action process (including AOC 45), are shown on Figure 2.

Non-masonry building materials generated by the demolition activities were transported for offsite reclamation/disposal. Impacted concrete and masonry wall materials and impacted concrete flooring/foundations were also transported for offsite disposal. The non-impacted concrete and masonry from the demolition activities were crushed and used onsite as hard fill onsite or stockpiled onsite for future use. Details of the foundation demolition activities, including related characterization sampling and material handling activities, are presented in the *Demolition Summary Report* (ARCADIS BBL, April 2007).

Further detailed site background information, including the site history, topography and drainage, and geologic and hydrogeologic setting, and results of the two-phase RCRA Facility Investigation (RFI), is presented in the *RCRA Facility Investigation Report* (ARCADIS BBL, June 2004). Details of the previous ICM pre-excavation delineation/verification soil sampling performed to determine the horizontal and vertical extent of

PCB-impacted soils in AOC 45 is presented in the 2005 ICM Certification Report. A brief summary of the ICM pre-excavation delineation/verification soil sampling activities and results is presented below.

1.4 Summary of Relevant Soil Sampling Results for PCBs

Based on the identification of PCBs at concentrations greater than 50 ppm in RFI soil samples collected below one of the AOC 45 sumps, soil borings were completed at 23 locations as part of the 2005 ICM (locations VS-45-1 through VS-45-23, as shown on Figure 3) to evaluate the extent of the PCB impacts. With one exception, the borings were advanced to depths ranging from approximately 8 feet to 20 feet below the surrounding grade (the boring at location VS-45-2 was advanced to a depth of approximately 58 feet below the surrounding grade, which is equivalent to approximately 60 feet below the bottom of the Pilot Plant concrete floor slab). The boring at location VS-45-2 was advanced to a greater depth than the others to delineate the deeper PCB impacts at that location. Soil samples collected from selected intervals within each soil boring were submitted to Severn Trent Laboratories, Inc. (STL) of Shelton, Connecticut and either analyzed for PCBs or archived for potential future analysis, if needed, based on the results for adjacent or overlying/underlying samples. A total of 77 soil samples from 18 of the 23 soil borings (plus 8 duplicate samples) were ultimately analyzed for PCBs.

Data validation was performed for each sample delivery group (SDG) where one or more PCB soil analytical result(s) were less than the 50 ppm ICM soil cleanup objective. The PCB laboratory analytical results for pre-excavation delineation/verification sampling are presented in Table 1 and shown on Figure 3. Based on the analytical results, PCBs were identified at concentrations exceeding 50 ppm at five soil boring locations (locations VS-45-1, VS-45-2, VS-45-7, VS-45-11, and VS-45-20, as shown on Figure 3). The approximate horizontal limits of the soils found to contain PCBs at concentrations exceeding 50 ppm are shown on Figure 3.

Soils exhibiting PCBs at concentrations exceeding 50 ppm were found to extend over an approximately 320 square foot area in the southwest corner of the Pilot Plant. The depth of the PCB-impacted soils ranged from approximately 8 feet to 29 feet below the bottom of the concrete floor slab (equivalent to approximately 6 to 27 feet below the surrounding grade). In addition, soils exhibiting PCBs at a concentration only slightly below 50 ppm were found in one area west of the former Pilot Plant (approximately 4.5 to 5.0 feet bgs at sampling location VS-45-4, as shown on Figure 3).

2. ICM Activities Summary

2.1 General

This section describes the AOC 45 ICM activities completed to remove soils exhibiting PCBs at concentrations greater than 50 ppm from two areas near the former Pilot Plant sumps, including:

- Excavation Area 1 – a 5-foot long by 5-foot wide excavation west of the Pilot Plant sumps.
- Excavation Area 2 – a 28-foot long by 28-foot wide excavation around the Pilot Plant sumps.

The footprint and depths of the two excavation areas are shown on Figure 4. Cross sections showing the final excavations in each area are presented on Figure 5. The AOC 45 ICM soil removal activities are discussed in the following subsections:

Subsection Number	Work Task
2.2	Mobilization/Site Preparation
2.3	Soil Excavation
2.4	Backfilling
2.5	Air Monitoring
2.6	Site Restoration/Demobilization

Photographs showing work in progress and site restoration are included in Appendix A. Copies of waste manifests and certificates of disposal for wastes generated by the ICM activities are included in Appendix B. A detailed description of each work task associated with the ICM activities is presented below.

2.2 Mobilization/Site Preparation

ARCADIS BBLES mobilized to the site on June 26, 2006 to initiate the AOC 45 ICM activities. As the initial activity, the horizontal limits of the two proposed excavations were identified by a field survey crew using global positioning system (GPS) survey equipment and coordinates obtained from the mapping included in the March 9, 2006 letter from ARCADIS BBL that responded to NYSDEC comments on the AOC 45 ICM Work Plan. The excavation limits were marked using spray paint and flagged metal pins.

After the excavation limits were identified, the approximate locations of nearby subsurface utilities (an 8-inch diameter metal storm sewer pipe, an abandoned 6-inch diameter fire-protection waterline, and concrete-encased utility trench) were identified based on available mapping and marked. Test pits were subsequently excavated to determine actual locations of the utilities. A section of the waterline that formerly connected to the Pilot Plant building was uncovered and removed.

Based on the proposed depth of soil removal in Excavation Area 2 (up to 29 feet below surrounding grade), ARCADIS BBLES elected to use a sheetpile wall and temporary bracing to support excavation sidewalls in accordance with Occupational Safety and Health Administration (OSHA) requirements in 29 CFR Part 1926, Subpart P. In preparation for the sheetpile wall installation, concrete foundations along the perimeter of the Pilot Plant were removed, the AOC 45 sump walls were broken up and removed, and a trench was excavated to a depth of approximately 3 to 4 feet along the proposed wall alignment (to identify and remove potential obstructions and to provide space for needed bracing). During the trenching activities, six steel I-beams installed vertically into the ground were encountered near the southeast corner of the proposed excavation. Efforts to remove the I-beams prior to sheetpile wall installation were initially unsuccessful due to the length and embedment depth of the beams. The I-beams were subsequently removed once the sheetpile wall was in-place and deeper soils around the beams could be excavated as part of the soil removal activities discussed below. Soils adhered to the beams (which were minimal due to the sandy nature of the area soils) were physically removed from the beams and managed with the excavated impacted soils. The cleaned beams were later transported offsite for reclamation of the steel.

The erosion and sedimentation control measures installed for the foundation demolition work were kept in place and maintained for the AOC 45 ICM activities.

2.3 Soil Excavation

PCB-impacted soils were removed from Excavation Area 1 on June 28, 2006. The soil removal was accomplished using a tracked excavator. The excavated soils were transferred to a lined material staging area (immediately adjacent to AOC 45) for subsequent loading and offsite transportation and disposal. The resulting excavation was a minimum of approximately 5 feet long by 5 feet wide and 6.5 feet deep. Based on the approximate excavation dimensions and factoring in some limited sloping, approximately 10 CY of soils were removed from Excavation Area 1.

The sidewall support system for Excavation Area 2 was installed following the soil removal in Excavation Area 1. The installation began on June 29, 2006 and was finished on July 3, 2006. Steel sheets, in lengths ranging from approximately 20 feet to 40 feet, were driven to refusal along the perimeter of the excavation area. Each sheet was 4 feet wide, and 7 sheets were used for along each side of the proposed excavation. As a result, the final excavation dimensions (28 feet by 28 feet) were slightly larger than those shown on the figure in ARCADIS BBL's March 9, 2006 letter to the NYSDEC (i.e., 26 feet by 27 feet). After the sheetpile was installed, interior bracing (consisting of a pre-assembled hydraulic waler system) was installed to support the sheeting at a depth of approximately 3 feet below the surrounding ground surface. Hydraulic fluid, consisting of peanut oil, was put into the waler system and used to exert a 2,000 pounds per square inch (psi) pressure against the sheetpile wall. The waler system minimized the embedment depth of the sheetpile sections that might otherwise be needed.

PCB-impacted soils within Excavation Area 2 were subsequently removed on July 10, 2006. The NYSDEC's project manager was onsite to observe the removal activities. Soils were removed to the depths identified in the table below.

Area	Excavation Area 2 – Final Depths (feet)	
	Relative to Surrounding Grade	Relative to Bottom of Former Concrete Floor Slab
Western Section	7.4 - 7.6	9.9 avg.
Middle Section	27.5 min.	29.8 min.
Eastern Section	18.3 - 18.7	20.8 avg.

The soil removal depths in Excavation Area 2 were verified using a survey level. The same tracked excavator used for Excavation Area 1 was used to remove soils from Excavation Area 2 to a depth of approximately 20 feet bgs. A crane equipped with a clamshell bucket was used to remove soils at depths below 20 feet bgs from Excavation Area 2. Approximately 660 CY of soils were removed from Excavation Area 2. The soils were transferred to the lined material staging area located adjacent to AOC 45. Soils within the staging area were covered at the end of the day's excavation.

Based on weight tickets provided by the disposal facility, the total amount of PCB-impacted soils and concrete debris generated by the AOC 45 ICM activities was 1,387 tons. The waste soils and debris were transported to the CWM Chemical Services, LLC facility located in Model City, New York for disposal as a TSCA-regulated PCB

waste and NYS hazardous waste (Waste Code B007). A waste shipment summary, which identifies manifest numbers and corresponding weights for each waste shipment, is included as Table 2. As indicated above, copies of the waste manifests and certificates of disposal for the AOC 45 ICM waste materials are included in Appendix B.

2.4 Backfilling

Excavation Area 1 was completely backfilled on June 28, 2006 using non-impacted (exempt) crushed concrete debris generated by the foundation demolition activities. Excavation Area 2 was backfilled from July 10, 2006 through July 12, 2006 as described below:

- Excess clean fill material obtained from construction activities at a nearby offsite location (which was approved by the NYSDEC for subsurface use) was placed within the excavation to a depth of approximately 1 foot below the surrounding grade. Analytical results for a sample of the fill material are presented in the AOC 45 ICM Work Plan. As the fill was placed in the excavation, the temporary interior bracing for the steel sheeting was removed. The fill was compacted in approximately 1-foot lifts using the excavator bucket to a depth of approximately 10 feet bgs. Above this depth, the fill was placed in 1-foot lifts and compacted using a vibratory plate tamper. In-situ compaction testing (i.e. Troxler) performed on select lifts confirmed that the fill was compacted to 95% of its maximum dry density (based on the results of standard Proctor tests). Results of the compaction (density) testing are included in Appendix C.
- Exempt crushed concrete debris generated by the foundation demolition activities was used to fill the last remaining portion (upper 1 foot) of Excavation Area 2 to meet the surrounding lines and grades.

2.5 Air Monitoring

Airborne monitoring for particulate (dust) was conducted during the ICM removal activities in accordance with the New York State Department of Health's (NYSDOH's) Community Air Monitoring Plan (CAMP), dated June 2000. Dust monitoring was conducted using a Real-Time Aerosol Monitor (mini-RAM). Air monitoring equipment was calibrated daily, prior to the start of work activities.

Air monitoring results were recorded by the onsite health and safety supervisor at a minimum frequency of once per hour, unless site conditions and work activities did not cause the generation of dust. Hourly monitoring readings are summarized on the air monitoring logs included in Appendix D.

A photoionization detector (PID) was available onsite for total organic vapor (TOV) screening should unforeseen conditions (obvious odors, heavily stained soils) be encountered during the AOC 45 ICM activities. No obvious odors or stained soils were noticed during the AOC 45 ICM soil removal activities. Therefore, TOV screening was not performed.

2.6 Site Restoration/Demobilization

Equipment used during the ICM activities was decontaminated prior to handling clean soils and prior to demobilization from the site. Decontamination was straightforward because: (1) the excavator and crane were operated outside the impacted soil areas with only the bucket/clamshell contacting the impacted soils; and (2) the excavated soils were sands, which were non-cohesive and generally did not adhere to the excavation equipment. The decontamination process involved wiping the bucket and clamshell with cloths and detergent and physically removing adhered soils from the excavator tracks.

Wastes generated during decontamination activities were combined with the PCB-impacted soils and transported for offsite disposal as a TSCA-regulated PCB waste and NYS hazardous waste (Waste Code B007) at the CWM Model City Landfill. Demobilization of equipment and materials used for the AOC 45 ICM activities was completed on July 13, 2006.

3. Chronology of Significant Milestone Dates

A chronology of significant milestone dates for the AOC 45 ICM soil removal activities is presented in the table below.

Activity	Dates
ICM Delineation/Pre-Excavation Verification Soil Sampling Activities: <ul style="list-style-type: none"> • Initial round of delineation/pre-excavation verification soil sampling • Second round of delineation/pre-excavation verification soil sampling (conducted to further delineate the extent of PCB-impacted soils in AOC 45) • Third round of delineation/pre-excavation verification soil sampling (conducted to further delineate the extent of PCB-impacted soils in AOC 45) • Final round of delineation/pre-excavation verification soil sampling (conducted to refine the delineation of PCB-impacted soils in AOC 45) 	6/7/05 6/15/05 6/29/05 – 6/30/05 8/4/05 – 8/10/05
Preparations During Foundation Demolition Activities: <ul style="list-style-type: none"> • Removal & Stockpiling of Pilot Plant Concrete Floor Slab and Foundation Walls (PCB-impacted materials in the western portion of the Plant) • Removal & Stockpiling of PCB-Impacted Soils Extending Below Concrete Floor Slab to Surrounding Grade 	5/15/06
Mobilization for AOC 45 ICM Soil Removal Activities	6/26/06
Surveying to Delineate Boundaries of Excavation Activities, Removal of PCB-Impacted Soils along Proposed Sheetpile Alignment in Excavation Area 2	6/26/06 – 6/27/06
Removal of PCB-Impacted Soils in Excavation Area 1, Backfilling of Excavation Area 1	6/28/06
Installation of Steel Sheetpile and Bracing in Excavation Area 2	6/29/06 – 7/3/06
Placement of Backfill Outside Steel Sheetpile Wall	7/5/06
Removal of PCB-Impacted Soils inside Sheetpile Wall around Excavation Area 2	7/10/06
Backfilling of Excavation Area 2	7/10/06 – 7/12/06
Offsite Transportation and Disposal of PCB-Impacted Materials: <ul style="list-style-type: none"> • Concrete Floor Slabs/Foundations and Soils Removed from below Slab to Approximately 3 to 4 feet below Grade in Excavation Area 2 • Soils Removed from Excavation Area 1 and Remaining Soils Removed from Excavation Area 2 	6/28/06 – 6/29/06, 7/6/06; 7/12/06 – 7/13/06
Removal and Decontamination of Sheetting & Bracing	7/12/06 – 7/13/06
Demobilization	7/13/06

4. Modification to ICM Work Plan

As discussed above, the size of Excavation Area 2 was slightly enlarged from the dimensions of 26 feet by 27 feet as proposed in the March 9, 2006 letter from ARCADIS BBL that responds to NYSDEC comments on the AOC 45 ICM Work Plan. Based on the width of the individual steel sheets used for the sheetpile wall support system (each sheet was 4 feet wide), the final horizontal dimensions of Excavation Area 2 were approximately 28 feet by 28 feet.

5. Summary and Conclusions

The AOC 45 ICM soil removal activities have been completed, resulting in the removal of soils beneath and around the former Pilot Plant sumps (AOC 45) that exhibited PCBs at concentrations exceeding 50 ppm. Additional sampling activities are being performed to further evaluate the extent of PCB-impacted soils more recently identified in the eastern portion of the Pilot Plant footprint, around the nearby former Plant 1 footprint, and elsewhere onsite. Remedial alternatives to address remaining impacted soils at the site will be evaluated in the Corrective Measures Study (CMS), after delineation sampling activities are completed. Following NYSDEC approval of the CMS and a Corrective Measures Work Plan, the proposed final measures will be implemented to attain site closure and allow for property transfer to a new owner for redevelopment.

Notes:

1. Samples were collected by Blasland, Bouck & Lee, Inc. (BBL) during June and August 2005.
2. Samples were analyzed for polychlorinated biphenyls (PCBs) by Severn Trent Laboratories, Inc. (STL) of Shelton, Connecticut using United States Environmental Protection Agency (USEPA) SW-846 Method 8082, as referenced in the New York State Department of Environmental Conservation (NYSDEC) 2000 Analytical Service Protocol (ASP).
3. Depths identified in the sample ID for samples collected outside the former Pilot Plant footprint (at sampling locations VS-45-3, VS-45-4, VS-45-5, VS-45-6, VS-45-8, VS-45-9, and VS-45-10) are relative to the surrounding ground surface. Depths identified in the sample ID for samples collected within the former Pilot Plant footprint (at sampling locations VS-45-1, VS-45-2, VS-45-2R, VS-45-7, VS-45-11 through VS-45-14, and VS-45-20 through VS-45-23) are relative to the top of the soil surface beneath the floor slab, which is approximately 2.3 feet higher than the surrounding ground surface.
4. The 'R' included in selected sample IDs indicates the sample was collected from a revisited sampling location.
5. Concentrations presented in parts per million (ppm), which is equivalent to milligrams per kilogram (mg/kg).
6. Data qualifiers indicate the following:
 < = Aroclors were not detected at a concentration exceeding the presented laboratory detection limit.
 J = Estimated result. Result is less than the laboratory detection limit.
7. DUP = Blind Duplicate [corresponding sampling location is indicated in brackets].
8. Shaded values indicate that the total PCB concentration exceeds the 50 ppm action level established for the
9. An asterisk (*) following the sample ID indicates that analytical results for the sample have been validated by BBL.
