1.0 BACKGROUND

Anchor Chemicals site, also known as Anchor-Lith Kem Ko, is located on a 1 1/2 acre complex, consisting of industries and warehouses, in Hicksville, New York. The site is flanked by railroad, commercial and residential areas. The site was listed on the NPL October 15, 1986. During the time Anchor Chemicals was in business, workers stored chemicals above and below ground level. The company had beneath the concrete floor of the building seventeen underground storage tanks with capacities ranging from 550 to 4,000 gallons. In the early 1980's six leaking underground tanks were removed and three monitoring wells were installed. Groundwater and subsurface soils on the site were contaminated with volatile organic compounds. Public water is available to everyone in the area but the contaminated groundwater is a potential threat to the water supply wells of the Westbury, Hicksville, and Bowling Green water districts. These water districts are located less than 6,500 feet southwest of the site. Public and private wells within 3 miles of the site provide water to over 90,000 people. Groundwater is used for industrial processes and irrigation. Within 1 1/2 miles of the site there are 11 schools and 12,000 people living within one mile of the site. Adjacent to the site exist residential housing, recreational and commercial resources.

Thomas Taccone of the U.S. Environmental Protection Agency (EPA), Region II, Emergency and Remedial Response Division (ERRD), New York Remediation Branch, requested that the Hazardous Waste Support Branch (HWSB) provide support in sampling the site. The sampling plan was to collect groundwater samples from five wells on the site. These samples were to be analyzed for TCL VOC's, Semi-Volatile Organic Compounds and TAL Metals by EPA's Laboratory in Edison, NJ. The data from the analyses will be used to update the baseline human health risk assessment.

Two different sampling methods were used during this sampling event. The two methods were: the Low Flow Purging and Sampling Method (Low Flow) and the Groundwater Well Sampling Method using the Bailer (Bailer). The sampling method used in the past to update the baseline human health risk assessment for the site was Bailer. Currently the EPA in the Region II, is in the process of changing its method of sampling to Low Flow. By using the two methods during the same sampling event, the data from this event may provide us with comparative data between the two methods.

2.0 SAMPLING PROCEDURES

The sampling procedures for both the Bailers and the Low Flow were in accordance with EPA/540/P-91/007, dated January 1991, Compendium of ERT Groundwater Sampling Procedures, Groundwater Well Sampling: SOP # 2007. However, since SOP # 2007 does not fully address the Low Flow the following procedures were added:

- A. Low Flow Purging and Sampling Procedure:

Wait at least 2 hours or more after placing the pump in the well before purging, using the low flow method. This method requires that the wells be purged at a starting rate between 200 and 500 ml/min. The rate is to be adjusted as needed to prevent causing drawdown and turbulence within the well. All wells were purged and sampled using the Redi-Flo 2 submersible pump from Grundfos. The components of these pumps are made of 316 stainless steel and virgin Teflon. The wells were considered stabilized and ready for sampling when the indicator parameters stabilized for three successive readings. Readings were taken at about five minutes apart. The parameters used to determine if the well is stabilized are: temperature \pm 10%, pH \pm 0.05%, specific conductance \pm 3%, and turbidity \pm 10%. The sampling flow rate was the same rate at which stabilization occurred except for collecting VOAs. Sampling flow rate for VOAs is at about 100ml/min.

B. Sampling procedures using Bailers:

Immediate after each well is sampled using the Low Flow method, the same pumps will be used to purged three well volumes in accordance with EPA/540/P-91/007, dated January 1991, Compendium of ERT Groundwater Sampling Procedures, Groundwater Well Sampling: SOP # 2007. Following the SOP # 2007 after purging the wells, a dedicated bailer is used to pull the samples.

3.0 DESCRIPTION OF EVENTS

The sampling team consisted of Michael A. Mercado and Carlos R. Villafaña of EPA Region II, DESA. On July 21, 1997, the sampling event started with a reconnaissance of the site and the lowering of pumps. By July 23, 1997, four of the five wells identified for this sampling event were sampled by both the Low Flow and the Bailer methods. MW-6D the fifth well was the only by the Low Flow Method. The decision not to sample MW-6D with a Bailer was due to the fact that there were problems stabilizing the well. By the time the well was stabilized and samples were taken using the Low Flow Method it was past 2230 hours. The decision was made by the project leader not to sample the well using the Bailer Method due to health and safety reasons.

A trip blank, equipment blank, environmental duplicate and a blind duplicate were taken during this sampling event. Table 1 provides more information on these QA/QC samples.

4.0 RESULTS

The Equipment Blanks and Trip Blanks were taken as a check and to see if any outside contaminants were introduced into the samples. If so, this was a way of quantifying the amount. As per Region II's Data Validation SOP for CLPs when contaminants are found in the blanks, in order to consider the same contaminants as attributable to the sample location, the sample compound must be greater than five times the amount

detected in the blanks. The following were the compounds detected in both the samples and the blanks:

| | |
|--------------------------------|--------------|
| Bis(2-ethylhexyl) Phthalate, | 3.5 ppb, JQM |
| Diethyl Phthalate, | 1.6 ppb, JQM |
| Di-n-butylphthalate, | 0.8 ppb, JQM |
| Di-n-octyl phthalate, | 0.5 ppb, JQM |
| Phenanthrene, | 1.6 ppb, JQM |
| Hexanedioic Acid, Bis(2-Ethyl, | 45 ppb, JQT |

The first four compounds are Phthalate and are possible laboratory contaminants. Phenanthrene along with the Phthalate are below the laboratory's reporting limits. Hexanedioic Acid, Bis(2-Ethyl, is a Tentatively Identified Compound (TIC).

The laboratory analysis shows that Benzo(a)Pyrene, Chromium and Nickel were detected above the Federal MCL's (see Table 2). The level of concentration for the above named compounds were found in higher concentrations than the previous sampling event. In fact, the analysis shows an overall higher concentration of metal in the samples taken during this sampling event than in the one before. Also, there were more organic compounds identified in the samples in this sampling event. The Tables 3 provides a list of TICs identified during the chemical analysis.

The analyzed sample data is from the US EPA, Region II, DESA, Laboratory Branch, Edison, NJ. The data sheets are attached as Appendix B.

5. COMPARISON BETWEEN METHODS:

The second part of this sampling event was to compare two methods of sampling. The two methods to be compared were Bailer and Low Flow. Low Flow is to become EPA Region II standard method for collecting groundwater samples from monitoring wells under normal conditions. Before the Low Flow method, Bailer was the most commonly used method for collecting groundwater samples from monitoring wells. Since most of the sites in the past were sampled using bailers, the majority of the site assessments are base on data from the bailer method. By comparing the two methods we may be provided with comparative data which could be used to validate the results between the two methods. The change is due to the understanding that Low Flow minimizes the stress on the geological formation and minimizes the disturbance of sediment that collects in the wells. The results from the collection, using Low Flow would be more representative of the groundwater conditions.

Samples taken using the Low Flow method should have a higher concentration of volatile organic compounds and a lower concentration of inorganic compounds when compared with samples taken using the Bailer method. The results of the chemical analysis of the samples from the two methods show the following:

Organics: The concentrations for the organic compounds were mostly quantified with a JQM. JQM states that the compound is presence but not quantified and it is only an estimated value. Most of the parameters of concern were very close to the detection limits for both sampling methods. Due to the information above it would not be acceptable to state which sampling method would provide the highest concentration of volatile organics compounds. A true comparison of the two methods could not be made.

Inorganics: Three out of four samples taken had a higher concentration of inorganics trace metals in the Bailer method than in the Low Flow method.

TABLE 1
QA/QC SAMPLE DATA

| TYPE OF SAMPLE | SAMPLE NUMBERS | SAMPLE LOCATION |

(Project Quality Assurance Officer's Signature) _____

(Project Quality Assurance Officer's Name) Jennifer Feranda, Environmental Scientist
Superfund Technical Support Team

- 1. Project Name:** Anchor Chemical, Hicksville, Long Island, NY
- 2. Project Requested By:** US EPA - Region 2, ERRD, New York Remediation Branch
- 3. Date of Request received from RPM:** December 23, 1996
- 4. Date of Project Initiation:** January 16, 1997
- 5. EPA Project Officer:** Michael A. Mercado
- 6. EPA Quality Assurance Officer:** Fennifer Feranda
- 7. Project Description:** Groundwater sampling events involved in the collection of water samples from five (5) monitoring wells at the Anchor Chemical Superfund site in Hicksville, Long Island. The five (5) monitoring wells to be sampled are identified on the enclosed site map, enclosure # 1. The five (5) monitoring wells are: MW-4, MW-5S, MW-5D, MW-6S and MW-6D. All sampling tasks will conform with the quality assurance set forth in the current Region 2 CERCLA Quality Assurance Manual and the sampling procedures in EPA/540/P-91/007 dated Jan. 91 for decontamination and sampling using bailers and submersible pumps. A copy of this Work/QA Short Form will be on site and available for reference during all sampling events.

A. Objective and Scope Statement: On 29 and 30 September 1995 the site's PRP removed approximately 24 cubic yards of contaminated sediments from four (4) on-Site drywells. The drywells were designated DW2, DW3, DW6 and DW8. Between March 29 and April 4, 1996 samples were taken from the monitoring wells on-site. The results of the sampling event indicated level above the National Primary Drinking Water Standards in metals. Also the sample data identified the presence of VOCs and BNAs compounds.

The primarily objective is to determine the effects, resulting from the excavation, on the quality of water in the underlaying aquifer. The effects will be determine by comparing the data between this sampling event and the previous sampling events. Following the previous sampling events procedures, five (5) monitoring wells will be sampled using bailers. These samples will be screened against Federal MCL standards, for VOCs, TCL BNAs and TAL metals (Encl 2). Enclosure 3 is the EPA Laboratory Reporting Limits which detects all compounds at or below the Federal MCL list except for, Antimony, Beryllium and Thallium. Also missing from the list in Enclosure 3 is Cyanide which is not tested. Low level analysis has been requested for TAL metals to address these parameters below the MCL.

The second part of this sampling event is to compare two methods of sampling. The two method to be compared are: the Low Flow Purging and Sampling Method (Low Flow) and the Groundwater Well Sampling Method using the Bailer (Bailer).

Currently the EPA Region II, is in the process of changing it's method of sampling to Low Flow. By using the two methods during the same sampling event, the data from this event may provided us with comparative data between the two methods.

B. Data Usage: Data and the interpretation of the data against the MCL will be sent to ERRD for incorporation into the project file. ERRD will be responsible for informing affected residents and the local health department of pertinent results. The results of the data from the two methods will be compiled with other results to provide us with comparative data between the two methods.

C. Monitoring Network Design and Rationale: A sample will be collected from each of the five monitoring wells as specified by ERRD (see enclosure 1). Bailers will be used to maintain consistency with previous sampling events as well as provided comparative data between Bailer and Low Flow. The five monitoring wells to be sampled are MW-6D and MW-6S, both up gradient of the drywells and MW-4, MW-5D and MW-5S which are down gradient. All wells are located on the site (see enclosure 1, site map).

Low Flow minimizes the stress on the geological formation and minimizes the disturbance of sediment that collects in the wells. Bailer on the other hand, causes stress to the geological formation and does not minimizes the disturbance of sediment within the wells. Due to the above, during all sampling event were Low Flow and Bailer are to be compared, all wells to be sampled will first be sampled using Low Flow and then immediately followed by sampling with Bailer. The samples will be taken in accordance with EPA/540/p-91/007, dated January 1991, Compendium of ERT Groundwater Sampling Procedures, Groundwater Well Sampling: SOP # 2007. However, since the SOP does not fully address the Low Flow additional procedures have been added to address Low Flow. The procedures are described in paragraph 12. Sampling Procedures.:

One VOC trip blank will be prepared for each day of sampling and stored in the same cooler containing the VOC samples. One Environmental duplicate, MS/MSD and MS/MD volume sample will be collected in each medium sampled. One field blank is required. The water used for all blanks will be demonstrated analyte-free.

If decontamination is needed, the following procedure will be used: equipment is scrubbed with Alconox and rinsed with water, then rinsed with nitric acid followed by another water rinse and then rinsed with acetone followed by another water rinse. As a minimum the final rinse will be deionized water.

Following these designs and rationales, we plan to have one trip blank per day, one environmental duplicate, one MS/MSD, one MS/MD and one field blank. The water used for the blanks will come from the DESA LAB which is the same water that is used to run the analytical method. This water is tested periodically.

D. Monitoring Parameters and their Frequency of Collection: Monitoring well samples and blanks will be analyzed for drinking water levels of VOC's, TCL BNA's, low level TAL metals and Cyanide, except for trip blanks. Trip blanks will be analyzed for drinking water levels VOC's only. There will be six (6)samples including an environmental duplicate. The above parameters were chosen by ERRD. Monitoring well MW-4 has been chosen to supply the environmental duplicate.

E. Parameter Table: All analytical and quality assurance requirements of the Laboratory Branch will be followed. All data pertaining to the samples' parameters are incorporated into the table in the next page:

PARAMETER TABLE

| Parameter*1 | Container Types | Analytical Method | Sample Preservation | Holding Times |
|----------------------|-------------------------|-------------------|--------------------------------|--------------------------|
| MCL Organics VOC's | 40ml VOC's Vial*2 | LAB SOP C-49 | (HCL to pH≤2.0) Cool to 4 C | 14 days |
| TCL BNA's | 1l amber glass bottle*3 | LAB SOP C-3 | Cool to 4 C | 7 days |
| Pesticides/PCBs | 1l amber glass bottle*3 | LAB SOP C-15 | Cool to 4 C | 7 days to extract |
| Cyanides | 1l plastic bottle*3 | LAB SOP C-28 | (NaOH) to PH≥12 Cool to 4 C | 14 days |
| Low level TAL Metals | 1l plastic bottle*3 | LAB SOP C-70 | HNO3 to pH≤2.0 Cool to 4 C | 6 months (Hg 28 days) |

*1 For each parameter there will be five well samples and one duplicate, for a total of 6 samples.

*2 Six, 40 ml vials for the first sample (no head space); three 40 ml vials for each additional sample.

*3 Three, 1 liters bottles for the first sample, one 1 liter bottle for each additional sample.

8. Project Fiscal Information (Optional): Not included.

9. Schedule of Tasks and Products:

| <u>Activity</u> | <u>Date</u> |
|-----------------------------------|------------------|
| Review and Background Information | January 7, 1997 |
| Submit a QA plan | January 17, 1997 |

| | |
|--|---|
| Book samples anticipated to be collected | TBA |
| Obtain Site Access | Pearranged by ERRD |
| Mobilize to Site | TBA |
| Complete Field Work | TBA |
| Package and ship samples to laboratory | Package at the time of sampling and will be delivered by samplers on the same day |
| Prepare Sampling Trip Report | Within one week of completion |
| Prepare and submit data presentation to ERRD | Within two weeks of receipt of validated analytical data |

10. Project Organization and Responsibility: The following is a list of key project personnel and their corresponding responsibilities:

| | |
|--|-----------------------------|
| Michael A Mercado, Superfund Contract Support Team Project Officer | -sampling operations |
| Michael A Mercado, Superfund Contract Support Team Project Officer | -sampling QC |
| Laboratory Branch | -laboratory analysis |
| Laboratory Branch | -laboratory QC |
| Laboratory Branch | -data processing activities |
| Laboratory Branch | -data processing QC |
| Laboratory Branch | -data quality review |
| N/A | -performance auditing |
| N/A | -systems auditing |
| HWSB | -overall QA |
| Michael A Mercado, Superfund Contract Support Team | -overall project |
| Carlos Villafaña, Superfund Contract Support Team | -health and safety officer |

11. Data Quality Requirements and Assessments: The data quality requirements for Laboratory Branch are listed in the EPA-DESA laboratory SOP's for QA/QC Plan for GC/MS May 94 for VOAs -BNAs and Inorganic QA/QC Plan Nov 93.

12. Sampling Procedures: All monitoring well sampling will be in accordance with EPA/540/P-91/007 dated: Jan 91, Compendium of ERT Groundwater Sampling Procedures, for the sampling of groundwater and decontamination of equipment. However since the SOP does not fully address the Low Flow the following procedures are added:

A. Low Flow Purging and Sampling Procedure: Wait at least 2 hours or more after placing the pump in the well before purging, using the low flow method. This method requires that the wells be purged at a starting rate between 200 and 500 ml/min. The rate is to be adjusted as needed to prevent causing drawdown and turbulence within the well. All wells are to be purged and sampled using the Redi-Flo 2 submersible pump from Grundfos. The components of these pumps are made of 316 stainless steel and virgin Teflon. The wells will be considered stabilized and ready for sampling when the indicator parameters stabilized for three successive readings. Readings should be taken at about five minutes apart. The parameters used to determine if the well is stabled are: temperature \pm 10% pH \pm 0.05%, specific conductance \pm 3%, and turbidity \pm 10%. The sampling flow rate should be the same rate at which stabilization occurred except for collecting VOAs. Sampling flow rate for VOAs should be about 100ml/min.

B. Sampling procedures using Bailers: Immediate after each well is sampled using the Low Flow method, the same pumps will be used to purged the wells until they stabilized. After the wells are stabilized, a dedicated bailers is used to pull the samples in accordance with EPA/540/P-91/007, dated January 1991, Compendium of ERT Groundwater Sampling Procedures, Groundwater Well Sampling: SOP # 2007.

13. Sample Custody Procedures: Sample custody seals will be placed on each cooler in which samples are contained. Chain of custody forms will accompany each cooler. Each time the seal is broken on the sample coolers, a new seal will be placed on. The custody seals will record the date and time of placement as well as the originator. It will also contain the date and time the seal was broken and the person responsible for this action. At the conclusion of the sampling event, all samples will be delivered personally to the EPA Laboratory Branch staff for log-in. If samples are delivered to Laboratory Branch after 5:00 PM, the coolers will be stored overnight in the designated secure refrigerator. The following morning, samples will be delivered by the samplers to Laboratory Branch staff followed by log-in.

14. Calibration Procedures and Preventative Maintenance: Laboratory will followed as specified under the EPA-DESA Laboratory SOP's. The following field equipment will be used to check for stabilization of the aquifer during purging: LaMotte Model 2008 Turbidity Meter, Orion Research Portable pH Meter 200 Series, and Cole-Parmer Conductively Meter, Model 1500. All of these will be calibrated before operating and maintained IAW equipment operator's manual.

15. Documentation, Data Reduction, and Reporting:

A. Documentation: Data sheets, field logs, traffic reports, photographs and chain of custody forms will be kept by the project manager of each individual site.

B. Data Reduction and Reporting: The laboratory performing the analysis will calculate and transfer data to ERRD-RPM for the site per DESA protocol.

16. Data Validation: The US EPA Laboratory Branch will perform all data validation in house for all samples which it analyzes.

17. Performance and Systems Audits: As according to DESA-HWSB and DESA-Lab SOP's.

18. Corrective Action: Corrective Action will be performed as required by the project manager in the field and by the audit report.

19. Reports: A data presentation will be prepared by the project manager and submitted to ERRD in New York. The report will include the data quality assessment and will discuss whether or not the samples had exceeded the National Primary Drinking Water Standards.

PROJECT NAME: ANCHOR CHEMICAL
EXPLANATIONS OF REMARK CODES

| REMARK CODE | EXPLANATION |
|-------------|---|
| B | RESULTS BASED UPON COLONY COUNTS OUTSIDE ACCEPTABLE RANGE |
| J | ESTIMATED VALUE |
| K | ACTUAL VALUE KNOWN TO BE LESS THAN VALUE GIVEN |
| L | ACTUAL VALUE KNOWN TO BE GREATER THAN VALUE GIVEN |
| N | NO OBSERVABLE EFFECT CONCENTRATION < 0.3% |
| O | SAMPLED BUT NOT ANALYZED DUE TO LAB ACCIDENT |
| T | REPORTED VALUE LESS THAN CRITERIA OF DETECTION |
| U | REPORTING LIMIT |

QA/QC REMARK CODES

| CODE | EXPLANATION |
|------|--|
| OD | ACCURACY CHECK SAMPLE ABOVE UPPER ACCEPTANCE LIMIT |
| QE | ACCURACY CHECK SAMPLE BELOW LOWER ACCEPTANCE LIMIT |
| QF | PRECISION OF CALIBRATION CURVE LESS THAN ACCEPTANCE CRITERIA |
| QJ | ESTIMATED DETECTION LIMIT DUE TO INTERFERENCE |
| QG | CONTINUING CALIBRATION CHECK DOES NOT MEET ACCEPTANCE CRITERIA |
| QS | SPIKE RECOVERIES ABOVE UPPER ACCEPTANCE LIMIT |
| OR | SPIKE RECOVERIES BELOW LOWER ACCEPTANCE LIMIT |
| QP | SAMPLE REPPLICATE PRECISION DOES NOT MEET ACCEPTANCE CRITERIA |
| OH | RECOMMENDED HOLDING TIMES EXCEEDED |
| OT | TENTATIVELY IDENTIFIED COMPOUND |
| QM | PRESENCE OF MATERIAL VERIFIED BUT NOT QUANTIFIED |
| QB | BLANK CONTAMINATED BY ANALYTE IN EXCESS OF ACCEPTANCE CRITERIA |
| QQ | SAMPLE IMPROPERLY PRESERVED |

LOCATION CODES FOR IDENTIFICATION OF SAMPLING POINTS AT INDUSTRIAL / SANITARY FACILITIES, LANDFILLS, HAZARDOUS WASTE SITES.

| CODE NUMBERS | SAMPLING POINTS |
|--------------|---|
| 1001 - 1050 | EFFLUENT PIPE NUMBER 001 TO 050 |
| 1051 - 1099 | OTHER EFFLUENTS SUCH AS COOLING TOWER DISCHARGE, DISCHARGE FROM HOLDING PONDS, ETC... |
| 1100 - 1249 | IN-PLANT SAMPLES |
| 1435 - 1454 | SEPARATE INFLUENT POINTS/WATER SOURCES |
| 15XX | INFILTRANT ASSOCIATED WITH EFFLUENT 10XX |
| 2000 | BLANK FOR VOLATILE ORGANICS |
| 3000 - 3099 | GROUND WATER FROM WELL 01 TO 99 |
| 3100 - 3199 | SEDIMENT SAMPLE (WATER BOTTOM) |
| 3200 - 3299 | SOIL SAMPLE |
| 3300 - 3399 | STREAM WATER SAMPLE |
| 3400 - 3499 | LAGOON SAMPLE |
| 3500 - 3599 | STORAGE TANK SAMPLE |
| 3600 - 3699 | LEACHATE SAMPLE |
| 3700 - 3799 | OTHER TYPE SAMPLE |

GENERAL INFORMATION

WEATHER CONDITIONS: _____

SAMPLE CHARACTERISTICS: CLEAR WATER

COMMENTS AND OBSERVATIONS: DURING PURGING, THE PUMP STOPPED PUMPING.

THE PUMP WAS IMMEDIATELY RESTARTED AT A HIGHER PUMPING RATE. AFTER
ABOUT 10 MIN. THE FLOW RATE WAS LOWER BETWEEN 200 & 500 ML/MIN.

ANALYSIS/PRESERVATION: (SEE FIELD DATA SHEET)

CERTIFICATION: ENVIRONMENTAL SAMPLING COMPANY (ESS) GLASSWARE

WELL DATA SHEET

SITE: ANCHOR CHEMICAL WELL#: MW-5DB

TYPE OF SAMPLE: GROUND WATER SAMPLING PERSONNEL: MERCADO/VILLAFANE

EVACUATION INFORMATION

DATE/TIME: 7/23/97 - 0935 HRS METHOD: SUBMERSIBLE PUMP

TOTAL DEPTH (FT): 121.35 TOP OF CSG. TO H₂O LEVEL(FT): 59.15

WATER COLUMN HEIGHT (FT): 62.2 WELL CSG. TYPE/DIAM.: 4" SS

pH METER CALIBRATION: 4(4.07) 7(7.00) 10(10.01) TIME: 0910HRS

SAMPLING INFORMATION

DATE/TIME OF SAMPLING: 7/23 - 1020 SAMPLE#: 203308 METHOD: LOW FLOW

FIELD MEASUREMENT DATA

| TIME (24HR) | VOLUME EVACUATED (GAL) | TEMP (C) | SPECIFIC CONDUCTANCE (UMHOS/CM) | pH (SU) | TURBIDITY (NTU) |
|----------------|------------------------------|-------------|---------------------------------------|------------|--------------------|
| 0935 | 2.5 | N/A | 149 | 8.78 | 17.8 |
| 0951 | 4.0 | N/A | 151 | 8.80 | 15.9 |
| 0956 | 4.5 | N/A | 152 | 8.81 | 13.2 |
| 1001 | 5.0 | N/A | 151 | 8.77 | 10.5 |
| 1006 | 5.5 | N/A | 150 | 8.78 | 9.8 |
| 1011 | 6.0 | N/A | 151 | 8.74 | 9.4 |
| 1016 | 6.5 | N/A | 151 | 8.70 | 9.4 |

GENERAL INFORMATION

WEATHER CONDITIONS: _____

SAMPLE CHARACTERISTICS: CLEAR WATER

COMMENTS AND OBSERVATIONS: MW-5DL IS A DUPLICATE OF MW-5DDL.

ANALYSIS/PRESERVATION: (SEE FIELD DATA SHEET)

CERTIFICATION: ENVIRONMENTAL SAMPLING COMPANY (ESS) GLASSWARE

WELL DATA SHEET

SITE: ANCHOR CHEMICAL WELL#: MW-5DDB

TYPE OF SAMPLE: GROUND WATER SAMPLING PERSONNEL: MERCADO/VILLAFANE

EVACUATION INFORMATION

DATE/TIME: 7/23/97 - 0935 HRS METHOD: SUBMERSIBLE PUMP

TOTAL DEPTH (FT): 121.35 TOP OF CSG. TO H₂O LEVEL(FT): 59.15

WATER COLUMN HEIGHT (FT): 62.2 WELL CSG. TYPE/DIAM.: 4" SS

TOTAL VOLUME EVACUATED(GAL): 119.1 TURBIDITY TRUE READING: 4.90 NTU

pH METER CALIBRATION: 4(4.04) 7(7.00) 10(10.01) TIME: 0910HRS

SAMPLING INFORMATION

DATE/TIME OF SAMPLING: 7/23 - 1230 SAMPLE#: 203316 METHOD: BAILER

FIELD MEASUREMENT DATA

| TIME (24HR) | VOLUME EVACUATED (GAL) | TEMP (C) | SPECIFIC CONDUCTANCE (UMHOS/CM) | pH (SU) | TURBIDITY (NTU) |
|----------------|------------------------------|-------------|---------------------------------------|------------|--------------------|
| 1105 | 15.0 | N/A | 155 | 8.80 | 20.7 |
| 1115 | 20.0 | N/A | 151 | 8.73 | 8.3 |
| 1125 | 25.0 | N/A | 146 | 8.62 | 2.0 |
| 1135 | 30.0 | N/A | 148 | 8.60 | 1.9 |
| 1145 | 35.0 | N/A | 148 | 8.60 | 1.9 |

GENERAL INFORMATION

WEATHER CONDITIONS: _____

SAMPLE CHARACTERISTICS: CLEAR WATER

COMMENTS AND OBSERVATIONS: PURGING STARTED IMMEDIATELY AFTER SAMPLING PULLED, USING THE LOW FLOW METHOD. MW-5DDB IS A DUPLICATE OF MW-5DB

ANALYSIS/PRESERVATION: (SEE FIELD DATA SHEET)

CERTIFICATION: ENVIRONMENTAL SAMPLING COMPANY (ESS) GLASSWARE

WELL DATA SHEET

SITE: ANCHOR CHEMICAL WELL#: MW-5DDL
