Re: Franklin Cleaners Site (Site No. 1-30-050)

D&B Work Assignment No. D004446-01

Quarterly Report No. 22

D&B No. 2531

Dear Mr. Long:

The purpose of this letter is to summarize the quarterly operation, maintenance, monitoring and sampling activities performed at the off-site Franklin Cleaners groundwater extraction and treatment system (see Attachment A, Figure 1), for the period beginning December 1, 2009 through February 28, 2010.

Operation, maintenance, monitoring and sampling activities were conducted by New York State Department of Environmental Conservation (NYSDEC) call-out contractor, Environmental Assessment and Remediations (EAR). Reporting, data management and assessment, and consulting and engineering evaluation services were performed by Dvirka and Bartilucci Consulting Engineers (D&B).

Presented below is a summary of system operation and maintenance completed during the quarter, as well as the results of the sample analysis completed during this reporting period at the off-site Franklin Cleaners groundwater extraction and treatment system. Note that groundwater monitoring well sample data is discussed in the Groundwater Sampling Report No. 1. In addition, a Site Management Plan (SMP) for the off-site Franklin Cleaners groundwater extraction and treatment system is currently being drafted.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation September 15, 2011 Page 2

Groundwater Extraction and Treatment System Operation and Maintenance

During this period, extraction well EW-1 operated at an average pumping rate of 35 gallons per minute (gpm) and extraction well EW-2 operated at an average pumping rate of 5.5 gpm. Normalized graphs of the average flow rate for EW-1 and EW-2 since September 2006 are presented in Attachment B. Based on a review of the data, the flow rates for EW-1 and EW-2 have decreased as compared to Quarter 21 and continue to exhibit an overall slightly decreasing trend.

Approximately 0.79 pounds of tetrachloroethene (PCE) were removed from the extracted groundwater by the treatment system during this reporting period and approximately 39.26 pounds of PCE have been removed since start-up of the treatment system in September 2003. The average PCE removal efficiency for this reporting period was greater than 99 percent. A graph of the average PCE removal rate is provided in Attachment C. Overall, the PCE removal rate is exhibiting a decreasing trend and has declined since September 2007.

Based on measurements recorded at the treatment system discharge flow meter, approximately 7,075,154 gallons of treated groundwater has been discharged to the Nassau County Department of Public Works (NCDPW) storm sewer system. Note that this volume is inconsistent with data collected from the influent flow meters for EW-1 and EW-2, which recorded a combined total flow of approximately 4,776,396 gallons of groundwater entering the treatment system. It was initially thought that this inconsistency was possibly due to either wear or fouling of the influent flow meter paddle wheels. However, as noted in the last quarterly report, cleaning of the influent flow meter paddle wheels was not effective at correcting this inconsistency. In addition, no significant wear on the paddle mechanisms was observed. It was also noted during several system monitoring events that the EW-1 and EW-2 flow meters were intermittently registering a flow of 0.0 gpm. In an effort to repair the total flow inconsistencies, EAR replaced the influent flow sensors for EW-1 and EW-2 on January 21, 2010; however, as evidenced by the inconsistent total flow measurements observed this reporting period, further diagnosis of this condition is warranted.

During this reporting period, the groundwater extraction and treatment system was operative for a total of approximately 2,051 hours and inoperative for a total of approximately 109 hours due to system alarm conditions and routine system maintenance.

Alarm conditions responded to during this reporting period included the following:

- Extraction well EW-1 and EW-2 malfunction (one event); and
- High-high wet well condition (two events).

Routine maintenance performed during this reporting period included the following:

• Blower maintenance conducted on December 11, 2009; and

CONSULTING ENGINEERS

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
September 15, 2011

Page 3

• Air stripper maintenance conducted on January 28 and February 2, 2010. The air stripper maintenance consisted of disassembly of the air stripper trays and pressure washing of the trays on the containment island in order to remove accumulated iron flocculant.

Non-routine maintenance performed during this reporting period included the following:

- Repair of a leak in the treatment system roof conducted on January 8, 2010;
- Maintenance of the containment island conducted on January 8, 12 and 13, 2010.
- Maintenance and repair of the pressure washer conducted on January 8, 12, 13 and 28, 2010;
- Replacement of EW-1 and EW-2 influent flow sensors conducted on January 21, 2010; and
- Replacement of pressure washer circuit breaker conducted on February 1, 2010.

A copy of the Site Activities Logs, System Monitoring Logs and a System Operations and Downtime Log for this reporting period, which includes a summary of system maintenance events and alarm responses, as prepared by D&B from December 2009 through January 5, 2010 and EAR from January 5 through February 28, 2010, are provided in Attachment D. A summary of the routine maintenance events completed this reporting period and the scheduled routine maintenance events for Quarter 23 is provided in Attachment E.

Groundwater Extraction and Treatment System Sampling

Groundwater samples were collected from the EW-1 and EW-2 well influent piping sample taps, as well as from the air stripper (liquid) discharge sample tap, at a frequency of twice per month during each of the 3 months comprising this reporting period. Each sample was analyzed for volatile organic compounds (VOCs) utilizing United States Environmental Protection Agency (USEPA) Method OLMO4.2 or SW846 Method 8620. In addition, the samples collected from the air stripper discharge sample tap were analyzed for iron and manganese utilizing USEPA Method SW846 6010 and for pH utilizing USEPA Method SW846 9040.

The analytical results of samples collected from the system influent are compared to the New York State Department of Environmental Conservation (NYSDEC) Class GA Groundwater Standards and Guidance Values, and the analytical results of samples collected from the air stripper discharge are compared to the site-specific NYSDEC State Pollutant Discharge Elimination System (SPDES) permit equivalency effluent limitations. Analytical results are presented in Attachment F.

CONSULTING ENGINEERS

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
September 15, 2011

Page 4

Based on the analytical results, extraction well EW-1 exhibited concentrations of PCE above its NYSDEC Class GA Standard of 5.0 micrograms per liter (ug/l) in groundwater ranging from 12.0 ug/l detected on December 8, 2009 and February 5, 2010, to a maximum of 15.0 ug/l detected on February 19, 2010. Extraction well EW-2 exhibited concentrations of PCE above its NYSDEC Class GA Standard of 5.0 ug/l in groundwater ranging from 47.0 ug/l detected on February 5, 2010, to a maximum of 62.0 ug/l detected on January 21, 2010. Based on the maximum concentrations detected and extraction well flow rates for EW-1 (31.4 gpm) and EW-2 (5.3 gpm), extraction well pump EW-1 is removing PCE at a rate of 2.36 x 10⁻⁴ pounds per hour (lb/hr) and extraction well pump EW-2 is removing PCE at a rate of 1.65 x 10⁻⁴ lb/hr.

The discharge sample results for the period exhibited VOCs and metals concentrations below the effluent limitations. System effluent water exhibited laboratory analyzed pH values of 6.1 and 6.2 detected on December 8, 2009 and January 4, 2010, slightly below the effluent limit range of 6.5 to 8.5. The NYSDEC was notified of the exceedances via e-mail correspondence. Note that field analysis of pH values identified a pH value of 6.27 in treatment system effluent water on December 8, 2009, which was also below the effluent limit range. However, a field analysis of pH identified a value of 6.86 in treatment system effluent water on January 4, 2010, which was within the effluent limit range.

A summary of the extraction and treatment system performance results since September 2007 is provided in Attachment G.

Vapor phase samples were also collected from the two carbon adsorption unit influent and effluent sample taps at a general frequency of once per week. Each sample was collected by filling a Tedlar bag directly from each of the influent and effluent sample taps located on the two carbon adsorption units. The samples were screened using a calibrated, hand-held photoionization detector (PID). During this reporting period, PID readings collected from both carbon vessels were 0.0 parts per million (ppm) for both the influent and effluent vapor samples at each carbon adsorption unit, with PID detections and exceedances of the site-specific effluent limit of 1.0 ppm as noted below:

January 14, 2010

- 0.1 ppm at the influent and 0.3 ppm at the effluent of Carbon Vessel No. 1; and
- 0.3 ppm at the influent and 0.2 ppm at the effluent of Carbon Vessel No. 2.

February 5, 2010

- 2.9 ppm at the influent and 0.9 ppm at the effluent of Carbon Vessel No. 1; and
- 1.7 ppm at the influent and 1.5 ppm at the effluent of Carbon Vessel No. 2.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation September 15, 2011 Page 5

February 19, 2010

• 5.2 ppm at the influent and 4.3 ppm at the effluent of Carbon Vessel No. 2.

The NYSDEC was immediately notified of the PID reading exceedances upon review of the data. In addition, and as recommended below, EAR's sample technicians should notify the NYSDEC and D&B if an effluent exceedance is noted during future monitoring events.

It should also be noted that based on the maximum influent PCE mass flow rates for EW-1 and EW-2, the carbon vessels are being loaded at a rate of 4.00 x 10⁻⁴ lb/hr and given an average blower flow rate of 630 cubic feet per minute (ft³/min), this equates to a maximum air concentration of 0.03 ppm. The elevated PID readings noted above may indicate that the granular activated carbon (GAC) has been exhausted and, as recommended below, it may be warranted to collect an air sample for laboratory analysis from each carbon vessel effluent sample tap to determine if the carbon vessels need to be serviced.

Data Validation

The samples collected in December and on January 4, 2010 have been analyzed by Mitkem Corporation (Mitkem). The samples collected on January 21, 2010 and February 2010 have been analyzed by Test America Laboratories (TAL), Shelton, CT. The data packages submitted by Mitkem and TAL have been reviewed for completeness and compliance with the NYSDEC Analytical Services Protocol (ASP) Quality Assurance/Quality Control (QA/QC) requirements. All sample results have been deemed valid and usable for environmental assessment purposes, as qualified below:

- Manganese was qualified as non-detect (U) in AS-1 on January 4, 2010 based on preparation blank results;
- VOCs were detected in continuing calibration above QC limits in January 21 and February 25, 2010 sampling events. These VOCs were qualified as estimated (UJ); and
- The samples were analyzed within the method-specific holding times and all QA/QC requirements (except noted above) were met.

Data Validation Checklists are presented in Attachment H.

Findings

Based on the results of the performance monitoring conducted during this reporting period, D&B offers the following findings:

CONSULTING ENGINEERS

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
September 15, 2011

Page 6

- The analytical results of the system influent samples show that groundwater extraction wells EW-1 and EW-2 continue to capture VOC-contaminated groundwater at an average combined total flow rate of 40.5 gpm, which is greater than the minimum required pumping rate of 20 gpm, as specified in the December 2000 Groundwater Extraction and Treatment System Design Report.
- Inconsistencies were again noted between the influent total gallons pumped for EW-1 and EW-2 and the treatment system discharge total gallons pumped. Note that the influent flow meters were replaced on January 21, 2010; however, the meters continue to intermittently malfunction.
- The recurring high-high wet well condition continues to be the most frequent alarm condition, causing a majority of the total system downtime since start-up.
- The laboratory and field screening discharge samples collected continue to intermittently exhibit a pH below the site specific effluent range of 6.5 to 8.5.
- The PID readings collected from the carbon vessel sample taps intermittently exhibit total VOCs greater than the site specific effluent limit of 1.0 ppm.
- Based on the influent mass loading rate and the blower air flow rate, the carbon vessels are currently being loaded at a rate of approximately 4.00 x 10⁻⁴ lb/hr. Given an average blower flow rate of 630 ft³/min, this equates to a maximum influent air concentration of 0.03 ppm, well below the PID screening concentrations noted throughout this reporting period.
- A new DER-10 document, dated May 2010, has been implemented since the March 1998 ROD was issued.
- The toxicity data, cleanup levels and remedial action objectives, as defined in the March 1998 ROD, remain unchanged.

Recommendations

Based on the results of performance monitoring conducted during this reporting period, D&B offers the following recommendations:

- Continue operation of the groundwater extraction and treatment system to minimize downgradient migration of PCE, currently being captured by the system.
- It is recommended that the NYSDEC call-out contractor diagnose the inconsistencies noted between the influent and effluent flow meters and replace or repair the meters as necessary.
- It is recommended that the NYSDEC call-out contractor diagnose the recurring high-high wet well conditions.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation September 15, 2011

Page 7

- Due to low analytical laboratory pH results detected at the air stripper effluent, it is recommended to continue the field monitoring of the influent and effluent pH and closely monitor the results. If field monitoring effluent pH values are consistently detected outside of the effluent limit range of 6.5 to 8.5, it may be warranted to perform a post-treatment pH adjustment of the effluent water.
- Due to the intermittent elevated PID readings detected at the carbon adsorption vessel
 effluent sample taps, it is recommended that a vapor sample be collected and laboratory
 analyzed via Method TO-15 at each carbon vessel effluent sample tap, in order to
 determine the actual VOC concentrations in the effluent vapor and to determine whether
 a carbon change-out is warranted at this time.

Please do not hesitate to contact me at (516) 364-9890, Ext. 3094, if you have any questions.

Very truly yours,

Slyli Ian

Comments:

Performance was acceptable with the following exception:

2A. Manganese was detected in preparation blank and detected in the sample at concentration less than ten times the concentration found in the blank. Therefore, manganese in sample AS was qualified as non-detect (U).

Comments:

Performance was acceptable with the following exceptions:

- 2A. Acetone was detected in the method blank. It was not detected in the associated samples and therefore did not impact the usability of the reported sample results.
- 13. The %Ds were above the QC limit for dichlorodifluoromethane and bromomethane in the continuing calibrations associated with all samples. Dichlorodifluoromethane and bromomethane were not detected in the samples and were qualified as estimated (UJ) in all samples.

| Project Number: | 2531-03 | | | | |
| Sample Date(s): | February 24, 2010 | | | | |
| Matrix/Number | Water/ 2 | | | | |
| of Samples: | Trip Blank/0 | | | | |
| Analyzing | Total America I allowed in City CVP | | | | |
| Laboratory: | TestAmerica Laboratories, Shelton, CT | | | | |
| Analyses: | Volatile Organic Compounds (VOCs): USEPA SW846 Method 8260B | | | | |
| Laboratory Report No: | 220-11579 | Date:3/16/2010 | | | |

ORGANIC ANALYSES VOCS

| | Reported | | Performance Acceptable | | Not |
|---------------------------------------|----------|---------------------------------------|---------------------------|-----|----------|
| | No | Yes | No | Yes | Required |
| 1. Holding times | | X | | X | |
| 2. Blanks | | | | | |
| A. Method blanks | | Х | X | | |
| B. Trip blanks | | * | | | |
| C. Field blanks | | · · · · · · · · · · · · · · · · · · · | | | |
| 3. Laboratory Control Sample (LCS) %R | | X | | X | |
| 4. Surrogate spike recoveries | | X | _ | Х | |
| 5. Field duplicates RPD | | | | - | Х |

VOCs - volatile organic compounds %R - percent recovery

%D - percent difference %RSD - percent relative standard deviation RRF - relative response factor RPD - relative percent difference

Comments:

Performance was acceptable with the following exceptions:

- 2. 1,2,4-Trichlorobenzene was detected in the method blank. 1,2,4-Trichlorobenzene was not detected in the samples and therefore did not impact the usability of the reported sample result.
- 3. Based on laboratory qualifiers, the %R was outside the QC limit for acetone in the LCS associated with all samples. It was not detected in the samples and therefore did not impact the usability of the reported sample result.
