Analyte	Sample Result	Data Qualifiers	RL	MDL	Units	Dil Fac	Date Analyzed	Lab Tech	Batch	Method
1,1,1-Trichloroethane	ND	D08, W1	570	160	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,1,2,2-Tetrachloroethane	ND	D08, W1	570	93	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,1,2-Trichloroethane	ND	D08, W1	570	120	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,1,2-Trichloro-1,2,2-trifluoroethane	ND	D08, W1	570	290	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,1-Dichloroethane	ND	D08, W1	570	180	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,1-Dichloroethene	ND	D08, W1	570	200	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2,4-Trichlorobenzene	ND	D08, W1	570	220	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2-Dibromo-3-chloropropane	ND J	D08, W1	570	290	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2-Dibromoethane	ND	D08, W1	570	22	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2-Dichlorobenzene	ND	D08, W1	570	150	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2-Dichloroethane	ND	D08, W1	570	230	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,2-Dichloropropane	ND	D08, W1	570	93	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,3-Dichlorobenzene	ND	D08, W1	570	150	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
1,4-Dichlorobenzene	ND	D08, W1	570	80	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
2-Butanone	ND	D08, W1	2900	1700	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
2-Hexanone	ND	D08, W1	2900	1200	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
4-Methyl-2-pentanone	ND	D08, W1	2900	180	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Acetone	ND	D08, W1	2900	2400	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Benzene	ND	D08, W1	570	27	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Bromodichloromethane	ND	D08, W1	570	110	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Bromoform	ND J	D08, W1	570	290	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Bromomethane	ND	D08, W1	570	130	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Carbon disulfide	ND J	D08, W1	570	260	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Carbon Tetrachloride	ND J	D08, W1	570	150	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Chlorobenzene	ND	D08, W1	570	75	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Dibromochloromethane	ND J	D08, W1	570	280	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Chloroethane	ND	D08, W1	570	120	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Chloroform	ND	D08, W1	570	390	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Chloromethane	ND	D08, W1	570	140	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
cis-1,2-Dichloroethene	ND	D08, W1	570	160	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
cis-1,3-Dichloropropene	ND	D08, W1	570	140	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Cyclohexane	4000 J	D08, W1	570	130	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Dichlorodifluoromethane	ND J	D08, W1	570	250	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Ethylbenzene	ND	D08, W1	570	170	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Isopropylbenzene	1800	D08, W1	570	86	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Methyl Acetate	ND	D08, W1	570	270	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Methyl-t-Butyl Ether (MTBE)	ND	D08, W1	570	220	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Methylcyclohexane	25000 J	D08, W1	570	270	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Methylene Chloride	ND	D08, W1	570	110	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Styrene	ND	D08, W1	570	140	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Tetrachloroethene	ND	D08, W1	570	77	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Toluene	ND	D08, W1	570	150	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
trans-1,2-Dichloroethene	ND	D08, W1	570	130	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
trans-1,3-Dichloropropene	ND	D08, W1	570	27	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Trichloroethene	ND	D08, W1	570	160	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Trichlorofluoromethane	ND	D08, W1	570	270	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B
Vinyl chloride	ND	D08, W1	570	190	ug/kg dry	5.00	12/10/10 13:53	LH	10L0861	8260B

Report: #13698R
Review Level: Tier III
Project: B0047517.0004.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # RTK1440 for samples collected in association with the Chevron – Former Gulf Oil Terminal Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis

12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) USEPA SW-846 Method 8260, 8270 and 8082. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	14 days from collection to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
AMW-1 (0-2) AMW-1 (2-4) AMW-1 (4-6) AMW-2 (0-2) AMW-2 (2-4) DUP-111710 MW-31D-1R (2-4) MW-31D-1R (4-6) MW-31D-2R (2-4) MW-31D-2R (4-6) MW-31D-2R (6-8)	Methylene chloride	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL Reporting limit

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.
All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
AMW-1 (0-2) AMW-1 (2-4) AMW-1 (4-6) AMW-2 (0-2) AMW-2 (2-4) MW-31D-1R (2-4) MW-31D-1R (4-6) MW-31D-2R (2-4) MW-31D-2R (4-6) MW-31D-2R (6-8) DUP-111710	CCV %D	Methylene chloride	-22.5%
AMW-2 (4-6) MW-31D-1R (0-2)	CCV %D	Methylene chloride	-24.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J

Initial/Continuing	Criteria	Sample Result	Qualification
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
RB-2-11-18-102 TB-3-11-18-10	Methyl acetate	>UL	--

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Acetone	17 J	19 J	AC
	Benzene	6.1 U	2.8 J	AC
	Ethylbenzene	6.1 U	3.1 J	AC
	Isopropylbenzene	12	44	114.3 %
	Methylcyclohexane	54	180	107.7 %
	Methylene Chloride	33	31	6.2 %
	Xylenes, total	4.6 J	6.8 J	AC

AC Acceptable
U Not detected

The compounds isopropylbenzene, and methylcyclohexane associated with sample locations MW-31D-2R (4-6) and DUP-111710 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

When samples were re-analyzed at a dilution, a methanol extraction was performed. The methanol extraction method generally exhibits greater extraction efficiency than the water extraction method, therefore the compounds are generally detected at a higher concentration associated with the methanol extraction method. In the instance when the re-analysis sample result completed by the methanol extraction method exhibits a concentration greater than the water extracted analysis, the result from the methanol extracted sample is reported.

Sample results associated with compounds that exhibited a concentration greater than the linear range of the instrument calibration and/or exhibited higher concentration of a detected compound in the methanol-extracted analysis are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
AMW-2 (0-2)	1,2-Dichloroethane	6.0 U	68 DJ	68 DJ
	Methylcyclohexane	230	2900 D	2900 D
	Xylenes, total	1300 E	16000 D	16000 D
AMW-2 (2-4)	Ethylbenzene	660 E	7200 D	7200 D
	Isopropylbenzene	420 E	3000 D	3000 D
	Methylcyclohexane	120	2200 D	2200 D
	Xylenes, total	3400 E	73000 D	73000 D
DUP-111710	Methylcyclohexane	66	180 D	180 D
	Isopropylbenzene	22	44 D	44 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ

Reported Sample Results	Qualification
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

The results for several sample locations were qualified by the laboratory due to dilutions being performed for matrix effects, sample viscosity, and/or high concentrations of target analytes. Since these causes do not have a direct impact on the quality or usability of the data, the laboratory qualifiers will be removed.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
AMW-1 (2-4) AMW-1 (4-6) AMW-2 (0-2) AMW-2 (4-6) AMW-2 (2-4) MW-31D-1R (0-2) MW-31D-1R (2-4) MW-31D-1R (4-6) MW-31D-2R (6-8) RB1 (11-17-10) AMW-5 (6-8) AMW-6 (2-4) AMW-6 (4-6) AMW-6 (6-8) RB-2-11-18-102	CCV %D	Acetophenone	-23.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All sample locations exhibited acceptable surrogate recoveries.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the SVOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
AMW-4 (4-6)	2,4-Dinitrophenol	<10%	<10%
	2,4-Dinitrotoluene	>UL	>UL
	2,6-Dinitrotoluene	>UL	>UL
	3,3-Dichlorobenzidine	<10%	AC
	4,6-Dinitro-2-methylphenol	>UL	AC
	Acenaphthylene	>UL	AC
	Caprolactam	<10%	<10%
	Di-n-octyl phthalate	>UL	AC
	Nitrobenzene	>UL	>UL
	N-Nitrosodiphenylamine	>UL	>UL
	Pentachlorophenol	>UL	AC

Sample Locations	Compound	MS Recovery	MSD Recovery
	3-Nitroaniline	AC	>UL
	Atrazine	AC	>UL

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
AMW-1 (0-2)	2,4-Dinitrophenol
	3,3-Dichlorobenzidine
	4,6-Dinitro-2-methylphenol
	Benzo(b)fluoranthene
	Hexachlorocyclopentadiene
AMW-4 (4-6)	3-Nitroaniline
	4,6-Dinitro-2-methylphenol
	4-Nitrophenol
	Di-n-octyl phthalate
	Pentachlorophenol

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

8. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	2-Methylnaphthalene	290	310	6.6 %
	Acenaphthene	410	530	25.5 %
	Anthracene	400	530	27.9 %
	Benzo(a)anthracene	640	780	19.7 %
	Benzo(a)pyrene	610	630	3.2 %
	Benzo(b)fluoranthene	740	750	1.3 %
	Benzo(ghi)perylene	220	270	20.4 %
	Benzo(k)fluoranthene	260	280	7.4 %
	Bis(2-ethylhexyl) phthalate	100 J	110 J	AC
	Carbazole	44 J	53 J	AC
	Chrysene	500	610	19.8 %
	Dibenzo(a,h)anthracene	53 J	57 J	AC
	Dibenzofuran	240	310	25.4 %
	Fluoranthene	1500	2000	28.5 %
	Fluorene	430	550	24.4 %
	Indeno(1,2,3-cd)pyrene	160 J	190 J	AC
	N-Nitrosodiphenylamine	210 U	160 J	AC
	Phenanthrene	1700	2200	25.6 %
	Pyrene	1200	1500	22.2 %

AC Acceptable

U Not detected

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

The results for several sample locations were qualified by the laboratory due to dilutions being performed for matrix effects, sample viscosity, and/or high concentrations of target analytes. Since these causes do not have a direct impact on the quality or usability of the data, the laboratory qualifiers will be removed.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) SW-846 Methods 6000/7000, 3500FE, D-516-90, and the Lloyd Kahn Method for TOC. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.
SW-846 7470	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (J). No other qualification of the sample results was required.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table.

All analytes associated with CRDL standard recoveries were within control limits with the exception of the analytes presented in the following table.

Sample Locations	Analytes	CRDL Recovery
RB1 (11-17-10)	Lead	67.0%
	Silver	142.0%

The criteria applied to evaluate the CRDL Standard criteria are presented below. In the case of a calibration deviation, the sample results are qualified.

CRDL Standard Recovery Criteria			
Analytes	**Control Limit**	**Sample Result**	**Qualification**
All analytes, with the exception of Al, Ba, Ca, Fe, Mg, Na, and K	CRDL %R <50% (<30% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	R
		Non-detect sample results	R
		Detected sample results ≥ 2x CRDL	J
	CRDL %R 50-69% (30-49% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	J
		Non-detect sample results	UJ
		Detected sample results ≥ 2x CRDL	No Action
	%R >130% but <180% (>150% but <200% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	J
		Non-detect sample results	No Action
		Detected sample results ≥ 2x CRDL	No Action
	CRI %R >180% (>200% for Sb, Pb, Tl)	Sample results ≥ MDL	R

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
AMW-1 (0-2)	Aluminum	<30%	<30%
	Calcium	>UL	<LL but >30%
	Iron	<30%	<30%
	Magnesium	>UL	AC
	Manganese	<30%	<30%
	Barium	AC	<LL but >30%
AMW-4 (4-6)	Aluminum	>UL	AC
	Iron	>UL	AC

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD was performed in place of a laboratory duplicate. Sample locations associated with MS/MSD recoveries exhibiting an RPD greater than of the control limit presented in the following table.

Sample Locations	Compound
AMW-1 (0-2)	Calcium
	Magnesium

The criteria used to evaluate the RPD between the MS/MSD recoveries are presented in the following table. In the case of an RPD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Aluminum	1340	1430	6.4 %
	Arsenic	1 J	0.9 J	AC
	Barium	4.83	4.63	4.2 %
	Beryllium	0.042 J	0.068 J	AC
	Cadmium	0.075 J	0.099 J	AC
	Calcium	304	245	21.4 %
	Chromium	2.88	2.21	26.3 %
	Cobalt	0.667	0.786	16.3 %
	Copper	1.6	2	22.2 %
	Iron	2130	2120	0.4 %
	Lead	2.5	3.6	36.0 %
	Magnesium	370	331	11.1 %
	Manganese	21.1	22	4.1 %
	Nickel	1.9 J	1.88 J	AC
	Potassium	247	249	.8 %
	Sodium	53.7 J	49.8 J	AC
	Vanadium	3.78	2.89	26.6 %
	Zinc	6.6	6.5	1.5 %

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

All serial dilutions were within control limits, with the exception of the analytes presented in the following table. The sample locations associated with the deviant %D are also presented in the following table.

Sample Locations	Analytes	Serial Dilution (%D)
AMW-1 (0-2)	Potassium	11%
AMW-4 (4-6)	Lead	21%
	Nickel	21%
	Potassium	11%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

8. Furnace Analysis QC

No furnace analyses were performed on the samples.

9. Method of Standard Additions (MSA)

No samples were analyzed following the method of standard additions.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Total Organic Carbon by Lloyd Kahn	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of greater than 12.
	Soil		Cool to 4°C±2°C.
Ferrous Iron by SM3500FE	Leachate	24 hours from collection to analysis	Cool to 4°C±2°C.
Sulfate by D-516-90	Leachate	28 days from collection to analysis	Cool to 4°C±2°C.

The analyses that exceeded the holding are presented in the following table.

Sample Locations	Holding Time	Criteria
AMW-1 (0-2) AMW-1 (2-4) AMW-1 (4-6) AMW-2 (0-2) AMW-2 (4-6) AMW-2 (2-4) MW-31D-1R (0-2) MW-31D-1R (2-4) MW-31D-1R (4-6) MW-31D-2R (2-4) MW-31D-2R (4-6) MW-31D-2R (6-8) DUP-111710 AMW-4 (2-4) AMW-4 (4-6) AMW-4 (6-8) AMW-5 (2-4) AMW-5 (4-6) AMW-5 (6-8) AMW-6 (2-4) AMW-6 (4-6) AMW-6 (6-8)	>48 hours	<24 hours

Sample results associated with sample locations analyzed by analytical method SW-846 8260 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All calibration standard recoveries were within the control limit.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier will be removed.

All analytes associated with MS recoveries were within control limits with the exception of the following analytes present in the table below.

Sample Location	Analytes	MS Recovery
AMW-6 (6-8)	Ferrous iron	73%

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified.

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery <30%	Non-detect	R
	Detect	J
MS percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate recoveries exhibited acceptable RPD.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Total Organic Carbon	3760	1300	97.2 %
	Sulfate	131	136	3.7 %

U = Not detected
AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Special Instructions/ Conditions of Receipt

218/2524

Possible Hazard Identification
☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal
☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months (A fee may be assessed if samples are retained longer than 1 month)

Turn Around Time Required
☐ 24 Hours ☐ 48 Hours ☐ 7 Days ☐ 14 Days ☐ 21 Days ☐ Other _____

QC Requirements (Specify)

	Date	Time		Date	Time
1. Relinquished By	11-17-10	1700	1. Received By	11/18/10	0945
2. Relinquished By			2. Received By		
3. Relinquished By			3. Received By		

Comments

Report: #13973R
Review Level: Tier III
Project: B0047517.0004.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # J1108 for samples collected in association with the Chevron – Former Gulf Oil Terminal Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) USEPA SW-846 Method 8260, 8270 and RSK-175. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	14 days from collection to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.
All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
TB3-012111	CCV %D	Dichlorodifluoromethane	37.0%
		1,1,2-Trichloro-1,2,2-trifluoroethane	32.5%
		Acetone	78.6%
		Methyl acetate	36.1%
		2-Butanone	46.4%
		Cyclohexane	22.2%
		Carbon tetrachloride	21.3%
		4-Methyl-2-pentanone	27.0%
		2-Hexanone	50.6%
MW-30D1-12411 DUP-12411 MW-26-D2-12511 MW-30UD-12511 MW-29UD-12511 MW-29-D2-12511 MW-29-D1-12511 MW-28-D1-12511 MW-28-D2-12511 TB-12411	CCV %D	Chloroethane	-24.6%
		Acetone	72.3%
		Methyl acetate	33.0%
		2-Butanone	41.2%
		1,2-Dichloroethane	21.9%
		4-Methyl-2-pentanone	25.2%
		2-Hexanone	43.6%
MW-31D-1R-012111 MW-31D-2R-012111 MW-25-D3-012111 MW-26-D1-12511	CCV %D	1,1,2-Trichloro-1,2,2-trifluoroethane	28.7%
		Acetone	86.2%
		2-Butanone	32.1%
		Cyclohexane	24.7%
		Carbon tetrachloride	21.5%
		1,2-Dichloroethane	20.1%
		4-Methyl-2-pentanone	23.3%
		2-Hexanone	38.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
MW-25-D3-012111	1,2-Dichloroethane	>UL	>UL

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-30D1-12411/ DUP-12411	1,1-Dichloroethane	2	2	0.0 %
	Benzene	81	87	7.1 %
	Cyclohexane	1.4	1.6	13.3 %
	Ethylbenzene	1.8	1.8	0.0 %
	Isopropylbenzene	0.97 J	1.1	AC
	Methyl tert-butyl ether	680	680	0.0 %
	Toluene	0.55 J	0.56 J	AC

AC Acceptable
U Not detected

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

Sample results associated with compounds that exhibited a concentration greater than the linear range of the instrument calibration and/or exhibited higher concentration of a detected compound in the methanol-extracted analysis are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-30D1-12411	Methyl tert-butyl ether	560 E	680 D	680 D
DUP-12411	Methyl tert-butyl ether	540 E	680 D	680 D
MW-29-D1-12511	Benzene	120 E	130 D	130 D
	Methyl tert-butyl ether	470 E	550 D	550 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
MW-28-D2-12511	Phenol-d6	AC
	2-Fluorophenol	AC
	2,4,6-Tribromophenol	<LL but > 10%
	Nitrobenzene-d5	AC
	2-Fluorobiphenyl	AC
	Terphenyl-d14	AC
MW-31D-1R-012111	Phenol-d6	AC
	2-Fluorophenol	AC
	2,4,6-Tribromophenol	AC
	Nitrobenzene-d5	<LL but > 10%
	2-Fluorobiphenyl	AC
	Terphenyl-d14	AC
AMW-4-12611 AMW-5-12611 AMW-11-12611 P-18R-12711	Phenol-d6	AC
	2-Fluorophenol	AC
	2,4,6-Tribromophenol	> UL
	Nitrobenzene-d5	AC
	2-Fluorobiphenyl	AC
	Terphenyl-d14	AC

UL Upper control limit
LL Lower control limit
D Diluted
AC Acceptable

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the SVOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
MW-25-D3-012111	Bis(2-ethylhexyl) phthalate	<LL but > 10%	<LL but > 10%

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J

Control Limit	Sample Result	Qualification
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

8. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Acenaphthene	15	15	0.0 %
	Anthracene	0.74 J	0.63 J	AC
	Carbazole	7.5	7.7	2.6 %
	Dibenzofuran	2.1 J	2.3 J	AC
	Di-n-butyl phthalate	0.39 J	0.33 J	AC
	Naphthalene	0.92 J	1 J	AC
	Phenanthrene	6.5	6.6	1.5 %

AC Acceptable
U Not detected

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

Sample results associated with compounds that exhibited a concentration greater than the linear range of the instrument calibration and/or exhibited higher concentration of a detected compound in the methanol-extracted analysis are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
AMW-11-12611	Acenaphthene	180 E	160 D	160 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL GC ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
RSK-175	Water	14 days from collection to extraction to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

3.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-30D1-12411 DUP-12411 MW-26-D2-12511 MW-26-D1-12511	CCV %D	Methane	-21.6%

Sample Locations	Initial/Continuing	Compound	Criteria
MW-29-D2-12511 MW-29-D1-12511 MW-28-D1-12511 MW-28-D2-12511			
AMW-4-12611 AMW-5-12611 AMW-11-12611 AMW-DR-12611 AMW-7-12611 P-18R-12711 MW-33D-12711 MW-35D-12711 MW-30UD-12511 MW-29UD-12511	CCV %D	Methane	-28.6%
		Ethane	-20.7%
		Ethene	-18.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

7. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Methane	1.7	1.2	34.4 %

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

9. Compound Identification

Sample results associated with compounds that exhibited a concentration greater than the linear range of the instrument calibration and/or exhibited higher concentration of a detected compound in the methanol-extracted analysis are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-30UD-12511	Methane	56 E	57 D	57 D
MW-29-D1-12511	Methane	12000 E	16000 D	16000 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) SW-846 Methods 6000/7000, 310.2, 350.1, 353.2, SM2540, SM4500 P E, SM4500 S2 D, D-516-90, and SM5310 D. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.
SW-846 7470	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-31D-1R-012111 MW-31D-2R-012111 MW-25-D3-012111	Copper (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL
MW-30D1-12411 DUP-12411 MW-26-D2-12511 MW-30UD-12511 MW-29UD-12511 MW-26-D1-12511 MW-29-D2-12511 MW-28-D1-12511	Aluminum (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL

Sample Locations	Analytes	Sample Result	Qualification
MW-30D1-12411 DUP-12411 MW-30UD-12511 MW-29UD-12511 MW-29-D2-12511	Aluminum (Total)	Detected sample results <RL and <BAL	"UB" at the RL
MW-29-D1-12511 MW-28-D1-12511	Aluminum (Total)	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table.

All analytes associated with CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW-25-D3-012111	Silver (Total)	132%	131%
MW-26-D2-12511	Silver (Dissolved)	133%	128%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD was performed in place of a laboratory duplicate.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Barium	0.044	0.044	0.0 %
	Cadmium	0.0006 J	0.00079 J	AC
	Calcium	107	107	0.0 %
	Chromium	0.0039 J	0.0037 J	AC
	Cobalt	0.0011 J	0.00093 J	AC
	Copper	0.003 J	0.0025 J	AC

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Iron	0.1	0.13	26.0 %
	Magnesium	283	279	1.4 %
	Manganese	0.094	0.093	1.0 %
	Potassium	113	114	0.8 %
	Sodium	2400	2400	0.0 %
	Vanadium	0.0052	0.0054	3.7 %
	Zinc	0.0037 J	0.0018 J	AC
	Barium, Dissolved	0.044	0.044	0.0 %
	Cadmium, Dissolved	0.00073 J	0.0006 J	AC
	Calcium, Dissolved	107	107	0.0 %
	Chromium, Dissolved	0.0032 J	0.0036 J	AC
	Cobalt, Dissolved	0.00084 J	0.004	AC
	Copper, Dissolved	0.0015 J	0.0021 J	AC
	Magnesium, Dissolved	277	281	1.4 %
	Manganese, Dissolved	0.086	0.086	0.0 %
	Potassium, Dissolved	114	114	0.0 %
	Sodium, Dissolved	2230	2450	9.4 %
	Vanadium, Dissolved	0.0055	0.0045 J	AC

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

All serial dilutions were within control limits, with the exception of the analytes presented in the following table. The sample locations associated with the deviant %D are also presented in the following table.

Sample Locations	Analytes	Serial Dilution (%D)
MW-25-D3-012111	Magnesium (Total)	12%
	Sodium (Total)	14%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

8. General Assessment

The calculated %D between the total and the dissolved sample results were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes	%D
MW-29-D2-12511	Magnesium	36.1%
AMW-DR-12611	Calcium	17.4%

The criteria used to evaluate total and dissolved %D are presented in the following table. In the case of a total and dissolved %D deviation, the sample results are qualified. The qualifications are applied to the all sample results associated with this SDG.

Sample Concentration	Control Limit	Sample Result	Qualification
Dissolved sample concentration > total sample concentration and > CRDL	>10%	Non-detect	UJ
		Detect	J
Dissolved sample concentration > total sample concentration and > CRDL	>50%	Non-detect	R
		Detect	R

9. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by 310.2	Water	14 days from collection to analysis	Cool to 4°C+2°C.
Ammonia by 350.1	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Nitrate-N by 353.2	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Nitrite by 353.2	Water	48 hours from collection to analysis	Cool to 4°C+2°C.
Total dissolved solids by SM2540	Water	7 days from collection to analysis	Cool to 4°C+2°C.
Orthophosphate by SM4500 P E	Water	48 hours from collection to analysis	Cool to 4°C+2°C.
Sulfide by SM4500 S2 D	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
Dissolved organic carbon by SM5310 D	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Sulfate by D-516-90	Water	28 days from collection to analysis	Cool to 4°C±2°C.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Holding Time	Criteria
Orthophosphate: MW-30D1-12411 DUP-12411 AMW-4-12611 AMW-5-12611 AMW-11-12611 AMW-DR-12611 AMW-7-12611	50-52 hours	<48 hours

Sample results associated with sample locations analyzed by analytical methods SM4500 P E were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
DUP-12411 AMW-4-12611 AMW-7-12611 P-18R-12711	Sulfate	Detected sample results <RL and <BAL	"UB" at the RL
AMW-5-12611 AMW-11-12611	Sulfate	Detected sample results >RL and <BAL	"UB" at detected sample concentration
MW-29-D2-12511	Alkalinity, total Alkalinity, bicarbonate	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All analytes associated with calibration standard recoveries were within control limits, with the exception of the analytes presented in the following table.

Sample Locations	Initial/Continuing	Analytes	Standard Recovery
MW-29-D1-12511 MW-28-D1-12511 MW-28-D2-12511	CCV	Nitrite	81%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Analytes	Control Limit	Sample Result	Qualification
All analytes except mercury	75% to 89%	Non-detect	UJ
		Detect	J
	111% to 125%	Non-detect	No Action
		Detect	J
	<75%	Non-detect	R
		Detect	J
	>125%	Non-detect	No Action
		Detect	R

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW-25-D3-012111	Dissolved organic carbon	49%	61%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times

the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate recoveries exhibited acceptable RPD.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-31D-2R (4-6)/ DUP-111710	Alkalinity, Bicarbonate	939	898	4.4 %
	Alkalinity, Total	939	898	4.4 %
	Ammonia as N	8	7.7	3.8 %
	Total Dissolved Solids	7950	7550	5.1 %
	Orthophosphate	0.29	0.27	7.1 %
	Sulfide	0.19	0.52	92.9 %
	Dissolved Organic Carbon	12.3	12.8	3.9 %

U = Not detected
AC = Acceptable

The analyte sulfide associated with samples locations MW-31D-2R (4-6) and DUP-111710 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Chevron – Former Gulf Oil Terminal

Data Usability Summary Report

OCEANSIDE, NEW YORK

Volatile, Semivolatile, Metals and Miscellaneous Analyses

SDG#J3544

Analyses Performed By:
TestAmerica
Amherst, New York

Report: #14101R
Review Level: Tier III
Project: B0047517.0004.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # J3544 for samples collected in association with the Chevron – Former Gulf Oil Terminal Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
					VOC	SVOC	PCB	MET	MISC
MW-P10	480-3544-1	Water	4/7/2011		X			X	X
MW-30D-2	480-3544-2	Water	4/7/2011		X			X	X
DUP 040711	480-3544-3	Water	4/7/2011	MW-30D-2	X			X	X
TRIP BLANK	480-3544-4	Water	4/7/2011		X			X	X

Note:
1. Miscellaneous parameters include chloride.
2. Matrix spike/matrix spike duplicate (MS/MSD) was performed on sample location MW-P10.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) USEPA SW-846 Method 8260. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	14 days from collection to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.
All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-30D-2 DUP 040711 TRIP BLANK	CCV %D	Dichlorodifluoromethane	27.5%
		Trichlorofluoromethane	27.7%
		1,1,1-Trichloroethane	28.8%
MW-P10	CCV %D	Bromomethane	51.1%
		Methyl acetate	31.7%
		1,1,1-Trichloroethane	28.2%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
MW-P10	1,1-Dichloroethane	>UL	>UL

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-30D-2/ DUP 040711	Methyl tert-butyl ether	1 U	0.42 J	AC

AC Acceptable
U Not detected

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) SW-846 Methods 6000/7000 and SM4500 Cl-. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.
SW-846 7470	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-30D-2	Iron (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table.

All analytes associated with CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD was performed in place of a laboratory duplicate.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-30D-2/ DUP 040711	Aluminum	0.55	0.38	36.5 %
	Arsenic	0.0061 J	0.01 U	AC
	Barium	0.047	0.047	0.0 %
	Cadmium	0.001	0.0012	18.1 %
	Calcium	133	134	0.7 %
	Chromium	0.0056	0.0051	9.3 %
	Cobalt	0.00086 J	0.001 J	AC
	Copper	0.0032 J	0.0016 J	AC
	Iron	0.5	0.38	27.2 %
	Lead	0.0036 J	0.005 U	AC
	Magnesium	304	303	0.3 %
	Manganese	0.15	0.15	0.0 %
	Nickel	0.0014 J	0.01 U	AC
	Potassium	123	123	0.0 %
	Sodium	2900	2870	1.0 %
	Vanadium	0.0042 J	0.0047 J	AC
	Zinc	0.0044 J	0.0023 J	AC
	Barium, Dissolved	0.047	0.047	0.0 %
	Cadmium, Dissolved	0.00089 J	0.00066 J	AC
	Calcium, Dissolved	138	137	0.7 %
	Chromium, Dissolved	0.0031 J	0.0026 J	AC
	Magnesium, Dissolved	315	310	1.6 %
	Manganese, Dissolved	0.15	0.15	0.0 %
	Nickel, Dissolved	0.01 U	0.0013 J	AC
	Potassium, Dissolved	138	138	0.0 %
	Sodium, Dissolved	2940	2890	1.7 %
	Vanadium, Dissolved	0.0035 J	0.0036 J	AC
	Zinc, Dissolved	0.0025 J	0.0019 J	AC

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

All serial dilutions were within control limits.

8. General Assessment

The calculated %D between the total and the dissolved sample results were within the control limit.

9. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Chloride by SM4500 Cl E	Water	28 days from collection to analysis	Cool to 4°C+2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (J). No other qualification of the sample results was required.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All analytes associated with calibration standard recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate recoveries exhibited acceptable RPD.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-30D-2/ DUP 040711	Chloride	5720	5620	1.7 %

U = Not detected
AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Chevron – Former Gulf Oil Terminal

Data Usability Summary Report

OCEANSIDE, NEW YORK

Volatile, Semivolatile, Metals and Miscellaneous Analyses

SDG#480-972

Analyses Performed By:
TestAmerica
Amherst, New York

Report: #14173R
Review Level: Tier III
Project: B0047517.0004.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) # 480-972 for samples collected in association with the Chevron – Former Gulf Oil Terminal Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) USEPA SW-846 Method 8260, 8270 and RSK-175. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	14 days from collection to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No qualification of the sample results was required.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.
All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-25VD MW-24-D2 MW-24-D1 MW-25-D1 MW-25-D2 TRIP BLANK 1/19/11	CCV %D	Carbon tetrachloride	-22.9%
		Trans-1,3-Dichloropropene	-22.4%
		Bromoform	-30.1%
MW-23D-1R MW-24VD MW-32D	CCV %D	Dichlorodifluoromethane	23.7%
		1,1,2-Trichloro-1,2,2-trifluoroethane	25.6%
AMW-10-012011 AMW-9-012011 AMW-8-012011	CCV %D	Acetone	67.1%
		Methyl acetate	25.4%
		2-Butanone	44.7%
		4-Methyl-2-pentanone	31.9%
		2-Hexanone	64.0%
AMW-1-012011 AMW-2-012011 TB-3-012011 AMW-3-012011	CCV %D	Trichlorofluoromethane	25.0%
		1,1,2-Trichloro-1,2,2-trifluoroethane	28.5%
		Acetone	73.9%
		Methyl acetate	31.9%
		2-Butanone	49.5%
		1,1,1-Trichloroethane	21.4%
		Carbon tetrachloride	23.6%
		4-Methyl-2-pentanone	27.4%
		2-Hexanone	50.4%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

[1] RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-23D-2R-012011/ DUP-1-20-11	Carbon disulfide	1.3	1.2	AC
	Methyl tert-butyl ether	200	190	5.1%
	Vinyl chloride	7.8	6.5	18.2%

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

Sample results associated with compound that exhibited a concentration greater than the linear range of the instrument calibration are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-25VD	Trichloroethene	190 E	180 D	180 D
MW-24-D2	cis-1,2-Dichloroethene	900 E	1200 D	1200 D
	Methyl tert-butyl ether	240 E	280 D	280 D
	Vinyl chloride	280 E	300 D	300 D
MW-24-D1	cis-1,2-Dichloroethene	1700 E	7400 D	7400 D
	Methyl tert-butyl ether	760 E	1100 D	1100 D
	Vinyl chloride	1300 E	1800 D	1800 D
MW-25-D1	cis-1,2-Dichloroethene	1600 E	5100 D	5100 D
	Methyl tert-butyl ether	700 E	960 D	960 D
	Methylene chloride	260 E	340 D	340 D
	Trichloroethene	110 E	110 D	110 D

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
	Vinyl chloride	2300 E	5900 D	5900 D
MW-25-D2	cis-1,2-Dichloroethene	1500 E	3500 D	3500 D
	Methyl tert-butyl ether	130 E	400 U	130 EJ
	Methylene chloride	1800 E	3700 D	3700 D
	Trichloroethene	2500 E	17000 D	17000 D
	Vinyl chloride	140 E	400 U	140 EJ
MW-23D-1R	Methyl tert-butyl ether	140 E	100 D	100 D
MW-23D-2R-012011	Methyl tert-butyl ether	180 E	200 D	200 D
DUP-1-20-11	Methyl tert-butyl ether	170 E	190 D	190 D
AMW-10-012011	cis-1,2-Dichloroethene	92000 E	240000 D	240000 D
	Trichloroethene	50000 E	58000 D	58000 D
	Vinyl chloride	19000 E	20000 D	20000 D
AMW-9-012011	cis-1,2-Dichloroethene	88000 E	98000 D	98000 D
AMW-2-012011	Xylenes	6700 E	7200 D	7200 D
AMW-8-012011	cis-1,2-Dichloroethene	29000 E	29000 D	29000 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-23D-2R-012011 DUP-1-20-11 AMW-10-012011 AMW-1-012011 AMW-9-012011 AMW-8-012011	Bis(2-ethylhexyl) phthalate	Detected sample results <RL and <BAL	"UB" at the RL

RL Reporting limit

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
AMW-3-012011	Phenol-d6	AC
	2-Fluorophenol	AC
	2,4,6-Tribromophenol	>UL
	Nitrobenzene-d5	AC
	2-Fluorobiphenyl	AC
	Terphenyl-d14	AC

UL Upper control limit
AC Acceptable

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the SVOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

A MS/MSD analysis was not performed on a sample location associated with this SDG.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-23D-2R-012011/ DUP-1-20-11	Acenaphthene	1.3 J	1.2 J	AC
	Carbazole	0.50 J	0.52 J	AC
	Di-n-butyl phthalate	0.41 J	0.53 J	AC
	Dibenzofuran	0.53 J	0.54 J	AC
	Fluorene	0.54 J	0.58 J	AC

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL GC ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
RSK-175	Water	14 days from collection to extraction to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

3.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99.

3.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-25-D2 MW-24-D2 MW-24-D1 MW-25-D1	CCV %D	Methane	-15.7%

Sample Locations	Initial/Continuing	Compound	Criteria
MW-25VD			
MW-23D-1R MW-24VD MW-32D	CCV %D	Methane	-29.5%
MW-23D-2R-012011 DUP-1-20-11 AMW-10-012011 AMW-1-012011 AMW-9-012011 AMW-2-012011	CCV %D	Methane	15.2%
		Ethene	18.1%
		Ethane	18.0%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
AMW-3-012011	Ethene	AC	>UL

AC = Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration (D).	Detect	No Action
	Non-detect	

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-23D-2R-012011 AMW-3-012011 AMW-10-012011 AMW-1-012011 AMW-9-012011 AMW-2-012011 AMW-8-012011 DUP-1-20-11	Ethene	>UL	NA

NA – Not analyzed

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent

sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-23D-2R-012011/ DUP-1-20-11	Methane	420	1400	107.7%

AC Acceptable

The compound methane associated with sample locations MW-23D-2R-012011and DUP-1-20-11 exhibited a field duplicate RPD greater than the control limit. The associated sample results from sample locations for the listed analyte were qualified as estimated.

7. Compound Identification

Sample results associated with compounds that exhibited a concentration greater than the linear range of the instrument calibration and/or exhibited higher concentration of a detected compound in the methanol-extracted analysis are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-27-D2	Methane	200 E	210 D	210 D
MW-26VD	Methane	520 E	260 D	260 D
MW-27-D1	Methane	1100 E	9300 D	9300 D
MW-25VD	Methane	290 E	330 D	330 D
MW-24-D2	Methane	1000 E	1100 D	1100 D
MW-24-D1	Methane	3000 E	1900 D	1900 D
	Ethene	120 E	110 D	110 D
MW-25-D1	Methane	2800 E	4200 D	4200 D
MW-25-D2	Methane	1100 E	2700 D	2700 D
MW-23D-1R	Methane	1100 E	7800 D	7800 D
MW-24VD	Methane	1400 E	170 D	170 D
MW-32D	Methane	280 E	1700 D	1700 D
AMW-10-012011	Methane	4900 E	3700 D	3700 D
AMW-3-012011	Methane	16000 E	12000 D	12000 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) SW-846 Methods 6000/7000, 310.2, 350.1, 353.2, SM2540, SM4500 P E, SM4500 S2 D, D-516-90, and SM5310 D. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

    U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

    B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

    E The reported value is estimated due to the presence of interference.

    N Spiked sample recovery is not within control limits.

    * Duplicate analysis is not within control limits.

- Validation Qualifiers

    J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

    UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

    UB Analyte considered non-detect at the listed value due to associated blank contamination.

    R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.
SW-846 7470	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-27-D2	Beryllium (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL
MW-26VD	Cadmium (Total)	Detected sample results <RL and <BAL	"UB" at the RL
	Manganese (Total)	Detected sample results >RL and <BAL	"UB" at detected sample concentration
	Manganese (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL
MW-23D-2R-012011 DUP-1-20-11 AMW-10-012011	Aluminum (Dissolved)	Detected sample results <RL and <BAL	"UB" at the RL

Sample Locations	Analytes	Sample Result	Qualification
AMW-1-012011 AMW-9-012011 AMW-8-012011 AMW-3-012011			

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table.

All analytes associated with CRDL standard recoveries were within control limits with the exception of the analytes presented in the following table.

Sample Locations	Analytes	CRDL Recovery
MW-27-D2 (Total) MW-26VD (Total) MW-27-D1 (Total)	Antimony	66%
MW-23D-2R-012011 (Dissolved) DUP-1-20-11 (Dissolved) AMW-10-012011 (Dissolved) AMW-1-012011 (Dissolved) AMW-9-012011(Dissolved) AMW-2-012011 (Dissolved) AMW-8-012011 (Dissolved) AMW-3-012011 (Dissolved)	Selenium	61%
MW-23D-2R-012011 (Total) DUP-1-20-11 (Total) AMW-10-012011 (Total) AMW-1-012011 (Total) AMW-9-012011(Total) AMW-2-012011 (Total) AMW-8-012011 (Total) AMW-3-012011 (Total)	Mercury	131%

The criteria applied to evaluate the CRDL Standard criteria are presented below. In the case of a calibration deviation, the sample results are qualified.

CRDL Standard Recovery Criteria			
Analytes	**Control Limit**	**Sample Result**	**Qualification**
All analytes, with the exception of Al, Ba, Ca, Fe, Mg, Na, and K	CRDL %R <50% (<30% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	R
		Non-detect sample results	R
		Detected sample results ≥ 2x CRDL	J
	CRDL %R 50-69% (30-49% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	J
		Non-detect sample results	UJ
		Detected sample results ≥ 2x CRDL	No Action
	%R >130% but <180% (>150% but <200% for Sb, Pb, Tl)	Sample results ≥ MDL but <2x CRDL	J
		Non-detect sample results	No Action
		Detected sample results ≥ 2x CRDL	No Action
	CRI %R >180% (>200% for Sb, Pb, Tl)	Sample results ≥ MDL	R

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate

sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water

matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD was performed in place of a laboratory duplicate.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-23D-2R-012011/ DUP-1-20-11 (Total)	Barium	110	110	0%
	Cadmium	0.58 J	0.64 J	AC
	Calcium	166000	163000	1.8%
	Chromium	2 J	1.9 J	AC
	Iron	65	60	AC
	Magnesium	286000	284000	0.7%
	Manganese	890	850	4.5%
	Potassium	95100	95400	0.3%
	Sodium	2570000	2550000	0.7%
	Vanadium	11	10	AC
MW-23D-2R-012011/ DUP-1-20-11 (Dissolved)	Arsenic, Dissolved	9.5 J	7.2 J	AC
	Barium, Dissolved	120	120	0%
	Cadmium, Dissolved	0.62 J	0.65 J	AC
	Calcium, Dissolved	185000	186000	0.5%
	Chromium, Dissolved	3.8 J	4	AC
	Cobalt, Dissolved	1.1 J	0.77 J	AC
	Iron, Dissolved	75	87	AC
	Magnesium, Dissolved	319000	326000	2.1%
	Manganese, Dissolved	880	910	3.3%
	Potassium, Dissolved	107000	108000	0.9%
	Sodium, Dissolved	2990000	3030000	1.3%
	Vanadium, Dissolved	6.8	6.7	AC

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution exhibited a %D within the control limit.

8. General Assessment

The calculated %D between the total and the dissolved sample results were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes	%D
MW-23D-2R-012011	Calcium	13.5%
	Magnesium	14.8%
	Potassium	13.2%
	Sodium	17.3%
DUP-1-20-11	Calcium	13.2%
	Magnesium	13.8%
	Potassium	12.4%
	Sodium	17.2%
AMW-3-012011	Magnesium	11.2%

The criteria used to evaluate total and dissolved %D are presented in the following table. In the case of a total and dissolved %D deviation, the sample results are qualified. The qualifications are applied to the all sample results associated with this SDG.

Sample Concentration	Control Limit	Sample Result	Qualification
Dissolved sample concentration > total sample concentration and > 5x RL	>10%	Non-detect	UJ
		Detect	J
Dissolved sample concentration > total sample concentration and > 5x RL	>50%	Non-detect	R
		Detect	R

9. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by 310.2	Water	14 days from collection to analysis	Cool to 4°C+2°C.
Ammonia by 350.1	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Nitrate-N by 353.2	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Nitrite by 353.2	Water	48 hours from collection to analysis	Cool to 4°C+2°C.
Total dissolved solids by SM2540	Water	7 days from collection to analysis	Cool to 4°C+2°C.
Orthophosphate by SM4500 P E	Water	48 hours from collection to analysis	Cool to 4°C+2°C.
Sulfide by SM4500 S2 D	Water	7 days from collection to analysis	Zinc acetate; preserved to a pH of greater than 9
Dissolved organic carbon by SM5310 D	Water	28 days from collection to analysis	Cool to 4°C+2°C; preserved to a pH of less than 2.
Sulfate by D-516-90	Water	28 days from collection to analysis	Cool to 4°C$\pm$2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
AMW-10-012011 AMW-9-012011 AMW-8-012011 AMW-3-012011	Sulfate	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All calibration standard recoveries were within the control limit.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW-27-D1	Sulfide	< 30%	NA

NA- Not Analyzed

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate recoveries exhibited acceptable RPD.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-23D-2R-012011/ DUP-1-20-11	Alkalinity, Bicarbonate	717	725	1.1%
	Alkalinity, Total	717	725	1.1%
	Ammonia as N	3.3	3.7	11.4%
	Sulfate	436	438	0.5%
	Total Dissolved Solids	9010	8600	4.7%
	Orthophosphate	0.52	0.43	18.9%
	Sulfide	18.8	19.2	2.1%
	Dissolved Organic Carbon	11.2	11.0	1.8%

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

1. Introduction

On behalf of Chevron Environmental Management Company (CEMC), ARCADIS U.S., Inc. (ARCADIS) is submitting this Interim Remedial Measure Completion Report (IRM Completion Report) to the New York State Department of Environmental Conservation (NYSDEC) in accordance with the Order on Consent and Administrative Settlement for the former Gulf Oil Terminal located in Oceanside, Township of Hempstead, New York (Site; NYSDEC Site #130165).

This IRM Completion Report identifies methodologies and tactics that were used during the implementation of IRM and IRM Addendum activities, and is organized into the following five sections:

- Section 1 – Introduction
- Section 2 – Project Organization and Responsibilities
- Section 3 – Summary of Interim Remedial Measure Activities
- Section 4 – Conclusions and Recommendations
- Section 5 – Remedial Costs Incurred
- Section 6 – References

1.1 Site Description and History

1.1.1 Site Description

The 7.2-acre site is located at 1 Industrial Place in Oceanside, Township of Hempstead, Nassau County, New York. **Figure 1** presents a Site Location Map. The Site is currently unoccupied and former buildings have been demolished with the exception of a small shed and an adjacent former storm water retention basin located in the northeastern corner of the site.

The Site is bound to the south by Barnum's Channel, to the east by the Long Island Rail Road, to the north by the former Mobil Petroleum Terminal, and to the west by Hampton Road. An auto recycler, construction company yard and marine construction company office building are located west of Hampton Road. Daly Boulevard is located north of the former Mobil Petroleum Terminal and another petroleum terminal (Sprague) is located north of Daly Boulevard.

1.1.2 Site History

The Site consists of three lots. In 1931, Gulf Oil Corporation developed a portion of the Site (Lot 504) as a petroleum terminal. Gulf Oil Corporation purchased Lots 503 and 502 in 1950 and 1956, respectively. Chevron acquired Gulf Oil Corporation in the mid-1980s. In 1986, Cumberland Farms, Inc. (CFI) purchased Chevron's northeast marketing assets. The purchase included the Oceanside Terminal, which was transferred to CFI in May 1986.

Operation of the petroleum terminal was ceased in the early 1990s. Demolition of the aboveground storage tanks (ASTs) at the former petroleum terminal was completed in 2003. The remaining on-site buildings (maintenance building, office building, and several small buildings associated with historical petroleum terminal operations) were demolished in 2005. The Site is currently vacant and **Figure 2** presents former historical structures.

The Site has undergone extensive investigation and remediation since the 1990s under NYSDEC oversight (Spill No. 92-03883). In January 2007, NYSDEC accepted Lowe's Home Centers, Inc. (Lowe's) as a volunteer under the Brownfield Cleanup Program (BCP) – Site No. C130165. Following Lowe's decision to withdraw from the BCP in 2009, NYSDEC transferred the Site into the Hazardous Waste Program (State Superfund Site). An Order on Consent and Administrative Settlement was executed between the NYSDEC and CEMC on December 23, 2009 (Index #W3-1142-09-08, Site #130165).

1.2 Interim Remedial Measure Remedial Action Objectives

The IRM and IRM Addendum were proposed as initial components of the remediation strategy to be implemented at the Site for remediation of source areas. The goal of the IRM and IRM Addendum were to excavate and/or stabilize, to the extent practicable, the soil impacts identified within a limited pre-defined area encompassing the former Vapor Recovery Unit (VRU) and three additional small areas unrelated to the VRU area, which warranted remediation such that a No Further Action (NFA) determination may be issued with regard to soil at the site.

The IRM objectives for soil were as follows:

- prevent ingestion/direct contact with impacted soil
- prevent inhalation of or exposure to constituents of concern (COCs) volatilizing from impacted soil

- prevent migration of COCs that would result in groundwater or surface-water impacts

- prevent impacts to biota from ingestion/direct contact with soil causing toxicity or impacts from bioaccumulation through the terrestrial food chain

Available data indicated that implementation of a soil excavation IRM at the Site was appropriate to address an anticipated source area of impacted soil that would likely be encountered during the commercial redevelopment of the Site. Excavation and removal of impacted soil served to protect human health and the environment through contaminant mass removal and elimination or control of potential exposure.

2. Project Organization and Responsibilities

2.1 Chevron Environmental Management Company

In accordance with the Order on Consent and Administrative Settlement for the site (NYSDEC Site #130165), CEMC is responsible for the implementation of the IRM activities for the site.

2.2 ARCADIS

ARCADIS was retained by CEMC to provide remedial investigation, engineering, design, and IRM construction oversight associated with this project. In addition, during implementation of IRM Addendum activities, ARCADIS provided labor and equipment to implement removal and restoration activities.

2.3 Remedial Construction Services, Inc.

Remedial Construction Services, Inc. (RECON) provided labor and equipment to implement removal and restoration activities for the initial IRM activities.

2.4 Waste Management, Inc.

Waste Management, Inc. (WM) provided off-site transportation and disposal services for non-hazardous waste materials generated at the Site during IRM activities.

2.5 Heritage Environmental Services, LLC

Heritage Environmental Services, LLC (Heritage) provided off-site transportation, treatment and disposal services for hazardous waste materials generated at the Site during IRM activities.

2.6 TestAmerica Laboratories, Inc.

TestAmerica Laboratories, Inc. (TestAmerica) provided all laboratory analytical services for the project.

2.7 New York State Department of Environmental Conservation

The NYSDEC served as the primary regulatory agency for this project and interacted and communicated with CEMC and ARCADIS to confirm compliance with the approved *Interim Remedial Measure Work Plan* (IRM Work Plan; ARCADIS 2012).

3. Summary of Interim Remedial Measure Activities

During IRM and IRM Addendum activities, ARCADIS documented Site activities by completing Daily Reports, which included photographic documentation of Site activities. **Appendix A** provides copies of the Daily Reports (with photographs) for IRM and IRM Addendum activities. A summary of IRM activities completed at the site is presented below.

3.1 Pre-Mobilization Activities

The pre-mobilization activities are presented below.

3.1.1 Permitting

ARCADIS acquired the following required permits and approvals during pre-design activities for implementation of the IRM in accordance with all applicable federal, state and local rules/regulations.

3.1.1.1 *Stormwater Pollution Prevention Plan*

ARCADIS prepared a Stormwater Pollution Plan (SWPPP) under a separate cover for review by the NYSDEC in accordance with the New York State Pollutant Discharge Elimination System (SPDES) General Permit for Stormwater Discharges from Construction Activities (Permit No. GP-0-10-001).

The SWPPP was required due to the disturbance of 1 or more acres of land during construction. The SWPPP was implemented in the field by RECON utilizing best management practices in a manner consistent with the New York State Standards and Specifications for Soil Erosion and Sediment Control (SESC).

3.1.1.2 *Soil Erosion and Sediment Control Plan*

SESC were installed at the Site to minimize the potential for erosion and migration of excavated soil and to control precipitation and storm water runoff. Controls included silt fence and hay bales around the excavation, grading, and soil staging areas as illustrated on **Figure 3**.

3.1.1.3 *Local "Use" Permit*

The Township of Hempstead required a "Use" Permit be issued prior to commencement of work. ARCADIS submitted a completed application requesting approval of the planned remediation activities to the Township of Hempstead prior to implementation of the IRM activities. The duration of the Use Permit was extended, as needed, to accommodate the completion of the IRM and IRM Addendum excavations.

3.1.2 Wetland Jurisdictional Determination

Based on knowledge of the site and a search of NYSDEC records and/or other sources, ARCADIS has identified no jurisdictional wetlands present within the Limits of Work. ARCADIS submitted a letter requesting confirmation of these findings to USACE prior to implementation of the IRM activities. Although USACE subsequently issued a letter based on their preliminary jurisdictional determination confirming that a Department of the Army permit would not be required provided the work was executed in accordance with the referenced materials.

3.1.3 Qualifications of Imported Backfill Materials

Stoney Creek Industries, Inc., located in Oceanside, New York, was identified as the source for imported general fill materials. On November 12, 2013, samples of imported backfill were collected and submitted to TestAmerica for chemical analyses. Chemical analyses included volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), herbicides, and pesticides and were compared to the NYSDEC 6 New York Code, Rules, and Regulations Part 375 Unrestricted Use Soil Cleanup Objectives (SCOs) and Restricted Use-Commercial SCOs to confirm that the material was suitable to be placed within excavated areas. The laboratory analytical results of the backfill sampling indicated that the material was acceptable for use at the Site. **Appendix B** presents the analytical results, which are summarized in **Table 1**. The sampled material was imported to the Site and was utilized for IRM and IRM Addendum activities.

Benimax, Inc., located in Miller Place, New York was identified as the source for imported stone products. However, the only stone products used at the Site were washed products that did not contain any fine materials, so sampling was not required.

3.1.4 Monitoring Well Protection/Abandonment

Monitoring wells located in the VRU excavation area, including well cluster MW-25, and wells MW-24 VD, AMW-1, AMW-2, AMW-8, AMW-9, AMW-10, and IW-1, as well as monitoring well AMW-5, located within one of the IRM Addendum excavation areas, were all abandoned in accordance with the Groundwater Monitoring Well Decommissioning Procedures (NYSDEC 2009a) in preparation for the respective excavations.

3.2 Mobilization and Site Preparation Activities

Mobilization and site preparation activities are presented below.

3.2.1 Utilities Stakeout

Prior to initiation of ground-disturbance activities for IRM and IRM Addendum activities, Dig Safely New York was contacted to identify subsurface utilities near the limits of disturbance for each phase of the IRM. In addition, a geophysical survey was conducted prior to each phase of remedial activity to assist in locating utilities within the limits of disturbance. During the utility location for the IRM Addendum activities, an anomaly (i.e., possible utility) was identified in the GS-2/GP-NORTH excavation. ARCADIS hand cleared the area of the anomaly to verify that no utilities were present.

3.2.2 Locating Excavation Limits

Prior to initiation of each phase of excavation activities, American Engineering and Land Surveying mobilized to the Site and located the horizontal limits of each respective excavation, as identified in the IRM Work Plan and IRM Addendum Work Plan (ARCADIS 2012 and 2014, respectively).

During the IRM activities, the remedial contractor determined the vertical limits of excavation by establishing depth markings on the arm of the excavator, and documented the removal depth at each area of the excavation. During IRM Addendum activities, a tape measure was dropped over the side of the excavation to directly measure/document the depth of excavation.

3.2.3 Stormwater Pollution Prevention Plan Implementation

The stormwater pollution prevention plan (SWPPP) was implemented in accordance with the project SWPPP (ARCADIS 2013). The SWPPP consisted of silt fencing installed by RECON, under the direction of ARCADIS, around the areas of ground disturbance. The silt fence was installed on September 23 and 24, 2013, and removed from the immediate area of the IRM excavation area on February 20 and 21, 2014. Silt fence at the site perimeter remained in place in anticipation of IRM Addendum activities. Inspections were completed on a weekly basis by RECON and the inspection forms are provided in **Appendix C**. Due to the limited nature of IRM Addendum activities (i.e., less than 1 acre of disturbance), implementation of the SWPPP was not required.

3.3 Removal Activities

3.3.1 Interim Remedial Measure Activities

The former Vapor Recovery Unit (VRU) area measured approximately 60 feet by 65 feet, and was excavated to the final depth that varied from 9 to 14 feet below ground surface (bgs). The excavation was performed using a cement-bentonite slurry to minimize the need for dewatering and provide downward pressure to prevent water infiltration and failure of the minimal remaining clay zone above the lower sand. The cement-bentonite slurry was produced using a batch plant to mix dry materials with public water. Cement-bentonite slurry from the batch plant was transferred to a surge tank for additional mixing, which was then pumped into the excavation while excavation was occurring. The cement-bentonite slurry prevented the trench sides from collapsing by providing outward and downward pressure(s), which balanced the inward and upward hydraulic force(s) and reduced ground water flow into the trench.

Impacted material was excavated using traditional construction equipment to the limits shown on **Figures 3 and 4**. Excavated material was removed from the excavation, laid on drainage pads adjacent to the excavation and then loaded into trucks, and transported to the staging area for waste characterization sampling and analysis prior to subsequent off-site disposal. After sampling of the excavated soils was complete, they were covered with polyethylene sheeting to prevent storm water from contacting stockpiled waste materials. All stockpiles were kept covered with plastic and secured to minimize potential air emissions and to prevent erosion during rain events until loading and transportation to the designated waste facility.

3.3.2 Interim Remedial Measure Addendum Activities

The three IRM Addendum excavation areas were excavated to their respective final design depths using traditional soil excavation methods (i.e., cement-bentonite slurry was not utilized). The AMW-5 excavation measured 10 feet by 10 feet and was excavated to 9 feet bgs. The GS-2/GP-NORTH excavation measured 10 feet by 15 feet and was excavated to 4 feet bgs. The SP-6 excavation measured 5 feet by 5 feet and was excavated to 3 feet bgs. Impacted material was excavated using traditional construction equipment to the limits shown on **Figure 5**. Material was removed from the excavation, staged adjacent to the excavation, and then loaded into trucks for off-site disposal.

3.4 Materials Handling

All material excavated during IRM activities was staged on site allowing for drainage, the addition and mixing of solidification amendment, and waste classification (as discussed below). Upon approval from the waste disposal facility, the staged material was placed into transport vehicles and transported to the appropriately licensed off-site disposal facility. Solidification amendment consisted of mixing Portland cement with the excavated material to verify the material would pass the paint filter test prior to load out.

For IRM Addendum activities, the waste materials were characterized prior to excavation. However, material from the AMW-5 and GS-2/GP-NORTH excavations were pre-excavated and staged prior to load out operations to be more efficient with the load out operations.

3.5 IRM Waste Characterization and Disposal

The soil excavated as part of the IRM and any associated liquid waste was classified as U228 listed hazardous waste under 40 Code of Federal Regulation (CFR) 261.31 due to trichloroethene (TCE) detected in the soil. Technical and Administrative Guidance Memorandum (TAGM) 3028 contained-in rule was used for soils that are hazardous by rule, but do not have hazardous levels of TCE or related constituents. As part of the sustainability program, the soils were evaluated to determine if the waste could be disposed as non-hazardous waste using the contained-in rule under TAGM 3028. By using the contained-in rule, part of the excavated soil was disposed as non-hazardous, which reduced the carbon footprint of the program by reducing the travel distances to the treatment facility and disposing the soil in a landfill instead of incineration.

As part of the Site-Specific Waste Management Procedures, inspections of the stockpiles and hazardous waste storage area (when in use) were completed on a weekly basis. **Appendix D** provides copies of the inspection forms.

The IRM Addendum excavation did not did not necessitate the level of soil characterization as prior site sampling data exhibited non-hazardous constituents and very low concentrations.

3.5.1 Characterization, Profiling, Approval

For IRM activities, the excavated soil was stockpiled into piles of approximately 70 to 180 cubic yards. Once a soil pile had been completed, ARCADIS collected 3 discrete and 1 composite waste profile samples from each of the piles. As each pile was separately samples and profiled, it was then characterized/defined and transported off to the waste specific facility.

For IRM Addendum activities, in-situ waste characterization samples were collected from each excavation area prior to mobilization to the Site. Al IRM addendum soils were shipped off to the same non-hazardous waste facility.

All waste characterization samples were submitted for analysis to TestAmerica for the following as requested by WM:

- 8260C Target Compound List VOCs by Gas Chromatograph/Mass Spectrometer (GC/MS) SW846 (grab)
- 8260C toxicity characteristic leaching procedure (TCLP) VOCs by GC/MS SW846 (grab)
- 8270D TCLP SVOCs (GC/MS) SW846
- Moisture Percent Moisture United States Environmental Protection Agency (USEPA) Target Analyte List (TAL)
- 8081B TCLP Organochlorine Pesticides (GC) SW846 TAL
- 8082A PCBs by GC SW846 TAL
- 8151 TCLP Herbicides SW846 TAL

- 6010C TCLP Metals (Inductively Coupled Plasma [ICP]) SW846 TAL
- 7470A TCLP Mercury (Cold Vapor Atomic Absorption [CVAA]) SW846 TAL
- 1010A Ignitability, Pensky-Martens Closed Cup
- 9071B HEM and SGT-HEM SW846 TAL (as received)
- 1664A HEM and SGT-HEM 1664A
- 350.1 Nitrogen, Ammonia MCAWW TAL410.4 COD MCAWW TAL
- 9012 Cyanide, Reactive SW846 TAL
- 9034 Sulfide, Reactive SW846 TAL
- 9045D pH SW846 TAL (as received)
- 9095B Paint Filter SW846 TAL
- Moisture Percent Moisture USEPA TAL
- SM 2540B Solids, Total SM TAL
- SM 2540G Total, Fixed, and Volatile Solids SM TAL

The frequency and sampling methods were in accordance with NYSDEC DER-10/Technical Guidance for Site Investigation and Remediation Table 5.4(e)10 - Recommended Number of Soil Samples for Soil Imported To or Exported from a Site (below).

Table 5.4(e)10 Recommended Number of Soil Samples for Soil Imported To or Exported From a Site			
Contaminant	**VOCs**	**SVOCs, Inorganics & PCBs/Pesticides**	
Soil Quantity (cubic yards)	**Discrete Samples**	**Composite**	**Discrete Samples/Composite**
0-50	1	1	3-5 discrete samples from different locations in the fill being provided will comprise a composite sample for analysis
50-100	2	1	
100-200	3	1	
200-300	4	1	
300-400	4	2	
400-500	5	2	
500-800	6	2	
800-1000	7	2	
➢ 1000	Add an additional 2 VOC and 1 composite for each additional 1000 Cubic yards or consult with DER		

The results of the waste characterization are presented in Appendix E and summarized in **Table 2**, and were compared to the following criteria:

- Toxicity Characteristic Levels (TCL) from CFR Title 40 Section 261.24, dated July 2, 2011

- Contained-in level and groundwater action levels from TAGM 3028 – "Contained-In" Criteria for Environmental Media (dated November 30, 1992) [For TCE only]

- Land disposal restrictions for wastewater and non-waste water from NYSDEC Part 376(j) Table UTS-Universal Treatment Standards and 40 CFR 268.49. [For TCE only]

All waste characterization results were compared to the Toxicity Characteristic Levels, and if the results are above the Toxicity Characteristic Levels criteria, the waste was profiled as hazardous.

During the IRM activities, if the waste was not characteristically hazardous, the waste was evaluated using the contained-in criteria and land disposal restriction (LDR) criteria. The contained-in criteria and LDR criteria were only applied to TCE. **Appendix F** presents all contained-in determinations. During IRM Addendum activities, three additional soil excavation areas were unrelated to the VRU area in which TCE-impacted soil was delineated. As the soil excavated from these additional areas were not considered listed hazardous waste, contained-in determinations were not necessary.

Using the criteria discussed above, during IRM activities, 1,161.91 tons of soil were disposed as hazardous waste at Heritage's East Liverpool, Ohio facility, and 2,301.90 tons of non-hazardous waste disposed under the contained-in criteria. The non-hazardous waste was disposed at one of three facilities: 2,072.14 tons at WM's GROWS North Landfill in Morrisville, Pennsylvania; 131.45 tons at WM's Tullytown Resource Recovery Facility in Tullytown, Pennsylvania; and 98.31 tons at WM's Chaffee Landfill in Chaffee, New York. The waste disposed as non-hazardous was contained out by approval of the NYSDEC and where applicable, the Pennsylvania Department of Environmental Protection. During IRM Addendum activities, an additional 109.81 tons of soil were disposed as non-hazardous waste (89.88 tons were disposed at GROWS North, and 19.93 tons were disposed at Tullytown). The disposal documentation (e.g., completed manifests, certificates of disposal) for IRM and IRM Addendum activities is presented in **Appendix G**.

3.6 Air Monitoring Plan

Air monitoring was performed at the Site to evaluate the potential for worker exposure and contaminant migration from the work zone. Air monitoring activities were performed in accordance with the procedures specified in the approved IRM Work Plan (ARCADIS 2012), the *Community Air Monitoring Plan* (CAMP), and the *Health and Safety Plan* (HASP).

3.6.1 Airborne Particulate Monitoring

Continuous particulate dust monitoring was performed utilizing TSI 8530 DustTrak II monitors at three discrete on-site monitoring stations: one upwind of the work area and two downwind of the work activities. Particulate meters were positioned such that the sample inlet was located at a height approximating the breathing zone and provided a continuous readable particulate dust concentration. A 15-minute time-weighted average (TWA) was recorded for each meter. All monitors were equipped with networking capability, such that field personnel would be notified, by text message and e-mail, of potential exceedances.

The locations of the three particulate meters were established each day, prior to commencing Site activities, depending on the predominant wind direction at the start of the day's activities. During the day, the monitors were relocated, as necessary, to maintain their respective positions upwind or downwind.

Appendix H presents the air monitoring data for airborne particulate. Several exceedances of the action levels were observed during the course of the project, as summarized below:

- September 30 through October 7, 2013: Landscaping crews adjacent to the Site sorted dirt prior to shipping, generating dust that interfered with on-site dust monitoring. After stopping work and implementing dust suppression, the off-site source was confirmed as the problem and work resumed.

- October 10, 2013: A short-term exceedance was caused by the discharge of a truck's brakes on site; work resumed after readings returned to normal.

- October 21, 2013: Brief exceedance appeared to occur on startup prior to work commencing; normal levels observed after recalibration.

- October 30, 2013: Exceedance observed on return from lunch; work was stopped and dust suppression implemented. Work resumed after levels returned to normal.

- November 15, 2013: Brief exceedance after a bag of Portland cement was opened to mix in with the waste. The operator was cautioned to use more care while mixing, and work resumed.

- August 25, 2014: brief exceedance along the northern property boundary. No Site activities were being conducted; therefore, this exceedance was the result of an off-site source migrating onto the Site.

- August 26, 2014: Exceedances were observed sporadically throughout the day. Each exceedance was brief and was directly attributed to vehicle traffic travelling too fast and/or too close to the monitoring stations. In each instance, the driver was reminded to observe the Site speed limit and remain on the established roadways, and work resumed.

- August 27, 2014: Exceedances were observed sporadically throughout the day. Each exceedance was brief and was directly attributed to vehicle traffic travelling too fast and/or in close proximity to the monitoring station. In each instance, the driver was reminded to observe the Site speed limit and remain on the established roadways, and work resumed upon confirming the exceedance conditions observed had been resolved.

3.6.2 Airborne Volatile Organic Compound Monitoring

Continuous VOC monitoring was conducted during intrusive activities by mounting RAE Systems Minirae 3000 photoionization detectors (PIDs) at three discrete on-site monitoring stations: one upwind of the work area and two downwind of the work activities perimeter. The PIDs were positioned such that the sample inlet was located at a height approximating the breathing zone and provided a continuous readable total VOC concentration. A 15-minute TWA was also recorded for each PID. All monitors were equipped with networking capability, such that field personnel would be notified, by text message and e-mail, of potential exceedances.

The locations of the three PIDs were established each day, prior to commencing Site activities, depending on the predominant wind direction at the start of the day's activities. During the day, the monitors were relocated, as necessary, to maintain their respective positions upwind or downwind.

Appendix H presents air monitoring data for VOCs. No exceedances of the action levels presented in the HASP or CAMP were observed.

3.7 Backfilling and Restoration

For IRM activities, the cement-bentonite slurry was left in place upon completion of the excavation to stabilize. The remainder of the open excavation was backfilled utilizing approximately 6 inches of 1- to 2-inch clean stone to match existing grade.

For IRM Addendum activities, each excavation was backfilled with clean fill materials. At the AMW-5 and GS-2/GP-NORTH excavations, clean stone was placed in the bottom of the excavation to bridge the saturated zone. The top of each excavation, as well as the entire GP-6 excavation, was backfilled with compacted general fill materials to match the existing grades.

4. Conclusions and Recommendations

IRM and IRM Addendum activities were completed as an initial component of the remedial strategy to be implemented at the Site for remediation of source areas. By completing IRM and IRM Addendum excavation activities as planned, soil impacts identified within the pre-defined areas successfully achieved the objectives of the IRM and IRM Addendum. Specifically, the excavation activities served to:

- prevent ingestion/direct contact with impacted soil
- prevent inhalation of or exposure to the COCs volatilizing from impacted soil
- prevent migration of COCs that would result in groundwater or surface-water impacts
- prevent impacts to biota from ingestion/direct contact with soil causing toxicity or impacts from bioaccumulation through the terrestrial food chain

As discussed in the IRM Work Plan (ARCADIS 2012), available data indicates that the implementation of IRM at the Site was appropriate to address anticipated source areas of impacted soil that will likely be encountered during the commercial redevelopment of the Site. Excavation and removal of impacted soil has successfully facilitated protection of human health and the environment through recovery of contaminant mass and elimination or control of potential exposure.

In addition, IRM Addendum activities successfully addressed remaining soil (outside of the VRU area) impacted in excess of the relevant SCOs.

Based on the successful completion of the IRM and IRM Addendum activities and submission of this IRM Completion Report, it is recommended that (soil) NFAs under the Consent Order be developed (with regard to soil) for the Site.

5. Remedial Costs Incurred

During implementation of IRM and IRM Addendum activities, CEMC incurred costs totaling approximately $2,500,000.

Notes:
Bold results indicate results above Unrestricted Use SCOs.
- - = Information not included in table. Refer to applicable reference.
< = less than.
% = percent.
* = Laboratory control sample or laboratory control sample duplicate exceeds the control limit.
B = Analyte was also detected in the associated method blank.
BHC = benzene hexachloride.
H = Sample was prepped or analyzed beyond the specified holding time.
J = Indicates an estimated value.
mg/kg = milligrams per kilogram.
NA = not analyzed.
SCO = Soil Cleanup Objective.

Table 2
Waste Characterization Analytical Summary

Interim Remedial Measures Completion Report
Chevron Environmental Management Company
Former Gulf Fuel Terminal (#6518040)
Oceanside, New York

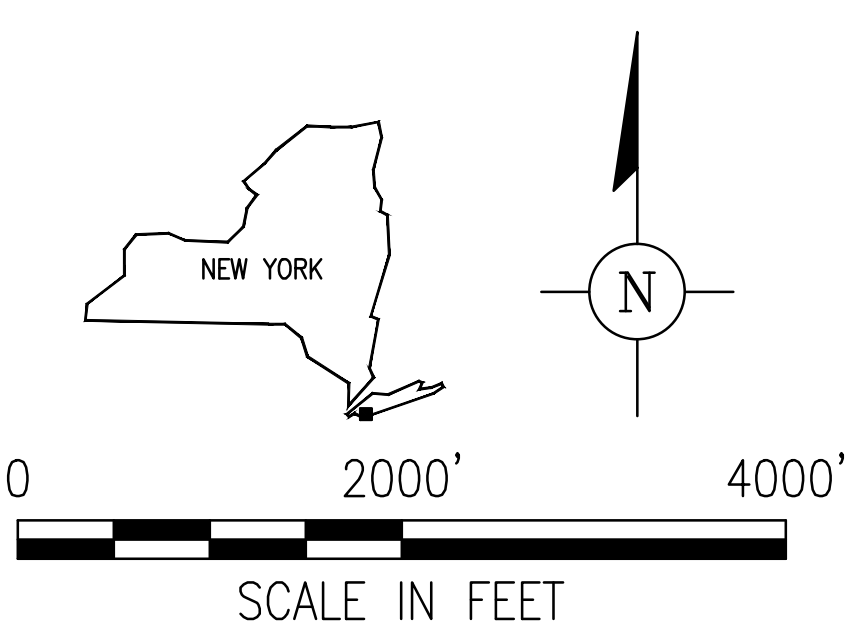
Notes:
1. Samples were collected by ARCADIS and submitted to TestAmerica Laboratory in Buffalo, New York, for analysis.
2. Duplicate sample results are presented in brackets.
3. Shading indicates that the sample result exceeds one or more of the listed criteria.
4. Toxicity Characteristic Levels, Code of Federal Regulations Title 40 Section 261.24 (dated July 1, 2011).
5. Contained-In Level - Soil and Groundwater Action Levels, Technical Administrative Guidance Memorandum 3028 - "Contained-In" Criteria for Environmental Media (dated November 30, 1992). Only select VOCs criteria are shown.
6. Land Disposal Restrictions - Nonwastewater and Wastewater Standards, Part 376(j), Table UTS-Universal Treatment Standards.
7. Quantitation limit is greater than the calculated regulatory level. The quantitation limit therefore becomes the regulatory level.



- - = Information not included in table. Refer to applicable reference.
< = less than.
> = greater than.
% = percent.
B = Analyte was also detected in the associated method blank.
BHC = benzene hexachloride.
°F = degrees Fahrenheit.
H = Sample was prepped or analyzed beyond the specified holding time.
J = Indicates an estimated value.
mg/L = milligram per liter.
mg/kg = milligram per kilogram.
mL/100 g = milliliters per 100 grams.
NA = not analyzed.
ND = not detected.
SU = Standard Unit.
TCLP = toxicity characteristic leaching procedure.
VOC = volatile organic compound.

1 INTRODUCTION

On behalf of Chevron Environmental Management Company (CEMC), Arcadis of New York, Inc. (Arcadis) is submitting this Supplemental Remedial Investigation Report (RI Report) to the New York State Department of Environmental Conservation (NYSDEC) for the former Gulf Oil Terminal located in Oceanside, Township of Hempstead, New York (NYSDEC Site #130165).

This RI Report has been prepared in accordance with the New York Codes, Rules and Regulations, the NYSDEC's Division of Environmental Remediation-10 – Technical Guidance for Site Investigation and Remediation (NYSDEC 2010).

The purpose of this report is to provide an update to the 2011 Remedial Investigation Data Summary Report (Arcadis, 2011) and to provide a summary of current site conditions to support the development of remedial actions as part of the Feasibility Study (FS) (will be provided under a separate cover).

1.1 Site Background

1.1.1 Site Description

The 7.2-acre site is located at 1 Industrial Place in Oceanside, Township of Hempstead, Nassau County, New York. A Site Location Map is presented on **Figure 1.** The site is currently being developed for retail use. The site is bound to the south by Barnum's Channel, to the east by the Long Island Railroad, to the north by the former Exxon Petroleum Terminal (included as part of the development), and to the west by Hampton Road. A vehicle recycling operation and office buildings are located west of Hampton Road, fronting Hog Island Channel. Daly Boulevard is located north of the former Exxon Petroleum Terminal, and Sprague Petroleum Terminal is located north of Daly Boulevard.

1.1.2 Site History

The site consists of three lots, Lots 502, 503, and 504. In 1931, Gulf Oil Corporation developed a portion of the site (Lot 504) as a petroleum terminal. Gulf Oil Corporation purchased Lots 503 and 502 in 1950 and 1956, respectively. Chevron acquired Gulf Oil Corporation in the mid-1980s. As part of the purchase agreement, Chevron was required to divest the northeast division. In 1986, Cumberland Farms, Inc. (CFI) purchased the northeast marketing assets of Gulf Oil Corporation from Chevron. The purchase included the Oceanside Terminal, which was transferred to CFI in May 1986. In December 1993, CFI, in a joint venture with Catamount Petroleum LP (Catamount), formed Gulf Oil Limited Partnership (Gulf). CFI owned two-thirds of Gulf as a limited partner, and Catamount owned one-third of Gulf as the general partner. In September 2005, CFI exercised its option to buy out Catamount and reorganized Gulf under a new general partner. However, ownership percentages of Gulf did not change during the reorganization. In 2015, the site was sold to Coremark L.L.C., who has leased the property to Costco. The site is currently being developed into a retail store.

Operation of the petroleum terminal was ceased in the early 1990s. Demolition of the aboveground storage tanks (ASTs) at the former petroleum terminal was completed in 2003. The remaining on-site

buildings (maintenance building, office building, and several small buildings associated with historical petroleum terminal operations) were demolished in 2005.

The site has undergone extensive investigation and remediation since the 1990s under NYSDEC oversight (Spill No. 92-03883). In January 2007, the NYSDEC accepted Lowe's Home Centers, Inc. (Lowe's) as a volunteer under the Brownfield Cleanup Program (BCP) – Site No. C130165. Following the decision by Lowe's to withdraw from the BCP in 2009, the NYSDEC transferred the site into the Hazardous Waste Program (State Superfund Site). An Order on Consent and Administrative Settlement was executed between the NYSDEC and CEMC on December 23, 2009 (Index # W3-1142-09-08, Site #130165).

The following were previously located on the Gulf parcel:

- Nine large-quantity ASTs containing fuel oil, kerosene, and gasoline;
- Two small 550-gallon ASTs containing fuel oil for the on-site garage and office building;
- Three underground storage tanks (USTs) containing fuel oil (one 550-gallon, one 1,000-gallon, and one 5,000-gallon);
- One 1,000-gallon UST containing waste oil;
- A loading rack;
- A retention pond;
- A maintenance garage;
- A vapor recovery unit (VRU); and
- An office complex.

Four of the nine large ASTs were demolished prior to 2000, with the remaining five large ASTs reportedly demolished in 2003. The two 550-gallon ASTs containing fuel oil for the maintenance garage and the office building were demolished in 2005.The approximate location of the former building, structures, tanks, and monitoring wells are depicted on the Site Plan (**Figure 2**).

Light non-aqueous phase liquid (LNAPL), consisting of a mixture of No. 2 and No. 4 fuel oil, kerosene, and gasoline, had previously been detected in a monitoring well near the bulkhead at the southern portion of the site at a thickness up to 2.28 feet. LNAPL was also encountered near the former VRU and the former garage building. The observed occurrences of LNAPL and shallow soil impacts were addressed through a series of initial remedial measurements. Measurable thicknesses of LNAPL have not been observed at the site since 2004.

In 2015, approximately 4 feet of clean fill were added to the site, and additional material will be added during paving of the site. To provide a summary of the analytical data in terms of current site conditions, and because some of the analytical data has been collected after the installation of the fill material, the discussion of sample depths in terms of foot below ground surface will be in reference to current ground surface (cgs). A comprehensive survey of the cgs at the site has not been completed because the ground surface elevation is still changing in connection with site development. To account for the change in ground surface elevation, 4 feet have been added to excavation depths and sample depth intervals for samples collected prior to 2015. All depth intervals are considered approximate until the site has been paved and the comprehensive survey has been completed. All depths discussed in this text reference the

depth from cgs. Both current and historical sample depths for soil and groundwater samples are shown on the tables and figures included with this report.

1.2 Remedial Actions

The historical remedial actions implemented prior to 2011 were completed while the site was being address under the Spills program. Refer to the 2011 Remedial Investigation Data Summary Report (Arcadis, 2011) for a summary of remedial actions completed prior to 2011.

Since 2011, two interim remedial measures (IRMs) have been completed at the site: excavation in the former VRU area and three excavations to address isolated hot spots. These IRMs are detailed in the Interim Remedial Measure Completion Report (Arcadis, 2014). A summary of each of these IRMs is provided below.

1.2.1 Former VRU Area – IRM Activities – 2013 and 2014

In fall 2013 and early 2014, an IRM was completed in the former VRU area. The VRU measured approximately 60 feet by 65 feet and was excavated to a final depth that varied from 13 to 18 feet below current ground surface (bcgs). The excavation was performed using a cement-bentonite slurry, which mitigated the need for dewatering and maintained adequate hydraulic pressure to prevent water infiltration and failure of the minimal remaining clay zone above the lower sand. The cement-bentonite slurry was produced using a batch plant to mix dry materials with public water. Cement-bentonite slurry from the batch plant was transferred to a surge tank for additional mixing, which was then pumped into the excavation area while excavation was occurring. The cement-bentonite slurry prevented the trench sides from collapsing by providing outward and downward pressure(s), which balanced the inward and upward hydraulic force(s) and reduced groundwater flow into the trench. Approximately 3,464 tons of soil was excavated for off-site disposal. Impacted material was excavated using traditional construction equipment to the limits shown on **Figure 2**.

1.2.2 IRM Addendum Activities – 2014

The three IRM Addendum excavation areas were excavated in 2014 in accordance with NYSDEC conditional approval letter (NYSDEC, 2014): the AMW-5 excavation measured 10 feet by 10 feet and was excavated to 13 feet bcgs; the GS-2/GP-NORTH excavation measured 10 feet by 15 feet and was excavated to 8 feet bcgs; and the GP-6 excavation measured 5 feet by 5 feet and was excavated to 7 feet bcgs. Impacted material was excavated using traditional construction equipment to the limits shown on **Figure 2**. Material was removed from the excavation, staged adjacent to the excavation, and then loaded into trucks for off-site disposal. Approximately 110 tons of soil were excavated for off-site disposal.

1.3 Future Site Use

The site and the ExxonMobil site to the north are currently being developed for commercial use as a large retail store. The current development plans have the store being primarily located on the ExxonMobil site, with a faction of the store located on the northern edge of the site. A gas station will be installed on the southern part of the site, with the reminder of the site being covered by a parking lot and landscaping.

2 REMEDIAL INVESTIGATION ACTIVITIES

Since 2010, a series of supplemental investigation activities were completed to further characterize the site conditions. The supplemental field investigation was conducted from November 2010 through April 2011 to further characterize the petroleum impacts (including historically observed LNAPL) and augment the existing monitoring well network. The results of this supplemental investigation are documented in the May 2011 Remedial Investigation Data Summary Report (Arcadis, 2011). In 2016, the former VRU area was investigated in accordance with the Residual Source Assessment Work Plan (Arcadis, 2016).

The field activities completed as part of the 2010/2011 Remedial Investigation are summarized in the May 2011 Remedial Investigation Data Summary Report (Arcadis, 2011), and the 2016 source zone evaluation activities are discussed below. Field activities associated with the Former VRU IRM, including well decommissioning and pre-characterization soil borings, are documented in the Interim Remedial Measure Completion Report (Arcadis, 2014).

During the course of the site investigations, the ground surface elevation of the site has changed as part of its development. In 2015, approximately 4 feet of clean fill were added to the site, and additional elevation will be added during paving of the site in 2017. To provide a summary of the analytical data in terms of current site conditions and because some of the analytical data has been collected after the installation of the fill material, the discussion of sample depths in terms of feet below ground surface will be in referenced to cgs. A comprehensive survey of the cgs at the site has not been completed because the ground surface is still changing. To account for the change in ground surface elevation, 4 feet have been added to sample depth intervals for samples collected prior to 2015. All depth intervals from the cgs are considered approximate until the site has been paved and the comprehensive survey has been completed. The historical sample interval and the approximate current sample interval are both shown on the data tables and data box figures provided with this report. The text below references the current sample interval only; soil and groundwater data from excavated areas are not included in this report.

2.1 Soil and Groundwater Cleanup Objectives

2.1.1 Soil Cleanup Objectives (SCOs)

The SCOs established for this site include the restricted use commercial SCOs and the protection of groundwater SCOs, which is consistent with both the current property zoning and the anticipated future use of this site as a commercial retail store. The analytical results of the soil samples are compared to these relevant SCOs, as well as to the unrestricted use SCOs. The SCOs are based on the NYSDEC Technical & Operational Guidance Series (TOGS) for Soil, Subpart 375-6: Remedial Program Soil Cleanup Objectives (effective December 14, 2006) (NYSDEC 2006).

2.1.2 Groundwater Quality Standards

Groundwater analytical data have been compared to NYSDEC TOGS for Groundwater (standard), Section 703.6 (effective August 4, 1999) (NYSDEC 1999).

2.2 Membrane Interface Probes (MIPs)

In February 2016, a residual source area investigation was completed using MIPs. As part of the MIPs investigation, 16 direct push MIPs were advanced into the lower sand unit in the area of the former VRU (**Figures 3**). The soil analytical results were compared to the MIPs response, and in general, the MIPs response indicated greater concentrations than was indicated in the soil analytical data. The results of the MIPs investigation were used to provide a semi-quantitative delineation of the residual source area and to select the location of the AMW-15 well cluster. The MIPs logs are provided in **Appendix A**.

2.3 Soil Borings

In June 2016, a series of eight soil borings were completed in the former VRU area and downgradient to provide additional delineation of the source area (**Figure 3**). The soil borings were advanced using Sonic drilling methods. During the advancement of the soil borings, five grab groundwater samples were collected below the former VRU excavation and submitted for analysis for volatile organic compounds (VOCs). The groundwater sampling was set at intervals of maximum photoionization detector (PID) measurements. In addition, 17 soil samples were collected from the lower sand unit and submitted for analysis of VOCs, and selected samples were also analyzed for semivolatile organic compounds (SVOCs), Target Analyte List (TAL) inorganics, and total organic carbon to provide additional characterization in the lower sand unit and data to support future remedial actions. The sample intervals were selected based on PID measurements and based on the results of the MIPs investigation. Soil boring logs are provided in **Appendix B**.

2.4 Monitoring Well Installation

Eleven monitoring wells were installed in 2016 during the residual source assessment at the locations shown on **Figure 2**.

- Four monitoring wells (AMW-15-D1, AMW-15-D2, AMW-15-D3, and AMW-15-VD) were installed to replace the MW-25 well cluster in the former VRU area. The MW-25 well cluster was removed during the 2013/2014 IRM.
- Two well clusters (AMW-13 and AMW-14), consisting of a D1, D2, and VD well, were installed downgradient of the former VRU area.
- MW-28D2, which was damaged beyond repair during site development, was decommissioned and replaced.

The boreholes for the monitoring wells were advanced using Sonic drilling methods. The monitoring wells located within the former VRU area were constructed by installing 10-foot-long sections of 2-inch-diameter, stainless steel well screens, with 2-foot sumps, and stainless steel risers to extend to the ground surface. The annular space of each borehole was filled with a #0 silica sand filter pack at least 1 foot above the top of the screen, and a 2-foot-thick bentonite seal was installed above the filter pack.

The wells located outside of the former VRU area were constructed of polyvinyl chloride (PVC) materials. Each of these wells were constructed by installing 10-foot-long screens of 2-inch-diameter, Schedule 40, machine-slotted PVC pipe and Schedule 40 PVC risers to extend to the ground surface. The annular

space of each borehole was filled with a #0 silica sand filter pack at least 1 foot above the top of the screen, and a 2-foot-thick bentonite seal was installed above the filter pack.

Monitoring wells were developed after completion according to the Arcadis Standard Operating Procedure for monitoring well installation and development (Arcadis, 2010a).

Well construction details and boring logs for all existing wells and wells decommissioned as part of the former VRU area IRM are provided in **Appendix C**, and well construction information is included in **Table 1**.

2.5 Groundwater Sampling

In 2016, three groundwater monitoring events were completed, including sampling events in January, June, and July 2016, such that each well (including the new monitoring wells) were sampled twice in 2016.

Groundwater samples were collected from a total of 31 existing and 11 newly installed monitoring wells and 8 temporary wells using low-flow sampling methods. Groundwater field measurements are summarized in **Table 2**. The locations of the monitoring wells sampled are illustrated on **Figure 2**. All groundwater samples were analyzed for VOCs, and a subset of the wells were analyzed for SVOCs and TAL metals (total and dissolved) and for monitored natural attenuation (MNA) parameters.

MNA parameters included:

- sulfate;
- sulfide;
- alkalinity-bicarbonate;
- alkalinity;
- iron (filtered and unfiltered); and
- manganese (filtered and unfiltered).

2.6 Methyl Tert-Butyl Ether (MTBE) Investigation

In October 2016, a supplemental MTBE investigation in the lower sand was completed. The investigation included collection of four grab groundwater samples from below the meadow mat in the lower sand unit, along the northern property boundary, and submitting the samples for analysis of VOCs. The results of the investigation were consistent with the data from existing monitoring wells. Additional detail on the MTBE investigation is provided in **Appendix D**.

MTBE was detected in all four of the groundwater samples collected from the temporary wells. Concentrations ranged from 76 ug/L in TW-4 at the western most sampling point (closest to Hampton Road) to 670 ug/L in TW-7 (eastern most sampling point). The data from the temporary monitoring wells was consist with the existing data from adjacent monitoring wells. The highest concentrations of MTBE are closest to the former VRU Area and concentrations decrease to the west of the former VRU area.

2.7 Community Air Monitoring Plan

Air monitoring, which was performed during implementation of the field investigation, was performed to ensure that no unacceptable exposures occurred in conjunction with the field investigation activities completed.

Consistent with the Community Air Monitoring Plan (Arcadis, 2010b) developed for use during RI activities on site, monitoring was performed to assess the potential for exposure to VOCs and particulates during the MIPs investigation. Data recorded during the air monitoring is provided in **Appendix E**.

As required by the CAMP, monitoring stations were set up and operated at appropriate locations upwind and downwind of the work area for monitoring of VOCs and particulates during field events involving the disturbance of subsurface soil. These units provided real-time monitoring of the perimeter air conditions with alarm that would sound in response to criteria exceedance. No alarms indicating an exceedance of VOC and particulate criteria occurred as a result of our investigation.

2.8 Waste Management

During the 2016 site characterization, all soil and groundwater investigation-derived waste was contained in 55-gallon drums and sampled for disposal off site. Trichloroethene (TCE), a listed hazardous waste compound, was not detected in the water or soil waste profile samples, and the waste was not characteristically hazardous. Therefore, the waste was disposed of as non-hazardous waste at the Waste Management Model City, New York facility.

3 SITE GEOLOGY AND HYDROGEOLOGY

3.1 Regional Geology/Hydrogeology

The regional geology generally consists of upper glacial deposits (clay, sand, gravel, and boulders) to depths of approximately 50 feet below ground surface (bgs), the Gardiners Clay (clay, silt, and lenses of sand) to a depth of 75 feet bgs, the Magothy Aquifer (sand with lenses of clay) to a depth of 800 feet bgs, the Raritan Confining Unit (clay with lenses of sand) to 900 feet bgs, and the Lloyd Aquifer (sand and gravel with lenses of clay) to 1,400 feet bgs. Bedrock is present beneath the Lloyd Aquifer and consists of crystalline metamorphic and igneous rock (muscovite-biotite schist, gneiss, and granite) (N.E. McClyonds and O. L. Franke, 1972).

3.2 Site Geology/Hydrogeology

The geologic units identified at the site during the RI include:

- sand and gravel fill from the ground surface to approximately 12 feet bcgs;
- meadow mat (silt with fibrous organics and trace clay) to approximately 20 feet bcgs;
- underlying sand (coarse to fine sand, trace to some fine gravel) to approximately 90 feet bcgs; and
- Gardiners Clay.

With the exception of the bulkhead area, the meadow mat was encountered throughout the site at a thickness ranging from 5 to 12 feet. Meadow mat was not observed in the bulkhead area during the RI investigation or in previous environmental investigations. The meadow mat in the former VRU area was excavated as part of the IRM.

The underlying sand (lower sand unit) has been divided into three horizons for purposes of discussion: monitoring wells in the D1 horizon are generally screened between 20 and 30 feet bgs, monitoring wells in the D2 horizon are screened between 30 and 42 feet bgs, and monitoring wells in the VD horizon are screened at the base of the unit (58 to 83 feet bcgs). Cross section locations are shown **on Figure 4**; Cross Sections A' and B' are provided on **Figures 5 and 6**, respectively.

3.3 Groundwater Flow

Groundwater has historically been observed at elevations ranging between 2 and 5 feet above mean sea level (7 to 9 feet bcgs). The groundwater elevation in the lower sand unit is strongly influenced by the tidal cycle. The groundwater elevation in the lower sand unit can change by as much as 3 feet in response to tidal changes. The groundwater elevation in the shallow fill material shows a minimal response to the tidal cycle (less than 0.5 feet). The groundwater flow direction in the shallow fill material is consistently to the southwest, regardless of the tidal cycle. The groundwater flow direction in the lower sand unit can change by as much as 180 degrees in response to the tidal cycle. The general flow direction in the lower sand unit is to the southwest. Groundwater elevation data is summarized in **Table 3**, and groundwater elevation contour maps for each are presented in **Appendix F**.

Hydraulic conductivity testing on the lower sand unit has not been successful to date. Attempts at slug testing in the lower sand unit have not been successful because the change in groundwater elevation has been too small and recovery too rapid to be able to distinguished from the tidal elevation changes. In September 2011, an injection test using 2,500 gallons of water was completed; however, the groundwater elevation response was too small in the observation wells to calculate hydraulic conductivity.

3.4 Horizontal and Vertical Gradients

On July 26, 2016, a complete round of groundwater elevation data was collected from the on-site monitoring wells at both high and low tides. Groundwater flow in the shallow fill material is to the southwest at a horizontal gradient of approximately 0.005 foot/foot (ft/ft). The general groundwater flow direction in the lower sand unit at low tide is to the southwest at a gradient of 0.008 ft/ft to 0.014 ft/ft. The table below provides a summary of the vertical gradient observed:

Wells	Vertical Gradient – Low Tide (ft/ft)	Vertical Gradient – High Tide (ft/ft)
AMW-13 D1/D2	0.006	0.001
AMW-13 D2/VD	-0.01	-0.009
AMW-14 D1/D2	-0.003	-0.001
AMW-14 D2/VD	-0.01	-0.013
AMW-15 D1/D2	0.002	-0.046
AMW-15 D2/VD	0.003	-0.006
MW-23-D1R/D2R	0.032	-0.005
MW-24-D1/D2	0.001	0.002
MW-26-D1/D2	0.01	0.001
MW-26-D2/VD	-0.04	0.016
MW-27-D1/D2	-0.007	-0.025
MW-28-D1/D2R	-0.186	-0.007
MW-29-D1/D2	-0.02	0.001
MW-29-D2/VD	-0.05	0.043
MW-30-D1/D2	0.01	-0.007
MW-30-D2/VD	-0.02	-0.016
MW-31-D1R/D2R	-0.073	-0.008

Note:
Negative gradients are upward.

Overall, the vertical gradients are variable depending on locations. The following generalization can be made:

- The vertical gradients between the D-1 and D-2 wells are evenly mixed between upwards and downwards at low tide and generally more upward at high tide.
- The vertical gradient between the D-2 and VD wells is generally upward at low tide and mixed at high tide.

4 INVESTIGATION RESULTS

4.1 Soil Results

Since 2004, a total of 227 soil samples have been collected for analysis at this site. Of the 227 soil samples, 162 samples were collected from the shallow fill unit, 10 samples were collected from the meadow mat, and 55 samples were collected from the lower sand unit. The following is a summary of the constituents of concern observed to exceed protection of groundwater and the commercial use SCOs in one or more soil sample at the site. The soil analytical data are summarized in **Tables 4 and 5**, and the locations of exceedances are illustrated on **Figures 7, 8, and 9**. Laboratory analytical results are provided in **Appendix F**.

Soil samples that have been excavated as part of an interim remedy are not included in the data summary figures but are presented in the summary tables.

4.1.1 Fill Unit – Protection of Groundwater SCO

Below is a summary of all exceedances of the Protection of Groundwater SCO in the fill unit. The summary does not include samples that have been excavated or remediated. Analytical results are presented on **Figures 7 and 8** and summarized in **Tables 4 and 5**.

4.1.1.1 VOCs

- Acetone was detected above the Protection of Groundwater SCO of 0.05 milligrams per kilogram (mg/kg) in five samples at concentrations ranging from 0.058 mg/kg in soil sample TP-11-1 (9 feet bcgs) to 0.18 mg/kg in soil sample AMW-6 (10 – 12 feet bcgs).
- Benzene was detected above the Protection of Groundwater SCO of 0.06 mg/kg in 57 samples at concentrations ranging from 0.066 mg/kg in PX-C6 (6 – 7 feet bcgs) to 23 mg/kg in soil sample T-12-D2 (7 – 7.5 feet bcgs).
- n-Butylbenzene was detected above the Protection of Groundwater SCO of 12 mg/kg in 10 samples at concentrations ranging from 12 mg/kg in soil samples G4-D1 (7 – 7.5 feet bcgs) and G9-D1 (7 – 7.5 feet bcgs) to 30 mg/kg in soil sample G8-S1 (5.5 – 6 feet bcgs).
- Ethylbenzene was detected above the Protection of Groundwater SCO of 1.1 mg/kg in 58 samples at concentrations ranging from 1.1 mg/kg in soil samples G8-D2 (7- 7.5 feet bcgs) and G10-D1 (7- 7.5 feet bcgs) to 230 mg/kg in soil sample PX-D2 (6 – 7 feet bcgs).
- Methylene Chloride was detected above the Protection of Groundwater SCO of 0.05 mg/kg in six samples at concentrations ranging from 0.062 mg/kg in soil sample AMW-3 (8 – 10 feet bcgs) to 0.11 mg/kg in soil sample TP-5-2 (9.5 feet bcgs).
- MTBE was detected above the Protection of Groundwater SCO of 0.93 mg/kg in one sample at a concentration of 0.99 mg/kg in soil sample LB-13 (7.5 – 8 feet bcgs).

- Naphthalene was detected above the Protection of Groundwater SCO of 12 mg/kg in 20 samples at concentrations ranging from 12 mg/kg in soil sample G8-D1 (7 – 7.5 feet bcgs) to 44 mg/kg in soil sample GP-7 (2002) (7 – 8 feet bcgs).
- n-Propylbenzene was detected above the Protection of Groundwater SCO of 3.9 mg/kg in 23 samples at concentrations ranging from 4.5 mg/kg in soil sample G10-D2 (7 – 7.5 feet bcgs) to 40 mg/kg in soil sample G8-S1 (5.5 – 6 feet bcgs).
- 1,2,4 Trimethylbenzene was detected above the Protection of Groundwater SCO of 3.6 mg/kg in eight samples at concentrations ranging from 4.2 mg/kg in soil sample G8-D2 (7 – 7.5 feet bcgs) to 11 mg/kg in soil sample G10-S2 (5.5 – 6 feet bcgs).
- Toluene was detected above the Protection of Groundwater SCO of 0.7 mg/kg in four samples at concentrations ranging from 0.72 mg/kg in soil sample PX-D4 (6 - 7 feet bcgs) to 2.1 mg/kg in soil sample PX-D2 (6 - 7 feet bcgs).
- Xylenes were detected above the Protection of Groundwater SCO of 1.6 mg/kg in 39 samples at concentrations ranging from 1.6 mg/kg in soil sample G6-S2 (5.5 - 6 feet bcgs) to 400 mg/kg in soil sample PX-D2 (6 – 7 feet bcgs).

4.1.1.2 SVOCs

- Benzo(b)fluoranthene was detected above the Protection of Groundwater SCO of 1.7 mg/kg in five samples at concentrations ranging from 2.8 mg/kg in soil sample TP-6-3 (9.5 feet bcgs) to 11 mg/kg in soil sample MW-31-D2R (10 – 12 feet bcgs).
- Benzo(k)fluoranthene was detected above the Protection of Groundwater SCO of 1.7 mg/kg in two samples at concentrations of 2.2 mg/kg in soil sample MW-17 (8 feet bcgs) and 4.5 mg/kg in soil sample MW-31-D2R (10 – 12 feet bcgs).
- Chrysene was detected above the Protection of Groundwater SCO of 1 mg/kg in six samples at concentrations ranging from 1.8 mg/kg in soil sample P-18R (4 – 6 feet bcgs) to 8.5 mg/kg in soil sample MW-31-D2R (10 – 12 feet bcgs).

4.1.1.3 Inorganics

- Arsenic was detected above the Protection of Groundwater SCO of 16 mg/kg in four samples at concentrations ranging from 16.2 mg/kg in soil sample AMW-6 (6 - 8 feet bcgs) to 28.1 mg/kg in soil sample TP-6-1 (9 feet bcgs).
- Mercury was detected above the Protection of Groundwater SCO of 0.73 mg/kg in soil sample TP-12-1 (8.7 feet bcgs) at a concentration 1.35 mg/kg.

4.1.2 Lower Sand Unit Protection of Groundwater

Below is a summary of the exceedance of the Protection of Groundwater SCO in the lower sand unit.

4.1.2.1 VOCs

- Cis 1-2-dichloroethene was detected above the Protection of Groundwater SCO of 0.25 mg/kg in three samples at concentrations ranging from 0.57 mg/kg in soil sample LB-6 (22 – 22.5 feet bcgs) to 2.7 mg/kg in soil sample ASB-7 (21 - 23 feet bcgs).
- Methylene Chloride was detected above the Protection of Groundwater SCO of 0.05 mg/kg in four samples at concentrations ranging from 0.077 mg/kg in soil sample ASB-4 (28 – 30 feet bcgs) to 0.12 mg/kg in soil samples MW-25-D3 (24 - 27 feet bcgs) and MW-30-VD (72 – 74 feet bcgs).
- TCE was detected above the Protection of Groundwater SCO of 0.47 mg/kg in one sample at a concentration of 2.9 mg/kg in soil sample LB-6 (22 – 22.5 feet bcgs).
- Vinyl Chloride was detected above the Protection of Groundwater SCO of 0.02 mg/kg in five samples at concentrations ranging from 0.061 mg/kg in soil sample ASB-6 (26 – 28 feet bcgs) to 0.58 mg/kg in soil sample ASB-7 (21 – 23 feet bcgs).
- Phenol was detected above the Protection of Groundwater SCO of 0.33 mg/kg in one sample at a concentration of 0.58 mg/kg in soil sample ASB-7 (20.5 – 21 feet bcgs).

4.1.3 Commercial Exceedances

There were no detections of analytes above the Commercial Use SCO in the lower sand unit.

Below is a summary of all exceedances of the Commercial Use SCO in the fill unit. The summary does not include samples that have been excavated or remediated. The locations at which soil exceedances of the Commercial Use SCO are also illustrated on **Figure 6**.

- Benzo(a)pyrene was detected above the Commercial Use SCO of 1 mg/kg in five samples at concentrations ranging from 2.7 mg/kg in soil sample TP-6-3 (9.5 feet bcgs) to 11 mg/kg in soil sample MW-31-D2R (10 – 12 feet bcgs).
- Benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene were detected above their respective Commercial Use SCO in the soil sample collected from MW-31-D2R at a depth of 10 to 12 feet bcgs.
- Arsenic was detected above the Commercial Use SCO of 16 mg/kg in four samples at concentrations ranging from 16.2 mg/kg in soil sample AMW-6 (6 - 8 feet bcgs) to 28.1 mg/kg in soil sample TP-6-1 (9 feet bcgs).

4.2 Groundwater Results

The following discussion of exceedance of TOGS criteria is limited to post-IRM sampling performed in 2016 because it is most representative of current site conditions in the lower sand unit.

The analytical results for the groundwater samples collected for the supplemental remedial investigations between 2011 to 2016 are summarized in **Table 6**, and a full set of historical groundwater analytical results are provided in **Appendix H**.

4.2.1 Fill Unit

A total of 29 groundwater samples have been collected from 11 monitoring wells and three temporary wells screened in the shallow fill unit during sampling events completed in 2016. A summary of the exceedances of the TOGS guidance values is provided below.

4.2.1.1 VOCs

- Benzene was detected above the TOGS guidance value of 1 µg/L in 11 monitoring wells at concentrations ranging from 1.1 µg/L in AMW-7 to 510 µg/L in AMW-3.
- Toluene was detected above the TOGS guidance value of 5 µg/L in three monitoring wells at concentrations ranging from 5.1 µg/L in AMW-12 to 36 µg/L in AMW-3.
- Ethylbenzene was detected above the TOGS guidance value of 5 µg/L in four monitoring wells at concentrations of 5.7 µg/L and 930 µg/L in temporary well TW-3 and AMW-11, respectively.
- Xylenes was detected above the TOGS guidance value of 5 µg/L in eight monitoring wells at concentrations ranging from 6.2 µg/L in temporary well TW-1 to 5,600 µg/L in TW-3.
- MTBE was detected above the TOGS guidance value of 10 µg/L in four monitoring wells at concentrations ranging from 16 µg/L in MW-18R to 95 µg/L in AMW-3.
- Isopropylbenzene was detected above the TOGS guidance value of 5 µg/L in eight monitoring wells at concentrations ranging from 6.3 µg/L in temporary well TW-1 to 110 µg/L in AMW-3.
- Cis-1,2-Dichloroethene (DCE) was detected above the TOGS guidance value of 5 µg/L in one monitoring well (MW-18R) at a concentration of 14 µg/L.
- Methylene Chloride was detected above the TOGS guidance value of 5 µg/L in one monitoring well (AMW-3) at a concentration of 15 µg/L.
- 1,1,2-Trichloroethane was detected above the TOGS guidance value of 1 µg/L in one monitoring well (AMW-3) at a concentration of 4.8 µg/L.

4.2.1.2 SVOCs

- Acenaphthalene was detected above the TOGS guidance value of 20 µg/L in one monitoring well (AMW-11) at concentrations of 96 µg/L and 160 µg/L.
- Benzo(a)anthracene was detected above the TOGS guidance value of 0.002 µg/L in two monitoring wells at concentrations of 0.39 µg/L and 2.9 µg/L in monitoring wells P-10 and AMW-11, respectively.
- Benzo(b)fluoranthene was detected above the TOGS guidance value of 0.002 µg/L in two monitoring wells at concentrations of 1.0 µg/L and 1.1 µg/L in monitoring wells P-10 and AMW-11, respectively.

- Bis(2-ethylhexyl)phthalate was detected above the TOGS guidance value of 5 µg/L in one monitoring well (P-10) at a concentration of 120 µg/L.
- Chrysene was detected above the TOGS guidance value of 0.002 µg/L in two monitoring wells at concentrations of 0.75 µg/L and 2.7 µg/L in monitoring wells P-10 and AMW-11, respectively.
- Fluorene was detected above the TOGS guidance value of 50 µg/L in one monitoring well (AMW-11) at concentrations of 55 µg/L and 110 µg/L.
- Naphthalene was detected above the TOGS guidance value of 10 µg/L in eight monitoring wells at concentrations ranging from 11 µg/L in AMW-3 to 220 µg/L in AMW-2.
- Phenanthrene was detected above the TOGS guidance value of 50 µg/L in one monitoring well (AMW-11) at a concentration of 140 µg/L.
- Phenol was detected above the TOGS guidance value of 1 µg/L in six monitoring wells at concentrations ranging from 1.3 µg/L in P-10 to 200 µg/L in temporary well TW-3.

4.2.2 Lower Sand Unit

A total of 67 groundwater sample were collected from 32 monitoring wells and 5 temporary wells screened in the lower sand unit during sampling events completed in 2016. A summary of the exceedances of the TOGS guidance values is provided below.

4.2.2.1 VOCs

- Benzene was detected above the TOGS guidance value of 1 µg/L in 15 monitoring wells at concentrations ranging from 1.1 µg/L in MW-31-D1R and MW-30-VD to 160 µg/L in MW-27-D2.
- Toluene was detected above the TOGS guidance value of 5 µg/L in five monitoring wells at concentrations ranging from 6.4 µg/L in IW-2-D1 to 17 µg/L in MW-27-D2.
- Ethylbenzene was detected above the TOGS guidance value of 5 µg/L in two monitoring wells at concentrations of 6.7 µg/L and 92 µg/L in temporary well ASB-4 and MW-27-D2, respectively.
- Xylenes were detected above the TOGS guidance value of 5 µg/L in six monitoring wells at concentrations ranging from 6.5 µg/L in AWM-15-D1 to 68 µg/L in MW-27-D2.
- Isopropylbenzene was detected above the TOGS guidance value of 5 µg/L in two monitoring wells at concentrations of 38 µg/L and 5.4 µg/L in MW-27-D2 and MW-29-D1, respectively.
- MTBE was detected above the TOGS guidance value of 10 µg/L in 20 monitoring wells at concentrations ranging from 12 µg/L in AMW-14-D1 to 640 µg/L in OW-1-D1.
- Acetone was detected above the TOGS guidance value of 50 µg/L in three monitoring wells at concentrations ranging from 53 µg/L in MW-27-D1 to 280 µg/L in MW-28-D1.
- Cis-1,2-DCE was detected above the TOGS guidance value of 5 µg/L in seven monitoring wells at concentrations ranging from 10 µg/L in MW-24-D1 to 1,900 µg/L in temporary well ASB-4.

- Chloroform was detected above the TOGS guidance value of 7 µg/L in two monitoring wells at concentrations of 19 µg/L and 21 µg/L in temporary wells ASB-5 and ASB-7, respectively.
- Methylene Chloride was detected above the TOGS guidance value of 5 µg/L in three monitoring wells at concentrations ranging from 5.7 µg/L in MW-27-D2 to 330 µg/L in temporary well ASB-4.
- TCE was detected above the TOGS guidance value of 5 µg/L in three monitoring wells at concentrations ranging from 5.5 µg/L in AMW-15-D1 to 2,100 µg/L in ASB-4.
- Vinyl Chloride was detected above the TOGS guidance value of 2 µg/L in 15 monitoring wells at concentrations ranging from 3.5 µg/L in AMW-15-D2 to 2,100 µg/L in AMW-14-D1.

The current extent of residual TCE, vinyl chloride, and MTBE in the lower sand unit is visually illustrated in a series of isoconcentration figures presented in **Appendix I**.

4.2.2.2 SVOCs

- Acenaphthalene was detected above the TOGS guidance value of 20 µg/L in two monitoring wells at concentrations of 22 µg/L and 47 µg/L in OW-1-D1 and IW-2-D1, respectively.
- Bis(2-ethylhexyl)phthalate was detected above the TOGS guidance value of 5 µg/L in five monitoring wells at concentrations ranging from 7.5 µg/L in MW-30-D1 to 11 µg/L in MW-26-D1 and MW-30-VD.
- Butylbenzylphthalate was detected above the TOGS guidance value of 50 µg/L in monitoring well MW-26-VD at a concentration of 96 µg/L.
- Naphthalene was detected above the TOGS guidance value of 10 µg/L in three monitoring wells at concentrations ranging from 24 µg/L in OW-2-D1 to 88 µg/L in MW-27-D2.
- Phenol was detected above the TOGS guidance value of 1 µg/L in two monitoring wells at concentrations of 14 µg/L and 56 µg/L in MW-28-D1 and MW-27-D2, respectively.
- Trans-1,2-DCE was detected above the TOGS guidance value of 5 µg/L in two monitoring wells at concentration of 11 µg/L and 13 µg/L in MW-24-D2 and temporary well ASB-4, respectively.
- Tetrachloroethene was detected above the TOGS guidance value of 5 µg/L in temporary well ASB-4-D1 at a concentration of 6.7 µg/L.

5 SITE CONCEPTUAL MODEL

The Site Conceptual Model is outlined below consistent with DER-10 expectations. The model includes a discussion of contaminant sources, current observed extent of contamination, relevant fate and transport characteristics, the potential migration pathways, and potential receptors.

5.1 Source of Contamination

There are two primary sources of contamination identified at the site, impacts from the historical petroleum terminal operations which occurred from 1931 to the early 1990's and the historic fill used to create the landmass which became the site.

5.2 Nature of Contamination

The nature of residual contamination in the soil and groundwater at this site, as characterized through this and previous investigation results, is summarized in the following sections for soil and groundwater impacts, respectively.

The data summaries presented in the following sections omit data of samples for soil locations previously remediated through the IRMs completed, as these data no longer represent the current conditions at the site.

5.3 Soil Impacts

The COCs detected in soil in the Fill Unit and Lower Sand Unit.

5.3.1 Fill Unit

The following sixteen COCs were detected in the fill unit at concentrations above the Protection of Groundwater SCO: acetone, benzene, n-butylbenzene, ethylbenzene, methylene chloride, MTBE, naphthene, n-propylbenzene, 1,2,4-trimethylbenzene, toluene, xylenes, benzo(a)pyrene, benzo(k)fluoranthene, chrysene, arsenic, and mercury.

The following seven COCs were detected in soil at concentrations above the Commercial Use SCO: Benzo(a)pyrene, benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and arsenic.

The soil analytical data is summarized in Tables 4 and 5 and presented on Figures 7 and 9.

5.3.2 Lower Sand Unit

The following five COCs were detected in the lower sand unit at concentrations above the Protection of Groundwater SCO: cis-1-2-DCE, methylene chloride, TCE, vinyl chloride, and phenol.

There were no exceedances of the Commercial Use SCO in the lower sand unit.

The soil analytical data is summarized in Tables 4 and 5 and presented on Figure 8.

5.4 Groundwater Impacts

5.4.1 Fill Unit

The following eighteen COCs were detected in groundwater in the fill unit at concentrations above TOGS guidance: benzene, toluene, ethylbenzene, xylenes, MTBE, isopropylbenzene, cis-1,2-DCE, methylene chloride, 1,1,2-trichloroethane, acenaphthalene, benzo(a)anthracene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, chrysene, fluorene, naphthalene, phenanthrene, and phenol.

5.4.2 Lower Sand Unit

The following eleven COCs were detected in groundwater in the lower sand unit at concentrations above the TOGS guidance values: benzene, toluene, ethylbenzene, xylenes, isopropylbenzene, MTBE, acetone, cis-1,2-DCE, trans-1,2-DCE, tetrachloroethene, chloroform, methylene chloride, TCE, acenaphthalene, bis(2-ethylhexyl) phthalate, butylbenzylphthalate, naphthalene, and phenol.

5.5 Extent of Residual Commination

There are two sources of contamination at the site: terminal operations, including the operation of the former VRU, and historical fill. Impacts from petroleum impacts (benzene, toluene, ethylbenzene and xylenes and MTBE) and historical fill are primarily limited to the fill unit, and impacts from the former VRU, which include CVOCs, primarily impact the lower sand unit. There are some petroleum-related impacts in the lower sand unit, including MTBE, and there are some CVOCs at low concentrations detected above TOGS guidance values in the fill unit.

5.5.1 Fill Unit

Low level petroleum and fill-related soil impacts are widespread in the fill unit. The significate impacts (greater than one order of magnitude above the Commercial Use SCO) were excavated as part of the IRMs (Section 1.2). Petroleum COCs have been detected in groundwater at concentrations above the TOGS guidance values in the last 5 years. The highest concentrations of petroleum COCs in groundwater are located in the central area of the site, near the former truck loading rack area. Concentrations of petroleum COCs decrease by an order of magnitude along the downgradient boundary of the site.

5.5.2 Lower Sand Unit

The primary source of COCs in the lower sand unit was the meadow mat below the former VRU area. The meadow mat was excavated in 2013/2014 as part of an IRM. Although other VOCs were detected in the lower sand unit at concentrations above the TOGS guidance values, the discussion of the extent of the plumes will be limited to TCE, vinyl chloride, and MTBE because they are most representative of conditions in the lower sand unit.

Concentrations of TCE in groundwater have decreased from 340,000 µg/L in MW-25-D2 in August 2013 to 2,100 µg/L in ASB-4 in June 2016; concentrations of vinyl chloride have decreased from 6,300 µg/L in MW-25-D1 in August 2013 to 2,100 µg/L in AMW-14-D1 in July 2016; and concentrations of MTBE have

decreased from 2,500 µg/L in MW-25-D2 in August 2013 to 640 µg/L in OW-4-D1 in January 2016. Below is a summary of the current extent of the plumes in the lower sand unit.

The TCE plume is approximately 100 feet long and extends from the base of the meadow mat at 20 feet bcgs to 35 feet bgs. The maximum concentration of TCE in the D1 horizon is in temporary well ASB-4 at 2,100 µg/L. TCE was not detected in the perimeter D-1 horizon monitoring wells or in the D2 and VD horizon monitoring wells. The TOGS guidance value is 5 µg/L for TCE.

The vinyl chloride plume is approximately 180 feet long and extends from the base of the meadow mat at 20 feet bcgs to 45 feet bcgs (D2 horizon). In June 2016, the maximum concentration of vinyl chloride in the D1 horizon was 2,100 µg/L in AMW-14-D1, and the maximum concentration in the D2 horizon was 38 µg/L in MW-24-D2. Vinyl chloride was detected in perimeter monitoring well MW-26-D1 at 20 µg/L. Vinyl chloride was not detected in the VD horizon monitoring wells. The TOGS guidance value is 2 µg/L for vinyl chloride.

MTBE was detected in all three horizons in the lower sand unit, and the extent of the MTBE plume has not been delineated off site. In the D1 horizon, the maximum concentration is 640 µg/L in OW-1-D1, and concentrations at the downgradient property line range from 4.7 µg/L in MW-28-D1 to 340 µg/L in MW-26-D1. In the D2 horizon, the maximum concentration is 130 µg/L in MW-24-D2, and the concentrations in the D2 horizon at the property boundary range from 0.25 µg/L in MW-28-D2 to 59 µg/L in MW-26-D2. MTBE was detected in five of the six wells in the VD horizon at concentrations ranging from 0.42 µg/L in MW-29-VD to 3.4 µg/L in AMW-13-VD. The TOGS guidance value for MTBE is 10 µg/L.

5.6 Mass of Constituents of Concern (COCs)

The total estimated mass of COCs in the Lower Sand Unit is based on groundwater analytical results in the Lower Sand Unit in 2016. The mass provided below is represents post IRM current site conditions.

Due to the limited data in the fill unit in 2016, COC mass was not calculated. The calculation is based:

- The areas presented on the isoconcentration maps in Appendix I;
- Thickness of 15 feet for the D1 horizon and 10 feet for the D2 horizon; and
- Porosity of 0.35.

COC	TCE (kg)	Vinyl Chloride (kg)	MTBE (kg)
Lower Sand Horizon D1	0.03	0.09	0.17
Lower Sand Horizon D2	--	0.0001	0.02

5.7 Migration Pathways

The following is a preliminary assessment of the potential migration pathways for each media of potential concern in connection with this site:

Groundwater

Groundwater must be considered as a potential migration pathway, however, a complete pathway to potential receptors is mitigated by the deed restrictions which prohibits any purpose other than for remediation and limits land use to commercial purposes. The potential groundwater to serve as a complete pathway to receptors is further mitigated by the fact that groundwater in the site vicinity has been demonstrated to have chloride and/or total solids concentrations which exceed the non-potable GSB classification criteria of 1,000 mg/L and 2,000 mg/L, respectively (Langan 2007).

Surface Water

Concentrations of COCs at the surface water groundwater interface were not observed to indicate a potential for a containment migration pathway to surface water.

Soil Vapor

Soil vapor has the potential to serve as a pathway for volatile COCs within the subsurface (including BTEX and CVOCs) to migrate into site future buildings on this site. However, the potential for a complete pathway to receptors within future building will be mitigated by installing an appropriate vapor barrier under the retail facility.

Soil and Groundwater Direct Contact

The potential for direct contact with impacted soil or groundwater to be the pathway for exposure to COCs is unlikely given that the grade of the site was recently raised through the placement of between three and five feet of clean fill across the entire site and the surface will largely be paved as a parking lot or covered by buildings. While direct contact still represents a potential pathway of concern for utility and excavation workers, this pathway can be effectively mitigated through a Site Management Plan requiring that excavations will be completed under an appropriate health and safety plan to protect workers.

Biotic

Based on the current site conditions and future use of the site as a retail facility, the potential risk to ecological receptors is considered limited due to the low-quality habitat at the site and in the surrounding area.

In summary, the only potential migration pathway would be direct contact with soil and groundwater, which has been reduced by the addition of fill material to the site and will be addressed in the Site Management Plan.

6 SUMMARY AND CONCLUSIONS

This section presents a summary of soil and groundwater conditions and the relevant conclusions that can be drawn regarding the nature and extent of soil and groundwater impacts at this site.

6.1 Soil Conditions

6.1.1 Fill Unit

The following COCs were detected in the fill unit at concentrations above the Protection of Groundwater SCO: acetone, benzene, n-butylbenzene, ethylbenzene, methylene chloride, MTBE, naphthene, n-propylbenzene, 1,2,4 trimethylbenzene, toluene, xylenes, benzo(k)fluoranthene, chrysene, arsenic, and mercury. The most widespread of these exceedances were for BTEX compounds, many of which were detected within an order of magnitude of the relevant criteria.

The following COCs were detected in the fill unit at concentrations above the Commercial Use SCO in the fill unit: benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and arsenic. The exceedances of the Commercial Use SCO in the fill unit are sporadic in nature and are within an order of magnitude of the SCO.

6.1.2 Lower Sand

The following COCs were detected in the lower sand unit at concentrations above the Protection of Groundwater SCO: cis 1-2-dichloroethene, methylene chloride, TCE, vinyl chloride, and phenol.

The primary COCs in the lower sand are the CVOCs and the exceedances are all in the vicinity of the former VRU area. Of the COCs detected above the Protection of Groundwater SCO, only vinyl chloride was detected at a concentration greater than an order of magnitude above the SCO.

6.2 Groundwater Conditions

The current, post-IRM, groundwater conditions at this site have recently been further investigated through the installation of wells in the former VRU area, the installation of additional monitoring wells downgradient of the former VRU area, and the sampling of the complete groundwater monitoring network. The results of the recent groundwater sampling are summarized in **Table 6** and on **Figures 10 and 11**. A complete summary of historical groundwater sampling results is provided in **Appendix G**.

The water-bearing units of interest beneath the site are a shallow fill unit and a lower sand unit. The units are separated by a meadow mat unit which is continuous across most of the site.

6.2.1 Fill Unit

The primary COCs in groundwater in the shallow groundwater/fill unit are benzene, ethylbenzene, xylenes, isopropylbenzene, and naphthalene. Other COCs were detected in groundwater at concentrations above the TOGS guidance values; however, the detections were isolated and/or concentrations were within an order of magnitude of the guidance values.

6.2.2 Lower Sand Unit

The primary COCs at the site are TCE, vinyl chloride, and MTBE in the lower sand. Other COCs were detected in groundwater at concentrations above their respective criteria; however, the detections were sporadic and/or within an order of magnitude of the criteria. Following the completion of the former CRU area IRM, the concentrations of VOCs have decreased: TCE decreased from 340,000 µg/L in MW-25-D2 in August 2013 to 2,100 µg/L in ASB-4 in June 2016; vinyl chloride decreased from 6,300 µg/L in MW-25-D1 in August 2013 to 2,100 µg/L in AMW-14-D1 in June 2016; and MTBE decreased from 100,000 µg/L in MW-25-D2 in August 2013 to 640 µg/L in OW-1-D1 in January 2016.

The extent of CVOCs impacts in the lower sand unit are limited to the shallow D1 and D2 horizons. No CVOCs were detected in the VD horizon at concentrations above the TOGS guidance values. The TCE impacts are limited to the D1 horizon in the footprint of the former VRU area IRM. Vinyl chloride, a degradation produce of TCE, extends beyond the former VRU area in the D1 and D2 horizons to the property line to the west of the former VRU area. Vinyl chloride was not detected in the VD horizon wells. The distribution of vinyl chloride is consistent with a TCE plume that is natural attenuating and shrinking.

MTBE was detected in the lower sand unit in all three horizons, although the detections of MTBE were not above the TOGS guidance value in the VD horizon. The horizontal extent in the D1 and D2 horizons has not been defined at the property boundary. Concentrations of MTBE were detected at the property boundary in the D1 horizon in MW-26-D1 (340 µg/L) and MW-29-D1 (23 µg/L) and in the D2 horizon in MW-26-D2 (59 µg/L) and MW-29-D2 (51 µg/L). The TOGS guidance value for MTBE is 10 µg/L.

6.3 Conclusions

The following conclusions are supported by the available site characterization results:

- The IRM implemented to address the identified source of CVOC contamination at the site involved the slurry-based excavation of the impacted soil within and surrounding the former VRU Area. A comparison of groundwater quality conditions observed before and after implementation of this IRM demonstrate the dramatic improvement of the observed groundwater conditions following removal action.
- Residual impacts observed in excess of relevant criteria or guidance within the shallow fill unit are composed mostly of petroleum related compounds including BTEX and MTBE. These exceedances are sporadically distributed around the site and are typically within an order of magnitude of the relevant criteria or guidance value.
- Residual impacts observed in excess of relevant criteria or guidance within the lower sand unit are primarily residual CVOCs including TCE, VC and other CVOC daughter compounds. These exceedances are observed at their highest concentrations beneath the former VRU area. However, these dissolved concentrations in groundwater are observed to attenuate very rapidly down gradient of the former source area such that concentrations of CVOCs in wells along the down gradient property boundary are below the relevant criteria or guidance with the exception of a single detection of VC at 20 µg/L in MW-26-D1. Petroleum related compounds including BTEX and MTBE are also observed to exceed relevant criteria or guidance at sporadic locations within the lower sand unit. Most of these exceedances are observed to be within an order of magnitude of the relevant criteria or guidance.
- The available site assessments completed to date provide an adequate characterization of the site assessment of appropriate alternatives capable of remediating the site.

Notes:
[1]Colorimetric dissolved oxygen measurement.
NA = Dissolved oxygen meter not properly functioning.
ºC = Celsius.
mg/L = milligrams per liter.
mV = millivolts.
NTUs = Nephelometric Turbidity Units.
SU = Standard Units.
mS/cm = milliSiemens per centimeter.
NR = Not reported.
Dissolved oxygen measurements collected in February 2013 were measured using a Horbia.

Table 4
Summary of pre-2010 Soil Analytical Data

Remedial Investigation Report
Former Gulf Oil Terminal
Oceanside, Town of Hempstead, NY

Notes:

1. Unrestricted Use SCO, Restricted use SCO for commercial use, and protection of groundwater are from 6 NYCRR Part 375-6.8.
2. Field duplicate sample results are presented in brackets, [ ].
3. Designations:
   - Gray font = Analyte was not detected.
   - Italic font = Analyte was detected above unrestricted use SCO.
   - Black Bold Italic font = Analyte detected above restricted - protection of groundwater SCO.
   - Gray Shading = Analyte detected above restricted - commercial use SCO.
4. Abbreviations:
   - - - = 6 NYCRR SCO not available.
   - 6 NYCRR = Title 6 of the Official Compilation of Codes, Rules, and Regulations of the State of New York.
   - ft = feet.
   - mg/kg = milligrams per kilogram or part per million.
   - NA = Not Analyzed.
   - ND = Not detected.
   - SCO = Soil Cleanup Objectives.
   - VOC = Volatile Organic Compounds.
   - SVOC = Semi-Volatile Organic Compounds.
5. Qualifier Definitions:
   - B = Analyte was detected in the blank and sample.
   - E = Analyte exceeded calibration range.
   - J = Estimated value. Result is greater than the RL but less than the MDL.
   - R = Rejected results.
   - U = Analyte not detected at listed reporting detection limit.

Table 5
Summary of 2010 to 2016 Soil Analytical Data

Remedial Investigation Report
Former Gulf Oil Terminal
Oceanside, Town of Hempstead, NY

Notes:

1. Unrestricted use SCO, Restricted use SCO for commercial use and protection of groundwater are from 6 NYCRR Part 375-6.8.
2. Field duplicate sample results are presented in brackets, [ ].
3. Designations:
   Gray font = Analyte was not detected.
   Italic font = Analyte was detected above unrestricted use SCO.
   Black Bold Italic font = Analyte detected above restricted - protection of groundwater SCO.
   Gray Shading = Analyte detected above restricted - commercial use SCO.
4. Abbreviations:
   - - = 6 NYCRR SCO not available.
   6 NYCRR = Title 6 of the Official Compilation of Codes, Rules, and Regulations of the State of New York.
   ft = feet.
   LCS/LCSD = Laboratory Control Sample/Laboratory Control Sample Duplicate.
   mg/kg = milligrams per kilogram or part per million.
   NA = Not Analyzed.
   SCO = Soil Cleanup Objectives.
   VOC = Volatile Organic Compounds.
   SVOC = Semi-Volatile Organic Compounds.
5. Qualifier Definitions:
   B = Analyte was detected in the blank and sample.
   E = Analyte exceeded calibration range.
   J = Estimated value. Result is greater than the RL but less than the MDL.
   R = Rejected results.
   U = Analyte not detected at listed reporting detection limit.
   * = LCS/LCSD or relative percent difference of LCS/LCSD exceeds the control limits.
