February 2019

ENGINEER OF RECORD CERTIFICATION

I, Peter Rich, am currently a registered professional engineer licensed by the State of New York, I had primary direct responsibility for the design of the remedial program activities, and I certify that the OU-2 Groundwater Treatment System SCADA Upgrades were completed and that construction activities were implemented in substantial conformance with the Department-approved OU2 SCADA System Upgrade 100% Design Report.

I certify that documents generated in support of this report have been submitted in accordance with the DER's electronic submission protocols and have been accepted by the Department.

I certify that data generated in support of this report have been submitted in accordance with the Department's electronic data deliverable and have been accepted by the Department.

I certify that information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Peter Rich, of Tetra Tech at 51 Franklin Street, Suite 400, Annapolis, MD 21401, am certifying as Owner's Designated Site Representative for the site.

Section 1
Introduction

1.1 PURPOSE

The purpose of this Construction Completion Report is to document the Supervisory Control and Data Acquisition (SCADA) upgrades performed at the Operable Unit-2 (OU-2) Groundwater Treatment System (GWTS) located at 60 Tanners Road in Lake Success, New York (the "Site"). The OU-2 GWTS extracts and treats groundwater associated with a plume of volatile organic compounds (VOCs) migrating from Lockheed Martin's former Unisys Site located at 1111 Marcus Avenue in Lake Success, New York (New York State Department of Environmental Conservation [NYSDEC] Site ID# 130045). The OU-2 GWTS is located off-site to the north of the former Unisys Site between the Northern State Parkway and the Long Island Expressway. This report includes project and site background information, a summary of the OU-2 GWTS upgrades design, a description of the pre-construction and construction activities completed, and deviations from the design. An electronic copy of this Construction Completion Report with supporting documentation is included.

1.2 BACKGROUND

In accordance with the Order on Consent and Administrative Settlement (Index # CO 1-20160426-40) between the NYSDEC and Lockheed Martin Corporation (Lockheed Martin) effective September 15, 2016, the Amendment to the Operable Unit-1 (OU-1) Record of Decision (OU-1 AROD; NYSDEC, 2015), and the OU-2 Record of Decision (OU-2 ROD; NYSDEC, 2014), Lockheed Martin augmented the existing on-site OU-1 GWTS to improve groundwater capture from the basal (lower) Magothy aquifer, increase OU-1 groundwater extraction to a nominal 850 gallons per minute (gpm) from 730 gpm, and treat the increased flow of extracted groundwater at the OU-1 GWTS. The recovery well RW-3 installation and OU-1 GWTS and SCADA upgrades were completed and the upgraded OU-1 GWTS was started up on

March 23, 2018; the OU-1 Construction Completion Report documents the OU-1 Upgrades (Tetra Tech and AECOM, 2018).

Lockheed Martin elected to initiate OU-2 GWTS SCADA system improvements following the OU-1 upgrades to integrate the OU-1 GWTS, OU-2 GWTS, and sub-slab depressurization system (SSDS) SCADA systems. Tetra Tech, Inc. (Tetra Tech) prepared the OU2 SCADA System Upgrade 100% Design Report including the SCADA system and communication upgrades required to integrate the three SCADA systems (Tetra Tech, 2016). AECOM Technical Services Inc. (AECOM) served as the Primary Contractor for the construction of the OU-2 GWTS SCADA upgrades and Tetra Tech served as the Engineer of Record for the construction. The OU-2 GWTS SCADA upgrades allow for more reliable control and monitoring of the OU-2 GWTS. Additionally, the upgrade established internet communications between the OU-1 GWTS, OU-2 GWTS, and the SSDS. With the OU-2 GWTS upgrades, operating data is recorded and archived on a server located at the SSDS. This Construction Completion Report documents the activities that were conducted at the OU-2 GWTS plant.

1.3 SITE HISTORY AND DESCRIPTION

The former Unisys Site is located in the County of Nassau, New York and is identified as Block B18 and Lot 300H on the Lake Success Tax Map #008-B18.0000-300-00H. The former Unisys Site is situated on an approximately 90.5-acre area bounded by Marcus Avenue to the north, Union Turnpike to the south, the Triad Business Park to the east, and Lakeville Road to the west (see Figure 1).

The former Unisys Corporation Facility site was an active manufacturing facility from its startup in 1941 until approximately 1995, when most manufacturing activities ceased. Some limited assembly, integration, prototype development and testing, and/or engineering and administrative activities were still being conducted at the site through early 1999. The former Unisys Facility was originally designed and built by the United States Government and was operated under a contract with the Sperry Gyroscope Company (Sperry) from 1941 to 1951. In 1951, the property was sold to Sperry, which merged with Burroughs in 1986 to form the Unisys Corporation. In 1995, Loral Corporation (Loral) acquired assets of Unisys Defense Systems, a division of Unisys Corporation. In early 1996, Lockheed Martin purchased Loral's electronics and systems integration businesses. The property was sold by Lockheed Martin in early 2000 for commercial

development. Presently, the former Unisys Facility houses multiple tenants that use the leased space for office areas, a small cafeteria, an outpatient hospital, distribution centers, maintenance spaces, and a fitness center.

The former Unisys Facility located at 1111 Marcus Avenue, Lake Success, New York (Nassau County) is located within the Town of North Hempstead. A portion of the facility, including the portion where the existing OU-1 recovery wells are located, is located in the Village of Lake Success, an incorporated village within the Town of North Hempstead. The former Unisys Site is classified as a Class 2 site on the Registry of Inactive Hazardous Waste Disposal Sites in New York State (Site No. 130045) due to the presence of VOCs in soil and groundwater. The former Unisys Site is currently owned by 1111 Marcus Ave Unit 2 Owner, LLC (Northwell Health) and WRD Marcus Avenue A, LLC (Waterstone). In order to facilitate remediation of the site and surrounding area, the NYSDEC divided remedial activities into two operable units: OU-1 (on-site) and OU-2 (off-site). The OU-1 AROD (January 2015) and the OU-2 ROD (December 2014) describe the site and regulatory history and the currently-operating remediation systems in further detail. The OU-2 GWTS is located on Manhasset-Lakeville Water District property, under lease to Lockheed Martin for groundwater recovery and treatment. The OU-2 GWTS recovery well (RW-100) is located on Great Neck Union Free School District property.

1.4 OU-2 GWTS DESCRIPTION

The OU-2 site plan in Appendix A shows the layout of the OU-2 GWTS. The OU-2 GWTS currently consists of one recovery well (RW-100), pumping at approximately 500 gpm. The extracted groundwater is treated via two randomly packed vertical air strippers in series to remove dissolved VOCs from the extracted groundwater. Following stripping, the extracted groundwater is filtered through one filter housing that contains eight 25-micron filter bags (with a standby unit available) prior to discharge back into the aquifer. The treated groundwater is pumped for injection back to the aquifer system through a combination of three diffusion wells identified as: DW-100, DW-101, and DW-102.

The air stripper off-gas is transferred using one push-pull centrifugal blower through a natural gas fired heat exchanger to reduce humidity and then through three 28,000-pound (lb) vapor phase granular activated carbon (VPGAC)-filled emission control units (ECUs), which are arranged in series. The VPGAC-treated air then passes through the two 33,000-lb potassium

permanganate-impregnated zeolite-filled ECUs, which are also arranged in series, to remove vinyl chloride. The Non-Detect Performance Standard in the Great Neck Union Free School District Access Agreement (Lockheed Martin, 2003) requires that the concentrations of site-related compounds in the air stripper off-gas air stream be reduced to below their respective NYSDEC acceptable laboratory detection limits.

Section 2
Summary of OU-2 GWTS Upgrades Design

2.1 REMEDIAL ACTION AND DESIGN OBJECTIVES

2.1.1 Remedial Action Objectives

In accordance with the OU-2 ROD, the following Remedial Action Objectives (RAOs) related to groundwater were identified for this site.

- RAOs for Public Health Protection
    - Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.
    - Prevent contact with, or inhalation of volatiles, from contaminated groundwater.
- RAOs for Environmental Protection
    - Restore ground water aquifer to pre-disposal/pre-release conditions, to the extent practicable.
    - Prevent the discharge of contaminants to surface water.
    - Remove the source of ground or surface water contamination.

2.1.2 Design Objectives

The design objectives of the OU-2 GWTS SCADA upgrades are to:

- Enhance the existing OU-2 GWTS SCADA such that the OU-1 GWTS, OU-2 GWTS, and SSDS can be operated as a single integrated SCADA system with functionality for all three systems at user interface systems located in any of the three locations.
- Modernize and standardize the SCADA systems between the SSDS, OU-1 GWTS, and OU-2 GWTS.

2.2 DESCRIPTION OF THE OU-2 GWTS UPGRADES DESIGN

Construction works were completed in accordance with the OU2 SCADA System Upgrade 100% Design Report; deviations from the design are noted in Section 4.7. The key components of the design include SCADA system upgrades and testing, and are discussed in Section 4.

2.3 PERMITS AND APPROVALS

No permits were required for this work since no mechanical or intrusive work was performed. NYSDEC approved the shutdown of the OU-2 GWTS for the SCADA upgrades during a conference call with Lockheed Martin on April 19, 2018.

Section 3

Interim Remedial Measures and Remedial Contracts

The OU-2 GWTS SCADA upgrades were performed as a single project, and no interim remedial measures or separate construction contracts were performed.

Section 4
Description of Construction Actions Performed

Construction activities completed at the Site were conducted in accordance with the OU2 SCADA System Upgrade 100% Design Report for the Former Unisys Facility (Tetra Tech, 2016). Deviations from the design are noted.

4.1 PROJECT ORGANIZATION

Presented below are the key companies involved in the OU-2 GWTS SCADA upgrades:

Principal Responsible Party

Lockheed Martin: Former property owner responsible for environmental remediation of the site.

Remediation Technical Operations (RTO)

CDM Smith: Served as Lockheed Martin's Technical Oversight Contractor for overall site remediation.

OU-2 GWTS Property Owner

Manhasset-Lakeville Water District, known as their Parkville Station.

Recovery Well RW-100 Property Owner

Great Neck Union Free School District

Primary Contractor

AECOM: Served as the primary contractor responsible for project construction.

Engineer of Record

Tetra Tech: Peter Rich, P.E.

General Subcontractor

Ground/Water Treatment & Technology, LLC (GWTT)

Electrical Subcontractor

LEB Electric, Ltd. (LEB)

Instrumentation and Controls Hardware Subcontractor

Horlick Company, Inc. (Horlick)

System Integration Subcontractor

Satuit Automation Group

4.2 GOVERNING DOCUMENTS

4.2.1 Construction Quality Control Plan

AECOM prepared a Construction Quality Control (CQC) Plan as a section in the AECOM Comprehensive Work Plan prepared for internal use for the purposes of project logistics, quality, and coordination (AECOM, 2017a). The CQC Plan managed performance of the OU-2 GWTS SCADA upgrades task through designed and documented Quality Assurance/Quality Control (QA/QC) methodologies applied in the field. The CQC Plan provided a detailed description of the observation and testing activities that were used to monitor construction quality and confirm that construction was in conformance with the design objectives and specifications. Field activities were recorded on the field reports provided in Appendix B.

4.2.2 Site Specific Health & Safety Plan and Emergency Response Plan

AECOM prepared the RW-3 Installation, OU-1 GWTS Upgrades, and OU-1 and OU-2 GWTS SCADA System Upgrades Health and Safety Plan (HASP) in March 2017 (AECOM, 2017b). After revisions in response to NYSDEC comments, Revision 3 of the HASP was approved by NYSDEC on March 24, 2017. The HASP includes an Emergency Response Plan including emergency contact information, emergency procedures, and incident reporting procedures.

Construction work performed for the OU-2 GWTS SCADA upgrades was in compliance with the HASP, which includes governmental requirements, including Site and worker safety requirements mandated by Federal Occupational Safety and Health Administration (OSHA).

4.2.3 Waste Management Plan

AECOM prepared a Waste Management Plan including waste handling procedures for the OU-2 GWTS SCADA upgrades construction, as a section of the AECOM Comprehensive Work Plan

prepared for internal use for the purposes of project logistics, quality, and coordination (AECOM, 2017a). The old OU-2 Main Control Panel (MCP) was disposed of as construction and demolition waste. Construction and demolition waste was the only waste generated during the OU-2 GWTS SCADA upgrades.

4.2.4 Community Air Monitoring Plan

No ground-disturbing activities were conducted as a part of the OU-2 GWTS SCADA upgrades; therefore, a Community Air Monitoring Plan was not required.

4.2.5 Storm-Water Pollution Prevention Plan

No ground-disturbing activities were conducted as a part of the OU-2 GWTS SCADA upgrades; therefore, a Soil Erosion and Sediment Control Plan was not required.

4.3 CONSTRUCTION PROGRAM ELEMENTS

4.3.1 Submission of Governing Documents and Submittals

Peter Rich of Tetra Tech as the Engineer of Record reviewed submittals for this project and confirmed that they were in compliance with the design except as noted in Section 4.7. A copy of the submittal log for OU-2 is included in Appendix C.

4.3.2 Contractors and Consultants

AECOM served as the primary contractor for the OU-2 GWTS SCADA upgrades construction and was responsible for the overall success of the project implementation. AECOM was responsible for project management and oversight, preparation of work plans and final reports, and contracting and coordination of subcontractors. The general subcontractor for the project was GWTT. Second-tier subcontractors are included in Section 4.1, Project Organization. Peter Rich of Tetra Tech served as the Engineer of Record for the project and was responsible for preparing the design documents and reviewing and approving submittals and requests for information. CDM Smith served as the RTO contractor for the project and was responsible for providing technical oversight including reviewing deliverables and inspecting and accepting work or deliverables in conjunction with Lockheed Martin.

4.3.3 Site Preparation and Mobilization

A pre-construction meeting was held with AECOM, Lockheed Martin, the RTO, Tetra Tech, and GWTT on January 17, 2017 and an operational readiness review meeting was held with AECOM, the RTO, Tetra Tech, and GWTT on March 8, 2017 prior to field mobilization for the OU-2 GWTS upgrades portion of the project. Field personnel completed a site orientation including review of the AECOM site-specific HASP or site-specific Contractor's HASPs before or upon mobilizing to the site.

The OU-2 GWTS MCP was fabricated at Horlick Company's factory in Randolph, Massachusetts, and after witness-testing and approval, the MCP was shipped to the site in November 2017. GWTT, the Electrical Subcontractor, LEB, and the System Integration Subcontractor, Satuit, mobilized to the site for the OU-2 GWTS electrical, instrumentation, and controls work prior to the startup of the OU-1 GWTS. Site preparation work included tagging wires on the new and existing MCP and cross-referencing wires to the as-built drawings for the OU-2 GWTS prior to OU-2 shut down, to prepare for installation of the MCP.

4.3.4 General Site Controls

AECOM's field services oversight person managed site controls including field documentation, coordination, and waste management. AECOM prepared field reports and documented tailgate health and safety meetings on a daily basis. Tetra Tech informed the Great Neck Union Free School District of OU-2 activities through routine weekly email communications. Construction and demolition wastes generated during construction were managed in accordance with the Waste Management Plan.

4.3.5 Nuisance Controls

Nuisance controls were not required for the OU-2 GWTS SCADA upgrades work. A majority of the work was completed inside the OU-2 GWTS building, and disturbances to the outside of the building and neighbors were minimal, including increased traffic through the adjacent neighborhood.

4.3.6 Reporting

The CQC Plan required the preparation and submittal of daily reports (AECOM, 2017a). Each daily report contains a summary of weather, equipment, work performed, and other pertinent

information. The daily reports were prepared by the AECOM field services oversight person. Daily field reports are included in electronic format in Appendix B.

4.4 OU-2 GWTS UPGRADES CONSTRUCTION COMPONENTS

4.4.1 OU-2 GWTS SCADA Upgrades

LEB completed the electrical portion of the OU-2 GWTS SCADA upgrades and Horlick Company and their subcontractor, Satuit Automation Group, completed the instrumentation and controls portion of the OU-2 GWTS SCADA upgrades. The OU-2 GWTS SCADA upgrades included replacing the OU-2 GWTS MCP and the RW-100 Programmable Logic Controller (PLC), installing a new operator workstation with upgraded software, installing a new uninterruptible power supply (UPS) rack, and upgrading the communications between the OU-2 GWTS, and the OU-1 GWTS and SSDS SCADA systems. The following specific activities were conducted:

1. The OU-2 GWTS primary (A-B SLC5/03) PLC processor and Input/Out (I/O) modules were replaced with Allen Bradley ControlLogix™ processor and I/O modules;
2. The secondary (MicroLogix 1200) PLC was replaced with ControlLogix™ processor and communication cards;
3. The Remote I/O convertors were replaced with Ethernet to fiber convertors at the master control panel and the RW-100 vault;
4. The PLC at the RW-100 vault was replaced with an Allen Bradley CompactLogix™ PLC;
5. The existing HMI software was replaced with FactoryTalk SE with a Workstation license, and updated graphics;
6. A new firewall and internet connection was installed to communicate with OU-1 and the SSDS;
7. A new operator workstation was provided for OU-2 GWTS monitoring and control; and
8. A new UPS rack was provided in the OU-2 GWTS control room.

Horlick fabricated the OU-2 GWTS MCP at their factory and a Factory Acceptance Test (FAT) was conducted on the OU-2 GWTS panels on August 17, 2017 prior to shipment to the site. Representatives from Tetra Tech and the RTO contractor witnessed the FAT and provided comments to Horlick. After Horlick incorporated changes and the panels were accepted by the Engineer of Record, they were delivered to the site on November 20, 2017.

Upon NYSDEC approval, the OU-2 GWTS was shut down on April 30, 2018 for the OU-2 GWTS SCADA upgrades. LEB removed the existing OU-2 GWTS MCP and installed the new MCP. Satuit Automation Group completed the new SCADA system software setup, programming, and integration, including setup of SCADA system cyber-security, PLC programming, setup of alarm interlocks, and calibration of instrumentation and control devices.

The Engineer of Record prepared an OU-2 GWTS Startup and Testing Plan in May 2018 (Tetra Tech, 2018a), and submitted a copy of the plan to NYSDEC prior to beginning startup testing. In accordance with the startup plan, once the new electrical, instrumentation, and controls equipment was installed and programmed, the Satuit Automation Group worked with the OU-2 GWTS operators to complete unwitnessed testing of the new SCADA system. Unwitnessed testing included all critical, primary, and advisory alarms, control and monitoring equipment associated with the OU-2 extraction well and treatment system, and performance testing of components and the full OU-2 GWTS. Following unwitnessed testing, the Engineer of Record was on site for witnessed testing in accordance with the startup plan, and worked with Satuit Automation Group to resolve outstanding issues.

Once all components critical to system startup were functioning as designed (Appendix D), the system was run fully manned for 72-hours. The test began Tuesday, June 12, 2018 and was completed Friday, June 15, 2018. NYSDEC was notified of the start and the successful completion of the 72-hour test. As described in Section 4.4.3, there were several detections in the initial discharge vapor sample collected as part of the system performance sampling; additional samples were collected to verify results and there were no detections in the follow-up samples. No operational issues were observed during the 72-hour test; therefore, the OU-2 GWTS remained in continuous operation since the completion of the 72-hour test on Friday, June 15, 2018.

4.4.2 SCADA Testing

As discussed in Section 4.4.1, a FAT was completed on the new OU-2 GWTS instrumentation and control panels constructed by the Horlick Company prior to shipment to the site. Results of the FAT test are included in Appendix D. Startup testing documentation is included in Appendix D, including a summary of the OU-2 GWTS alarm testing and resolutions.

4.4.3 System Performance Sampling

Tetra Tech, as the system operator and engineer of record, completed system performance sampling in accordance with the OU-2 GWTS Startup and Testing Plan. Water samples were collected from the OU-2 GWTS influent (WSP-1), air stripper 1 effluent (WSP-2), and final OU-2 GWTS effluent (WSP-3). Vapor samples were collected from the carbon bed influent (VSP-1), treated vapor effluent (VSP-8), carbon bed 1 effluent (VSP-2), and carbon bed 3 effluent (VSP-4).

System performance samples were analyzed by TestAmerica Laboratories, Inc. of Burlington, Vermont. Tetra Tech collected the initial system performance samples within 24-hours of system startup. There were several volatile organic compound detections in the system effluent vapor sample, VSP-8. In response, Tetra Tech conducted a second round of sampling on June 21, 2018 to verify results. There were no detections in the system effluent vapor sample in the second round of sampling, indicating that the system was operating as designed. System performance sample laboratory results were presented to NYSDEC and included in the Q3 2018 OU-2 OMM Report (Tetra Tech, 2018b).

4.4.4 Documentation

At the completion of the field work, AECOM submitted documentation including red line drawings, panel specifications, and testing results to Lockheed Martin, the RTO, and the Engineer of Record. In addition, spare parts were provided for the OU-2 GWTS spare part inventory in accordance with the specifications. A copy of the submittal log for OU-2 is included in Appendix C.

4.5 WASTE MANAGEMENT

The old MCP and equipment removed as part of the OU-2 GWTS SCADA upgrades were disposed of as construction and demolition waste. No other wastes were produced during the OU-2 GWTS SCADA upgrades.

4.6 OTHER ENGINEERING CONTROLS

The remedy for the site did not require the construction of any other engineering control systems.

4.7 DEVIATIONS FROM THE DESIGN

Record drawings are included in Appendix E. Deviations from the design are shown on the as-built drawings and are summarized below:

- Voltage drop issue: During unwitnessed testing, a voltage drop was observed along the level switch LSHH-111 circuit, between the secondary system shut down inside the well vault and the MCP in the OU-2 GWTS control room. LEB Electric traced the wires and confirmed that they were continuous runs, and completed megger testing and confirmed that the wiring was in good condition, eliminating these as potential causes for the voltage drop. After additional investigation, it was noted that the existing #10 wires were insufficient for the 120 volts, alternating current (VAC) circuit, and that this could be remedied by converting the circuit to a 24 volts, direct current (VDC) circuit. Therefore, the 120 VAC rated relay at the well vault was replaced with a low voltage, 24VDC relay to convert the circuit.
- Temperature/Humidity Sensor Replacement: During unwitnessed testing, it was identified that the existing Dwyer temperature/humidity sensors for the carbon vessel feed stream were not compatible with the new Allen Bradley PLC input requirement. The new Allen Bradley PLC is set up for singular inputs only. To resolve this issue, an isolator was installed to separate the temperature and humidity sensors from the PLC as they are used for monitoring only.
- Communications: When attempting to setup radio communication per the design, it was observed that heavy traffic over the radio between the OU-1 GWTS, OU-2 GWTS, and the SSDS was interfering with the communication between the systems. To minimize traffic between the three workstations, the OU-2 GWTS operator workstation was licensed and reconfigured to be a standalone FactoryTalk SCADA workstation. This change allows the OU-2 GWTS SCADA to act as a standalone server, storing minimum data and reports and providing the functionality of a server. In addition, the OU-1 GWTS, SSDS, and OU-2 GWTS SCADA systems were reconfigured to communicate through a virtual private network (VPN) connection. The three systems were secured with a Sonicwall TZ400 Wireless Security Appliance Software. These changes allow the three stations to communicate so that the three systems can be monitored from any of the three workstations, and data from the three systems is stored on the SSDS server.

- Cooling Fan Thermostat and Wiring: A Pentair temperature control switch was installed to control operation of the cooling fan in the OU-2 MCP. When the temperature in the MCP exceeds the thermostat set point, the fan switches on to regulate the temperature.

Work Performed:	Weather	Cloudy/light rain
The OU-2 system was tested for alarm conditions. At the	Temp °F	62
recovery well RW-100 the float switches (high/high-high) were	Tailgate Meeting	
tested while the system panel switches were set to manual.	Topics	Electrical Lockout
Lifting the high switch shutdown the RW-100 pump, but		
lifting the high-high switch did not shutdown the system.		
Todd Farmer will work to fix this issue. The 24 volt relay was		
installed for the high-high switch but a dc TVSS will need to be		
installed. The temperature/relativity sensor for the vapor		
lines required using a analog input card that was a spare		
from OU-1. The card was installed and the readings are being		
displayed on the HMI. One of the temperature sensors is		
faulty and will need to be replaced.

Client	Lockheed Martin	Job Name	& OU-1/2 Upgrades	Job Number	60532812
Location	Great Neck, NY			Attachments?	

Work Performed:	Weather	Sunny
Todd Farmer is onsite and working on uploading screens to the	Temp °F	75
Operator Interface Terminal (OIT).	Tailgate Meeting	
Todd has tested the radio modems for the wireless connection.	Topics	Electrical Lockout
Todd has been able to ping the units when then are close.		

He has accessed the 16S Fan Room at the main building to	Work Force	ST	OT
install the configured modem. He has been testing the modems	Sub POC:		
from three locations (SSDS, OU-1 and OU-2). The OU-1 location	Other:		
has the master radio modem and slave modems are at SSDS	Horlick		
and OU-2. The connections from the master to the slave units			
seem to communicate, but there is an issue when trying to			
connect from a slave to another slave unit.			
Ping connection from OU-2 to OU-1 was only 25% of the time.			
The signal was RSSI -73 dbm.			
Ping connection from SSDS to OU-1 was only 100% of the time.			
Signal was RSSI -46 dBm.			
Ping connection from OU2 to SSDS was 0%.			
The master was then set at the SSDS location and slave modems			
were set at OU-1 and OU-2. OU-1 to SSDS had a 100% ping			
success rate. OU-2 to SSDS had a 25% to 75% rate.			
OU-1 to OU-2 had a 0% ping rate.			
Todd needs to speak with Phoenix Contact to see if the			
signals can be improved with the existing hardware.

No.	Reference	Comment/Action
1	Complete submittal	Engineer's Note: These comments are in reference to Contractors Submittal SD-13450-I-02-A, the Witness Factory Test (WFT) was conducted on OU-2 system control panels at Horlick Company, Inc. 91 Pacella Park Drive Randolph MA 02368 Phone 781-963-0090 Fax 781-986-1540 Test Date – 08/17/2017 (8-5pm) & 08/18/2017 (8-5pm) If above location/schedule changes, please inform the Engineer immediately.
2	Complete submittal	*The results of the WTF has been determined as approved as per the comments noted below. The Control System's Integrator (Satuitag's) has been informed to address the comments noted below and per the markups on the attached drawings and submit to Engineer for approval. This submittal shall include updated drawings to indicate corrective actions performed (clouded).* *<u>Upon approval of the WFT submittal the panels can be shipped to the site.</u>*
3	Compete submittal	Contractor to note that an OU-2 corrective action has been implemented. Attached report details the actions performed. Contractor to perform changes to proposed OU-2 MCP 200 and RW-100 panels before shipping the panel to the site.

4	Submittal Pg.7 of 91, pdf	Confirm that all previous submittal comments (listed below are few) are addressed. 1. SD-13450-D-01-B 2. SD-13700-I-01-A
5	Submittal Pg.7 of 91, pdf	PLC Programming FAT shall include review and testing of Control Strategies (where applicable) per specification section 13600. Include as part of this submittal, a control strategy test form for each strategy for Contractors check list and Engineer's sign off at the Witnessed Site Acceptance Testing.
7	Complete Submittal	As noted in specification section 13600 and requested here, Contractor to provide all resources, document and equipment for a successful site acceptance testing so as to mitigate re-testing (at no additional cost to Engineer) and schedule extension requests.
8	Plant Startup and Shutdown Control Native Hand written notes Daft FAT 8/18/17	Plant ready = Output Signal from OU-2 PLC to RW-100 PLC • No faults • Plant in Auto Program Plant ready button. Indicate status as Green, Red (not ready), Yellow -alarms If the operators hits the "Plant Ready" button the system shall automatically and sequence equipment starts per the control narrative. Pop up for confirmation if the following: "Confirm if all the values are in there respective positions to run the plant" Ability to hit "confirm" then start the plant checklist for all running Signals/Status Follow the sequence as detailed in CS-5
12	Control Native Hand written meeting notes Daft FAT 8/18/17	Tags /labels on network cables
13	Control Native Hand written meeting notes Daft FAT 8/18/17	Labels on panel - too small

14	Control Native Hand written meeting notes Daft FAT 8/18/17	Engineer to confirm if all spares need to be wired.
15	Control Native Hand written meeting notes Daft FAT 8/18/17	Panel door shall have drawing holder sleeve.
16	Control Native Hand written meeting notes Daft FAT 8/18/17	RTU- COMM- Shall be shown on screen and network screen.
17	Control Native Hand written meeting notes Daft FAT 8/18/17	All alarming designations shall include instrument tags/designations as per SSDS program.
18	Control Native Hand written meeting notes Daft FAT 8/18/17	Engineer to provide report generation requirements/samples.
19	SOP OU2-03-System Check Prior to Start-Up	No comments
20	Attachment OU2-03-1-Valve Tag Schedule	No comments
21	SOP OU2-01-System Start-Up Page 1 of 4 Paragraph 4	Engineer to check if pressing “Eff Airflow Reset” button” on the panel front is required.
22	SOP OU2-01-System Start-Up Page 2 of 4 Paragraph 6	No comments
23	Attachment SOP OU2-01-1-Typical Operating Parameters	No comments

24	SOP OU2-02-System Shutdown	No comments
26	Code Issues hand written notes CS-01 Daft FAT 8/18/17	Descriptions of physical locations of switches to be added to program.
27	Code Issues hand written notes CS-01 Daft FAT 8/18/17	Add E-Stop to pump and for plant shutdown. Pop up window for Operator Authorization to shut down.
28	Code Issues hand written notes CS-01 Daft FAT 8/18/17	Engineer (process) to check if strainer pressure inlet/outlet height allowance requires pump shut down.
29	Specification Section 13500-1.01-A-6	Feedback Failure alarm needs to be programmed.
30	Specification Section 13500-1.01-A-6	Field Verify Force Override of equipment failures.
31	Specification Section 13500-1.01-A-6	Tracking Failure alarm needs to be programmed.
32	Specification Section 13500-1.01-A-6	Add time delay to “Power Outage” Forced Stop Alarm.
33	Specification Section 13500-1.01-A-6	Alarms to be assigned priority levels.
34	Section 13500 Extraction well Strategy No. 01	Interlock “plant ready” signal
35	Section 13500 Extraction well Strategy No. 01	Item 6 Alarm FIT-131 low flow Alarm to be programmed in.
36	Section 13500 Tower Air Stripper Strategy No. 02	Item 1 Overview – (Typical Comment) Change blowers notes control pop up to match SSDS.

37	Section 13500 Duct Heater Strategy No. 03	Item 2 Monitor Engineer to provide info for: • Duct heater signal running • Fault status on the display • Running status on the display "TSH503 Duct Temperature Switch High" to match existing program.
38	Section 13500 Duct Heater Strategy No. 03	Item 3 Control Program Fault and Interlocks
39	Section 13500 Clear Wells #1 & #2 Strategy No. 04	Item 1 Overview Under Clear well #1 add bullet points: • Fix pump running display on the graphic. • Reprogram control variable display to correct the errors. • Pump control popup to match SSDS.
40	Section 13500 Clear Wells #1 & #2 Strategy No. 04	Item 1 Overview Under Clear well #2 add bullet points: • Fix pump running display on the graphic. • Pump control popup to match SSDS.
41	Section 13500 Clear Wells #1 & #2 Strategy No. 04	Item 3 Overview Show pump running status via the pump graphics.
42	Section 13500 Plant Startup and Shutdown Sequence Strategy No. 05	Needs to be programmed.

The following are comments from Owner's Representative – CDM – Eric Silverman (attendee of WFT) that need to be addressed. Please ignore the duplicates, if any.

OU2 WFT

Thursday, August 17, 2017
9:21 AM
Alex (GWTT), Amal (Tetra Tech), Todd Farmer (Stuitags), Nathan (CDM), John

9am-5:30

Panel Walkthrough and I/O Checkout General Comments

- Need to determine IP addressing scheme
- Network cables to be labeled before shipping
- Disable unused ports on switches
- Need to change port numbers on drawings as they do not match what is wired
- PanelView is new and not programmed yet
- UPS mounting needs to be resolved - Suggest adding receptacle to outside of panel enclosure and need to add dedicated fused terminal blocks for UPS inside enclosure.
- Add labels to rack "on-off" selector switches in panel
- Swap out GFCI receptacles per Amal
- Add low level switch from change order to autodialer which will cause a pump shutdown. Being processed now.
- Only TVSS1 is wired to PLC input card, should also monitor TVSS429 and TVSS554? TVSS429 circuit is failsafe however TVSS554 is unclear. Need to reference RW-100 drawings for both circuits and make sure final direction is clear for final corrective action approved by DEP.
- Need to add all ranges for existing instrumentation into program.
- In general, appears that submittal comments were not addressed
- RTU-2 is not built yet.
- Check software licensing at SSDS - Todd thinks copies of licensing are illegal
- No PanelView, no RTU-02 testing, doors not connected to PLC panel, RW-100 PLC not tested.
- Need to update SOPs to match new logic
- Add cable labels

Graphic Review

- Tie instruments to pipelines with lines
- Add descriptors to any "bubbles" that are on the graphic screen that are not tied to pipelines (i.e., PDIS-301, PDIS-302, and PDIS-303)
- Show actual instrumentation on overview (i.e., ultrasonic and not pressure transducer)
- Change PI to PT, LT to LIT, etc.
- Show box around vault extents
- Need to add animation to pumps and motors
- Need to match SSDS graphics for look and feel of symbols, colors, etc. Todd to re-do graphic pieces like pop-ups, hand switches, colors, etc. Not followed to date.
- Check on controls for Bag Filters. Amal said there was RFI
- Change color of software selector switches to differentiate from field switches.
- Need to add PID "Feedback Failure" alarm.
- Need to field verify "Force Override" functionality
- Need to add "Tracking Failure"

- Need to add UPS status, bypass, fault to PLC for Phoenix and MCP-100 systems
- Alarm priorities not programmed yet
- OU-2 liquid screen - correct spelling to "partially"
- OU-1 Vapor System Overview - Add [illegible]

NOTES:

1. PLEASE SEE DRAWING E3A FOR CONDUIT AND CONDUCTOR SCHEDULE FOR ITEMS DEPICTED ON THIS DRAWING.
2. PLEASE SEE DRAWING E5 FOR RW-100 WELL VAULT DETAIL AND ELECTRICAL LAYOUT.
3. THE NEW ELECTRICAL CONDUIT, CONDUCTORS, CONTROLS AND INSTRUMENTATION ARE DELINEATED IN THIS DIAGRAM AND ARE SHOWN IN A DARK LINE WEIGHT. THE EXISTING ELECTRICAL CONDUIT, CONDUCTORS, CONTROLS AND INSTRUMENTATION ARE DELINEATED IN THIS DIAGRAM AND ARE SHOWN IN A LIGHTER/GRAYED BACK LINE WEIGHT. THE CONTRACTOR SHALL COMPLETE INSTALLATION OF THE NEW ITEMS AND THE REMOVAL AND/OR MODIFICATIONS OF EXISTING MATERIALS AS DELINEATED OR REQUIRED.
4. CONDUIT RUN TROUGH ATTIC
5. BLOWER B-340 DISCONNECT FROM SERVICE
6. OUTPUT CABLES FROM THE FIBER OPTIC PATCH WERE NOT RUN IN CONDUIT TO THE MCP
7. THE INFLUENT VAULT HAS TWO LIGHTS.
8. LOCATION OF RTU-OU-02 TO BE FIELD DETERMINED WITH ENGINEERS APPROVAL.
9. LOCATE NEW OPERATOR WORKSTATION ON THE EXISTING OPERATOR TABLE.

NOTES:

1. CONTRACT DRAWINGS ARE PREPARED BY TETRA TECH USING THE REVISED RECORD DRAWINGS (ISSUED BY ARCADIS, MAY 2012) FOR OPERABLE UNIT - 2 OFF-SITE INTERIM REMEDIAL MEASURE PREPARED BY AMEC IN OCTOBER 2014. CONTRACT SHALL FIELD VERIFY ALL NECESSARY COMPONENTS, SUBMIT SHOP DRAWINGS FOR ENGINEERS APPROVAL BEFORE ANY PURCHASES AND WORK IMPLEMENTATION.
2. THE SYMBOLS SHOWN ON THIS SHEET ARE STANDARD DESIGNATIONS. NOT ALL SYMBOLS ARE APPLICABLE TO THE INCLUDED DIAGRAMS AND INSTRUMENT TAG NUMBERING SYSTEM.
3. NOT ALL PIPING, FITTINGS, AND TANK DETAILS ARE SHOWN. REFER TO PROCESS DRAWINGS FOR ACTUAL DETAILS.
4. FOR INTERLOCKS REFER TO CONTROL DESCRIPTION SPECIFICATION SECTION 13500.

GENERAL INSTRUMENT OR FUNCTION SYMBOLS

DISCRETE INSTRUMENTS	PRIMARY LOCATION NORMALLY ACCESSIBLE TO OPERATOR **	FIELD MOUNTED	AUXILIARY LOCATION NORMALLY ACCESSIBLE TO OPERATOR **
DISCRETE INSTRUMENTS	1 IPI *	2	3
SHARED DISPLAY, SHARED CONTROL	4	5	6
COMPUTER FUNCTION	7	8	9
PROGRAMMABLE LOGIC CONTROL	10	11	12

* ABBREVIATIONS OF THE USER'S CHOICE SUCH AS IPI (INSTRUMENT PANEL # 1), IC2 (INSTRUMENT CONSOLE #2) CC3 (COMPUTER CONSOLE #3), ETC. MAY BE USED WHEN IT IS NECESSARY TO SPECIFY INSTRUMENT OR FUNCTION LOCATION.

** NORMALLY INACCESSIBLE OR BEHIND–THE–PANEL DEVICES OR FUNCTIONS MAY BE DEPICTED BY USING THE SAME SYMBOLS BUT WITH DASHED HORIZONTAL BARS, I.E.

*** THE LETTER A BELOW AN ALARM LIGHT MEANS ADVISORY ONLY.

1. PANEL WIRING DIAGRAMS SHOWN ON DRAWING SHEETS I-203 TO I-214 AND I-300 TO I-305 ARE PROVIDED FOR GENERAL UNDERSTANDING AND FOR REFERENCE PURPOSES ONLY AND SHALL NOT BE USED FOR CONSTRUCTION. CONTRACTOR SHALL FIELD SURVEY, CHECK EXISTING I/O AND PROVIDE SHOP DRAWING SUBMITTALS PER THE SPECIFICATIONS FOR ENGINEERS APPROVAL. CONTRACTOR IS RESPONSIBLE TO PROVIDE A FULLY FUNCTIONAL SYSTEM.

LINE NUMBER DESCRIPTION

0000
WIRING DIAGRAM SHEET NUMBER (1 or 2 digits) — LINE NUMBER (Always 2 digits)

WIRE NUMBER DESCRIPTION

00000
WIRING DIAGRAM SHEET NUMBER (1 or 2 digits) — WIRE NUMBER (Always 1digit); LINE NUMBER (Always 2digits)

INPUT OR OUTPUT WIRE NUMBER CONFIGURATION

XXXX
OUTPUT = O, INPUT = I — I/O NUMBER

LEGEND

NO. SYM. DENOTES EQUIPMENT LOCATED IN THIS PANEL

DENOTES EQUIPMENT LOCATED IN FIELD LOCATIONS

DASHED LINES DENOTE WIRING TO FIELD DEVICES

000 FROM/TO WIRING DIAGRAM
LINE NUMBER (ALWAYS 2 DIGITS)
WIRING DIAGRAM SHEET NUMBER (1 OR 2 DIGITS)

DENOTES TERMINAL BLOCK

DENOTES MAIN +24V DEDICATED PWR. SUP. PART OF PLC SYSTEM

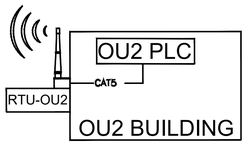
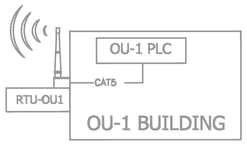
RADIO TELEMETRY ARCHITECTURE





900MHZ RF
(FREQ. HOPING SPREAD SPECTRUM)

NOTES:

1. REFER TO SITE PLAN FOR PANEL LOCATIONS.
2. REFER TO DIV.13 SPECIFICATIONS FOR RTU-OU-2 AND SSDS COMMUNICATION UPGRADES DETAILS.
3. CONTRACTOR TO PROVIDE ALTERNATE PRICING FOR INTERNET SERVICE CONNECTION, FIREWALL, NETWORKING COMPONENTS, AND ASSOCIATED HARDWARE AND INTEGRATION. BEFORE COMMISSION OF OU-2 RADIO COMMUNICATION WITH RTU-3303.
4. FOLLOWING COMMISSIONING OF NEW CONTROLLERS AND HMI OPERATOR STATION UPDATES, COMMUNICATIONS OVER RADIO NETWORK ARE TO BE EVALUATED FOR SYSTEM PERFORMANCE TO DETERMINE IF ALTERNATE COMMUNICATIONS OVER INTERNET ARE REQUIRED.

1 / I-404 ANTENNA DETAIL, WEST VIEW OF OU-2 BUILDING
NTS

NOTES:
1. FIELD LOCATE ANTENNA SUPPORT STRUCTURE BY ESTABLISHING RADIO PATH CONNECTIVITY AS DESCRIBED IN THE SPECIFICATIONS. THE CONTRACTOR IS RESPONSIBLE TO FINALIZE DETAILS FOR ANTENNA INSTALLATION AT THE SITE BASED ON FIELD OBSERVATIONS AND PATH CONNECTIVITY MEASUREMENTS.

2. PROVIDE GROUND IMPULSE SUPPRESSER ON ANTENNA CABLE ADJACENT TO EACH RADIO FURNISHED. GROUND METALLIC ANTENNA SUPPORT STRUCTURES AND GROUND IMPULSE SUPPRESSERS TO NEW GROUND RODS. USE #4 GROUND WIRE TO EACH GROUND ROD LOCATION.

3. REFER TO E-101 CABLE AND CONDUIT SCHEDULE FOR ANTENNA CABLE.

4. SUPPORT EXPOSED ANTENNA RUNS EVERY 10' IN ACCORDANCE WITH THE RECOMMENDATIONS OF THE ANTENNA CABLE MANUFACTURER.

5. CONTRACTOR TO SET THE ANTENNA HEIGHT APPROPRIATELY TO ACHIEVE A FUNCTIONAL COMMUNICATION SIGNAL BETWEEN OU2 AND SSDS. RADIO SURVEY TEST RESULTS INDICATE A 20FT OT ANTENNA MOUNTED ON THE ROOF TOP OF OU-2 BUILDING MAY BE ANTICIPATED. EXACT LOCATION OF ANTENNA SHALL BE DETERMINED AND INSTALLED WITH APPROVAL OF OWNER/ENGINEER.

NOTES:
1. CONTRACTOR TO SET THE ANTENNA HEIGHT APPROPRIATELY TO ACHIEVE A FUNCTIONAL COMMUNICATION SIGNAL BETWEEN OU2 AND SSDS. FOUND ON RADIO SURVEY TEST RESULTS A 20FT OT ANTENNA MOUNTED ON THE ROOF TOP OF OU-2 BUILDING IS ANTICIPATED. EXACT LOCATION OF ANTENNA SHALL BE DETERMINED AND REINSTALLED WITH APPROVAL OF OWNER/ENGINEER.
