Mr. Payson Long

Re: Franklin Cleaners Site (Site No. 1-30-050)

D&B Work Assignment No. D004446-01

Quarterly Report No. 20 (June 1, 2009 through August 31, 2009)

November 23, 2009

D&B No. 2531

Dear Mr. Long:

The purpose of this letter is to summarize the performance monitoring activities completed by Dvirka and Bartilucci Consulting Engineers (D&B) associated with the groundwater extraction and treatment system at the Franklin Cleaners Site. This report addresses the period from June 1, 2009 through August 31, 2009. A site location map is presented as Figure 1 in Attachment A.

Presented below is a summary of system operations during the quarter, as well as the results of analytical testing completed in accordance with the approved work plan for the referenced work assignment.

#### **Groundwater Extraction and Treatment System Operation**

During this period, extraction well EW-1 operated at an average pumping rate of 37.6 gallons per minute (gpm) and extraction well EW-2 operated at an average pumping rate of 4.9 gpm. Approximately 0.81 pounds of tetracholoethene (PCE) were removed from the extracted groundwater by the low profile air stripper during this reporting period and approximately 37.7 pounds of PCE have been removed since start-up of the system in September 2003. The average PCE removal efficiency for this quarter was greater than 99 percent.

Based on measurements recorded at the treatment system discharge flow meter, approximately 6,489,531 gallons of treated groundwater have been discharged to the Nassau County Department of Public Works (NCDPW) storm sewer system. Note that this volume is inconsistent with the influent flow meters for EW-1 and EW-2 which recorded approximately 5,329,722 gallons of groundwater entering the

**CONSULTING ENGINEERS** 

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
November 23, 2009

Page 2

treatment system. This inconsistency is possibly due to fouling of the influent flow meter paddle wheels. However, as noted in the last quarterly report, cleaning of the influent flow meter paddle wheels was not effective at reducing this inconsistency. As detailed in the recommendations of this and the previous quarterly report, further diagnosis of these inconsistencies by a NYSDEC-issued call-out contractor is warranted.

During this reporting period, the groundwater extraction and treatment system was inoperative for a total of approximately 125 hours due to system alarm conditions and routine system maintenance. Of the 125 hours, approximately 120 hours of "downtime" was due to a high-high wet well condition in the treatment system building, approximately 2 hours of "downtime" was due to routine pressure blower maintenance, and approximately 3 hours of "downtime" was due to a non-routine maintenance event in which the malfunctioning system autodialer was replaced with a new unit. In response to the downtime associated with high-high wet well conditions and as per our previous recommendations, D&B lowered the level of the high level (wet well pump on) float approximately 4 inches on June 24, 2009. Note that the float was lowered in an attempt to activate the wet well pumps sooner than the previous setting would allow, therefore, possibly alleviating conditions contributing to the frequent high-high wet well alarms. Based on review of the frequency of this alarm condition subsequent to the float repositioning, the frequency of the high-high wet well condition following the float repositioning is less, as compared to previous months. D&B will continue to monitor the occurrence of high-high wet well alarms in the Quarter 21 report.

A summary of system downtime is presented in Attachment B. Copies of routine system maintenance reports, as prepared by Systematic Technologies, Inc., are presented in Attachment C.

#### **Groundwater Extraction and Treatment System Sampling**

Groundwater samples were collected from the EW-1 and EW-2 well influent piping sample taps, as well as from the air stripper (liquid) discharge sample tap, at a frequency of twice per month during each of the 3 months comprising this reporting period. Each sample was analyzed for volatile organic compounds (VOCs) utilizing United States Environmental Protection Agency (USEPA) Method OLMO4.2. The samples collected from the air stripper discharge sample tap were additionally analyzed for iron and manganese utilizing USEPA Method 200.7 and for pH utilizing USEPA Method 150.1.

The analytical results of samples collected from the system influent are compared to the New York State Department of Environmental Conservation (NYSDEC) Class GA Groundwater Standards and Guidance Values, and the analytical results of samples collected from the air stripper discharge are compared to the site-specific NYSDEC State Pollutant Discharge Elimination System (SPDES) permit equivalency effluent limitations. Analytical results are presented in Attachment D. Based on the analytical results, extraction well EW-1 exhibited concentrations of PCE above its NYSDEC Class GA Standard of 5.0 micrograms per liter (ug/l) in groundwater ranging from 8.0 ug/l detected on July 1, 2009, to a maximum of 15.0 ug/l detected on June 3, 2009. Extraction well EW-2 exhibited concentrations of PCE above its NYSDEC Class GA Standard of 5.0 ug/l ranging from

CONSULTING ENGINEERS

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
November 23, 2009

Page 3

47.0 ug/l detected on July 15, 2009, to a maximum of 61.0 ug/l detected on July 28, 2008. The discharge sample results for the period exhibited VOCs, metals and pH concentrations below the effluent limitations, with the exception of the pH results collected on June 18 (6.4), July 1 (6.1) and July 15, 2009 (6.3), which were slightly less than the effluent limit range of 6.5 to 8.5.

A summary of the extraction and treatment system performance results since the system was put into operation is provided in Attachment E.

In addition, vapor phase samples were collected from the two carbon adsorption unit influent and effluent sample taps at a general frequency of once per week. Each sample was collected by filling a Tedlar bag directly from each of the influent and effluent sample taps located on the two carbon adsorption units. The samples were screened using a calibrated, hand-held photoionization detector (PID). During the reporting period, PID readings collected from both carbon vessels were 0.0 parts per million (ppm) for both the influent and effluent vapor samples at each carbon adsorption unit. Note that the PID readings collected from carbon vessel outlets Nos. 1 and 2 were both below the NYSDEC site-specific effluent limit of 1.0 ppm for total VOCs.

#### **Groundwater Quality Data**

The network of downgradient groundwater monitoring wells was sampled to evaluate the effectiveness of the groundwater extraction and treatment system. Samples were collected from groundwater monitoring wells ASMW-1 through ASMW-7 on August 13, 2009. Samples were analyzed for VOCs utilizing USEPA Method OLMO4.2. The locations of the monitoring wells are depicted on Figure 2 provided in Attachment A.

The results of the analyses of the groundwater samples collected from the monitoring wells are provided in Attachment D and summarized on Figure 2 provided in Attachment A. The results are compared to the NYSDEC Class GA Groundwater Standards and Guidance Values. PCE, at a concentration of 10.0 ug/l, was detected at a concentration exceeding its Class GA Standard of 5.0 ug/l in groundwater monitoring well ASMW-1. The concentration of PCE detected in groundwater monitoring well ASMW-1 (10.0 ug/l) and ASMW-2 (4.2 ug/l) decreased from 11.0 ug/l and 10.0 ug/l, respectively, as compared to the previous quarter (May 18, 2009). PCE concentrations have continued to maintain a decreasing trend since 2003. In addition, 1,1,1-Trichloroethane, at a concentration of 2.3 ug/l, was also detected in groundwater monitoring well ASMW-1. Note that VOCs were not detected in the groundwater samples collected from groundwater monitoring wells ASMW-3, ASMW-4, ASMW-5, ASMW-6 and ASMW-7 during this period. Please refer to the trend line graphs provided in Attachment F, which summarize PCE concentrations detected in samples collected from ASMW-1, ASMW-2 and ASMW-3 since June 2003.

Groundwater sampling for Quarter 21 is scheduled for November 2009.

Page 4

#### **Data Validation**

The biweekly system samples and groundwater samples have been analyzed for VOCs by Mitkem Corporation (Mitkem). The effluent sample (AS-1) was additionally analyzed for iron, manganese and pH. Mitkem is a New York State Department of Health Environmental Laboratory Approval Program-certified laboratory. The data packages submitted by Mitkem have been reviewed for completeness and compliance with the NYSDEC Analytical Services Protocol (ASP) Quality Assurance/Quality Control (QA/QC) requirements. All sample results have been deemed valid and usable for environmental assessment purposes as qualified below:

- All samples were analyzed within the method specified holding times and all QA/QC requirements (surrogate recoveries, calibrations, blanks, etc.) were met.
- No problems were noted with sample results and qualification of the data was not required.

Data Validation Checklists are presented in Attachment G.

#### Findings/Conclusions

Based on the results of the performance monitoring conducted during this reporting period, D&B offers the following conclusions:

- The analytical results of the system influent samples show that groundwater extraction wells EW-1 and EW-2 continue to capture VOC-contaminated groundwater at a combined total flow rate of 42.5 gpm, which is greater than the minimum required pumping rate of 20 gpm, as specified in the December 2000 Groundwater Extraction and Treatment System Design Report.
- The analytical results of the groundwater discharge samples show that the air stripper is effectively removing the captured VOCs and reducing concentrations to below the effluent discharge criteria.
- Concentrations of PCE detected in groundwater monitoring well ASMW-1 decreased from 11.0 ug/l (May 18, 2009) to 10.0 ug/l (August 13, 2009). In addition, ASMW-1 continues to exhibit an overall decreasing trend from a high of 30.0 ug/l (May 16, 2005) for the past 4-year period.
- Concentrations of PCE detected in groundwater monitoring well ASMW-2 decreased from 10.0 ug/l (May 18, 2009) to 4.2 ug/l (August 13, 2009). In addition, ASMW-2 continues to exhibit an overall decreasing trend from a high of 100 ug/l (February 24, 2005) for the past 4-year period.

Page 5

- PCE concentrations remain non-detect in upgradient monitoring well ASMW-3 and downgradient groundwater monitoring wells ASMW-4, ASMW-5, ASMW-6 and ASMW-7.
- Inconsistencies were again noted between the influent flow meters for EW-1 and EW-2, and the treatment system discharge flow meter. Cleaning of the influent flow meter was ineffective at reducing this inconsistency during this reporting period. Further diagnosis is warranted and recommended in the following section.
- The recurring high-high wet well condition continues to be the most frequent alarm condition, causing a majority of the total system downtime since start-up. In an attempt to limit the conditions contributing to this alarm condition, D&B lowered the high wet well float approximately 4 inches. Subsequent to the float repositioning conducted this quarter, the frequency of the high-high wet well conditions has been reduced, but not eliminated.
- As the downgradient early warning groundwater monitoring wells continue to exhibit non-detect VOC concentrations, D&B concludes that the selected remedy is functioning as intended by the Record of Decisions (ROD). In addition, please note that the Village of Rockville Centre Public Supply Well located to the south of Molloy College and downgradient of the groundwater treatment system, continues to exhibit non-detect concentrations of chlorinated VOCs.
- According to information received from the Director of Facilities at Molloy College, no new groundwater irrigation wells have been installed on the Molloy College property, which is located immediately downgradient of the Franklin Cleaners off-site groundwater extraction and treatment system.
- A new DER-10 document, dated December 2002, has been implemented since the March 1998 ROD was issued.
- The toxicity data, cleanup levels and remedial action objectives, as defined in the March 1998 ROD, remain unchanged.

#### Recommendations

Based on the results of performance monitoring conducted during this period, D&B offers the following recommendations:

- Continue operation of the groundwater extraction and treatment system to minimize downgradient migration of PCE, currently being captured by the system.
- Continue groundwater monitoring through the existing monitoring well network to determine contaminant concentration trends over time and to evaluate the continued effectiveness of the remediation system.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation November 23, 2009 Page 6

- Lower the level of the high level float an additional 4 inches in an effort to further reduce the frequency of high-high wet well alarm conditions.
- D&B again recommends that the NYSDEC issue a call-out to further diagnose the inconsistencies noted between the influent and effluent flow meters and potentially replace these items, as necessary, based on the result of the diagnosis.

Please do not hesitate to contact me at (516) 364-9890, Ext. 3094, if you have any questions.

Very truly yours,

Stephen Tauss Project Manager

#### NOTES:

Samples were collected by filling a Tedlar bag at each of the sampling locations. Samples were tested using a handheld photoionization detector (PID). \* Sample not taken due to sporadic and inconsistent readings from PID, possibly due to very cold weather and possible condensation on the bulb.

#### NOTES:

#### **ABBREVIATIONS:**

### **QUALIFIERS:**

1. Performance results for the reporting period are shaded.

gpm: gallons per minute 2. Estimated through the end of the reporting period. ug/L: micrograms per liter lb/hr: pounds per hour NS: Not sampled

J: Compound found at a concentration below CRDL, value estimated

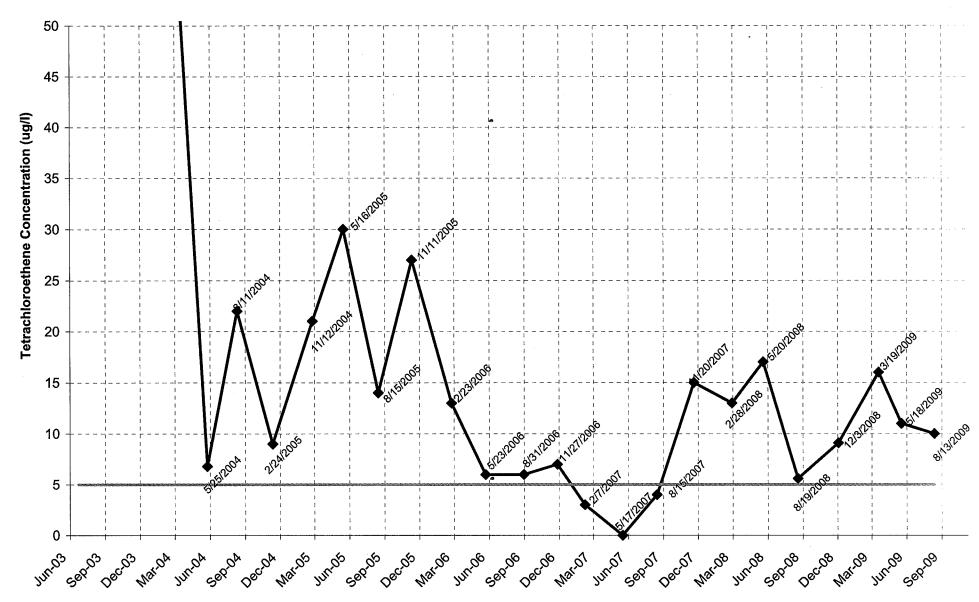

B: Compound detected in method blank as well as the sample, value estimated
