Re: Former Thypin Steel, Inc. Plant
In Situ Chemical Oxidation Injection Program Completion Report
Manorhaven, New York

Dear Mr. Asher:

Roux Associates, Inc. and its associated firm, Remedial Engineering, P.C., (Roux Associates), on behalf of MBA-Manorhaven, LLC (MBA-Manorhaven), have prepared this *In Situ* Chemical Oxidant Injection Program Completion Report (ISCO-IPCR) in accordance with the New York State Department of Environmental Conservation DER-10: Technical Guidance for Site Investigation and Remediation dated May 3, 2012 for the property located at the former Thypin Steel Facility in Manorhaven, New York (Site), see Figure 1. The Site consists of Operable Units 1 and 2. The subject of this ISCO-IPSR is Operable Unit 1 (OU-1). OU-1 is defined as the onsite shallow and intermediate aquifer zones of the project, and OU-2 is defined as the deep aquifer zone and offsite portion. This ISCO-IPCR discusses the shallow groundwater zone and upper intermediate groundwater zone remediation completed using an ISCO injection program within OU-1. All work was performed in accordance with the Voluntary Cleanup Agreement (VCA) between the New York State Department of Environmental Conservation (NYSDEC) and MBA-Manorhaven, LLC dated January 2, 2001 (Index Agreement No. V00336-1).

ISCO Injection Program Implementation

The ISCO injection program, as described in the RAWP Amendment, which was approved by the NYDEC on September 30, 2008, was developed to meet the objectives of the RAWP (Roux Associates, 2005). The ISCO injection program was to provide a replacement for the ERD technology in the intermediate groundwater zone as was originally presented in the RAWP as well as the supplement remedy for the shallow groundwater zone. Similarly, the objective of the ISCO injection program was to reduce the mass of chlorinated volatile organic compound (CVOC) contamination within the groundwater beneath the Site thereby resulting in mitigation of off-Site impacts beyond the Site boundary. ISCO is a strong and widely accepted technology used for destroying

(oxidizing) organic contaminants such as CVOCs. The chemical oxidant that was used is RegenOx™ manufactured by Regenesis, Inc (Regenesis). RegenOx™ is a solid alkaline oxidant that uses two parts: a sodium percarbonate complex (oxidant complex) and a multi-part catalytic formula (micro-scale ferrous salt in a catalyst gel). The two parts are combined and mixed with water to produce an effective oxidant that is then injected into groundwater. This oxidant has been widely used in the industry to treat groundwater impacted with CVOCs. As the oxidant is distributed into the areas of CVOC contamination, the volatiles are completely destroyed leaving carbon dioxide and water. This remedial methodology was selected because it was capable of actively and aggressively reducing the mass of CVOC contamination beneath the Site. The ISCO injection program was an adaptable remedial approach that could be completed in phases and would be adjusted based on Site conditions.

The ISCO injection program was performed by Roux Associates in accordance with Roux Associates' July 11, 2008 RAWP Amendment and was completed in four phases as well as an additional pilot study. The injection program included:

- Installation of five observation wells prior to the first injection event and two additional observation wells prior to the second injection event;
- Implementation of the *In Situ* chemical oxidation injection pilot study, utilizing the Sidewinder tool (i.e., pressure pulse technology), prior to the third injection program;
- Mixture of 24 tons of RegenOx^{TM} oxidant complex with 60,000 gallons of water to form an injection solution;
- Injection of the above oxidant solution within 11 air sparge points (screened from 21 to 23 ft bls) to remediate the shallow aquifer zone;
- Injection of the above solution within 18 temporary injection points from the interval 15 to 25 ft bls to remediate the shallow aquifer zone; and
- Injection of the above solution within 139 temporary injection points from the interval 25 to 35 ft bls and two permanent monitoring wells (screened from 30 to 50 ft bls) to remediate the intermediate aquifer zone.

The first phase of the ISCO injection program included baseline groundwater monitoring/ sampling, and a first phase injection event followed by two months of groundwater monitoring. Based on the review of the groundwater data, it was determined that a second phase injection event would be warranted. The second injection event was completed and subsequently followed by one month of groundwater monitoring. Based on the review of the groundwater data, it was determined that a third phase injection event would be warranted. However, at the request of the NYSDEC, an evaluation of alternative injection methodologies as well as the chemical oxidants was completed prior to the implementation

of the third phase injection event. Thus, an ISCO pilot study was completed and subsequently followed by one month of groundwater monitoring. Based on the pilot study results, it was determined that a third injection event would be warranted utilizing the Sidewinder tool. The third injection event was completed and subsequently followed by two months of groundwater monitoring. At the request of the NYSDEC, a fourth and final injection event was completed, based on groundwater data collected during the post third injection event monitoring. All groundwater sampling data for VOCs is summarized in Table 1. All injection point locations and CVOC data are shown on Plate 1. All Laboratory analytical data reports are provided in Attachment A.

First Phase ISCO Injection Event

Prior to the start of the first phase of the ISCO injection program, groundwater samples were collected from monitoring wells MW-24, MW-31S, MW-31I, MW-33S, MW-33I, MW-34S, MW-34I, MW-35S, MW-35I, MW-26S, MW-26I, MW-30S, MW-30I, and the five new observation wells (OW-3 through OW-7) on November 24, 2008 December 6, 2008 and December 23, 2008. The analytical data from all three sample dates were used as baseline data since the wells were not all sampled on the same date. All groundwater samples and QA/QC samples were sent to TestAmerica of Shelton, Connecticut for the analysis of full list volatile organic compounds (VOCs), total and dissolved iron and manganese, total organic carbon (TOC), and alkalinity. All of the baseline and monitoring data is summarized in Table 1. As shown in Plate 1, the principal CVOC present within the groundwater beneath the Site is TCE, with lower concentrations of other CVOCs including the daughter product, 1,2 DCE.

The first phase ISCO injection event was completed within the shallow aquifer zone from December 17, 2008 through December 31, 2008 and was performed by Zebra Environmental, Inc. of Lynbrook, New York (Zebra Environmental) under Roux Associates' supervision. The chemical oxidation solution was injected at temporary shallow injection points within Area 1 and Area 2 and within 11 AS wells (see Plate 1). The depth of injection for each temporary point extended from approximately 15 ft to 25 ft bls, which is within the shallow groundwater aquifer zone. The existing AS wells that received the chemical oxidation solution were AS-4, AS-6, AS-7, AS-8, AS-19, AS-20, AS-21, AS-22, AS-23, AS-27 and AS-28, as shown on Plate 1. The AS wells are screened from 21 to 23 ft bls.

The first phase of the ISCO injection program was continued in the upper intermediate aquifer zone, which was completed on February 5, 2009. The injections were completed within the upper intermediate aquifer zone (i.e., 25-35 ft bls) utilizing temporary injection points within six injection rows, in accordance with the RAWP Amendment, as shown in Plate 1. The intermediate injection points were distributed every 15 feet along six injection rows. The injection rows were completed downgradient of the Area 1 and strategically placed across the extent of the dissolved plume beneath the Site. Roux Associates field personnel performed field parameter monitoring (e.g., pH and dissolved oxygen [DO] readings) and groundwater sampling activities to evaluate the effectiveness of the injection

program. In order to confirm that a 15-foot spacing of the temporary injection points was adequate, the field parameters were monitored during the completion of the entire first row of injection points for the intermediate groundwater zone. The field parameters in the adjacent observation wells confirmed that the oxidant was present and the injections were typically effective at a distance of 15 feet or more.

Field parameter readings were collected in the monitoring and observation wells approximately every two weeks following the injections, and the first round of groundwater performance monitoring samples were collected on February 2, 2009 and February 3, 2009. The second round of groundwater performance monitoring samples was collected on March 11, 2009 and March 12, 2009 in accordance with the RAWP Amendment. The comparison of field parameter data collected during the baseline and performance monitoring periods indicated that ISCO injections into Site groundwater were effectively dispersed and that an oxidizing environment was developed as a result of the ISCO injections. The longevity of the oxidant in the subsurface at this Site (the time that the oxidant is active) was observed to be approximately four weeks following the first injection event.

First Phase ISCO Injection Event – Shallow Aquifer Zone Results

The ISCO injection program was performed to provide a final polishing step for the shallow aquifer in the form of an aggressive alternative technology following the completion of extensive AS/SVE system operations. The CVOC data from the groundwater samples collected from the shallow monitoring wells during the performance monitoring events were either non-detect, or detected at low concentration levels consistent with the baseline sampling round. The relatively small mass of dissolved CVOC contamination that was originally present within the shallow aquifer has been remediated to the NYSDEC ambient water quality standard and guidance values (AWQSGVs), to the extent practicable, utilizing multiple NYSDEC-approved technologies and no further remedial actions could be performed that would significantly or cost effectively further remediate the shallow aquifer zone.

The shallow groundwater zone at the water-table is 15 feet thick and represents the interface where contaminants have the potential to partition to soil gas. The relatively clean shallow groundwater creates a buffer zone between the potential source of soil gas (i.e., dissolved CVOC contamination in the deeper intermediate aquifer) and the vadose zone. Therefore, the overall objective of protecting the public health and the environment under the conditions of the contemplated use of the Site for residential purposes can now be achieved through appropriate application of Site Management Plan controls at the time of development.

First Phase ISCO Injection Event – Intermediate Aquifer Zone Results

In the upper intermediate zone, the results of the first performance monitoring round showed a reduction of TCE in OW-3 and OW-4 and an increase of TCE concentrations in OW-5, OW-6, and OW-7. The overall results following the second performance monitoring round showed a reduction of TCE in OW-3 and an increase of concentrations

of TCE in OW-4 through OW-7. The most pronounced increase in concentrations was observed in OW-4 with a TCE concentration of 7,900 µg/L, which increased from 6,700 µg/L, as measured during the baseline sampling round. This is a result of the chemical reactions forcing the sorbed organics to come into solution and increasing the groundwater concentrations. A localized increase in dissolved phase concentration in groundwater is not uncommon following an initial injection program.

Based on the field parameters and the performance monitoring results, it appeared that the injection program did not effectively influence the deeper intermediate zone as observed in monitoring wells MW-34I and MW-35I. It has been observed during previous soil boring activities that the intermediate aquifer zone transitions to a tighter and finer-grained deposit and these aquifer characteristics most likely limited the effectiveness of the injection program at deeper intervals. The intermediate monitoring wells (i.e., MW-34I and MW-35I) are screened from 30 to 50 ft bls and do not provide a representative sample of the targeted treatment zone (i.e., 25-35 ft bls).

Overall, the first injection program was successful in distributing the oxidant throughout the targeted area and vertical treatment zone, resulting in a reduction of the mass of the CVOC contamination. It was proposed that a second phase injection event would be able to target additional CVOC mass within the upper intermediate aquifer zone as described below.

Second Phase ISCO Injection Event

Based on the results of the first phase injection event it was recommended by Roux Associates to perform a second injection event to further address the upper intermediate aquifer zone. It was proposed by Roux Associates that two additional observation wells would be installed adjacent to MW-34I and MW-35I (OW-9 and OW-8, respectively) and screened from 25 to 35 ft bls. This zone corresponds to the interval of ISCO injections and the targeted treatment area. The modification to the injection program was approved by NYSDEC and NYSDOH via email correspondence on April 16, 2009.

The second phase of ISCO injections was performed from May 4, 2009 through May 29, 2009 within Area 1 and within the four previously completed northern injection rows upgradient of observation wells (i.e., OW-4, OW-5, and OW-6) that showed more than a marginal rebound of TCE following the initial injection event. The injections were completed within the upper intermediate aquifer zone (i.e., 25-35 ft bls). The same oxidant loading utilized during the first phase of ISCO injections was used during the second phase. The locations of the injection points are shown on Plate 1.

Roux Associates' field personnel performed field parameter monitoring (e.g., pH and DO readings) and groundwater sampling activities to evaluate the effectiveness of the injection program. The field parameters in the adjacent observation wells (i.e., OW-4 and OW-5) confirmed that the oxidant was present and the injections were effective at a distance of 15 feet or more during a majority of the injection locations.

Field parameter readings were collected every two weeks in the observation wells following the injections, and the first round of groundwater performance monitoring parameters and samples were collected on June 9, 2009. All groundwater and QA/QC samples were sent to TestAmerica of Shelton, Connecticut for the analysis of full list VOCs using USEPA Method 8260B. The comparison of field parameter data collected during the baseline and performance monitoring periods indicated that ISCO injections into Site groundwater were effectively dispersed and that an oxidizing environment was developed as a result of the ISCO injections. The longevity of the oxidant in the subsurface at the Site during the second injection program was observed to be approximately two weeks.

The second round of groundwater field measurements was performed on June 22, 2009. Based on the field parameters and initial groundwater monitoring results the second groundwater sampling monitoring event was not performed because the field parameter data indicated that the oxidant was no longer active.

Second Phase ISCO Injection Event Results

In the upper intermediate zone, the results of the performance monitoring round following the second injection event showed an overall decreasing trend throughout some areas of the plume. The majority of the observation wells contained relatively low concentrations of TCE or a decrease in concentration as follows:

- The TCE concentrations within the groundwater samples collected from OW-3, OW5, OW-7, OW-8 and OW-9 were all below 100 µg/L, with an average TCE concentration of 52 µg/L.

- The TCE concentrations within the groundwater samples collected from OW-5 decreased from 2,400 to 66 µg/L.

- The TCE concentrations within the groundwater samples collected from OW-6 decreased from 1,000 to 800 µg/L.

The one area where a reduction in concentration was not found was in the vicinity of OW-4. The groundwater sample collected from OW-4 contained a TCE concentration of 8,900 µg/L, which is elevated as compared to the remainder of the upper intermediate aquifer zone. These elevated concentrations represent a localized area that has been shown to be extremely difficult to treat and is composed of a very tight formation, similar to the formation that is present at depths deeper than 35 ft bls.

ISCO Pilot Study (Sidewinder Tool)

Prior to the initiation of the third phase injection event, the NYSDEC requested an evaluation of alternative injection methodologies to enhance the application of the oxidant chemical into the target zone (i.e., 25 to 35 ft bls). After thorough evaluation of injection methodologies, the Sidewinder tool, developed by Wavefront Energy and Environmental Services, USA Inc. (Wavefront), was chosen to aid in the application of the RegenOx

chemical. The Sidewinder tool system injects the solution at high acceleration impulses (pressure-pulsing). These pulses are designed to allow for better distribution of the injected solution into the soil formation. After a review of the available materials for ISCO injections it was verified that the RegenOx chemical oxidant was the appropriate material to be utilized at the Site. Therefore, it was proposed that the pressure-pulse delivery methodology be implemented on a pilot study basis prior to proceeding with the third phase injection event.

A pilot study, consisting of injecting RegenOx into three temporary injection points around OW-6 as well as injecting into permanent injection well IW-1, utilizing the Sidewinder tool, was completed in October 2010 with subsequent performance monitoring, including the collection of field parameters and groundwater samples. All work was completed in accordance to the *In Situ Chemical Oxidation Injection Pilot Study Work Plan* dated September 8, 2010 (ISCO Work Plan), which was approved by the NYSDEC via letter correspondence dated September 20, 2010. Prior to the start of the pilot study, baseline groundwater samples were collected on September 22, 2010 from OW-1, OW-2, MW-35I and OW-6. All groundwater and QA/QC samples were sent to TestAmerica Laboratories of Shelton, Connecticut for the analysis of full list VOCs using USEPA Method 8260B.

ISCO Pilot Study (Sidewinder Tool) Results

A detailed description of the pilot study activities and results were submitted to the NYSDEC in the ISCO Pilot Study Summary Report dated February 9, 2011. A summary of the results are as follows.

The field observations, field parameter measurements and VOC analytical data collected from OW-6 during the pilot study indicate that injections of the RegenOx™ solution into Site groundwater using the Sidewinder tool were only effective at temporary injection points, at an injection depth limit of 32 ft bls. The Sidewinder tool was effective in allowing for better distribution of the injected oxidant solution into the soil formation through temporary injection points, which had not been observed in the previous two ISCO injection events, when the Sidewinder tool was not used. This was further supported by the VOC analytical data results from post-pilot study samples collected at OW-6, which showed a decrease in the baseline TCE concentration 140 µg/L to 18 µg/L. Injecting into permanent injection well IW-1 was unsuccessful due to the tight subsurface formation, which caused day-lighting of the oxidant at the ground surface. Similarly, the lack of change in field parameter measurements and VOC analytical data at the three wells (OW-1, OW-2, and MW-35I) monitored around IW-1 indicate that using the Sidewinder Tool in a permanent injection well was unsuccessful.

Additional Groundwater Sampling

At the request of the NYSDEC in a letter dated June 16, 2011, Roux Associates performed additional groundwater sampling at four locations south/southwest of OW-6 within the vicinity of OW-7, MW-26I and MW-30I (Investigation Area). In accordance with the Additional Groundwater Sampling Work Plan dated July 12, 2011 and approved by the NYSDEC in an email correspondence dated July 19, 2011, four temporary shallow

groundwater monitoring wells (shallow wells) and four temporary upper intermediate groundwater monitoring wells (intermediate wells) were installed in clusters (i.e., shallow well adjacent to an upper intermediate well) from July 25, 2011 through July 28, 2011.

Groundwater samples from each temporary well were collected one week following well development, in accordance with United States Environmental Protection Agency (USEPA) Region I low-flow groundwater sampling procedures (July 30, 1996). All groundwater and QA/QC samples were sent to TestAmerica Laboratories of Shelton, Connecticut for the analysis of full list VOCs using USEPA Method 8260B.

Additional Groundwater Sampling Results

As described in the Additional Groundwater Sampling Summary Report dated September 7, 2011, there were no VOC exceedances in any of the shallow well samples. Only four individual VOCs were detected in the temporary groundwater monitoring well samples and only two of the four compounds (i.e., trichloroethylene and cis-1,2,Dichloroethene) were detected above the AWQSGV of 5 µg/L, for those compounds. TCE was the only compound that was detected in all of the upper intermediate wells (i.e., TW-1I, TW-2I, TW-3I, and TW-4I) at a concentration of 8 µg/L, 82 µg/L, 8.1 µg/L, and 81 µg/L, respectively. Cis-1,2,Dichloroethene was the only other VOC detected at a concentration above NYSDEC AWQSGV and was detected at a concentration of 14 µg/L from the sample collected at TW-4I. One of the four detected compounds (i.e., Acetone) is a known laboratory contaminant and is not discussed further in this Report.

Based on the aforementioned sampling results, it was recommended by Roux Associates to remove of all temporary monitoring wells. No additional work was warranted in the Investigation Area, since the detections were relatively low and represented discontinuous areas, which were not impacting the shallow groundwater zone. Temporary monitoring well removals as well as not conducting additional work in the Investigation Area was approved by the NYSDEC in a letter correspondence dated October 5, 2011. All temporary groundwater monitoring wells were abandoned using the casing pulling method, in accordance with the NYSDEC CP-43 well decommissioning policy.

Third Phase ISCO Injection Event

Based on the results from the second phase injection event and subsequent ISCO pilot study, it was recommended by Roux Associates to perform a third injection event to further address the upper intermediate aquifer zone. It was proposed by Roux Associates to include the use of the Sidewinder tool to aid in the application of injected oxidant solution into the soil formation. The modification to the Supplemental ISCO Injection Work Plan dated April 9, 2010 was included in the Additional Groundwater Sampling Summary Report dated September 7, 2011, which was conditionally approved by the NYSDEC in a letter correspondence dated October 5, 2011. As per the NYSDEC, the modification to the third phase of ISCO injections scope of work included eliminating injecting around OW-6 and injecting the oxidant solution directly into groundwater monitoring wells MW-34I and MW-35I, which have screen intervals of 30 to 50 ft bls.

The third phase of ISCO injections was performed from October 31, 2011 through November 11, 2011. Prior to the start of injection event, groundwater samples were collected from wells OW-4, OW-5, MW-34I and MW-35I on October 13, 2011 and sent to TestAmerica of Edison, New Jersey for the analysis of full list VOCs using USEPA Method 8260B. The analytical results from the October 13, 2011 sampling date were used as baseline data for the third phase injection event. The injections were completed within the upper intermediate aquifer zone (i.e., 25-35 ft bls) at 14 locations upgradient and around OW-4, four locations around OW-5 and within monitoring wells MW-34I and MW-35I. The same oxidant loading utilized during the first and second phase of injections was used during the third phase. Due to the tight subsurface conditions, only approximately 25 gallons of the oxidant mixture was injected into MW-34I and approximately 250 gallons of the oxidant mixture was injected into MW-35I. The remaining oxidant mixtures that could not be injected into each well, was injected into a temporary injection point up gradient of each well. The location of the injection program is shown in Plate 1.

Roux Associates' field personnel performed field parameter monitoring (e.g., pH and DO readings) and groundwater sampling activities to evaluate the effectiveness of the injection program. During the ISCO injection activities, the field parameters in the adjacent observation wells (i.e., OW-4 and OW-5) confirmed that the oxidant was present and the injections were effective at a distance of at least 15 feet during a majority of the injection locations.

Field parameter readings were collected approximately every two weeks in wells OW-4, OW-5, MW-34I and MW-35I following the injections, and the first round of groundwater samples were collected on January 6, 2012 from OW-4 and MW-34I. However, these samples were collected while the oxidant was still active, as indicated by the field parameter measurements, and considered not to be representative of true post-injection conditions. Thus, samples were collected from all four wells on March 2, 2012. The second round of groundwater sampling was performed on March 30, 2012. The comparison of field parameter data collected during the baseline and performance monitoring periods indicated that ISCO injections into Site groundwater were effectively dispersed and that an oxidizing environment was developed as a result of the ISCO injections. The longevity of the oxidant in the subsurface at the Site during the third injection program was observed to be approximately four months.

Third Phase ISCO Injection Event Results

Based on the performance sampling results, the third phase ISCO injection program did not effectively influence the CVOC concentrations in any of the monitoring wells. There was only a slight reduction in TCE concentration between the baseline and post-injection samples of OW-5 (i.e., 170 µg/L to 160 µg/L), respectively. The groundwater samples collected from OW-4, MW-34I and MW-35I contained TCE concentrations that were higher than the baseline data (see Plate 1). The third phase injection event was the first time in the injection program in which oxidant was successfully injected throughout the

entire target zone of 25-35 feet bls. Therefore, although this was the third round of injections, it was the first time the oxidant reached some parts of the aquifer. As such, these elevated concentrations may be a result of the chemical reactions forcing the sorbed organics to come into solution and increasing the groundwater concentrations. A localized increase in dissolved phase concentration in groundwater is not uncommon following an initial injection.

Fourth Phase ISCO Injection Event

As requested by the NYSDEC, a fourth and final injection event was completed between May 29, 2012 and June 7, 2012. The fourth injection event was focused around observation well OW-4, which included injecting oxidant into a total of 10 temporary injection points upgradient and around OW-4, as well as injecting oxidant directly into MW-35I. All work was performed in accordance with the previous injection events including, but not limited to, injecting RegenOx chemical oxidant with the use of the Sidewinder tool, into the target interval of 25-35 feet below land surface at the ten temporary injection points and into MW-35I. Similar to the previous third phase injection event, only approximately 250 gallons of the oxidant mixture was injected into MW-35I, due to the tight subsurface conditions. The remaining oxidant mixture that could not be injected into the well was injected into a temporary injection point up gradient of MW-35I.

Following the completion of the injections, groundwater field parameters were monitored in OW-4 and MW-35I for approximately three months to determine the optimal time to collect samples for VOC analysis. The comparison of field parameter data collected during the baseline and performance monitoring periods indicated that ISCO injections into Site groundwater were effectively dispersed and that an oxidizing environment was developed as a result of the ISCO injections. The longevity of the oxidant in the subsurface at the Site during the fourth phase injection event was observed to be approximately four months. Based on the field parameter results, groundwater samples were collected from OW-4 and MW-35I on September 21, 2012. All groundwater and QA/QC samples were sent to TestAmerica Laboratories of Edison, New Jersey for the analysis of full list VOCs using USEPA Method 8260B.

Fourth Phase ISCO Injection Event Results

Based on the performance sampling results, the fourth phase ISCO injection program effectively influenced the CVOC concentrations in MW-35I; however, CVOC concentrations in OW-4 remained relatively unchanged. As previously mentioned, these elevated concentrations within OW-4 represent a localized area that has been shown to be extremely difficult to treat and is composed of a very tight formation, similar to the formation that is present at depths deeper than 35 ft bls.

Conclusion

The CVOC data from the groundwater samples collected from the shallow monitoring wells during the performance monitoring events were either non-detect, or detected at low concentration levels consistent with the baseline sampling round. The relatively small mass of dissolved CVOC contamination that was originally present within the shallow

aquifer zone has been remediated to the AWQSGVs, to the extent practicable, utilizing multiple NYSDEC-approved technologies and no further remedial actions could be performed that would significantly, or cost effectively further remediate the shallow aquifer zone.

The results of the performance monitoring rounds following each phase of the injection program showed an overall decreasing trend throughout some areas of the plume within the upper intermediate zone. The majority of the observation wells contained relatively low concentrations of TCE or a decrease in concentration as follows:

- The TCE concentrations within the groundwater samples collected from OW-3, OW-7, OW-8 and OW-9 following the completion of the second phase of injections were all below 100 micrograms per liter (µg/L), with an average TCE concentration of 52 µg/L.

- The TCE concentration within the groundwater samples collected from OW-4 following the fourth phase of injections decreased from a historical high concentration of 8,900 µg/L to 2,100 µg/L.

- The TCE concentrations within the groundwater samples collected from OW-5 decreased from a historical high concentration of 2,400 µg/L to 160 µg/L.

- The TCE concentrations within the groundwater samples collected from OW-6 following the completion of the ISCO injection pilot study decreased from a historical high concentration of 1,000 µg/L to 18 µg/L.

- The TCE concentrations within the groundwater samples collected from MW-26I following the second phase of injections decreased from a historical high concentration of 1,100 µg/L to 27 µg/L.

- The TCE concentrations within the groundwater samples collected from MW-34I following the fourth phase of injections decreased from a historical high concentration of 7,200 µg/L to 2,900 µg/L.

- The TCE concentrations within the groundwater samples collected from MW-35I following the fourth phase of injections decreased from a historical high concentration of 5,500 µg/L to 410 µg/L.

Overall, the ISCO injection program has been successful in obtaining the mass reduction of CVOCs onsite and mitigation of offsite impacts of CVOCs in the intermediate groundwater zone, which was one of the primary objectives of the remedial actions, as defined in the Site's RAWP and RAWP Amendment (see Plate 1). This is evident in the aforementioned reduction of TCE concentrations, as described above. A summary of the groundwater sampling data for VOCs is summarized in Table 1. A summary of CVOC mass reduction percentages for the wells with historical concentrations above 1,000 µg/L (i.e., OW-4, OW-5, OW-6, MW-26I, MW-34I, and MW-35I) are shown below.

Well Designation	TCE Concentration Historical High (µg/L)	TCE Concentration Post Injection Program (µg/L)	Percent Reduction (%)
OW-4	8,900	2,100	76
OW-5	2,400	160	93
OW-6	1,000	18	98
MW-26I	1,100	27	97
MW-34I	7,200	2,900	60
MW-35I	5,500	410	92

However, even though an overall reduction of CVOC concentrations was observed in wells OW-4 and MW-34I as compared to pre-ISCO injection program groundwater results, a static CVOC concentration level was reached in both wells following the second phase of injections. As shown on Plate 1, CVOC concentrations remained relatively unchanged following the third and fourth phases of injections in OW-4 and MW-34I. As discussed in Section 4 of this Report, this is most likely due to the fact that the lower intermediate aquifer consists of a tighter, silty formation and the contamination was more likely to sorb onto the finer grained particles, which is not coming into contact with the oxidant during injections even when the state of the art Sidewinder tool was utilized. Thus, all phases of the ISCO injection program have not been effective at reducing CVOC concentrations to meet AWQSGVs in the vicinity of OW-4 and MW-34I. The groundwater sample collected from OW-4 following the latest phase (i.e., fourth phase) of the ISCO program contained a TCE concentration of 2,100 µg/L, which is lower than historical (prior to implementation of the ISCO injection program) concentration of 8,900 µg/L but elevated as compared to the remainder of the upper intermediate aquifer zone. The groundwater sample collected from MW-34I following the third phase of the ISCO program contained a TCE concentration 2,900 µg/L, which is lower than the historical concentration of 7,200 µg/L but elevated as compared to the remainder of the intermediate aquifer zone. As previously mentioned, these elevated concentrations represent a localized area that has been shown to be extremely difficult to treat and is composed of a very tight formation.

With the application of the ISCO injection program, elevated concentrations of CVOCs specifically within the shallow aquifer and upper portions of the intermediate aquifer have been targeted and remediated, to the extent practicable, by a proven technology as approved by the NYSDEC. The multi-phased approach, including the use of the

Sidewinder tool, effectively dispersed the oxidant within the targeted treatment zones and the mass of contamination has been reduced in the groundwater beneath the Site.

Sincerely,

ROUX ASSOCIATES, INC.

Laboratory Analytical Reports

(Provided on CD)

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 220-7337-1

SDG Number: 220-7337-1

Job Description: 0771.0001Y000 MBA-Thypin/Manorhaven

For:
Roux Associates, Inc.
209 Shafter Street
Islandia, NY 11749-5074

Attention: Mr. Chris Proce

Approved for release.
Jill M Duhancik
Project Manager I

12/05/2008

The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Project Manager.

TestAmerica Connecticut Certifications and Approvals: CTDOH PH-047, MADEP CT023, RIDOH A43, NYDOH 10602, NY NELAP 10602, NHDES 2528, NJDEP CT410, ME DOH CT023, UT DOH 2032614458

Job Narrative
220-J7337-1

Comments
No additional comments.

Receipt
The following sample(s) was received with insufficient preservation: MW-34s, plastic 250ml nitric acid bottle. The pH was adjusted prior to preparation.

The following samples were received at the laboratory outside the required temperature criteria: FIELD BLANK-120108 (220-7337-18), MW-24 (220-7337-17). The client was contacted regarding this issue, and the laboratory was instructed to proceed with analysis.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method(s) 8260B: Internal standard (ISTD) response for the following samples were outside control limits: DUP-112408 (220-7337-15), MW-34 I (220-7337-11), MW-35 I (220-7337-13). The samples were re-analyzed with appropriate dilutions. One set of compliant results have been reported.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Comments
No additional comments.

Receipt
The following sample was received at the laboratory with no sample collection time documented on the chain of custody: TRIP BLANK-122308 (220-7654-7). As a result, a sample collection time of 12:00 a.m. on the date of collection has been used.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

QUALITY CONTROL NARRATIVE

TestAmerica Connecticut adheres to a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

FORMULAS FOR NYSDEC SAMPLE CALCULATIONS

Volatiles

(Ax)(IS)(DF)
(AIS)(RRF)(V)(% solids) = C

(AX)(IS)(VT)(1000)(DF)
(AIS)(RRF)(VA)(V)(% solids) = C (for medium level soils)

SemiVolatiles

(AX)(IS)(VE)(DF)(GPC factor is 2 if needed)
(AIS)(RRF)(volume injected)(V)(% solids) = C

Pesticides

(AX)(VE)(DF)
(RRF)(V)(% solids)(volume injected) = C

PCBs for compound/retention time

(AX)(VE)(DF)
(RRF of compound at the stated retention time)(V)(% solids)(volume injected) = C

DRO/CTETPH

(AX)(VE)(DF)
(RRF)(V)(% solids)(volume injected) = C

AX = area of the target Ion
AIS = Area of Internal standard
C = concentration as ug/L or ug/Kg
DF = dilution
IS = Internal standard concentration (ng)
RRF = average RF (from initial cal except CLP methods from continuing cal)
V = sample volume for liquids in mls or sample weight for solids in grams
VA = volume of aliquot for medium level soils
VE = volume of concentrated extract
VT = volume of methanol for volatile medium level soils

DATA REPORTING QUALIFIERS

Client: Roux Associates, Inc.

Job Number: 220-7654-1
Sdg Number: 220-7654

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
Metals		
	U	Indicates analyzed for but not detected.
	J	Sample result is greater than the MDL but below the CRDL
General Chemistry		
	U	Indicates analyzed for but not detected.
	J	Sample result is greater than the MDL but below the CRDL

QC Flag Legend

A - Target compound detected but, quantitated amount
exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

QC Flag Legend

T - Target compound detected outside RT window.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 23253

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 23298

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 23360

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

Probe ID	PH ELECTRODE	Analysis Type	Single Line Fit

Calibration Results

Slope	-59.833	CorrCoeff	1.0000
Intercept	30.110	Equation: Y = (59.833) X + (30.110)	

Calibration Validity **True** Operator A

	Result	Minimum	Maximum
Slope	-59.833	-63.00	-55.00
Intercept	30.110	-50.00	50.00
Correlation Coefficient	1.0000	0.99	1.00

Note: "True" means the calibration was within the specified ranges
"False" means the calibration was NOT within the specified ranges

Calibration Data	Standard	Reading
	4.00	208.86
	7.00	31.61
	10.00	-150.14

Date

QUALITY CONTROL NARRATIVE

TestAmerica Connecticut adheres to a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the repreparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

Volatile (GC or GC/MS)	Semivolatile (GC/MS)	Metals ICP-MS	Metals ICP Trace
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.

- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the repreparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

FORMULAS FOR NYSDEC SAMPLE CALCULATIONS

Volatiles

(Ax)(IS)(DF)
(AIS)(RRF)(V)(% solids) = C

(AX)(IS)(VT)(1000)(DF)
(AIS)(RRF)(VA)(V)(% solids) = C (for medium level soils)

SemiVolatiles

(AX)(IS)(VE)(DF)(GPC factor is 2 if needed)
(AIS)(RRF)(volume injected)(V)(% solids) = C

Pesticides

(AX)(VE)(DF)
(RRF)(V)(% solids)(volume injected) = C

PCBs for compound/retention time

(AX)(VE)(DF)
(RRF of compound at the stated retention time)(V)(% solids)(volume injected) = C

DRO/CTETPH

(AX)(VE)(DF)
(RRF)(V)(% solids)(volume injected) = C

AX = area of the target Ion
AIS = Area of Internal standard
C = concentration as ug/L or ug/Kg
DF = dilution
IS = Internal standard concentration (ng)
RRF = average RF (from initial cal except CLP methods from continuing cal)
V = sample volume for liquids in mls or sample weight for solids in grams
VA = volume of aliquot for medium level soils
VE = volume of concentrated extract
VT = volume of methanol for volatile medium level soils

DATA REPORTING QUALIFIERS

Client: Roux Associates, Inc.

Job Number: 220-7945-1
Sdg Number: 220-7945-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Analyzed for but not detected.
	J	Indicates an estimated value.
	*	LCS or LCSD exceeds the control limits
	B	The analyte was found in an associated blank, as well as in the sample.
Metals		
	U	Indicates analyzed for but not detected.
	J	Sample result is greater than the MDL but below the CRDL
General Chemistry		
	U	Indicates analyzed for but not detected.
	J	Sample result is greater than the MDL but below the CRDL

QC Flag Legend

A - Target compound detected but, quantitated amount
exceeded maximum amount.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

Target Version: 4.14
Processing Host: CON1004

Concentration Formula: Amt * DF * Uf * 1/Vo * CpndVariable

Name	Value	Description
DF	1.000	Dilution Factor
Uf	5.000	ng unit correction factor
Vo	5.000	Sample Volume purged (mL)
Cpnd Variable		Local Compound Variable

QC Flag Legend

R - Spike/Surrogate failed recovery limits.
M - Compound response manually integrated.
H - Operator selected an alternate compound hit.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 29143

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 24185

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP ( )EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 24200

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

Date 2/12/09

Authorizing Signature (2nd level Review)

TestAmerica Form #MEF01105.CT

Table Name: W021009 Autosampler Type: TYPE TJA
Sample Positions: 131/192 QC Positions: 2/19 # Sets: 1
Rinse Station location is rack -1, pos. -1.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 24297

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.

Authorizing Signature (2nd level Review) Date 2/12/09

TestAmerica Form #MEF01105.CT

Table Name: W021209 Autosampler Type: TYPE TJA
Sample Positions: 131/192 QC Positions: 0/19 # Sets: 1
Rinse Station location is rack -1, pos. -1.

METALS QUALITY CONTROL APPROVAL REPORT

Batch Number 24359

	1st Level Review	Comments
Chain of Custody forms have been completed.	✓	
Initial Calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Continuing calibration meets the following criteria*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Correct analytical sequence followed (CRI, ICSA,etc.) and criteria* met.	✓	
All blank criteria* met. ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
IDLs, Linear Range and IECs current.	✓	
LSC, MS,MD, MSD (if required) meet acceptance limits*: ( )CLP (✓)EPA200.7 ( )NYSDEC (✓)SW846 ( )Other	✓	
Serial dilution analyzed once per SDG or 20 samples.	✓	
Post digestion spike performed as required.	✓	
Flagging correct.	✓	
All raw data submitted as per deliverable requiements.	✓	
Prep batch completed with proper information.	✓	
All deviations, prep and anlaysis methods noted in NCMs.	✓	

* Reference SOPs for appropriate acceptance criteria.

This data meets the requirements of the Metals SOP's, unless otherwise documented in a NCM.
