Re: Review of Test Results  
Mitchel Field Remedial Action Facility  
Garden City, New York

Dear Mr. Smith:

As requested by Purex Industries, Inc. (Purex), Woodward-Clyde Consultants (WCC) has reviewed analytical data and other pertinent information related to proposed changes in the groundwater treatment system at the Mitchel Field facility. Included in this report is an evaluation of data related to removal of existing activated carbon adsorbers from the Plume Area treatment train. Also included in this report is a review of pilot-scale tests performed at the Mitchel Field site to evaluate methods for iron pretreatment.

## BACKGROUND

At the present time, contaminated groundwater recovered from the Plume Area at Mitchel Field is treated by air stripping, followed by dual-media filtration and activated carbon adsorption prior to discharge through a New York State permitted (SPDES) outfall. Using this treatment sequence, the air stripper towers act as the primary treatment step for removal of volatile organic contaminants (VOCs), with the activated carbon adsorbers (two units in series) acting as the secondary or polishing step.

Past operation of the air stripping towers demonstrated that the Plume Area air stripper towers can remove volatile organics to levels suitable for direct discharge. In a letter dated May 29, 1992 to Mr. Robert Greene (Appendix A) of the New York State Department of Environmental Conservation (NYSDEC), Purex requested approval from the NYSDEC to remove activated carbon units which are currently used as a secondary or polishing step to treat recovered groundwater from the Plume Area at the Mitchel Field site.

As described in the letter dated May 29, 1992, Purex proposed a formal test to demonstrate the effectiveness of air stripping alone for treatment of groundwater recovered from the Plume Area. As described in this letter, treatment of recovered groundwater will be

85C2598-B/PUREXTES.MJW

November 2, 1992  
Page 2

simplified, and yearly operation and maintenance costs would be substantially reduced if carbon adsorption is not required. The NYSDEC responded with a letter dated June 16, 1992.

Past operation of the Plume Area air stripper towers has indicated that iron precipitation on the air stripper packing was the primary impediment to effective VOC removal. Pilot-scale treatability studies were later performed to evaluate methods to remove iron from the recovered groundwater prior to air stripping. The overall objective of these tests was to identify methods for iron pretreatment which would control or eliminate iron precipitate fouling of the air stripper tower media.

## **TEST PROCEDURES**

### **Removal of Activated Carbon Adsorbers**

A test was conducted between June 19 and September 29, 1992 at the Mitchel Field facility to evaluate the efficiency of the existing Plume Area air stripper towers alone for removal of VOCs. Testing was performed by Metcalf and Eddy Services, Inc., under the direction of Purex. Data related to these tests was later transmitted to WCC for review.

During this testing, contaminated groundwater from the Plume Area was treated by Plume Area air stripper towers (four towers operated in parallel configuration), followed by dual-media filtration and activated carbon adsorption (two adsorbers operated in series configuration) prior to discharge. Table 1 provides a chronology of significant work activities performed during this testing program.

Water samples were collected on a periodic basis at different points within the system. Table 2 summarizes the general sampling frequency and chemical analyses performed at each sample point. Copies of all analytical data is included in Appendix B.

During this test, a combination of physical and chemical parameters were used to monitor operation of the Plume Area air stripper towers. Physical parameters such as liquid flow, air flow, and pressure drop were monitored on a daily basis and were used as the primary method to judge the overall operating condition of each tower. Samples were also collected daily from the combined Plume Area air stripper effluent (sample point ASE-1) to assess the combined efficiency of the four towers.

Page 3

### **Iron Pretreatment Testing**

Pilot-scale treatability tests were performed at the Mitchel Field site to evaluate methods to remove iron from the Plume Area groundwater prior to air stripping. Pilot-scale treatability tests were performed by Hungerford & Terry, Inc. (H&T), under the direction of WCC.

The objective of these tests was to identify methods for removal of iron which take advantage of existing process equipment and require minimal space. Pilot-scale tests conducted by H&T evaluated the use of oxidation in conjunction with filtration for removal of iron. Chlorine was used as the primary oxidant during these tests. Types of filter media included combinations of silica sand, anthracite coal, and glauconite (greensand).

### **SUMMARY OF TESTING**

During the test, four air stripper towers were used to treat water from the Plume Area. Plume Area Air Stripping Tower E221 was taken out of service between July 2 and 17, 1992 for replacement of media. Source Area Air Stripping Tower E123 was placed into temporary service to replace E221. It should be noted that treated water from E123 was returned to the Plume Area treatment train after passing through E123. Plume Area air stripper tower E222 was taken out of service on August 11, 1992 for a media change and was returned to service the same day. The remaining two Plume Area air stripper towers (E220 and E223) remained in service during the testing period.

The dual-media filter (PV301) was used continuously during the test. The dual-media filter was backwashed approximately every 24 hours.

The Plume Area activated carbon adsorbers (PV325 and PV326) were also used continuously during the test. The Plume Area carbon adsorbers were backwashed on approximately a daily basis to remove accumulated particulates and control blinding.

Iron treatability testing was performed on untreated Plume Area raw water. A total of three filtration tests were performed using the combination of silica sand and anthracite coal (two tests) and the combination of glauconite and anthracite coal (one test). During all three tests, chlorine was added to the Plume Area raw water to oxidize iron prior to filtration.

## **RESULTS**

### **Removal of Activated Carbon Adsorbers**

Analytical results of samples collected at location ASE-1 indicated consistent removal of volatile and semi-volatile organics to levels below those specified in the current SPDES permit (revised June 21, 1991) for the Mitchel Field facility. Contaminant levels measured at sample point ASE-1 did not exceed SPDES permitted levels at any time during the test. Analytical results of samples collected at sample points CFM-1 and CFE-1 also indicated levels of volatile organics below those specified in the current SPDES permit.

Samples collected at sample points SFE-1, CFM-1, and CFE-1, and analyzed for total iron, indicated residual iron levels at sample point SFE-1, with total iron levels generally below method detection levels at sample points CFM-1 and CFE-1. The reduction in total iron levels between sample point SFE-1, and sample points CFM-1 and CFE-1, illustrates the deposition of iron and resulting blinding of activated carbon within the two activated carbon adsorbers (PV325 and PV326).

### **Iron Pretreatment Testing**

Results of the H&T tests indicated successful pretreatment of iron using a combination of oxidation, followed by filtration. Results of these tests indicated satisfactory removal of iron from the Plume Area raw water using a combination of chlorine to oxidize iron, followed by dual-media filtration (using silica sand and anthracite coal) for removal of precipitated iron. A copy of the final report summarizing the results of the H&T tests was submitted previously to the NYSDEC.

## **CONCLUSIONS**

Results of testing clearly demonstrate that the Plume Area contaminated groundwater can be treated to established SPDES requirements using air stripping alone, with additional treatment not being required. Based on this test, secondary treatment in the form of the existing activated carbon adsorbers is not required.

Iron precipitation has been identified as the primary mechanism for fouling in the Plume Area air stripper towers. This iron fouling results in a reduction in VOC removal efficiency within the air stripper towers. Results of previous pilot-scale tests performed by H&T indicated satisfactory iron removal from untreated Plume Area groundwater can be realized

Mr. Jeffrey Smith  
Purex Industries, Inc.  
November 2, 1992  
Page 5

through the combination of chlorine to oxidize the soluble iron, followed by dual-media filtration consisting of silica sand and anthracite coal to remove precipitated iron.

Results of the H&T tests indicated that the existing dual-media filter (PV301) could be utilized for removal of iron prior to air stripping. In this instance, piping modifications would be made to the existing treatment system such that recovered groundwater from the Plume Area is first treated by a combination of oxidation (chlorination) and dual-media filtration (using PV301) followed by air stripping. In this configuration, the majority of the iron would be removed prior to air stripping, reducing the potential for fouling of media within the air stripper towers and related reduction in VOC removal efficiency. Providing iron removal prior to air stripping should minimize media fouling and would, in turn, improve operation and reliability of these towers and minimize personnel time required to maintain these towers.

## **RECOMMENDATIONS**

Results of the most recent tests performed by M&E, under the direction of Purex, demonstrate that the Plume Area air stripper towers can provide removal of VOCs to levels which are in compliance with the existing SPDES permit for the Mitchel Field site. These results demonstrate that the existing Plume Area activated carbon adsorbers are not required to achieve effluent guidelines set forth in the SPDES permit.

Results of pilot-scale tests performed by H&T demonstrated satisfactory removal of iron from the Plume Area raw water when using the combination of oxidation (chlorination) and dual-media filtration. Relocation of the existing dual-media filters upstream of the air stripper towers would provide iron removal prior to air stripping, reducing the potential for fouling, and improving the overall efficiency and reliability of the air stripping process.

WCC appreciates the opportunity to provide these services to Purex. Should you have any questions, please feel free to call.

Very truly yours,

Michael J. Wierman, P.E.

Re: SPDES Permit NY 020-6610  
Request for Modification,  
NYDEC Application No. 1-2820-01370/00001-0

Dear Mr. Greene:

Please consider this letter, submitted in four copies, as an application for modification of the above SPDES Permit. The permit was issued to Purex Industries, Inc. ("Purex"), for its Mitchel Field Remedial Action Facility. This facility's sole function is to remediate contaminated groundwater.

The facility remediates contaminated groundwater at a rate of 1,400 gallons per minute (gpm). Of this flow, 700 gpm emanates from the source area ("source") and 700 gpm from the plume area ("plume"). To effectuate remediation of these flows, a total of eight air strippers are utilized. Four air strippers treat the source and four treat the plume. Activated carbon treatment was installed as a secondary control on both flows because initial air stripper effluent levels were expected to exceed state and federal discharge criteria.

Owing to the success of remediation activities, air stripper effluent concentrations have decreased markedly and secondary treatment of the plume is no longer necessary. Thus, Purex requests approval to discontinue the secondary carbon adsorption

Robert Greene

of Environmental Conservation  
Stony Brook, New York

May 29, 1992  
Page 2

units presently servicing the plume area groundwater. Both plume activated carbon units nonetheless would remain in place; to be used at a moment's notice should this effluent discharge, as measured using EPA Methods #601 and #602, be exceeded. The 700 gallon per minute flow from the source area would continue to be treated by both air stripping and carbon adsorption as it does now. No modification is being requested of the source area flow.

Purex is seeking to modify the wording of its original application Form 2 D NPDES for Outfall Number 001 only. Specifically, Purex respectfully submits that this wording should be modified to read as follows:

2-A Carbon Adsorption. After the water has been filtered, the water will pass through activated carbon adsorbers, PV 321, PV 322, and may pass through PV 325, and 326 to remove residual organics in water prior to discharge (Underlining indicates proposed modification.)

PV 325 and PV 326 are the carbon adsorbers representing the secondary treatment for the plume. PV 321 and PV 322 represent the secondary treatment for the source. Both effluents would be analyzed in accordance with EPA Methods #601 and #602.

Purex has recently purchased a new Hewlett Packard GC to be used for EPA test Methods #601 and #602 volatile organic carbons analyses. The on-site laboratory already has a Hewlett Packard GC MS which is used for EPA test Method #624. This on-site laboratory has also recently become New York State certified.

All DMR's since December 1991 show Purex in full compliance with the SPDES permit as measured using EPA Methods #601 and #602 on the samples taken once per week. Purex proposes a six month trial period whereby if the plume flow air stripper aqueous effluent meets the SPDES permit, as measured on a daily basis using EPA Methods #601 and #602 then the secondary carbon adsorber need not be used. This time period will allow sufficient data to be gathered to clearly demonstrate that the air stripper treatment is sufficient alone to meet the SPDES discharge criteria for the plume groundwater.

Robert Greene  
New York State Department  
of Environmental Conservation  
Stony Brook, New York

May 29, 1992  
Page 3

On successful completion of the trial period compliance sampling would resume on a weekly basis and the carbon adsorbers would be taken off line.

In addition, plant effluent would continue to be monitored as outlined in the Approved Monitoring Program for the facility, so as to assure a daily check on plant discharge. Should a problem arise, the plume flow's aqueous air stripper effluent would be diverted back through the secondary carbon adsorption treatment system. Such diversion would continue until the air stripper's aqueous effluent was again within the SPDES discharge criteria.

The annual carbon replacement cost associated with the two, 20,000 pound capacity, plume carbon vessels exceeds \$80,000. Inasmuch as the plume flow's aqueous air stripper effluent is within discharge criteria, further incurrence of this cost is unwarranted. These carbon beds require frequent changes because trace quantities of iron plug the carbon bed, blinding the carbon and creating unacceptably high pressure differentials across the system. These adverse contemporaneous phenomena are both caused by the iron's adherence to the carbon granules which simultaneously prevents contaminant adsorption and further restricts fluid flow through the carbon bed's interstitial spacing.

For seventeen (17) days in December, sampling of the plume's aqueous air stripper effluent was performed. The samples were analyzed by an independent, New York State certified, laboratory using EPA Methods #601 and #602. In all instances, contaminant levels were either ND or BQL (Below Quantitation Limit), and well below their corresponding SPDES limits. More recent daily data was also collected and showed consistent and full compliance with the latest proposed SPDES Permit discharge limits, as measured by EPA Methods #601 and #602.

In summary, continued use of the plume's secondary treatment system, namely the two carbon adsorbers, is no longer necessary on a regular basis. Nevertheless, the carbon adsorbing units would remain on site. These units would be activated if plume air stripper aqueous effluents exceed SPDES Permit discharge limits.

Robert Greene  
New York State Department  
of Environmental Conservation  
Stony Brook, New York

May 29, 1992  
Page 4

Purex will agree to the following:

1. Discharge Limitations - as specified in the Department's proposed permit modification dated October 30, 1989;
2. Effluent Compliance Testing - in accordance with EPA Methods #601 and #602, as specified in the Department's proposed permit modification dated January 25, 1991 and June 22, 1991;
3. Future reporting of results on the DMR's will include both the level of detection and any positive analytical results below the SPDES permit discharge limitations as requested in the Department's March 25, 1992 letter.

Further, Purex respectfully requests that its SPDES Permit be modified as follows:

Activated carbon secondary aqueous treatment discontinuance for plume flow air stripper aqueous effluents, with provision for rapid reinitiation should conditions so warrant.

The granting of this request will obviate the need for administrative hearings concerning any department initiated permit modification proposal.

Please contact me if you have any questions or require any further information.

Very truly yours
