FINAL PRE-DESIGN INVESTIGATION REPORT

Former Aluminum Louvre Site
Site No. 130195

Town of Old Bethpage
Nassau County, New York

Prepared for:
New York State
Department of
Environmental Conservation

February 28, 2020

CDM Smith

Certification Statement

I, Amy Picunas, certify that I am currently a New York State registered professional engineer and that this *Final Pre-Design Investigation Report for Former Aluminum Louvre, NYSDEC Site No. 130195*, February 28, 2020 was prepared in accordance with all applicable statutes and regulations and in substantial confirmation with the DER Technical Guidance for Site Investigation and Remediation (DER-10) and that all activities were performed in full accordance with the DER-approved work plan and any DER-approved modifications.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, Amy Picunas, of 11 British American Boulevard, Latham, New York, am certifying as Owner's Designated Site Representative for the site.

NYS Professional Engineer # 089022

Date February 28, 2020

Signature Amy Picunas

Section 1
Introduction

1.1 Site Background

New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) has requested assistance from Camp Dresser McKee & Smith (CDM Smith) to complete a pre-design investigation (PDI) and remedial design (RD) for implementation of a remedial action for Operable Unit (OU) 1 of the Former Aluminum Louvre (FAL) Site (herein referred to as the "Site"). A record of decision (ROD) was issued for this Site in March 2013 (NYSDEC, 2013). This report provides a summary of the three PDI phases conducted between October 2017 and March 2019. The results have been compiled into an updated conceptual site model for the Site, subsequently used as the basis of design, both of which are presented in this report.

1.1.1 Current Site Use

The FAL Site includes two parcels: 161 Bethpage-Sweet Hollow Road (tax parcel 47-A-265, approximately 2.14 acres) and 301 Winding Road (tax parcel 47-A-263, approximately 1.22 acres) in Old Bethpage, NY. The Site is in an industrial park surrounded by a suburban area. To the west and southwest of the Site is an inactive waste incinerator and the former Old Bethpage Landfill. **Figure 1-1** presents the site vicinity map and **Figure 1-2** presents the site location map.

The main features of the Site include two commercial buildings, which are surrounded by paved outdoor parking and storage. Each parcel contains one of the commercial buildings. Both properties on the Site are zoned for light industrial use. The building on 161 Bethpage-Sweet Hollow Road contains one tenant: New York Paving, a commercial paving company. The 161 Bethpage-Sweet Hollow Road building owner uses approximately 75% of the building for storage of drag racing vehicles/equipment and storage of other various vehicles. The 301 Winding Road property has one tenant, IntelliGen Power Systems LLC. IntelliGen Power Systems utilizes the building to maintain and fabricate cogeneration power units. The surrounding properties are used for a combination of commercial and light industrial. The nearest residential area is 0.35 mile northwest of the Site.

1.1.2 Historical Use

The Aluminum Louvre Corporation formerly owned 161 Bethpage-Sweet Hollow Road and simultaneously occupied both lots that comprise the Site. Aluminum Louvre manufactured louvers, which involved stamping, cutting, and shaping of metal stock; degreasing parts and painting. From 1986 to 1993, Aluminum Louvre generated volatile organic compound (VOCs) solvent waste, including tetrachloroethylene (PCE), trichloroethylene (TCE) and 1,1,1-trichloroethane (1,1,1-TCA). Nassau County records also indicate that Aluminum Louvre used TCE and 1,1,1-TCA from 1983 to 1994. In 1997, a contaminated dry well at the 301 Winding Road

property was remediated under a voluntary cleanup agreement (VCA). Dry well remediation was also conducted under a separate VCA at the 161 Bethpage-Sweet Hollow Road property from 1999 to 2000. In 2007, the United States Environmental Protection Agency (USEPA) collected soil and groundwater samples at the Site and found both mediums to be contaminated with TCE and other VOCs. NYSDEC investigated the properties from 2008 to 2009 as part of the Old Bethpage Industrial Area Site Characterization and determined that the Site should be listed on the Registry of Inactive Hazardous Waste Disposal Sites. The Site was divided into three OUs: OU-1 includes on-site contamination, OU-2 covers off-site contamination, and OU-3 consists of an area-wide groundwater evaluation.

1.1.3 Remedial History and Previous Site Investigations

There have been sixteen separate environmental investigations and two VCAs conducted at or in the vicinity of the Site. Of these sixteen studies, seven investigations included the 161 Bethpage-Sweet Hollow Road property, six investigations included the 301 Winding Road property and three included both properties. In 2013, a remediation investigation report (RIR) was completed by HDR (HDR, 2013a) for the NYSDEC under the New York State Environmental Restoration Program (NYSERP) and a ROD was issued (NYSDEC, 2013). This section summarizes the activities and findings from the remedial investigation (RI).

The primary contaminants of concern (COCs) in the soil are VOCs including TCE, PCE, cis-1,2-dichloroethene (cis-1,2-DCE), 1,1,1-TCA, toluene, and xylene. These VOCs were detected above the NYSDEC unrestricted use soil cleanup objectives (SCOs). TCE and PCE were the most frequently detected compounds and exceeded the unrestricted use SCOs by the largest factor. The highest contaminant concentrations were detected on the 301 Winding Road properties near a former dry well just south of the 161 Bethpage-Sweet Hollow Road building. Refer to **Figure 1-3** for dry well locations. Based on sampling results and field screening observations, the contaminated subsurface soil appeared to be largely confined to a layer of silty clay, in which the highest VOC concentrations were consistently detected between 14 and 18 feet below ground surface (bgs). In addition, a small area of soil impacted with polychlorinated biphenyls and three pesticides above the unrestricted use SCOs were identified near another dry well east of the 301 Winding Road building. The areas to the west and north of the two buildings investigated as part of the RI soil investigation did not have soil contamination above applicable unrestricted use SCOs.

Vapor intrusion sampling was conducted in two phases in 2011 and 2012 and included the collection of sub-slab vapor samples at six locations inside the Site buildings, indoor air samples, and outdoor air samples. The highest concentrations were observed in the sub-slab sample collected in the southeast corner of the 161 Bethpage-Sweet Hollow Road building during the 2012 event (1,1,1-TCA at 560 microgram per cubic meter [µg/m^3], PCE at 8,300 µg/m^3, and TCE at 23,000 µg/m^3). The co-located indoor air samples collected inside the Site buildings indicated exceedances of New York State Department of Health (NYSDOH) air guidance values for ambient air of PCE (57 µg/m^3) and TCE (3.8 µg/m^3).

In 2011 and 2012 a network of monitoring wells was installed on- and off-site. Well clusters were installed at six locations on-site. Each location was set with three screened intervals from 60 to 70 feet bgs, one between 95 to 100 feet bgs, and the deepest from 120 to 125 feet bgs. In 2012, an additional four wells were installed off-site to the east and southeast to further delineate the horizontal and vertical extent of the chlorinated solvent plume with the same screened intervals as the on-site wells. One single-depth deep well with a screened interval from 173 to 183 feet bgs was installed in the "source area", located in the paved area just east of the northeast corner of 301 Winding Road property where concentrations of VOCs are highest.

VOCs were present in samples collected during both the 2011 and 2012 groundwater sampling events at the 161 Bethpage-Sweet Hollow Road and 301 Winding Road properties and included TCE, PCE, cis-1,2-DCE, and 1,1,1-TCA, and toluene and xylene to a lesser extent. The highest groundwater concentrations were measured in samples collected from the northeastern portion of the 301 Winding Road property. Groundwater contamination extends from the water table to greater than 125 feet bgs in some areas, both on-site and off-site. TCE, the main contaminant in the groundwater at the Site, was detected above the NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values (AWQS) Class GA standard of 5 micrograms per liter (µg/L) both on-site and off-site. The highest concentrations of TCE (2,500 µg/L) in groundwater were found at the water table, which is located approximately 65 feet bgs in the source area within the eastern portion of the 301 Winding Road property, and in intermediate depth intervals to the east and southeast of the main source area, both on-site and off-site. With increasing distance from the source area, the highest concentrations of TCE and other chlorinated VOCs were found in the deeper sampling intervals of the multi-level wells. TCE (300 µg/L) was discovered at 95 feet bgs on the 303 Winding Road property, approximately 130 feet southeast of the source area and in the general direction of the groundwater flow.

TCE concentrations above the NYSDEC standard were also observed approximately 130 feet downgradient from the source area in the eastern part of the 161 Bethpage-Sweet Hollow Road property (550 µg/L, at 70 feet bgs), in the direction of the observed flow of shallow groundwater. Further to the east and southeast, TCE was detected above the AWQS Class GA standard in the intermediate and deep intervals at two off-site monitoring wells.

To the northwest and west of the Site, the concentrations of chlorinated VOCs were mostly below detection limits or detected at low concentrations. Concentrations of TCE above the applicable standards extend approximately 275 feet to the south-southeast of the source area to the New England Motor Freight (NEMF) property located at 1 Arlene Way. Concentrations below the applicable standard for TCE were observed directly south of the NEMF property at 95 feet bgs (1.7 µg/L).

1.1.4 Physical Setting

The Site is located in the Hamlet of Old Bethpage within the Town of Oyster Bay, New York. Old Bethpage is located within Nassau County but also directly west of the boundary between Nassau and Suffolk County within central western Long Island. The Site is covered with pavement and buildings with the exception of narrow strips of vegetation trimming the parking areas. The Site lies at an elevation of between 127 and 135 feet above mean sea level (amsl) and generally slopes to the southeast. Overall each tax lot is generally flat, however a 3 to 4-foot retaining wall

separates the two parcels. The 161 Bethpage-Sweet Hollow Road property is the higher property in elevation of the two.

Long Island is comprised of Cretaceous and Pleistocene unconsolidated deposits underlain by Early Paleozoic to Precambrian bedrock. Pleistocene-aged deposits unconformably overlie the Cretaceous-aged deposits. In the vicinity of the Site, the Upper Pleistocene sediments are mostly absent and the Cretaceous sediments of the Magothy formation are more prevalent. The Pleistocene-aged deposits are those that comprise the upper glacial aquifer, the surficial water bearing unit on Long Island. These deposits are primarily comprised of glacial till of the terminal moraines along the central axis of Long Island, and outwash deposits of sand and gravel between and south of the Moraines. The Site is within central-western Long Island, within which the outwash deposits are dominated by fine to coarse sand and gravel. It is noted than some thin local lenses of clay or silty zones exist within the Upper Pleistocene sediments of the Old Bethpage area (Smolensky, et al. 1989). The dominant Magothy lithology generally is fine to medium quartz sand interbedded with coarse sand, sandy clay, and solid clay. Lignite, pyrite, and iron oxide concretions are also found in the Magothy. The top of the Magothy is approximately 35 feet amsl (approximately 85 feet bgs at the Site). The thickness of the Magothy is approximately 650 feet at the Site.

The subsurface investigation performed during the RI, indicated that observed materials at the Site mostly consisted of sand with interbedded layers of clay and silty sand. A layer of silty clay was noted between 11 and 16 feet bgs and ranged in thickness from approximately one to six feet. As stated, this silty clay layer coincided with some of the highest observed concentrations of VOCs in soil at the Site (HDR, 2013a). The PDI investigation assisted in confirming and refining the site-specific geology. Further discussion of the PDI refined site-specific geology, as well as, the site-specific hydrogeology is detailed in **Section 3**.

1.2 Record of Decision Components

Based on the HDR-issued 2013 RI and the 2013 Feasibility Study (HDR, 2013b), a ROD for OU-1 of the Site was issued in March 2013 (NYSDEC, 2013). The following is a list of the elements of the selected remedy:

- A RD program will be implemented to provide the details necessary for the construction, operation, optimization, maintenance, and monitoring of the remedial program. Green remediation principles and techniques shall be included in the RD program.
- In-situ thermal remediation (ISTR) treatment will be implemented to destroy or volatilize VOCs in the unsaturated soil on the east side of the site. The gasses produced will be collected by vapor extraction wells and treated in an ex-situ treatment unit.
- Both on-site buildings will be required to have sub-slab depressurization systems (SSDSs), or similar engineered systems, to prevent the migration of vapors into the building from soil and/or groundwater.
- Air sparging (AS) will be implemented to address the on-site groundwater plume contaminated by VOCs. Soil vapor extraction (SVE) will be used to collect the sparged vapors.

- An institutional control will be imposed at the Site in the form of environmental easement.
- A Site Management Plan including an Institutional and Engineering Control Plan, Monitoring Plan, and an Operation and Maintenance Plan will be required for the maintenance of the Site after the selected remedy has been implemented.

1.3 Pre-Design Investigation Purpose and Objectives

The overall goal of the PDI was to confirm and further define the limit and extent of contaminated soils beyond those detailed in the RI and ROD. Specifically, the objectives of the PDI were to:

- Establish the present nature of the Site topography and parcel boundaries.
- Evaluate hydrogeological parameters that may impact the RD.
- Confirm the nature and extent of contamination with finer spatial detail to inform appropriate remedial action.
- Develop an understanding of above- and below-ground utilities and features that may impact design and remedy effectiveness.
- Evaluate the extent of sub-slab vapor contamination at the 161 Bethpage-Sweet Hollow Road and 301 Winding Road properties.
- Update the conceptual site model for the Site, including the extent of the remediation zone, so that an effective RD can be developed to comply with the ROD for the Site.

The purpose of this PDI report is to present the results of the data collected to help address the abovementioned objectives. The results of the PDI were used in the development of the basis of design detailed in **Section 6** of this report. Ultimately, the additional sampling and characterization of the Site will be used to prepare and inform the RD so that it meets the remedial action objectives (RAOs) stated in the ROD. In general, the RD will be prepared such that the remedial program will restore the Site to pre-disposal conditions to the extent feasible and at minimum, shall eliminate significant threats to public health and the environment. A discussion of the specific RAOs for groundwater, soil and soil vapor for the Site is further detailed in **Section 6**.

Section 2 presents field activities performed during the three phases of the PDI. **Section 3** discusses the Site geology and hydrogeology, with **Section 4** presenting the nature and extent of contamination at the Site. **Section 5** presents an updated conceptual site model and **Section 6** presents the basis of design for this Site.

Section 2
Pre-Design Field Activities

This section provides a description of the PDI field activities performed during Phase I, conducted in October and November 2017, Phase II, conducted from June 2018 through July 2018, and Phase III, conducted during March 2019. A sample summary of the samples collected during all three phases of the field activities of the PDI is provided in **Table 2-1**.

2.1 Phase I (October 2017 – November 2017)

2.1.1 Geophysical Survey

CDM Smith subcontracted Advanced Geophysical Services (AGS) to conduct a geophysical survey at the Site for the Phase I drilling activities. The objectives of the survey were to clear proposed drilling locations of identifiable utilities, and to identify any underground utilities or features such as dry wells, in the paved areas east of both buildings. CDM Smith accompanied AGS during the survey which was conducted on October 9, 2017.

AGS utilized a combination of ground penetrating radar (GPR), radio frequency utility locating, and handheld metal detection methods to complete the survey. All five locations identified in this investigation for drilling were cleared of identifiable utilities. AGS identified eleven dry wells, shown on Figure 1 of **Appendix A**, and associated piping connections through visual observation and GPR. It was noted piping was present between dry wells DW-7, DW-8 and DW-9 (refer to **Figure 1-3**). Additionally, a water utility and telecommunications line were identified and marked out on the ground using spray paint. A copy of the geophysical survey figure markup was provided by AGS is provided in **Appendix A.** Note the locations of the utilities on the markup figure are approximate and for informational purposes only.

2.1.2 Soil Vapor Intrusion

CDM Smith conducted soil vapor intrusion (SVI) sampling between November 13, 2017 and November 15, 2017. A total of three permanent sub-slab soil vapor sampling ports were installed at the 301 Winding Road property and four permanent sub-slab sample ports were installed in the 161 Bethpage-Sweet Hollow Road property. An indoor air sample was co-located at every sub-slab sample location at both properties. Two outdoor air samples were also collected. The first was collected in the alley to the north of the 301 Winding Road property. The second was collected along the eastern portion of the 161 Bethpage-Sweet Hollow Road property. All samples were collected in 4-hour summa canisters and sent to TestAmerica Laboratories (TA) for analysis of VOCs by USEPA Method TO-15. The SVI sampling locations are shown on **Figure 2-1** and a summary of SVI samples collected is presented in **Table 2-1**. The sampling activities and analysis results are presented in **Section 4.1**.

2.1.3 Subsurface Soil

CDM Smith conducted a subsurface investigation between October 22, 2017 and November 17, 2017. CDM Smith subcontracted Cascade Drilling (Cascade), formerly Aquifer Drilling and Testing (ADT) located in Lynbrook, New York to perform drilling activities. The primary intent of the Phase I subsurface investigation was to characterize the existing subsurface conditions and

identify the nature of contamination and lateral extent of a submerged clay layer expected at approximately 80 feet bgs based on previous investigations. During the investigation, a shallow clay layer was identified at a depth of approximately 16.5 to 19 feet bgs, and a deep clay layer was observed at approximately 75.5 feet bgs to 81.5 feet bgs at boring locations near the Site buildings. Additionally, a third intermediate layer consisting of silty clay and/or gray clay material was identified at a depth of approximately 60 feet bgs. The shallow, intermediate and deep clay layers will be referred to as Clay 1, Clay 2 and Clay 3, respectively throughout the report. The soil boring logs for all PDI soil boring locations are presented in **Appendix B** and field notes are presented in **Appendix C**. Photodocumentation is presented in **Appendix D**.

Between October 23 and October 27, 2017, Cascade advanced soil borings at 3 locations (PDI-3 through PDI-5) using direct push drilling methods at the 161 Bethpage-Sweet Hollow Road property. Soil and groundwater samples were collected to further delineate contamination and characterize the existing Site conditions. At one location (PDI-4), the Geoprobe® hit refusal twice at 45 feet bgs due to the tightness of the sand formation. PDI-3 was advanced to a depth of 100 feet bgs and PDI-5 was advanced to a depth of 60 feet bgs. The soil boring locations are shown on **Figure 2-2** and a soil sample summary is presented in **Table 2-1**. The borings were screened for VOCs using a photoionization detector (PID) and the lithology was recorded at each location. Additionally, samples were collected for analysis of VOCs using USEPA Method 8260C at depths where clay material was present. The analytical results are discussed in **Section 4.2.1**.

Due to issues advancing the boring at the 161 Bethpage-Sweet Hollow Road property (PDI-4), Cascade recommended using Sonic drilling methods to complete PDI-4 and the remaining two borings within the 301 Winding Road Property (PDI-1 and PDI-2). Cascade re-mobilized to the Site between November 14 and November 17, 2017. A Geoprobe® Sonic 8140LC rig was utilized to advance borings at locations PDI-2 and PDI-4. Similar issues were encountered at PDI-4, and a final depth of only 60 feet bgs was achieved. Consequently, no soil samples were collected at PDI-4. PDI-2 was advanced to a depth of 80 feet bgs and soil samples were collected from the Clay 3 layer. Due to the amount of time and difficulty still experienced with the Geoprobe Sonic 8140LC, Cascade mobilized a larger Sonic drill rig on November 17, 2017 to complete boring PDI-1. The soil boring locations are shown on **Figure 2-2** and a soil sample summary is presented in **Table 2-1**. In addition to VOC samples, a total of five total organic carbon (TOC) samples were collected at PDI-1 between 8 feet bgs and 24 feet bgs in 4-foot intervals to assess the thermal treatability of the soil. The soil samples were analyzed for VOCs via USEPA Method 8260C and TOC via USEPA Method 9060. All soil samples sampled for VOCs and/or TOC were sent to TA for analysis. A sample summary is provided in **Table 2-1**. The analytical results are provided in **Section 4.2.1**.

2.1.4 Groundwater

In October and November 2017, CDM Smith collected groundwater grab samples through the casing on the Geoprobe® and Sonic drilling equipment. Two groundwater samples were to be collected at each location, one at the water table (expected at approximately 60 feet bgs based on previous investigations) and the second directly above the submerged clay layer (Clay 3, expected at approximately 80 to 90 feet bgs). Due to the narrow separation observed between the actual top of the water table (approximately 70 to 72 feet bgs) and the top of the Clay 3 layer (75 to 80 feet bgs), only one groundwater sample was collected at locations PDI-1, PDI-2 and PDI-3, from the groundwater present between Clay 2 and Clay 3. Two groundwater samples were collected at

PDI-5. Samples were collected for analysis of VOCs using USEPA Method 8260C at all locations. Additionally, samples were collected at PDI-1 and PDI-5 for analysis of 1,4-dioxane using Method 8270 selective ion monitoring (SIM). Groundwater sampled for VOCs and/or 1,4-dioxane were sent to TA for analysis. A sample summary is provided in **Table 2-1**. The groundwater sample locations are shown on **Figure 2-3** and a groundwater sample summary is presented in **Table 2-1**.

CDM Smith proposed to conduct two slug tests in existing monitoring wells in the same hydrostratigraphic units as the treatment zone at MW-161-1-S and MW-161-2-S, however both locations were dry during the October and November 2017 sampling event. Slug testing performed during Phase II is described in **Section 2.2.3.3** and analytical results are presented in **Section 3.1.3**.

2.2 Phase II (June 2018 – July 2018)

The primary intent of the subsequent PDI investigation, performed as a Phase II, was to provide a finer spatial detail of the extent and depth of contamination in the Clay 1 and Clay 2 layers that was not fully characterized in the Phase I investigation. Finer spatial detail of the extent of contamination assists in an accurately-defined target treatment zone (TTZ). Thermal treatment is an expensive technology; therefore, it was agreed between NYSDEC and CDM Smith the additional cost of conducting Phase II sampling to further refine the TTZ is justified.

There is a potential for the Site COCs to migrate through Clay 1, which could both possibly contaminate Clay 2 and serve as a continued source of groundwater contamination. The Phase II sampling investigation targeted the soil of Clay 1 and 2, as well as, the groundwater beneath and downgradient of the source area. Phase II investigation activities were performed in a manner that minimized the potential for contamination within Clay 1 to be transferred to Clay 2 during intrusive subsurface activities.

2.2.1 Geophysical Survey

A subsequent survey performed by AGS was conducted to clear proposed indoor drilling locations during Phase II. The objectives of the survey were to clear proposed drilling locations of identifiable utilities, and to identify any underground utilities or features within the second most southern garage bay of 161 Bethpage-Sweet Hollow Road and the eastern extension of 301 Winding Road. CDM Smith accompanied AGS during the survey which was conducted on July 23, 2018.

AGS utilized a combination of GPR, radio frequency utility locating, and handheld metal detection methods to complete the survey. All three indoor locations identified in this investigation for drilling were cleared of identifiable utilities. AGS identified three unknown utilities, shown on Figure 2 of **Appendix A.** All unknown utilities were noted on the ground using chalk during the sampling event. The areas for which the geophysical survey was requested, as well as, areas where utilities or features were identified are also presented in Figure 2 of **Appendix A**. Note the locations of the utilities on the markup figure are approximate and for informational purposes only.

2.2.2 Subsurface Soil

Subsurface soil samples collected during the Phase II field investigation were performed to provide a finer spatial detail of the impacted soil in the Clay 1 and Clay 2 layers, beyond the results collected during Phase I field investigation.

Between June 13 and June 29, 2018, Cascade advanced soil borings at 15 locations (PDI-6 through PDI-20) at the 161 Bethpage–Sweet Hollow Road and 301 Winding Road properties. Cascade used direct push drilling methods for locations PDI-6 through PDI-9 and Sonic drilling methods for locations PDI-10 through PDI-20. Locations PDI-6 through PDI-9 and PDI-18 were advanced to the shallow Clay 1 layer where soil samples were sampled for VOCs via USEPA Method 8260C.

At locations PDI-10 through PDI-20, soil samples were collected for VOC analysis at the intermediate Clay 2 layer, where gray clay material was present. Boring locations, PDI-10 through PDI-16 were performed as a part of a transect targeting both the Clay 2 layer and the groundwater present between the Clay 2 and Clay 3 layers. Locations from PDI-10 to PDI-16 were performed in a transect moving north to south, approximately 60 feet east of both the 161 Bethpage-Sweet Hollow Road and 301 Winding Road buildings. Soil samples were collected at the top of the Clay 2 layer, where observed, at the boring locations. No soil samples were collected at PDI-11 or PDI-12 as the Clay 2 layer was not observed.

Angled drilling was utilized at locations PDI-17, PDI-19 and PDI-20 near the source area so that samples could be obtained from the Clay 2 layer without drilling through known highly contaminated zones. The soil boring locations are shown on **Figure 2-2** and a soil summary table is presented in **Table 2-1**. All borings were screened for VOCs using a PID and the lithology was recorded at each location. All soil samples were analyzed for VOCs via USEPA Method 8260C. Additionally, six samples were collected from PDI-17, PDI-19, and PDI-20 and analyzed for ferrous iron via Method SM3500D. The analytical results are presented in **Section 4.2.2**.

On July 25, 2018, Cascade advanced soil borings at 3 locations (PDI-23 through PDI-25) within the 161 Bethpage-Sweet Hollow Road and 301 Winding Road buildings using direct push drilling methods. The soil boring locations are shown on **Figure 2-2** and a soil sample summary table is presented in **Table 2-1**. The borings were screened for VOCs using a PID and the lithology was recorded at each location. Additionally, soil samples were collected for VOC analysis at depths above the Clay 1 layer at each location. The soil samples were analyzed for VOCs via USEPA Method 8260C. The analytical results are provided in **Section 4.2.2**.

All soil samples sampled for VOCs during the Phase II field investigation were sent to TA for analysis. Soil boring logs for all Phase II locations are presented in **Appendix B**. Photodocumentation is presented in **Appendix D**.

2.2.3 Groundwater

2.2.3.1 Permanent Monitoring Well Installation and Development

In response to the Phase I groundwater grab sampling results monitoring wells were installed to further delineate and observe the contamination plume between Clay 2 and Clay 3. The locations of the new permanent monitoring wells were selected based on the groundwater grab samples

collected along the transect including sample locations PDI-10 through PDI-16 discussed in **Section 2.2.3.2**.

Between July 2 and 3, 2018, Cascade utilized a Sonic drill rig to install two monitoring wells. MW-161-3 was installed to a depth of 75 feet bgs and is located approximately 132 feet directly east of the northeastern corner of the 301 Winding Road building. MW-161-4 was installed to a depth of 75.3 feet bgs and is located approximately 125 feet east of the 301 Winding Road building and approximately 25 feet south of MW-161-3. MW-161-3 and MW-161-4 both have 10-foot-long screens. Both wells are located in the 161 Bethpage-Sweet Hollow Road parking lot.

Both wells were constructed using two-inch diameter, polyvinyl chloride (PVC), pre-packed, 10-slot screen and schedule 40, two-inch diameter PVC riser. A sand backfill was added around the wells to two-feet above the top of screen using No. 2 filter sand. A 2-foot bentonite seal was then added, and the wells were grouted with Portland cement to 1-foot below grade. A flush-mount aluminum road box with a concrete pad was installed for each of the wells. The wells were developed with a Mega Purger Whale® submersible pump by CDM Smith until water quality parameters stabilized and a minimum of 3 to 5 well volumes were purged. Monitoring well construction diagrams and development logs are included in **Appendix E**.

2.2.3.2 Groundwater Sampling

As stated, groundwater grab samples from PDI-10 through PDI-16 were performed to further delineate and observe the contamination plume between Clay 2 and Clay 3 and subsequently, select the locations for permanent monitoring wells, MW-161-3 and MW-161-4. The groundwater samples collected from the permanent monitoring wells were collected to provide samples that are truly representative of the groundwater downgradient of the source area. Groundwater grab samples PDI-17, PDI-19 and PDI-20 were collected to characterize the groundwater contamination between Clay 2 and Clay 3 directly beneath the source area, to determine if impacts to groundwater exist beneath Clay 2 beyond the sample results (PDI-1) collected during Phase I.

In June and July 2018, CDM Smith collected grab samples through both the casing on the Geoprobe® and the Sonic drill rig. One groundwater grab sample was collected at each of the 10 locations (PDI-10 through PDI-17, PDI-19, PDI-20). No groundwater samples were collected at PDI-18 or PDI-23 through PDI-25 as these locations were advanced to a maximum depth of 30 feet bgs, which is roughly 30 feet above the water table. In addition, CDM Smith collected groundwater samples via low flow methodology using an inertial pump at three monitoring well locations (MW-161-1-I, MW-161-3, and MW-161-4). Low flow logs are provided in **Appendix E**. MW-161-1-I was an existing monitoring well installed by HDR during the RI in April 2011 but was later decommissioned by CDM Smith, as discussed in **Section 2.2.3.4**. Permanent monitoring wells, MW-161-3 and MW-161-4 were installed by CDM Smith in July 2018 as described in **Section 2.2.2.1**. The groundwater sample locations are shown on **Figure 2-3** and a groundwater sample summary is presented in **Table 2-1**.

All samples were analyzed for VOCs. Additionally, samples collected at MW-161-1-I, MW-161-3, and MW-161-4 were analyzed for poly-/per-fluorinated alkyl substances (PFAS) and 1,4-dioxane. PFAS samples were analyzed by the laboratory using USEPA Method 537 (modified) while 1,4-dioxane was analyzed using USEPA Method 8270 SIM. Groundwater sampled for VOCs, PFAS,

and/or 1,4-dioxane were sent to TA for analysis. The analytical results are presented in **Section 4.4.2**.

2.2.3.3 Slug Testing

In order to evaluate hydrogeological parameters that may impact the RD, hydraulic conductivity was determined via a standard slug test. Slug testing was intended to be performed at MW-161-1-S and MW-161-2-S during the October and November 2017 sampling event. Due to dry conditions in the existing wells during the October and November 2017 sampling event, slug tests were instead conducted at the newly installed wells MW-161-4 and MW-161-3. Between July 24 and 25, 2018, CDM Smith conducted standard slug tests at both MW-161-3 and MW-161-4, located approximately 130 feet west of the 301 Winding Road building within the OU-1 boundary. The slug was constructed of a solid core length of PVC pipe, 5 feet in length and 1.5 inches in diameter. A rising head test was conducted at each well location. As the water level was observed below the top of screen at each well location, falling head tests would yield non-representative results. Therefore, only rising head test results were used in the hydraulic conductivity calculations. Tests were repeated two times at each well. A pressure transducer (Level Troll by In-Situ) was used at each well to record changes in water level with respect to time. Water level data were downloaded to the WinSitu5 software on to a field laptop and analyzed off-site. Results of the slug testing were analyzed in AQTESOLV using the Bouwer and Rice solution and are presented in **Section 3.1.3**. Calculations are provided in **Appendix F**.

2.2.3.4 Monitoring Well Decommissioning

Two existing wells within the source area and one existing well north of the 161 Bethpage-Sweet Hollow Road building installed during the RI were abandoned in place in June 2018 during the PDI. The two wells within the source area, MW-301-01-S (total well depth of 66 feet bgs) and ALC-MW3 (total well depth of 60 feet bgs) were grouted to the surface. The well north of 161 Bethpage-Sweet Hollow Road, MW-161-1-I (total well depth of 95 feet bgs) was grouted to the surface, as well. All three wells were abandoned to limit their ability to continue to provide a contaminant migration pathway into the zones underlying the Clay 1 layer.

2.3 Phase III (March 2019)

The subsurface soil investigation performed under Phase II provided characterization of both Clay 1 and Clay 2, however due to obstructions within the on-site buildings during the investigation, characterization of Clay 1 beneath the 161 Bethpage-Sweet Hollow Road and 301 Winding Road buildings was missing. The primary intent of the Phase III PDI investigation was to provide a finer spatial detail of the extent of contamination in Clay 1 along the western and northern boundaries of the proposed TTZ, that was not fully characterized in the Phase II investigation due to obstruction issues. Due to the expense of operating a thermal treatment unit, NYSDEC and CDM Smith agreed the additional cost of conducting Phase III sampling to further refine the TTZ is justified.

2.3.1 Geophysical Survey and Subsurface Investigation

AGS conducted a GPR survey at the Site on March 6, 2019 to clear the proposed indoor drilling locations to be performed as a part of the Phase III sampling event and to identify any possible utilities or features within the subsurface of the proposed TTZ. The GPR survey was also

performed in this area to identify subsurface utilities or features that may affect the implementation of the ISTR within the source area. The specific areas included in this GPR survey were the most southern garage bay of 161 Bethpage-Sweet Hollow Road, the eastern extension of 301 Winding Road, and the paved area east of the 301 Winding Road extension. CDM Smith accompanied AGS during the survey.

AGS utilized a combination of GPR, radio frequency utility locating, and handheld metal detection methods to complete the survey. All 11 indoor locations identified in this investigation for drilling were cleared of identifiable utilities. AGS identified one unknown utility and the three dry wells, as indicated within the AGS report dated April 23, 2019 of **Appendix A.** The unknown utility were noted on the ground in survey paint during the sampling event. The areas for which the geophysical survey was requested, as well as, areas where utilities or features were identified within the AGS report dated April 23, 2019included in **Appendix A**.

During the GPR survey conducted during the Phase II field investigation, an unknown utility was noted within the 301 Winding Road extension. The GPR survey conducted during the Phase III field investigation did not indicate the previously identified unknown utility. The AGS personnel stated the signals noted within this area where not indicative of a utility or subsurface feature.

Prior to the Phase III subsurface soil investigation activities on March 11, 2019, Cascade utilized an air knife to identify the unknown utility identified during the GPR survey located northeast of the northeastern corner of the 301 Winding Road building. No utility was located within this area, during the air knife investigation. The presence of utilities or subsurface features within the proposed TTZ have the potential to affect the implementation of ISTR within the source area. It was previously indicated that piping existed between DW-7, DW-8, and DW-9 within the source area east of 301 Winding Road, however, GPR surveys did not indicate the presence of piping. On March 11, 2019, Cascade utilized the air knife to confirm or deny the presence of piping between the dry wells. An approximately 5-inch diameter PVC pipe connection was identified between DW-7 and DW-8, and between DW-8 and DW-9 at approximately 2.5 feet bgs. The approximate location of the connections is shown on **Figure 1-3**. Photodocumentation of the subsurface investigation is included in **Appendix D**.

2.3.2 Subsurface Soil

On March 12 and 13, 2019, Cascade advanced soil borings at 11 locations (PDI-26 through PDI-36) within the 161 Bethpage-Sweet Hollow Road and 301 Winding Road buildings, as well as, in between the two buildings using direct push drilling methods. The soil boring locations are shown on **Figure 2-2** and a soil sample summary table is presented in **Table 2-1**. The borings were screened for VOCs using a PID and the lithology was recorded at each location. Additionally, soil samples were collected for VOC analysis at depths above the Clay 1 layer at each location. The soil samples were sent to TA to be analyzed for VOCs via USEPA Method 8260C. The analytical results are provided in **Section 4.2.2**. Soil boring logs for all Phase III sample locations are presented in **Appendix B** and photodocumentation is presented in **Appendix D**.

2.4 Decontamination

All non-dedicated equipment and tools used to collect subsurface soil samples for chemical analysis were decontaminated prior to and between each sample interval using an Alconox and water mix for washing and potable water rinse prior to reuse. Decontamination fluids were collected and containerized in drums. All non-dedicated sampling equipment for chemical analyses were decontaminated per the CDM Smith Generic Quality Assurance Project Plan (QAPP) (CDM Smith, 2018) and all associated standard operating procedures.

2.5 Investigation Derived Waste

Investigation derived waste (IDW) generated from field activities consisted of both soil cuttings and groundwater. All soil cuttings generated from subsurface soil borings and groundwater purged from monitoring wells were containerized in 55-gallon drums for off-site disposal. The drums were securely stored within the parking lots of the 161 Bethpage-Sweet Hollow Road and 301 Winding Road properties prior to off-site disposal. Drums from waste generated during the Phase I sampling were removed from the Site on January 17, 2018. Drums from waste generated during the Phase II sampling were removed from the Site on October 4, 2018 and December 14, 2018. The drum from waste generated during the Phase III sampling will be removed from the Site in the summer of 2019. All waste was disposed as non-hazardous to either the Clean Water of New York facility in Staten Island, New York or Veolia ES Technical Solutions, LLC in Flanders, New Jersey. Coordination and transportation of the waste was performed by Brookside Environmental Inc. Waste manifests are provided in **Appendix G**.

2.6 Quality Assurance/Quality Control

2.6.1 Laboratory Analysis and Validation

All soil, groundwater and air samples were analyzed by TA, which is a NYSDOH-approved and ELAP-certified laboratory. **Table 2-1** provides a sample summary and the associated analytical parameters analyzed at each sampling location. NYSDEC Analytical Services Protocols Category B data deliverables are provided in **Appendix H**.

Indoor air, sub-slab vapor, and outdoor air SVI samples were all analyzed for VOCs via USEPA Method TO-15. Between all phases of groundwater sampling, groundwater samples were analyzed for VOCs via Method 8260C, PFAS via Method E537, and 1-4-dioxane via Method 8270C SIM. Between all phases of soil sampling, soil samples were analyzed for VOCs via Method 8260C, TOC via SM5310C, and ferrous iron via Method SM3500D.

All analytical data received from TA for samples collected in October and November 2017 were validated by an independent data validator, Data Validation of Greensboro, Vermont. Analytical data received from TA for samples collected in June 2018, July 2018, and March 2019 were validated by Data Validation Services of North Creek, New York. Validation was performed in accordance with NYSDEC Data Usability Summary Report (DUSR) guidance referenced in NYSDEC DER-10 (NYSDEC, 2010). The DUSRs are provided in **Appendix I**. No issues were identified that would affect the use of the soil, groundwater and air data.

2.6.2 Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples include field duplicate samples, matrix spike/matrix spike duplicate (MS/MSD) samples, field blank (FB) samples, and trip blank (TB) samples. Field duplicate samples evaluate laboratory repeatability and MS/MSD samples evaluate matrix effects and the reliability of the analytical processes and equipment. FB samples are collected to evaluate the efficacy of equipment decontamination and general cleanliness of the field procedures while TB samples are provided to evaluate whether samples were contaminated by ambient conditions during transit from the project Site to the laboratory. Field duplicate, MS/MSD, FB, and TB samples were collected in accordance with the QAPP during each of the field investigation phases. **Table 2-1** presents each duplicate and its parent sample collected during the PDI. Analytical results for the QA/QC samples are included in **Appendix H**.

Section 3
Site-Specific Geology and Hydrogeology

3.1 Site Hydrogeology

A total of three synoptic rounds of groundwater measurements were collected by CDM Smith in January 2018, June/July 2018, and March 2019 from a maximum of 19 monitoring wells on Site. Measurements were taken to develop an understanding of groundwater flow patterns that may impact the RD and to confirm the groundwater measurements collected by HDR presented in the RIR. In January 2018 the groundwater elevation ranged from 60.9 to 62.07 feet amsl (depth to groundwater ranged from 67.8 to 75.01 feet bgs). The second round of synoptic groundwater measurements were collected in June and July of 2018 during the Phase II of the PDI field activities. Groundwater elevation ranged from 61.52 to 66.68 feet amsl (depth to groundwater ranged from 60.73 to 74.25 feet bgs). The third round of synoptic groundwater measurements were collected in March 2019 during the Phase III field investigation. Groundwater elevation ranged from 65.72 to 68.03 feet amsl (depth to groundwater ranged from 59.95 to 74.1 feet bgs). Groundwater elevation data for all synoptic rounds performed by CDM Smith, as well, as historic groundwater elevation data from HDR are included in **Table 3-1**. Groundwater contour plots showing the January 2018 elevations are presented in **Figure 3-1**. Groundwater contour plots showing the March 2019 elevations are presented in **Figure 3-2**. Limited access to onsite monitoring wells during the June/July 2018 synoptic round of water levels yielded a lack of representative groundwater data to be utilized for accurate groundwater contours for June/July 2018. Groundwater flow at the Site is generally to the southeast, as suggested by the synoptic measurement rounds.

Details about the slug testing performed on two monitoring wells, MW-161-3 and MW-161-4 in July 2018 are presented in **Section 2.2.3.3** and calculations are provided in **Appendix F**. MW-161-3 and MW-161-4 were screened in silty sand with some interbedded layers of clay and poorly graded sand. Results of the slug testing, analyzed in AQTESOLV Pro using the Bouwer and Rice Solution, yielded hydraulic conductivity estimates of between 0.401 feet/day in MW-161-4 and 0.606 feet/day in MW-161-3 with a geometric mean of 0.493 feet/day, all of which are representative of a medium sand with some interbedded silt (silty sand) and clay lenses, matching the interpolated lithology.

Using an effective porosity literature value for medium sand, the groundwater flow rate was estimated as follows:

$$V = \frac{Ki}{n}$$

Where: V = groundwater flow rate
K = hydraulic conductivity: 0.493 feet/day
i = gradient, 0.00530
n = effective porosity, assumed to be 28% or 0.28 (Morris and Johnson, 1967).

Using these values, the average linear velocity of groundwater (V) is calculated as follows:

$$V = \frac{(0.493 \text{ feet/day})*(0.00530)}{0.28}$$

$$V = 0.00934 \text{ feet/day}$$

$$V = 3.41 \text{ feet/year}$$

3.2 Site Geology and Lithology

During the PDI, lithology was recorded at each boring location in order to provide an accurate depiction of the general stratigraphy seen at the Site with the purpose of being included in the conceptual site model. The majority of the material seen at the Site is a fine to coarse sand with interbedded layers of silty sand and clay. All PDI borings performed by CDM Smith were generally advanced within the upper glacial aquifer. The lithology recorded at the Site was consistent with Upper Pleistocene glacial deposits typical of the upper glacial aquifer, observed within the vicinity of the Site. During the RI, one specific silty clay lenses was noted at the Site between 11 and 16 feet bgs among the sand with interbedded silty sand lenses. During the PDI, several silty sand lenses, as well as, three distinct clay lenses (Clay 1, Clay 2, and Clay 3) were observed within the subsurface of the Site boundary. The shallowest of the three distinct clay lenses, Clay 1 was consistent with the silty clay lens observed during the RI. Soil boring logs are included as **Appendix B**.

CDM Smith reviewed the bore logs provided in the HDR RIR, and two distinct clay layers were observed. The following is a summary of HDR's findings. During the RI, Clay 1, the shallow stiff orange, light gray silty clay layer was observed to be approximately 0.5 feet to 6 feet thick ranging from 11 to 16 feet bgs by HDR. Additionally, a deep submerged clay layer (Clay 3) was observed to be approximately 3 feet to 6 feet thick ranging from 79 to 91 feet bgs.

Further investigation during the PDI was performed to confirm this observed lithology. An additional intermediate clay lens (Clay 2) was observed during the PDI and the following discussion provides the details of the projected stratigraphy. Clay 1, estimated to be 0.5 feet to 6 feet thick, is located within the vadose zone at depths ranging from 12 to 28 feet bgs. Clay 2, estimated to be 0.5 foot to 5 feet thick, is located within both the lower vadose zone and is partially submerged beneath the water table, at depths ranging from 52 to 70 feet bgs. Historical water levels collected by HDR during the RI have shown that the water level was observed generally above where Clay 2 was observed during the PDI. Clay 3, estimated to be 0.5 feet to 8.5 feet thick, is submerged beneath the water table at depths ranging from 61.5 to 88 feet bgs. All three clay layers generally consisted of a light gray to gray stiff lean clay. The three clay layers at times exhibited both silt or sand banding. The three clay layers were most prominent (in thickness) in the source area beneath the paved area just east of the northeast corner of 301 Winding Road property. All three clay layers seem to pinch out moving east. Clay 2 was not observed at the most northeasterly boring locations performed during the PDI. Stratigraphic cross-sections based on field observations made at the PDI boring locations and observations made by HDR during the RI are discussed in **Section 4**.

Section 4
Nature and Extent of Contamination

The following sections present a summary of the soil, groundwater, and sub-slab vapor sampling results conducted as part of the PDI at the Site. As a preliminary evaluation, soil sample results were compared to the NYSDEC restricted commercial use SCOs and groundwater results were compared to NYSDEC TOGS 1.1.1 AWQS for Class GA groundwater. The SCOs used for the basis of design are discussed in Section 6. The State of New York does not have any standards, criteria or guidance for concentrations of volatile chemicals in subsurface vapors, however; NYSDEC uses NYSDOH guidance (i.e. the sub-slab vapor/indoor air matrices) to determine appropriate action limits depending on contaminant of concern, sub-slab results and indoor air results (NYSDOH, 2017).

4.1 Phase I (October 2017 – November 2017)

4.1.1 Summary of Soil Vapor Intrusion Sampling Results

Seven sub-slab soil vapor samples, seven indoor air samples and two outdoor air samples were analyzed by TA (USEPA Method TO-15). One duplicate sub-slab vapor sample was also collected. The NYSDOH has set air guidance values of 30 µg/m^3 for PCE, 2 µg/m^3 for TCE, and 60 µg/m^3 for methylene chloride (MeCl) in indoor and outdoor ambient air samples, which are presented and compared to the soil vapor intrusion sampling results in **Table 4-1**. In addition, the NYSDOH sub-slab vapor/indoor air matrices were used to evaluate the extent of human health impacts to further inform the RD.

All soil vapor intrusion sample analytical results are summarized in **Table 4-1** and the results are presented on **Figure 4-1**. A comparison of soil vapor intrusion results against the NYSDOH sub-slab vapor/indoor air matrices including the associated recommendations is presented in **Table 4-2**. Recommended actions based on the matrices are also summarized below:

- *TCE:* Matrix A recommended mitigation for the samples collected at SVI-161-1, SVI-161-2, SVI-161-3, SVI-301-1, SVI-301-2 and SVI-301-3. The action of identify the source(s) and resample or mitigate was identified for SVI-161-4.
- *PCE:* Matrix B recommended mitigation for the samples collected at SVI-301-1, SVI-301-2 and SVI-301-3. Monitoring was recommended for SVI-161-3 and no further action was identified for the remaining samples.
- *MeCl:* Matrix B recommended identification of source(s) and resampling or mitigation for the sample collected at SVI-161-2. All other sample results do not require further action.
- *Carbon Tetrachloride:* Matrix A recommended no further action for all sample locations.
- *1,1-Dichloroethene (1,1-DCE):* Matrix A recommended no further action for all sample locations.

- *1,1,1-TCA:* Matrix B recommended no further action for all sample locations.

Based on the results of SVI investigation and ROD requirements, mitigation is required for both 301 Winding Road and 161 Bethpage-Sweet Hollow Road. The data presented above will be utilized in determining the design of the SSDSs for the RD.

4.1.2 Summary of Subsurface Soil Sampling Results

The soils observed during the October and November 2017 PDI consisted primarily of fine to coarse sand. Clay 1, a distinct 1.5- to 2-foot-thick clay layer, was identified in the vadose zone at PDI-1, PDI-2, and PDI-3 at depths ranging from 16.5 to 19 feet bgs. At PDI-1 and PDI-2, a submerged clay layer (Clay 3) was observed at approximately 81.5 feet bgs and 75.5 feet bgs, respectively. Additionally, a 2- to 3-foot-thick silty clay layer (Clay 2) was identified at approximately 60 feet bgs (60 to 65 feet bgs) at PDI-1 through PDI-3. A PID was used to screen all borings. The highest PID reading was measured at PDI-1 at a depth of 34 feet bgs (21 parts per million [ppm]). The soil boring logs are included in **Appendix B** and field notes are provided in **Appendix C**.

A total of 10 soil samples and one field duplicate were collected from three borings (PDI-1, PDI-2, and PDI-5) during this phase of the PDI and analyzed for VOCs. No samples were collected at PDI-4 as the boring was terminated at 60 feet bgs, above any identifiable clay layer. Samples were not collected at PDI-3 since the initially targeted material at the Clay 3 layer was not sufficient for sample collection. Five samples and one duplicate sample were also collected and analyzed for TOC at PDI-1. Additionally, one MS/MSD sample was collected in the October-November 2017 sampling event for VOC analysis. The results were compared to restricted commercial use SCOs. The soil analytical results are summarized in **Table 4-3**. The soil analytical results from Clay 1 and Clay 2 are presented in **Figure 4-2A** and **Figure 4-2B**, respectively.

VOCs were detected in each of the three borings, however all concentrations were below restricted commercial use SCOs. Detections were observed for PCE, TCE, 1,1,1-TCA, 1,1-DCE, acetone, cis-1,2-DCE, MeCl, and methyl tert-butyl ether. The highest detections observed were for TCE, ranging from 10 micrograms per kilogram (µg/kg) in PDI-2 at a depth of 75.5 feet bgs to 32 µg/kg in PDI-1 at a depth of 83.5 feet bgs. These detections are well below the restricted commercial use SCO for TCE of 200,000 µg/kg (200 milligram per kilogram (mg/kg)). PCE detections ranged from 0.16 µg/kg to 4.8 µg/kg, well below the restricted commercial use SCO of 150,000 µg/kg (150 mg/kg). Non-aqueous phase liquid (NAPL) shake test field kits were used to assess the presence of NAPL at the top of the submerged clay layer; all tests indicated no NAPL was present.

TOC was detected in four of the five samples collected ranging from 1,040,000 µg/kg at a depth of 24 feet bgs to 6,610,000 µg/kg at a depth of 16 feet bgs. TOC, known to preferentially absorb VOCs present in the subsurface, is a parameter utilized in determining the potential performance requirements for in-situ remediation applications such as those being considered for this Site. These TOC results will be utilized in the preparation of the RD.

4.1.3 Summary of Groundwater Sampling Results

A total of five groundwater samples were collected, in addition to, one field duplicate sample and one MS/MSD sample during the October and November 2017 sampling event. One groundwater sample was collected from PDI-1, PDI-2 and PDI-3, while two groundwater samples were collected from PDI-5. Groundwater sampling results from this sampling event are presented in **Table 4-4** and shown on **Figure 4-3**. Cis-1,2-DCE, PCE and TCE were all detected above the AWQS at various locations at the following ranges:

- *Cis-1,2-DCE:* detected above the standard of 5 µg/L in PDI-5-GW-80-85-20171026 (9.1 µg/L) and the field duplicate GW-FD-01-20171026 (9.0 µg/L).
- *PCE:* detected above the standard of 5 µg/L in PDI-3-GW-80-85-20171024 (5.1 µg/L) and PDI-5-GW-80-85-20171026 and the duplicate sample GW-FD-01-20171026 (22 µg/L and 23 µg/L respectively).
- *TCE:* detected above the standard of 5 µg/L in PDI-2-GW-72-75-20171116 (9.9 µg/L), PDI-3-GW-80-85-20171024 (190 µg/L), PDI-5-GW-72-75-20171026 (23 µg/L), and PDI-5-GW-80-85-20171026 and the field duplicate sample GW-FD-01-20171026 (640 µg/L in both samples).

1,4-Dioxane was detected in both samples collected at PDI-1 and PDI-2, ranging from 0.27 µg/L in PDI-5 at a depth range of 72 to 75 feet bgs to 1.8 µg/L in PDI-1 at a depth of 75 feet bgs. NYSDEC does not currently have any standards or guidance values for 1,4-dioxane in groundwater. Additionally, no federal maximum contaminant level (MCL) has been established for 1,4-dioxane in drinking water. However, USEPA risk assessments indicate that a drinking water concentration of 0.35 µg/L represents a $1x10^{-6}$ risk (USEPA 2013). Additionally, the Drinking Water Quality Council (DWQC) recommended NYSDOH adopt a MCL of 1 µg/L for 1,4-dioxane. 1,4-Dioxane was detected above the recommended MCL in PDI-1, at a depth of 75 feet bgs.

4.2 Phase II (June 2018 – July 2018)

4.2.1 Summary of Subsurface Soil Investigation and Sampling Results

The soils observed during Phase II consisted primarily of fine to coarse sand. Clay 1 was identified as a distinct 1 to 4-foot thick clay layer in the vadose zone at PDI-6, PDI-7, PDI-8, PDI-9, PDI-12, PDI-13, PDI-14, PDI-15, PDI-18, PDI-19, PDI-20, PDI-23, PDI-24, and PDI-25 at depths ranging from 14 to 26 feet bgs. At PDI-10, PDI-13, PDI-14, PDI-15, PDI-16, PDI-17, and PDI-20 Clay 2 was identified as a distinct 1 to 3-foot thick clay layer in the vadose zone at depths ranging from 52 to 57 feet bgs. Clay 2 was not identified in the lower vadose zone at PDI-11 and PDI-12, however silty clay was also identified between 50 and 52 feet bgs. A 0.5 to 2-foot submerged clay layer what is anticipated to be a part of the Clay 2 layer was identified at PDI-13, PDI-14, PDI-15, PDI-19, and PDI-20 at depths ranging from 60 to 69 feet bgs. A PID was used to screen all borings. The highest PID reading was measured at PDI-16 at a depth of 43 feet bgs (280 ppm). The soil boring logs are included in **Appendix B** and field notes are provided in **Appendix C**.

A total of 17 soil samples and three field duplicates were collected from 16 locations (PDI-6 through PDI-10, PDI-13 through PDI-20, and PDI-23 through PDI-25) during this phase of the PDI and analyzed for VOCs. Additionally, three MS/MSD samples were collected during the June and July 2018 sampling event for VOC analysis. One sample was collected from the gray clay layer at

PDI-6 at a depth of 16 feet bgs. No samples were collected from PDI-11 or PDI-12 as no distinct Clay 2 layer was observed in the lower vadose zone. The results were compared to restricted commercial use SCOs. The soil analytical results are summarized in **Table 4-3** and shown on **Figure 4-2A** and **Figure 4-2B**.

VOCs were detected in each of the 16 locations, however all concentrations were below restricted commercial use SCOs. Detections were observed for PCE, TCE, 1,1,1-TCA, 1,1,2-trichloroethane, 1,2-dichlorobenzene, acetone, chloroform, cis-1,2-DCE, ethylbenzene, isopropylbenzene, 2-butanone, MeCl, trichlorofluoromethane, and total xylenes. The highest detections observed were for TCE, ranging from 0.38J µg/kg in PDI-15 at a depth of 52 feet bgs to 42,000 µg/kg in PDI-7 at a depth of 17 feet bgs. These detections are well below the restricted commercial use SCO for TCE of 200,000 µg/kg. PCE detections ranged from 0.34J µg/kg in PDI-16 at a depth of 55 feet bgs to 17,000 µg/kg in PDI-7 at a depth of 17 feet bgs, well below the restricted commercial use SCO of 150,000 µg/kg.

Six samples were collected from PDI-17, PDI-19, and PDI-20 and analyzed for ferrous iron. Results ranged from 880JL µg/kg in PDI-19 from 79 feet bgs to 6,200JL µg/kg in PDI-20 from 74 feet bgs.

4.2.2 Summary of Groundwater Sampling Results

A total of 13 groundwater samples, in addition to two field duplicate samples and two MS/MSD samples, were collected during the June and July 2018 sampling event. Groundwater grab samples were collected at 10 locations (PDI-10 through PDI-17, PDI-19, PDI-20) and groundwater samples were collected via low-flow methodology at three permanent monitoring well locations (MW-161-1-I, MW-161-3, and MW-161-4). Groundwater sampling results from this sampling event are presented in **Table 4-4** and shown on **Figure 4-3**. Ten of the 13 groundwater samples contained exceedances for certain VOC compounds. Cis-1,2-DCE, PCE and TCE were all detected above the AWQS at various locations at the following ranges:

- *Cis-1,2-DCE:* detected above the standard of 5 µg/L in PDI-19-WG-85-06282018 (17 µg/L) and PDI-MW-161-1-I-06262018 (13 µg/L).
- *PCE:* detected above the standard of 5 µg/L in PDI-MW-161-1-I-06262018 (15 µg/L).
- *TCE:* detected above the standard of 5 µg/L in PDI-10-WG-74-06182018 (9.4 µg/L), PDI-11-WG-75-06182018 and the field duplicate PDI-111-WG-75-06182018 (13 µg/L in both samples), PDI-13-WG-75-06212018 (8.5 µg/L), PDI-15-WG-75-06252018 (15 µg/L), PDI-16-WG-75-06262018 (85 µg/L), PDI-19-WG-85-06282018 (460 µg/L), PDI-20-WG-85-06292018 (14 µg/L), PDI-MW-161-1-I-06262018 (370 µg/L), MW-161-3-20180725 (54 µg/L), and MW-161-4-20180724 and the field duplicate MW-1161-4-20180724 (51 µg/L and 52 µg/L respectively).

1,4-Dioxane was not detected in any of the three samples collected at MW-161-1-I, MW-161-3, or MW-161-4, therefore 1,4-dioxane was not detected above the recommended DWQC MCL of 1 µg/L or the USEPA risk assessment drinking water concentration of 0.35 µg/L

Perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS) were detected in all three samples collected at MW-161-1-I, MW-161-3, and MW-161-4. The combined concentration

of PFOA and PFOS ranged from 0.023 µg/L to 0.036 µg/L. The PFOS concentration in the three samples ranged from 0.015 µg/L to 0.028 µg/L. The PFOA concentration ranged from 0.007 µg/L to 0.014 µg/L. At this time, NYSDEC does not have an AWQS for any PFAS compounds in groundwater. USEPA has established a health advisory level at 70 parts per trillion (ppt, 0.07 µg/L) for the combined concentrations of PFOA and PFOS (USEPA, 2016). All combined concentrations at the three existing wells were observed below the USEPA health advisory level. In late 2018, the DWQC also recommended NYSDOH adopt an MCL of 10 ppt (0.01 µg/L) for PFOS and 10 ppt (0.01 µg/L) for PFOA, individually. PFOS was detected above the recommended MCL in all three monitoring wells, MW-161-1-I, MW-161-3, and MW-161-4. PFOA was detected above the recommended MCL, in only MW-161-1-I.

4.3 Phase III (March 2019)

4.3.1 Summary of Subsurface Soil Sampling Results

The soils observed during Phase III consisted primarily of fine to coarse sand. Clay 1 was identified in the vadose zone at PDI-26 through PDI-36 at depths ranging from 13 to 18 feet bgs. A PID was used to screen all borings. The highest PID reading was measured at PDI-34 at a depth of 15 feet bgs (37.4 ppm). The soil boring logs are included in **Appendix B** and field notes are provided in **Appendix C**.

A total of 11 soil samples and one field duplicate were collected from Clay 1 at 11 locations during this phase of the PDI and analyzed for VOCs. Additionally, one MS/MSD sample was collected during the March 2019 sampling event for VOC analysis. The results were compared to restricted commercial use SCOs. The soil analytical results are summarized in **Table 4-3** and shown on **Figure 4-2A**.

VOCs were detected in each of the 11 locations, however all concentrations were below restricted commercial use SCOs. Detections were observed for PCE, TCE, 1,1,1-TCA, 1,2-dichlorobenzene, acetone, cis-1,2-DCE, MeCl, and vinyl chloride. The highest detections observed were for TCE, ranging from 2.3J µg/kg in PDI-28 at a depth of 16 feet bgs to 29 µg/kg in PDI-26 and PDI-30 at a depth of 17.5 feet bgs. These detections are well below the restricted commercial use SCO for TCE of 200,000 µg/kg. PCE detections ranged from 1.5J µg/kg in PDI-26 and PDI-30 at a depth of 17.5 feet bgs to 19 µg/kg in PDI-34 at a depth of 15 feet bgs, well below the restricted commercial use SCO of 150,000 µg/kg.

4.4 Conclusions

The following details the nature and extent of contamination conclusions:

- Historical and current analytical data have confirmed that high-concentration source material is present within and above the stiff gray lean clay of Clay 1 (at approximately 17 feet bgs) within the vadose zone. The maximum concentration observed was 1,000,000 µg/kg.
- The presence of both TCE and PCE (and to a lesser extent MeCl) at significant concentrations in sub-slab vapor and indoor air, in the 161 Bethpage-Sweet Hollow Road

and 301 Winding Road properties, support the ROD requirement for mitigation via engineering controls in both properties.

- The degree of contamination is Clay 2 is approximately four orders of magnitude less than that of Clay 1. TCE was observed at a maximum concentration of 400 µg/kg in the stiff gray lean clay of Clay 2, 40 feet beneath the source area in Clay 1.
- Historical groundwater samples collected from beneath the source area had a maximum TCE concentration of 2,500 µg/L (July 2011 from MW-301-1). Current groundwater samples under the source area yielded a maximum TCE concentration of 460 µg/L (July 2018 from PDI-19). In addition, the PDI groundwater sample that had highest concentration of TCE (640 µg/L) was located approximately 135 feet west of the source area (PDI-5) and was collected at a depth of 80 to 95 feet bgs, potentially indicating a second plume not associated with the discharge at 301 Winding Road. TCE concentrations observed during the PDI are all well within an order of magnitude of the cleanup goal of 400 µg/L.

Section 5
Conceptual Site Model

The physical setting, contaminant sources, migration pathways, and receptors were synthesized into the conceptual site model discussed below.

5.1 Physical Setting

The Upper Glacial Aquifer in the vicinity of the Site is dominated by fine to coarse sand and gravel with some thin local lenses of clay and silty zones. The low-permeability clay and silty zones were the focus of this PDI since they serve as controlling features in contaminant transport. The low-permeability lenses serve as reservoirs of contamination and are therefore the main targets for active remediation.

The shallowest clay layer observed at the Site, referred to as Clay 1 in this report, is of primary importance for the RD because it is the first large clay layer that contaminants discharged to the environment (likely through dry wells) encountered. This low-permeability clay lens lies within the Upper Glacial Aquifer approximately 17 feet bgs. It was generally observed to be firm, have relatively low plasticity, and relatively low moisture.

Two additional distinct clay layers (Clay 2 and Clay 3) were observed at the Site, at approximately 60 and 80 feet bgs, respectively. The elevation of the clay surfaces is not very consistent throughout the Site. The varying elevation of each of the clay surfaces indicates it is wrinkled or scoured, and therefore, not a flat surface.

The thickness of the clay layers also varies across the Site, as shown on **Figures 5-1A**, **5-1B, 5-1C and 5-1D**. In addition, recorded lithology indicated that all three clay layers decrease in thickness moving east at the Site. Clay 1 is where the contaminant source was observed. The bottom of dry wells DW-8 and DW-9 also reside at the top of Clay 1.

The groundwater elevation at the Site was generally observed between 60 and 70 feet during the RI and PDI. Recent groundwater elevation data collected during the PDI in 2018 indicated the groundwater was between an elevation of 61 and 62 feet amsl. Therefore, the water table was observed at or directly below the Clay 2 layer.

During RI activities in 2012, the water table was indicated to be at an elevation of approximately 68 to 70 feet amsl above the Clay 2 layer. The groundwater elevation consistently recorded in 2018 was approximately 6 to 8 feet below the recorded elevation in 2011 and 2012. It is possible that recorded groundwater elevations in 2012 were indicative of a perched groundwater above Clay 2.

Groundwater flow direction was consistent between the RI and the January 2018 PDI groundwater data. The intermediate flow direction is generally to the southeast. Hydraulic conductivity was measured at two wells located approximately 120 feet east of the source area.

The hydraulic conductivity was estimated to be between 0.401 and 0.607 feet/day, which was indicative of a medium sand with interbedded silt (silty sand) and clay lenses.

5.2 Contaminant Source

Data and observations collected during the PDI indicated that the ongoing source of groundwater contamination is high-concentration source material present in and above Clay 1 under the paved area just east of the northeast corner of 301 Winding Road and south of 161 Bethpage-Sweet Hollow Road. Based on the RI, it was determined that the contamination originated from one or more of the former dry wells within the Site. Dense non-aqueous phase liquid (DNAPL) was extracted during the VCA from one of the former dry wells (DW-9), it was stated in the 2013 RIR that over one percent TCE was observed in the bottom sediments of DW-9 prior to remediation (HDR, 2013a). Additionally, DW-7, an existing dry well investigated during the RI was stated to be the center of the highest contaminant concentrations in soil. Due to the significantly high levels of TCE observed in the soil specifically within Clay 1, it is reasonable to conclude that the DNAPL has migrated into the clay and exists on top of the clay in the depressions of the irregular clay surface.

Contamination in Clay 1 is the most obvious source of the VOC vapor detected in sub-slab and indoor air samples. Historical and PDI sample results for VOCs in Clay 1 are presented in **Figure 5-2**.

The groundwater data (**Figure 4-3**) indicates that a second plume may be entering the Site from upgradient. MW-161-I is upgradient of the known source zone described above yet had higher TCE concentrations than were detected during this PDI under the source zone. Additionally, the sample from MW-161-I had a higher mass fraction of PCE than the source zone samples, which would also indicate a separate source.

5.3 Migration Pathways

Several migration pathways were observed during the PDI and are described below.

- *Migration vertically downward onto Clay 1*: Concentrations indicative of DNAPL were present at the Clay 1 layer at several locations (ALC-MW3, ALC-MW3-NE, DB-301-2E, and DB-MW3-E), as indicated by the results presented by HDR in the RIR and portrayed on **Figure 5-1B** and **Figure 5-1C**. As contamination was discharged through the dry wells, Clay 1 is the first low-permeability zone that the contamination encountered as it traveled downward.

- *Vertical migration below Clay 1*: Contamination was detected in soil and groundwater samples below Clay 1, albeit at concentrations orders of magnitude lower than what was detected in Clay 1. These lower contaminations do not give the indication that a significant mass of DNAPL migrated below Clay 1 or is present below Clay 1. The contamination below Clay 1 may be due to relatively small amounts of historical DNAPL transport to this zone, or rain water infiltration coming from the dry wells carrying dissolved phase mass deeper.

- *Vapor migration*: VOCs were detected in sub-slab samples and indoor air samples. The elevated concentrations of VOCs in Clay 1 are likely serving as a source of VOC vapors into the vadose zone, which in turn are transported through advective air currents and vapor-phase diffusion in the vadose zone. Data collected during the RI indicated a lack of VOC detections above Clay 1, which aids in the suggestion that VOCs concentrations in Clay 1 are the main source of VOC vapors into the vadose zone and suggests that the piping present between the dry wells within the source area allowed direct discharge of the chlorinated solvents to Clay 1.
- *Mass discharge to groundwater and transport through advection*: Historical groundwater samples from underneath the source zone had a maximum TCE concentration of 2,500 µg/L (July 2011 from MW-301-1). MW-301-1 appeared to be screened across the low-permeability Clay 2 and serving as a conduit for contamination through this layer; this well was abandoned during this PDI. A groundwater sample was collected from under the source zone during the PDI and had a maximum TCE concentration of 460 µg/L (location PDI-19). Given these concentrations, there appears to be mass discharge to groundwater occurring from the overlying vadose zone under the source zone. However, the resulting groundwater concentrations from this mass discharge are only slightly above the cleanup goal of 400 µg/L.

5.4 Contaminant Fate

At all groundwater samples, TCE is the dominant contaminant, and the presence of biodegradation byproducts is limited. While mass is being lost from the subsurface due to volatilization, dilution, and dispersion, evidence for destructive natural attenuation (reductive microbial dechlorination) at the Site is sparse.

Section 6
Basis of Design

6.1 Remedial Action Objectives for OU-1

The goal for the selected remedy is to restore the Site to pre-disposal conditions to the extent feasible. The specific RAOs for soil, groundwater, and soil vapor at the Site, as stated in the 2013 ROD, are:

Groundwater

- RAOs for Public Health Protection
  - *Prevent ingestion of groundwater with contaminant levels exceeding drinking water standards.*
  - *Prevent contact with, or inhalation of volatiles, from contaminated groundwater.*
- RAOs for Environmental Protection
  - *Restore groundwater aquifer to pre-disposal/pre-release conditions, to the extent practicable.*
  - *Remove the source of ground or surface water contamination.*

Soil

- RAOs for Public Health Protection
  - *Prevent ingestion/direct contact with contaminated soil.*
  - *Prevent inhalation of or exposure from contaminants volatilizing from contaminants in soil.*
- RAOs for Environmental Protection
  - *Prevent migration of contaminants that would result in groundwater or surface water contamination.*

Soil Vapor

- RAOs for Public Health Protection

  Mitigate impacts to public health resulting from existing, or the potential for, soil vapor intrusion into buildings at a site.

6.2 Record of Decision Requirements

As previously stated, the ROD issued for OU-1 included a selected remedy consisting of a RD program, ISTR, AS/SVE, SSDSs (or similar engineered systems within 301 Winding Road and 161 Bethpage-Sweet Hollow Road), institutional controls, and a Site Management Plan.

This basis of design is intended to discuss the remediation strategy for implementing the abovementioned elements of the selected remedy as discussed in the ROD.

6.3 Remediation Strategy

6.3.1 Vadose Zone

The ROD does not state the specific soil cleanup objective that ISTR must achieve in the vadose zone. **Table 6-1** shows the SCOs listed in NYSDEC Subpart 375-6.8(a) and 375-6.8(b), including SCOs for unrestricted use and restricted use. The NYSDEC non-site-specific (default) protection of groundwater SCO is shown, as well as a calculated site-specific protection of groundwater SCO. Note that the default protection of groundwater SCO is the same as the unrestricted use SCO.

The site-specific protection of groundwater SCO is a soil concentration that, after partitioning of the vadose zone soil contaminants to infiltrating rainwater, does not create an exceedance of the groundwater cleanup goal of 400 µg/L. This SCO is the product of the fraction of organic carbon measured in the soils from the site (**Table 4-3**), a dilution-attenuation factor of 20, the organic carbon partition coefficient, and the groundwater cleanup goal of 400 µg/L. The dilution/attenuation factor used is the USEPA standard dilution-attenuation factor in sandy soils, which has a value of 20. The USEPA standard organic carbon partition coefficient values for each contaminant were used in the calculations (USEPA, 1996). Contaminant specific values are shown in **Table 6-2** and calculations are shown in **Appendix J.**

Restricted commercial use SCOs are higher than the site-specific protection of groundwater SCOs. Restricted use SCOs would therefore not meet the RAOs for the site. Cleaning up the vadose zone to unrestricted use SCOs or the site-specific protection of groundwater SCO would meet RAOs, provide adequate protection of groundwater, and significantly reduce the ongoing source of vapor intrusion in the site buildings. ISTR is anticipated to have the capacity to remediate the soil to below either of these SCOs. The extent of the treatment zone is discussed in Section 6.4 below.

Clay 1, the approximately 1- to 7-foot-thick clay underlying the Site at around 17 feet bgs, holds the reservoir of DNAPL contamination that will be targeted for remediation. ISTR facilitates the mobilization of chlorinated VOCs over a wide range of concentrations in groundwater and soil through desorption and volatilization. ISTR is very effective in heterogeneous and low-permeability soils.

ISTR will not be extended deeper than Clay 1 because deeper soil concentrations were orders of magnitude lower than in Clay 1, and no secondary source of contamination continuously contributing to significant groundwater contamination was detected.

6.3.2 On-Site Vapor Intrusion

SSDSs will be installed in 161 Bethpage-Sweet Hollow Road and 301 Winding Road to protect indoor air receptors and achieve RAOs. SSDS design and implementation may be performed independently of ISTR. It will likely require coordination during ISTR activities, and the necessary extent of the SSDSs may be less following ISTR.

6.3.3 On-Site Groundwater

The selected remedy in the ROD for on-site groundwater was AS and SVE. No AS/SVE is included in this remediation strategy for three reasons:

1. Clay layers were observed at the water table (Clay 2 and Clay 3). AS/SVE implementation would be difficult because the clay layers are low-permeability layers would block air bubbles from the AS rising into the vapor collection zone in the vadose zone.

2. Only one groundwater sample around the source zone was observed above 400 µg/L. The groundwater data did not point to a large volume of groundwater contamination that could be remediated with active treatment.

3. Following the implementation of ISTR in the vadose zone, the source of groundwater contamination will have been remediated to the extent practicable. In addition, residual groundwater contamination moving off-site is expected to be remediated as a part of an OU-2 remedial action.

6.4 Treatment Zone

As discussed in Section 6.3.1 above, using either the unrestricted use SCO or the site-specific protection of groundwater SCO is needed to achieve RAOs. **Figure 6-1** presents the areal extent of the treatment zone encompassing soil above the unrestricted use SCOs. Figure 6-1 presents concentrations in Total VOCs; but for all intents and purposes, the overwhelming constituents making up total VOCs are TCE and PCE. The combined unrestricted use SCOs and site-specific protection of groundwater SCOs for these two contaminants are 1,770 µg/kg and 18,984 µg/kg, respectively. There are few locations that have concentrations between these two values. This means that the drawn treatment zones for each of these SCOs would not be materially different. Since this is the case, it is reasonable to err on the side of caution and have unrestricted use as the remedial goal for soils.

The areal extent of the treatment zone is approximately 1,420 square feet and encompasses the area of soil above the unrestricted use SCO. The depth of the treatment zone is to the bottom of Clay 1, approximately 17 feet bgs.

The buildings requiring SSDSs are also shown on **Figure 6-1**.

6.5 In-situ Thermal Remediation Design Components

The RD for ISTR will include both prescriptive and performance-based requirements. Prescriptive requirements of the ISTR treatment operations are provided to fully utilize the site-specific information collected during the PDI; performance-based requirements will be provided for other operations to allow the Remedial Action contractor to maximize their expertise. Note

historical building records and survey drawings for both 161 Bethpage-Sweet Hollow Road and 301 Winding Road procured from the Town of Oyster Bay are included as **Appendix K**.

Prescriptive design requirements are anticipated for the following:

- Concentration-based performance targets
- Boundaries of the treatment zone, including depth
- Baseline and performance sampling and analysis

Performance-based requirements are anticipated for the following:

- Mobilization/demobilization
- Construction of a staging area and decontamination pad
- Design, construction, and operation of the thermal remediation system, including:
    - Energy needs
    - Heating points and vapor extraction points
    - Piping and blowers
    - Above ground treatment system
    - Waste management
    - Heating operations

6.6 Sub-slab Depressurization System Design Components

Vapor sampling results are shown on **Figure 4-1**. SSDSs are to be installed for the entirety of the two buildings on the site:

- 161 Bethpage-Sweet Hollow Road
- 301 Winding Road

The components of the SSDS design are anticipated to be as follows:

- Performance of a communication test to determine the radius of influence and properly design and size the SSDSs in accordance with NYSDOH guidelines,
- Evaluation of the current electrical supply and demand that may be needed and determine if additional capacity is needed,
- Sufficient sub-slab extraction points for each of the buildings to provide a cumulative depressurization footprint that encompasses each building footprint,
- Piping as well as conveyance piping system on the walls and within the existing ceiling,

- Fan(s), with enclosures if deemed necessary,
- Connection of the system to the existing electric at the Site.

6.7 Site Access and Security

CDM Smith anticipates that the NYSDEC will assist in securing any required site access to complete the remediation work at the Site. If necessary, a site access agreement will be prepared and provided to the relevant party for review and approval. The site agreement will specify the planned activities, tentative schedule, traffic control, and coordination and notification requirements.

6.8 Energy Availability for ISTR

ISTR requires energy for operation. Different ISTR technologies rely on different energy sources: electrical power can be used for either electrical resistance heating (ERH) or thermal conductive heating (TCH), and petroleum hydrocarbons (typically natural gas or liquified propane gas) can be used for TCH only. At the site, PSEG Long Island is the utility managing the distribution of electricity, and National Grid manages natural gas distribution. CDM Smith contacted various thermal treatment vendors to determine planning-level electricity needs for ERH and planning-level natural gas needs for TCH. The vendors were provided information on approximate area and depth of the TTZ and contaminant of concern to estimate power/energy requirements.

A planning-level estimate of electricity needs for the ERH is 800 amperes at 480 volts. Conversations with James Domozych, a Lead Design Engineer in PSEG Long Island's Distribution Design group confirmed on March 1, 2019 the local distribution lines near 301 Winding Road have the capacity to handle the additional electrical that would be needed for ERH. Additionally, PSEG Long Island will generate a specification letter once the load is determined that is then brought to an independent electrical contractor to complete the work. In other words, the actual connection is not provided by PSEG Long Island, but rather by an electrician hired by the project owners and/or operators. In theory, this structure reduces the time required to receive service for the project. Once the electrical contractor is selected, a Commercial/ Industrial Load Letter would need to be filled out with PSEG Long Island. The Load Letter requires information on the service characteristics, total load required, and the electrical contractor contracted to perform any necessary upgrades. A blank Commercial/ Industrial Load Letter is provided in **Appendix L**. A new separately metered service would be set up for the duration of the project.

A planning-level estimate of natural gas needs for the TCH is approximately 4,300 million British Thermal Units (MMBTU), with a peak demand of 40 MMBTU per day. In order to meet this peak demand, a service upgrade to the entirety Long Island must first be completed. Conversations with the National Grid Account Manager for the 301 Winding Road property, Dylan Doyle, revealed challenges in upgrading natural gas service. Any project over 2 MMBTU will require a service upgrade to the property and is feasible for this ITRC project. However, keeping in mind the planning-level estimate for peak demand for this ITRC project is 40 MMBTU, Mr. Doyle stated that any project over 15 MMBTU will not be approved until a decision is made for the Northeast Supply Enhancement Project (NESE). This project will expand the Transco pipeline to the Northeast coast, including Long Island, and allow National Grid to utilize natural gas from

Pennsylvania. On May 15, 2019 New York State environmental regulators denied a permit for the proposed 24-mile underwater pipeline. On June 5, 2019 New Jersey State regulators also denied permits for the underwater pipeline. NESE can reapply for the permits but a timeframe for the project is unknown. In the event a service upgrade is approved, a Gas Load Letter must be submitted to National Grid including information on equipment and, if required, an independent plumber hired by the project owners and/or operators to conduct any pipework. A blank Gas Load Letter is provided in **Appendix L**. A new separately metered service would be set up for the duration of the project.

6.9 Stormwater Management

Three inter-connected drywells are present in and around the treatment zone for managing stormwater (described in Section 2.3.1). This infrastructure would interfere with the efficient operation of ISTR because the void space in the drywells would provide preferential pathways for the volatilizing contaminants from Clay 1, and it would likely be challenging to maintain pneumatic control on these drywells. Additionally, the interconnecting PVC pipes would be damaged during heating, and infiltrating stormwater may quench the treatment zone, which would slow heating.

The design needs to take into account the existing stormwater infrastructure and need for stormwater management during and after the remediation. The functions for stormwater management that need to be addressed during design include:

- Ensure infrastructure does not interfere with effectiveness/constructability/operations of thermal remedy.
- Collect stormwater during operations from the treatment zone (given existing infrastructure will likely be removed).
- Convey stormwater away from the thermal treatment zone during operations (to avoid quenching).
- Provide a means to discharge water from the thermal treatment operations to an acceptable and permitted outlet.
- After remediation is complete, provide stormwater drainage that meets site needs and complies with permitting requirements.

6.10 Permitting

It is anticipated that state and local permits will be required to implement the remediation work at the Site. The types of permits the remedial contractor will need to obtain in order to complete this work include, but are not limited to:

- Municipal permits may be needed for installation and new wells. All drilling and monitoring well installation activities will be completed by a New York State licensed well driller.
- Municipal hydrant permits will be obtained so that nearby fire hydrants can be utilized as a water supply, as necessary.
- Municipal permits will be obtained for drywell abandonment/reconstruction, if needed.
- Air permits will be required for the ITRC vapor discharge

- A State Pollution Discharge Elimination System permit will be obtained by the remedial contractor for discharging stormwater
- Finally, permits may be required for disposing of used filters and granular activated carbon from the ISTR unit.

6.11 Waste Management

Waste generated during the remedial action will consist of soil cuttings and trash. The waste will be contained, analyzed and properly disposed. Based on the waste characterization during the PDI, the soil cuttings will likely be non-hazardous.

6.12 Monitoring

Further details regarding monitoring activities will be provided in the design documents. The purpose of monitoring will be to evaluate the performance of the thermal remediation and the performance of the SSDS. In particular for ISTR, performance metrics will include achieving required soil concentrations (SCOs), maintaining pneumatic control of area under treatment, maintaining thermal system uptime, and others.

Recommendations Based on NYSDOH Decision Matrices[4]

Location	Sample Date	Location	Compound	Sub-Slab Air Concentrations (µg/m^3)	Indoor Air Concentrations (µg/m^3)	Action Recommended[2]	Final Action Recommended[3]
SVI-161-1	11/14/2017	161 Bethpage-Sweethollow Road	Carbon tetrachloride	< 13	**0.1**	No Further Action	Based on TCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 7.9	< 0.79	No Further Action	
			TCE	**1200**	**1.2**	Mitigation	
			Methylene Chloride	< 17	**0.6**	No Further Action	
			PCE	**360**	< 1.4	No Further Action	
			1,1,1-TCA	**22**	< 1.1	No Further Action	
SVI-161-2	11/15/2017	161 Bethpage-Sweethollow Road	Carbon tetrachloride	< 7.6	< 250	No Further Action	Based on TCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 4.8	< 160	No Further Action	
			TCE	**91**	< 210	Mitigation	
			Methylene Chloride	< 11	< 340	No Further Action	
			PCE	**420**	< 270	No Further Action	
			1,1,1-TCA	**7.2**	< 220	No Further Action	
SVI-161-3	11/14/2017	161 Bethpage-Sweethollow Road	Carbon tetrachloride	**0.11**	**0.39**	No Further Action	Based on TCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 0.79	< 0.79	No Further Action	
			TCE	**16**	**3.4**	Mitigation	
			Methylene Chloride	**1.4**	**0.44**	No Further Action	
			PCE	**230**	**3.1**	Monitor	
			1,1,1-TCA	**5.4**	< 1.1	No Further Action	
SVI-161-4	11/14/2017	161 Bethpage-Sweethollow Road	Carbon tetrachloride	**0.28**	**0.42**	No Further Action	Based on TCE results, identification of sources, resampling and/or mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 0.79	< 0.79	No Further Action	
			TCE	**5.5**	**3.1**	Reasonable Action	
			Methylene Chloride	< 1.7	**0.4**	No Further Action	
			PCE	**8.8**	**1.9**	No Further Action	
			1,1,1-TCA	**0.37**	< 1.1	No Further Action	
SVI-301-1	11/14/2017	301 Winding Road	Carbon tetrachloride	< 25	< 6.3	No Further Action	Based on TCE and PCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 16	< 4.0	No Further Action	
			TCE	**3000**	**4.1**	Mitigation	
			Methylene Chloride	< 35	< 8.7	No Further Action	
			PCE	**420**	**770**	Mitigation	
			1,1,1-TCA	**15**	< 5.5	No Further Action	
SVI-301-2	11/14/2017	301 Winding Road	Carbon tetrachloride	< 21	< 4.4	No Further Action	Based on TCE and PCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 13	< 2.8	No Further Action	
			TCE	**2000**	**4.2**	Mitigation	
			Methylene Chloride	< 30	< 6.1	No Further Action	
			PCE	**1000**	**720**	Mitigation	
			1,1,1-TCA	**15**	< 3.8	No Further Action	
SVI-301-3	11/14/2017	301 Winding Road	Carbon tetrachloride	< 21	**0.43**	No Further Action	Based on TCE and PCE results mitigation is needed to minimize current or potential exposures associated with soil vapor intrusion.
			1,1-DCE	< 13	< 0.79	No Further Action	
			TCE	**2500**	**6.5**	Mitigation	
			Methylene Chloride	< 29	**0.33**	No Further Action	
			PCE	**590**	**130**	Mitigation	
			1,1,1-TCA	**32**	< 1.1	No Further Action	

Key:
µg/m^3 - microgram per cubic meter
PCE - tetrachloroethene
TCE - trichloroethene
1,1,1-TCA - 1,1,1-trichloroethane
1,1-DCE - 1,1-dichloroethene
< reporting detection limit - analyte was not detected above the reporting detection limit

Notes:
1. All concentrations are presented in µg/m^3.
2. Outdoor ambient air sample OA-5 was used for comparison with SSV-4, SSV-5, SSV-6, and SSV-7 sub-slab and indoor air samples.
3. Action levels based on NYSDOH Matrix A for TCE, cis-1,2-DCE, 1,1-DCE and carbon tetrachloride, Matrix B for PCE, 1,1,1-TCA and methylene chloride, and Matrix C for vinyl chloride.
4. "Guidance for Evaluating Soil Vapor Intrusion in the State of New York", NYSDOH, October 2006. (Revised May 2017)

Key:
B - analyte detected in the associated method blank
H - biased high
J - detected above the method detection limit, but below the reporting limit; value is estimated
L - biased low
R - indicates the reported result is unusable; analyte may or may not be present
T - indicates that a quality control parameter has exceeded laboratory limits
U - analyte not detected at or above the method detection limit
ft bgs - feet below ground surface
ID - identification
µg/kg - microgram per kilogram
NA - not analyzed
ND - not detected or not reportable
NS - no standard exists
NYSDEC - New York State Department of Environmental Conservation
SCO - soil cleanup objective
TOC - total organic carbon
TSD - technical support document

Notes:
1. All values shown in µg/kg.
2. Results shaded in light blue fill have exceeded NYSDEC Subpart 375-6.8(b) Restricted Commerical Use Soil Clean

Metals													
Ferrous Iron	NS	NA		NA		NA		NA		NA		NA	

Key:
B - analyte detected in the associated method blank
H - biased high
J - detected above the method detection limit, but below the reporting limit; value is estimated
L - biased low
R - indicates the reported result is unusable; analyte may or may not be present
T - indicates that a quality control parameter has exceeded laboratory limits
U - analyte not detected at or above the method detection limit
ft bgs - feet below ground surface
ID - identification
µg/kg - microgram per kilogram
NA - not analyzed
ND - not detected or not reportable
NS - no standard exists
NYSDEC - New York State Department of Environmental Conservation
SCO - soil cleanup objective
TOC - total organic carbon
TSD - technical support document

Notes:
1. All values shown in µg/kg.
2. Results shaded in light blue fill have exceeded NYSDEC Subpart 375-6.8(b) Restricted Commerical Use Soil Clean

Subject: Geophysical Investigation Results
Former Aluminum Louvre Site
Old Bethpage, New York

Dear Ms. Amy Picunas

Advanced Geological Services (AGS) presents this letter report to CDM Smith of Latham, New York detailing the methods and results of the geophysical investigation conducted at the Former Aluminum Louvre site located at 161 Bethpage-Sweethollow Road, Old Bethpage, New York. The objective of the geophysical investigation was to locate and identify potential utilities and to "clear" several proposed drilling locations. The field activities for this geophysical investigation were completed by AGS on March 6, 2019.

Methods

The ground penetrating radar (GPR), radio frequency (RF) and metal detection (MD) methods were utilized for this geophysical investigation. To locate utilities within the survey area AGS collected RF data in a grid pattern and placed a traceable signal on surficially identifiable utilities. The survey area was scanned with the MD instrument looking for potential utilities that had a metallic signature. Additional GPR profiles were collected throughout the site to locate potential utilities not identified with the other geophysical methods.

All identified utilities were marked with spray paint according to the American Public Works Association (APWA) color code. AGS collected GPS locations using an instrument with a sub-meter accuracy for each identified utility.

AGS scanned the each proposed drilling location with the RF instrument looking for potentially active electric lines. Each proposed drilling location was further scanned with the MD instrument to locate potential metallic anomalies that could be associated with utilities or other

buried metallic obstructions. GPR profiles were collected in a grid like pattern centered at proposed drilling location.

Ground Penetrating Radar (GPR) Method

The ground penetrating radar (GPR) method was used to locate and identify potential utilities and other buried features. The GPR method is based upon the transmission of repetitive, radio frequency electromagnetic (EM) pulses into the subsurface. When the transmitted energy of down going wave contacts an interface of dissimilar electrical character, part of the energy is returned to the surface in the form of a reflected signal. This reflected signal is detected by a receiving transducer and is displayed on the screen of the GPR unit as well as being recorded on the internal hard-drive. The received GPR response remains constant as long as the electrical contrast between media is present and constant. Lateral or vertical changes in the electrical properties of the subsurface result in equivalent changes in the GPR responses. The system records a continuous image of the subsurface by plotting two way travel time of the reflected EM pulse versus distance traveled along the ground surface. Two way travel time values are then converted to depth using known soil velocity functions.

The GPR field procedures involved (1) instrument calibration, (2) test run completion, (3) production profile collection and recording, and (4) data storage for subsequent processing and analysis in the office. Each radar profile was examined for characteristic GPR signatures that may indicate the presence of buried targets. A Geophysical Survey System SIR System 3000 and a 400 megahertz (MHz) antenna were used with a recording window of 60 nanoseconds (ns) to provide the required depth penetration and subsurface detail.

Radio Frequency (RF) Utility Locating Method

A Radiodetection RD400/PDL2 multi-frequency RF utility locating system was used for this project to locate potential electric lines and other surficially identifiable utilities and/or features. This instrument consists of a receiver/tracer and a remote transmitter, which operates at frequencies ranging between 8 kHz and 65 kHz. In addition, the receiver can be used in 60 Hz passive mode to identify active buried electrical lines. This utility tracing instrument provides audible and visual feedback to the operator when a utility that is coupled with the transmitted signal is crossed. The transmitter produces a radio-frequency signal in the utility to be traced by either induction coupling or direct hook-up. The receiver output provides measured field strength of the received signal and varies an audible pitch depending upon how far the utility is from the receiver. By carefully adjusting the gain of the receiver it is possible to

determine the location of the utility and to separate it from adjacent utilities.

Hand Held Metal Detection (MD) Method

The survey area and each proposed drilling location was scanned using a hand held metal detection (MD) instrument. This method uses the principle of electromagnetic induction to detect shallow buried metal objects such as USTs, metal utility conduits, rebar in concrete, manhole covers, and various metallic debris. This is done by carrying a hand-held radio transmitter-receiver unit above the ground and continuously scanning the surface. A primary coil broadcasts a radio signal from a transmitter. This primary radio signal induces secondary electrical currents in metal objects. These secondary currents in turn produce a magnetic field which is detected by the receiver.

The MD instrument used for this investigation was a Fisher TW-6 pipe and cable locater. This instrument is expressly designed to detect metallic pipes, cables, USTs, manhole covers, and other buried metallic objects. The instrument produces an audible response and significant meter deflections when near a metal object. The peak instrument response usually occurs when the unit is directly over the object.

Results

Figure 1 is a map showing the identified utilities and site features. The aerial photograph was taken and published in 2016. It was downloaded from https://gis.ny.gov. All coordinates shown on Figure 1 are in the NAD1983 New York Long Island state plane coordinate system with all units in feet. The GPS instrument has sub-meter accuracy. AGS is not a licensed surveyor so all locations should be considered approximate. All identified utilities were marked on the ground surface with spray paint according to the APWA color code.

AGS identified one utility of an unknown type (Figure 1). The utility's depth is unknown. Additionally AGS identified three dry wells. No utilities were identified entering these structures and each appeared to extend to a radius between 4 and 5 feet, centered at the storm grate at the surface.

AGS "cleared" numerous proposed drilling locations. Each "cleared" proposed drilling location exhibited a reflection-free GPR signature and no RF or MD response. The final locations for each proposed drilling location was discussed and reviewed with the onsite representative.

Closing

AGS identified several utilities and "cleared" several proposed drilling locations. Upon completion of the geophysical investigation AGS reviewed the results with the onsite CDM Smith representative.

All geophysical data and field notes collected as a part of this investigation will be stored at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the presence or absence of additional objects or targets beyond those identified.

If you have any questions regarding the results of this field investigation, please contact me at 610-722-5500. It was a pleasure working with you on this project and we look forward to being able to provide you with sub-surface imaging services in the future.

Sincerely,
Prepared by

Christopher Call P.G.
Senior Geophysicist

Notes:
1) AGS utilized a Ground Penetrating Radar System with a 400 MHz antenna, a RF and a HD instruments for this geophysical investigation. All identified utilities were marked on the ground surface with spray paint according to the APWA standard.
2) AGS identified one utility of an unknown type and three dry wells.
3) AGS utilized a GPS instrument with a sub-meter accuracy to obtain coordinates for the utilities identified during this geophysical investigation. The locations shown above are in the NAD1983 New York State plane coordinate system with all units in feet.
4) The aerial photograph was downloaded from https://gis.ny.gov/. The photograph was taken in 2016.
5) AGS is not a licensed surveyor so all locations should be considered approximate.
6) The items shown on this figure may not be all inclusive. AGS does not warrant the fact that additional buried features might be present at this site.

PAGE	REFERENCE	DATE

Location Old Bethpage, NY Date 10/23/17

Project / Client Former Aluminum Louvre PDI

10/23/17 645 A. Reilly and C. Meehan (CDM Smith) onsite
Weather: cloudy, 64°F
715 Cascade (2 personnel) onsite
Checked with NY Paving to confirm ok to access geoprobe locations
730 Cascade mob - begin at PDI-4
800 Begin advancing PDI-4 boring
hand clear top five feet, dark and light brown sand, some small rocks
5-10 ft, recovery 4 ft, PID 0.0 ppm
brown sand, dry, mostly loose, slightly
Finer 7-8 ft, some dark silty at 9-10
10-15 recovery 4 ft, PID 0.0 ppm
brown sand, dry, soft, loose
15-20, recovery 4.5 ft, PID: 0.0
15.5-16.0 moist, brown and black/gray
silty sand, loose
16-17 brown silty, sand, med firmness
17-20 silty brown sand, loose
20-25 ft, recovery 4.5 ft PID 0.0
21 ft: dark gray and brown silty sand
moist, loose
21-23 ft: light/med brown silty sand

Rite in the Rain

Location _____ Date 10/23/17

Project / Client _____

28-29 ft, light brown silty sand with narrow dark bands, loose, dry
29-30 firm, compacted rusty silty sand, some clay
30-35, recovery 5.0 ft, PID:
30-31, moist brown silty sand w/ some clay
31-32 brown sand loose, fine, dry
32-33 light brown, dry, loose sand with some narrow black bands
33-35 light brown/brown sand dry, loose
35-40 recovery 5 ft, PID 0.1 @ 36'
35-36 darker brown silty sand, moist
37-40 loose, dry light brown and rust colored sand, fine
40-45, recovery 5 ft. PID 0.0 ppm dry, course medium brown sand
42-42.5 ft rust colored silty sand with clay, some black silty material with metallic flecks
45-50, recovery 5 ft, PID 0.0 light brown, dry, coarse sand, loose
1445 Checked MW-161-1-S, found dry

Location _____ Date 10/23/17

Project / Client _____

Gauged water level in MW-161-1-I (95 ft) deep; DTW 75.6. Also noted that wells are 1-inch diameter, connect use Grundfos. Called Pine Syracuse. They are going to procure a 0.75-inch bladder pump
50-55, recovery 5ft, PID 0.0 ppm
50-51 dry, light brown granular sand
51-52 dry, rusty color sand
@ 52', ~4" band of gray sandy clay
-dry, rust color sand, loose
55-60, recovery 5 ft, PID 0.0 ppm
light brown and rust colored sand, dry
60-65, recovery 5ft, PID 0.0
60-64 - brown, loose, dry sand
64-65 - more rust colored, silty sand, bottom ~2" Gray silty clay
1630 End for day to avoid getting dark since takes ~30 min / five feet
1645 Offsite

10/23/17

Rite in the Rain

Location _____ Date 10/24/17

Project / Client _____

7:00 A. Rielly (COM Smith) on site
715 C Meehan (COM Smith) on site
720 Cascade on site
Weather: cloudy, windy, 69° F, rain and thunderstorms expected today
755 Continue boring PDI-3
830 65-70 ft, recovery 5ft, PID 0.0
65-66 moist sand w/ clay, brown
66-67 sandy clay, orange-brown, dense
67-69 black silty sand, moist
69-70 light brown silty sand, moist med density, bottom 2" dark gray clay with orange silty layers
measured water level @ 69.5 ft bgs
70-75, recovery 5ft
70-74 black silty clay; dry, firm, crumbles easily, metallic specks
74-75 brown brittle clay with black silty and brown sand layers still dry, using water meter down hole,
75-80, 5 ft recovery, PID 0.0
brown sandy, moist throughout, top foot appeared more wet - going to proceed to 80-85 5ft interval

Location _____ Date 10/24/17

Project / Client _____

80-85, recovery 5ft, PID 0.0 ppm
80-81 brown, coarse sand, moist
81-83.5 wet, brown silty sand
83.5-84.5 gray clay with brown silty
84.5-85 brown and rust color silty sand. DTW 69.6 in hole, hole backfilled
85-90, PID 0.0, could not get soil out of macrocore casing. Driller banged it out onto poly sheeting. Moist, dry silty sand, brown
1430 Used water tape to measure down hole. Water reading still at ~70 ft bgs, however Cascade could not get any water with screen interval set at 70-75 ft bgs. Called A. Piccone to relay that we still have not hit defined clay layer as of 90 ft bgs. Will continue to 95
90-95, recovery 5ft PID 0.0
wet, brown sand
95-100 couldn't get liner out of casing, dumped sample onto poly, brown, silty sand w/ clay

Rite in the Rain

Location _____ Date 10/24/17

Project / Client _____

1700 Advancing groundwater sampler to screen interval 80-85 ft bgs to attempt sample collection

1750 Collected PDI-3-GW-80_85_20171024 turbidity high, no reading, VOCs

1815 Off site. Drillers to backfill borehole PDI-3 in AM, Covered hole with drum

Location Old Bethpage, NY Date 10/25/17

Project / Client Former Aluminum Louvre NYSDEC

720 CDM Smith (A. Kelly, C. Meehan) onsite. Heavy rain last night, parking lot area of 161 Bethpage Sweet Hollow Rd flooded. PDI-4 borehole flooded

Weather: cloudy, 63°F

830 Cascade on site, still have same rig

900 Cascade grouting PDI-3 borehole

NY Paving has set up pump to remove stormwater from parking area

915 mob to location PDI-5, will return to PDI-4

930 Begin drilling PDI-5

hand cleaning 0-5 ft bgs, ~4" concrete, brown sand, medium gravel

5-10 ft, recovery 5 ft, PID 0.0 ppm dry, light rust and slightly darker rust colored sand, loose to firm area dark silty with brown sand at 7 ft

10-15, recovery 2 ft, PID 0.0 ppm

13-13.5 rust colored sand, light pack

13.5-15 light rust sand, dry, loose

15-20, recovery 4 ft, PID 0.0

16-18 ft dry, light brown sand with dark brown thin bands of silty @ 16'

Rite in the Rain

Drum #	Sample in Drum
16	PDI-12
17	PDI-12
18	PDI-13
19	PD-24+25
20	Unknown (geoprobe soil 6/13/18)

0800 First Brookside truck offsite with 30 water drums. 20 soil drums remain. 4 composite samples collected.

0800 SO-IDW-2018p04 collected for VOCs via TerraCore. + % Moist.

0815 SO-IDW-2-20181004 collected for VOCs + % Moist.

0830 SO-IDW-3-20181004 collected for VOCs and % Moist.

0845 SO-IDW-4-20181004 collected for VOCs and % Moist

0900 Packed and labeled samples. Mike from Brookside assisted in closing drums and moving them all to the southern part of lot.

0945 Mike from Brookside offsite.

3/6/19

Location Old Bethpage, NY Date 3/11/19

Project / Client FAL / NYSDEC

0715 A. HARROLD + L. ESTRADA onsite to perform oversight of PDI delineation borings within 161 and 301.

0720 Arthe not in the office today. Employee let us in to last garage bay.

0800 Cascade onsite: Personnel: Luke Caballero and Mike. Cascade only brought equip to perform cleaning. Showed them the locations in 161 Bethpage Sweet Hollow Rd.

0830 Mob to 301 Winding to show addl locs and ~~to~~ cleaning needed by dry wells.

0845 Drillers began ~~the~~ cleaning South West of DW-8.

0915 Sounding of Dry wells
DW-9 DTW: 3.54 ft bgs
DTB: difficult to tell due to skinny dipper weight
DW-8 DTW: 4.00 ft bgs
DW-7 DTW: 2.90

3/11/19

Rite in the Rain

Location Old Bethpage, NY Date 3/11/19

Project / Client FAL / NYSDEC

0950	Visually located a pipe off DW-7 to the southeast.
1015	Located PVC pipe between DW-8 and DW-9. Looks to be a 5" in PVC pipe approx. 2.5 ft bgs
1130	CDM SMITH AND CASCADE OFFSITE FOR LUNCH.
1230	BACK ONSITE.
1245	Mob to clear metallic anomaly in 301 Winding Rd back area. Directly northeast of the 301 Storage rd.
1400	Cascade cleared down to 5 ft @ metallic anomaly and did not locate any thing of interest. C. ESTRADA + A. HARROLD collected water levels with 301 Winding Rd parking lot.
1415	Cascade patched all cuts in pavement.
1430	CDM SMITH CONTINUED COLLECTING WATER LEVELS.
1545	CDM SMITH OFFSITE

0715 CDM SMITH ONSITE TO PERFORM ~~DR~~ OVERSIGHT OF SOIL BORINGS IN 161 and 301.

0725 CASCADE ONSITE. TO SET ~~UP~~ UP RIG.

0746 MOB TO 161 GARAGE TO PDI-26.

0830 Collected PDI-26-SO-17.5-031219 for VOCs. @ 17.5' bgs

0840 Mob to PDI-29.

0915 Collected sample PDI-29-17.5-031219 for VOCs. @ 17.5' bgs

0920 Mob to PDI-27

0945 Collected sample PDI-27-SO-17-031219 for VOCs @ 17' bgs

0950 quick break

1000 Mob to PDI-30

1030 Collected sample PDI-30-SO-17.5-031219 for VOCs @ 17.5 ft bgs.

1045 Mob to PDI-31.

1100 Collected sample PDI-31-SO-17.5-031219 for VOCs @ 17.5'

1110 Mob to PDI-32.

3/12/19

Location Old Bethpage Date 3/12/19

Project / Client FAL/NYSDEC

1130 Collected sample PDI-32-SO-16-031219 for VOCs @ 16 ft bgs.

1145 Mob to PDI-28 (last boring w/in 161 ~~bldg~~ Bethpage Sweet-Hollow Rd.

1215 Collected PDI-28-SO-16-031219 for VOCs @ 16ft bgs

1230 Collected swing distances for borings locs. and patching holes in garage floor in 161.

1245 CDM SMITH down to 301 Wind. to speak w/ Sal and staff. Sal said they do not get enough amperage to their facility despite having requested more from PSEG. Possibly looking to upgrade and could use 480V after we use it for treatment.

1315 Spoke w/ Artie about patches in garage bay. He said we were all set and they would repaint.

1330 Offsite for lunch.

Detail: Hydraulic Conductivity and Groundwater Flow Rate	**Reviewed By/Date ____**	**Calc #: ____** **Revision No./Date: ____**

Calculation Brief Title: Hydraulic Conductivity and Velocity of Groundwater Calculations

1.0 Purpose/Objective: Provide brief statement of results to be expected from this calculation.

The purpose of these calculations is to use data obtained from slug tests to calculate the hydraulic conductivity and average linear velocity of groundwater.

2.0 Procedure: Outline the steps followed and approach.

Slug tests were performed at two monitoring wells using a slug comprised of a solid PVC cylinder and an in-well transducer to collect periodic water level versus time measurements. Measurements are recorded before, during and after the slug is removed as the water level changes toward an equilibrium condition. The raw slug test measurements collected by the transducer and dimensions of the slug were inputted into the software program AQUTESOLV Pro which calculates the hydraulic conductivity using the Bouwer and Rice method. The geometric mean of the hydraulic conductivity calculated from the two monitoring wells (MW-161-3 and MW-161-4) was used to estimate the average linear velocity of groundwater.

3.0 References/Data Sources:

A. List out information used and its source(s). Attach copies of information used for the calculation including source for all calculation formulas.

B. Show full version of key equations here with references.

Bouwer and Rice Equation for calculating hydraulic conductivity (Fetter, 2001)

$$K = \frac{r_c^2 \ln(R_e/r_w)}{2L_e} * \frac{1 \ln (h_0/h)}{t}$$

Where: K = hydraulic conductivity; R_e = radial distance over which head is dissipated; h_0 = drawdown at time t = 0; r_c = radius of well casing; L_e = length of screen; h = drawdown at time t=t; r_w = radius of the well; t = time since $h = h_0$

Equation for calculating linear velocity (Fetter, 2001)

$$V_x = \frac{K}{n} * \frac{dh}{dl}$$

A Calculation Form (Word Format)

Where: Vx = linear velocity of the groundwater K = hydraulic conductivity n = effective porosity
dh = vertical gradient dl = horizontal gradient

4.0 Assumptions and Limitations:

A. List assumptions and basis.

No lithology data was available for MW-161-3 or MW-161-4 so lithology data from other nearby borings was used to estimate the saturated thickness of the aquifer. A consistent clay layer was found at an elevation of 50 feet above mean sea level and assumed to confine the lower boundary of the aquifer. Both wells were screened across the water table; therefore, the aquifer is assumed to be unconfined. It is assumed the hydraulic gradient is unaffected by seasonality and incorporates areas of steeper and shallower gradients as a conservative estimate for the entire site.

B. Identify limitations of calculations and results.

Two rising head tests were performed at each of the two wells. The geometric mean of the average calculated hydraulic conductivity values obtained from each well were used to calculate the average linear velocity of groundwater. The hydraulic gradient of the site was estimated based on groundwater contour maps from January 2018.

5.0 Calculations: Attach calculation to this form. Create clear and descriptive process that is easily followed. Show actual equations in normal format. Use sketches and graphs liberally. Box significant results and annotate liberally. Use units, where appropriate.

The table below is an example of information for the slug (used in both wells) and monitoring wells that were inputted into the AQTESOLV Pro software.

Slug			**Well (MW-161-3 and MW-161-4)**		
60	in	Length	2	in	Diameter
1.5	in	Diameter	1	in	Radius
0.75	in	Radius	3.141593	in^2	Area
1.767146	in^2	Area	8	in	Hole Diameter
106.0288	in^3	Volume	65 – 75	ft bgs	Screen Depth
			2.53125	ft	Initial Displacement
			80	ft	Aquifer Saturated Thickness

The attached pages contain the AQTESOLV Pro output files from the rising head tests. The table below presents a summary of the hydraulic conductivity values calculated at each well using AQTESOLV Pro.

Hydraulic Conductivity Values Calculated in AQTESOLV Pro				
MW-161-3				
7.500E-6	ft/sec	0.6480	ft/day	
6.543E-6	ft/sec	0.5653	ft/day	
7.021E-6	ft/sec	0.6066	ft/day	Average, silty sand
MW-161-4				
5.068E-6	ft/sec	0.4379	ft/day	
4.218E-6	ft/sec	0.3644	ft/day	
4.643E-6	ft/sec	0.4012	ft/day	Average, silty sand
Average calculated hydraulic conductivity (geometric mean): 5.710E-6 ft/sec (0.4933 ft/day)				

A Calculation Form (Word Format)

CLIENT NYSDEC | JOB NO. 0897.215458 | COMPUTED BY A. HARROLD
PROJECT FORMER ALUMINUM LOUVRE | DATE CHECKED | DATE 7/3/2019
DETAIL HYDRAULIC CONDUCTIVITY & GW FLOW RATE | CHECKED BY | PAGE NO.

1] CALCULATE HYDRAULIC GRADIENT OF THE SITE

$$\text{HYDRAULIC GRADIENT } (i) = \frac{dh}{dl}$$

WHERE: dh = VERTICAL GRADIENT
dl = HORIZONTAL GRADIENT

GIVEN:

DISTANCE BETWEEN MW-161-1 AND MW-161-2 (dl) = 220 ft
GROUNDWATER ELEVATIONS (MEASURED JAN 2018)
MW-161-1 : 74.06 ft bgs DTW → 62.07 ft amsl
MW-161-2 : 71.3 ft bgs DTW → 60.9 ft amsl

$$i = \frac{dh}{dl} = \frac{(62.07 - 60.9)\text{ ft}}{220\text{ ft}} = 0.00530$$

2] CALCULATE AVERAGE LINEAR VELOCITY (V_x)

$$\text{AVERAGE LINEAR VELOCITY } (V_x) = \frac{K}{n} \times i$$

WHERE: K = HYDRAULIC CONDUCTIVITY
n = EFFECTIVE POROSITY
i = HYDRAULIC GRADIENT

ASSUMPTIONS:

$K = 5.710 \times 10^{-6}$ ft/sec (0.493 ft/day) AQTESOLV Pro Software
$n = 0.28$ (Morris and Johnson, 1987) assuming silty sand

$$V_x = \frac{K}{n} \times i = \frac{5.710 \times 10^{-6}\text{ ft/sec}}{0.28} \times 0.00530 = 1.08 \times 10^{-7}\text{ ft/sec} \quad (0.00934\text{ ft/day})$$

A Calculation Form (Word Format)

6.0 Conclusions/Results:

A. List results concisely and tie back to 1.0 Purpose/Objective.

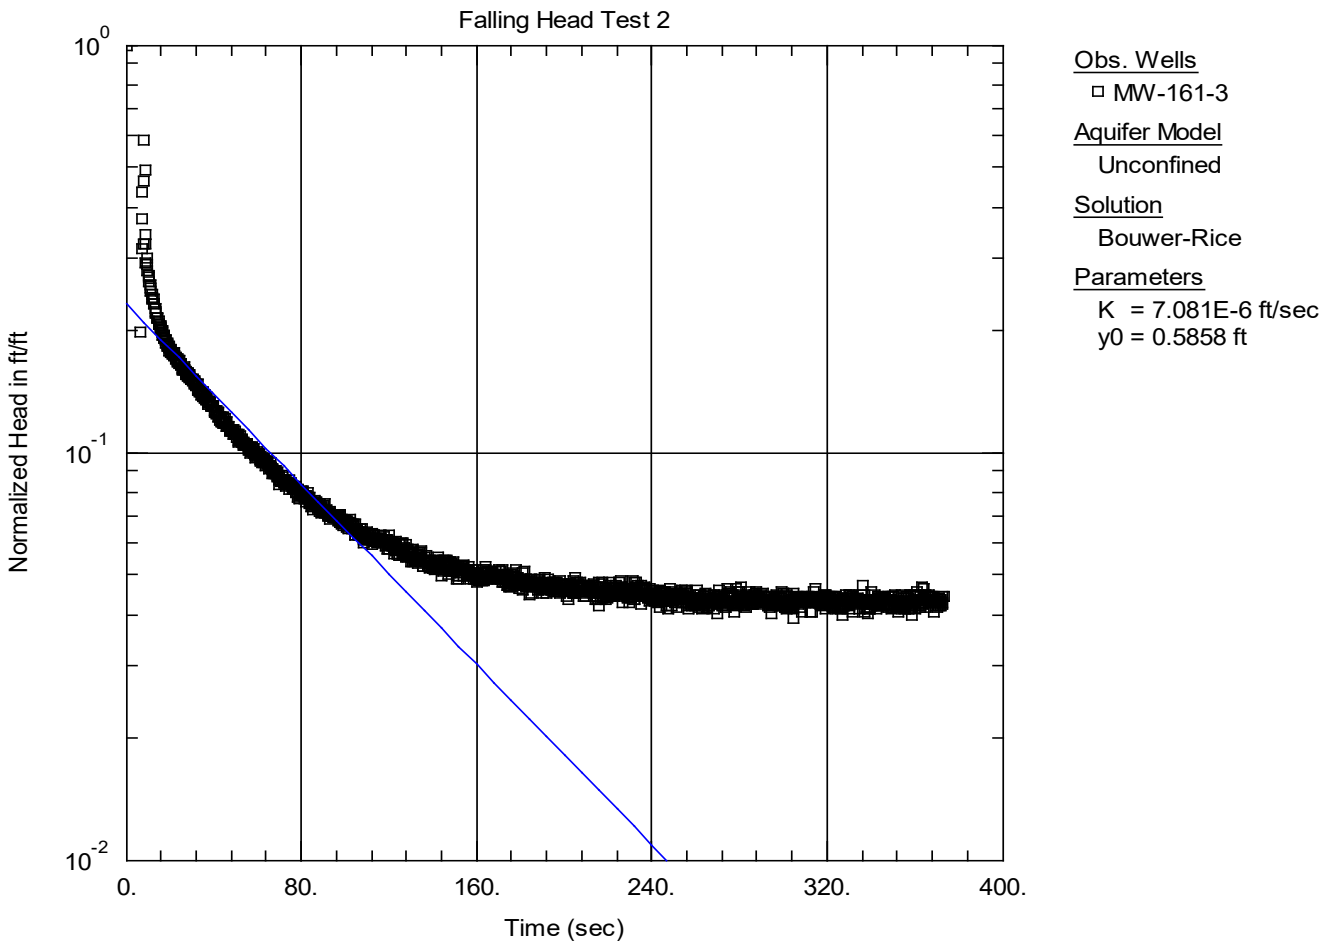
The average hydraulic conductivity calculated using the geometric mean of results of rising head slug testing and AQTESOLV Pro was 0.493 feet/day. The average linear velocity of groundwater was calculated to be approximately 0.00934 feet/day.

B. Restate limitations.

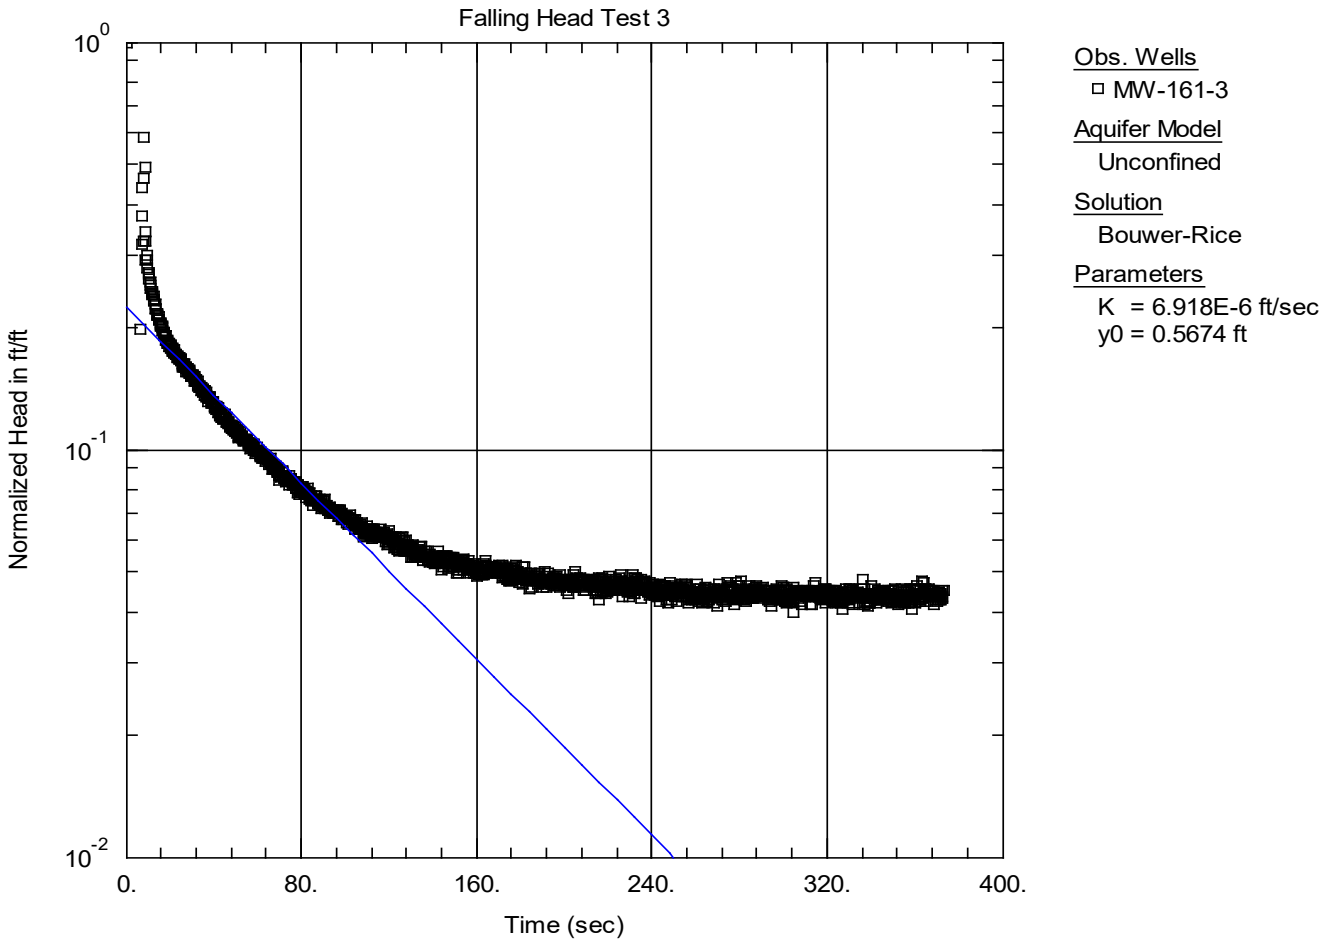
The average linear velocity of groundwater was calculated using the average (geometric mean) hydraulic conductivity values calculated from raw rising head slug test data obtained from two wells. Calculated average hydraulic conductivity values ranged from 0.4012 feet/day at MW-161-4 to 0.6066 feet/day at MW-161-3. An average value (geometric mean) of 0.493 feet/day was used in the velocity calculations. The hydraulic gradient of the site was estimated using groundwater contour maps from January 2018.

Hydraulic Conductivity using AQTESOLV Pro

MW-161-3 Falling Head Tests



Hydraulic Conductivity (K) = 0.6118 ft/ day
Groundwater Velocity (V*x*) = 1.974 ft/day

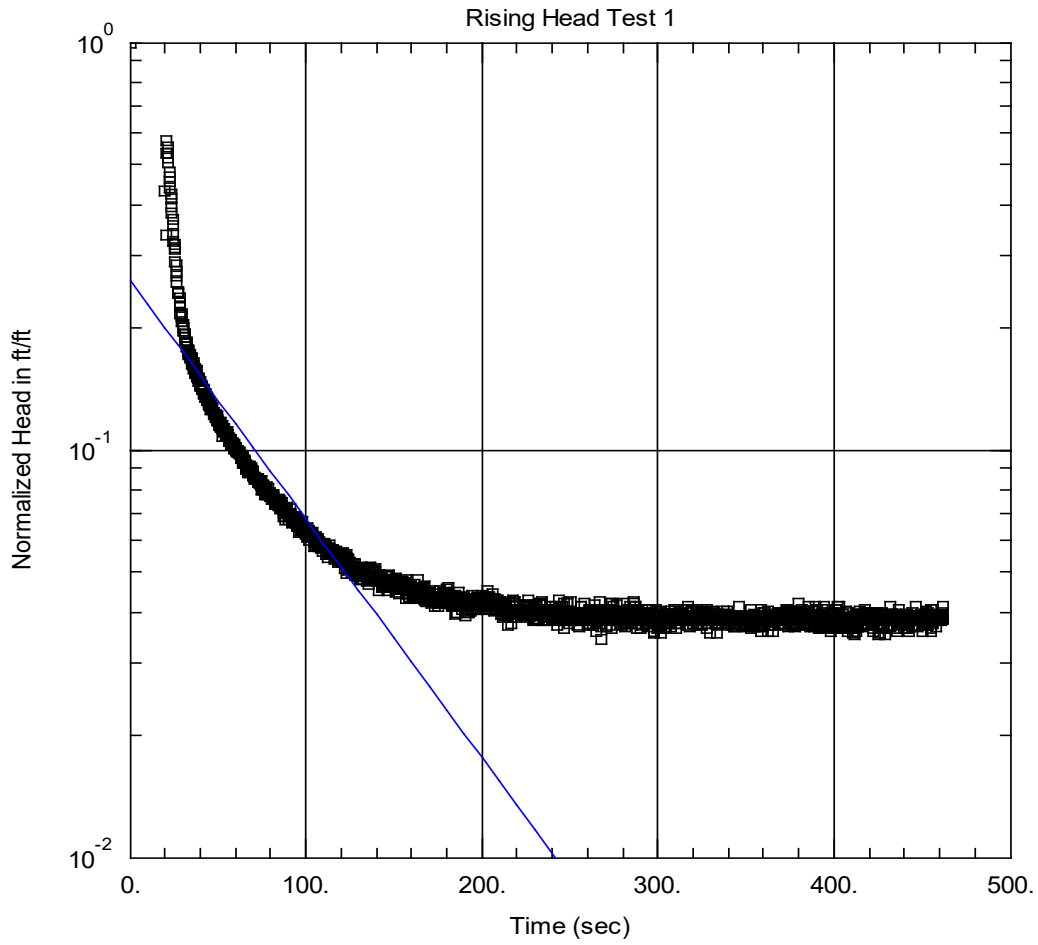


Hydraulic Conductivity (K) = 0.5977 ft/ day
Groundwater Velocity (V*x*) = 1.928 ft/ day

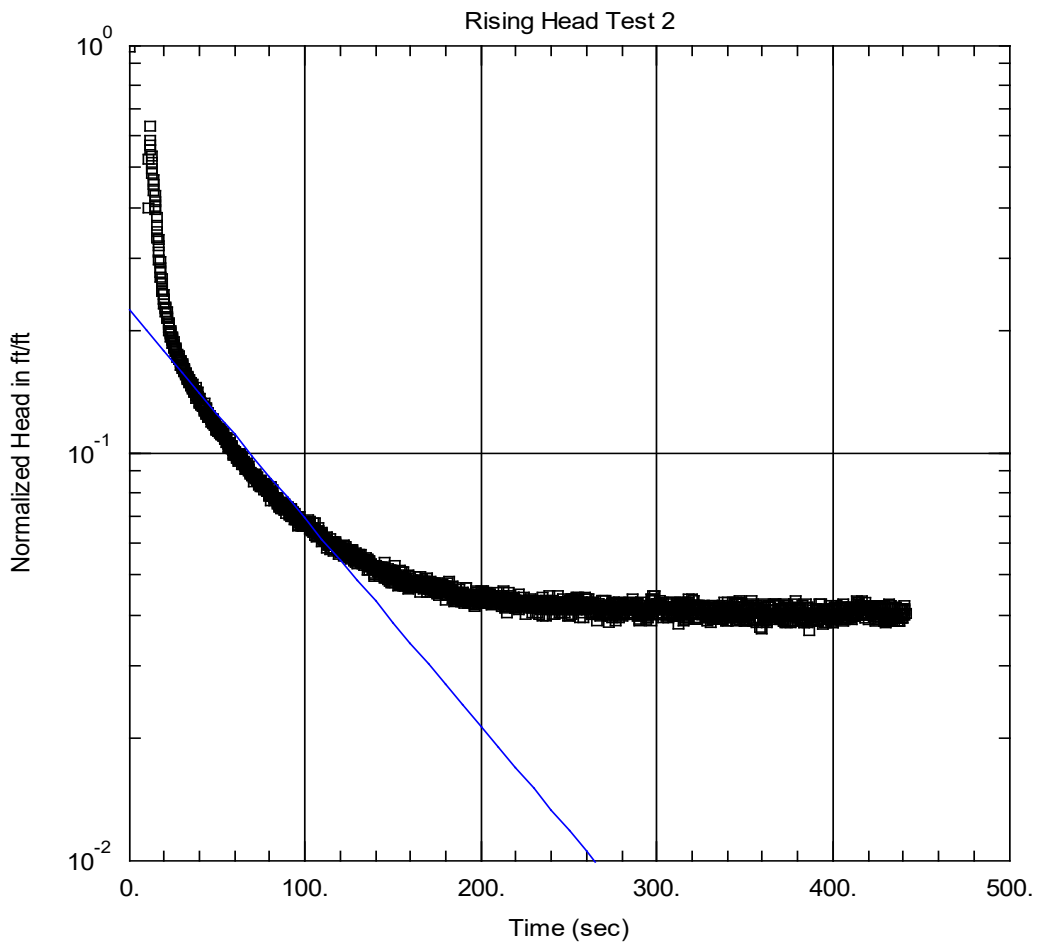
Average Hydraulic Conductivity (K) = 0.6048 ft/ day
Average Groundwater Velocity (V*x*) = 1.951 ft/day

Hydraulic Conductivity using AQTESOLV Pro

MW-161-3 Rising Head Tests



Hydraulic Conductivity (K) = 0.648 ft/ day
Groundwater Velocity (V*x*) = 2.0903 ft/ day



Hydraulic Conductivity (K) = 0.5653 ft/ day
Groundwater Velocity (V*x*) = 1.8236 ft/ day

Average Hydraulic Conductivity (K) = 0.60665 ft/ day
Average Groundwater Velocity (V*x*) = 1.9570 ft/ day

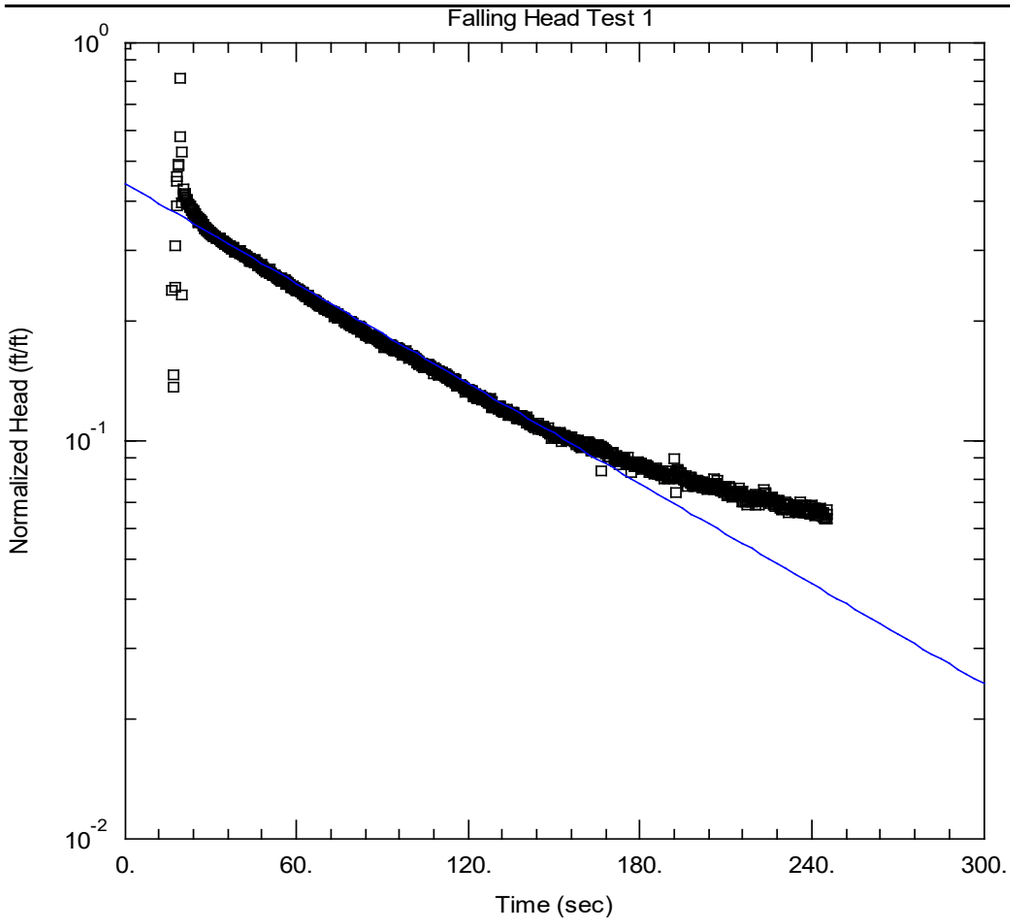
Hydraulic Conductivity using AQTESOLV Pro

MW-161-4 Falling Head Tests



Obs. Wells
- MW-161-4

Aquifer Model
Unconfined

Solution
Bouwer-Rice

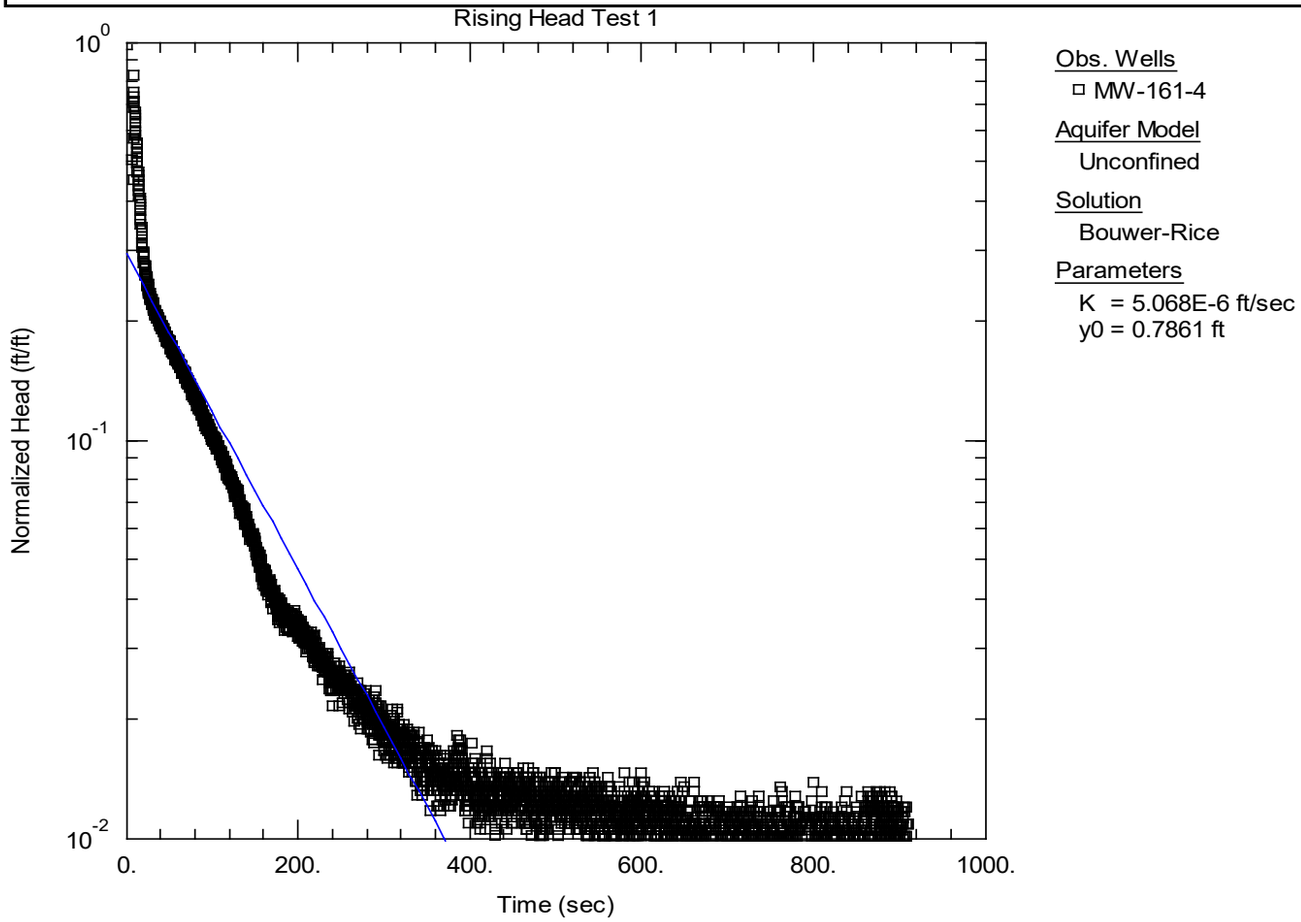
Parameters
K = 5.36E-6 ft/sec
y0 = 1.175 ft

Hydraulic Conductivity (K) = 0.4631 ft/ day

Groundwater Velocity (V*x*) = 1.4939 ft/ day

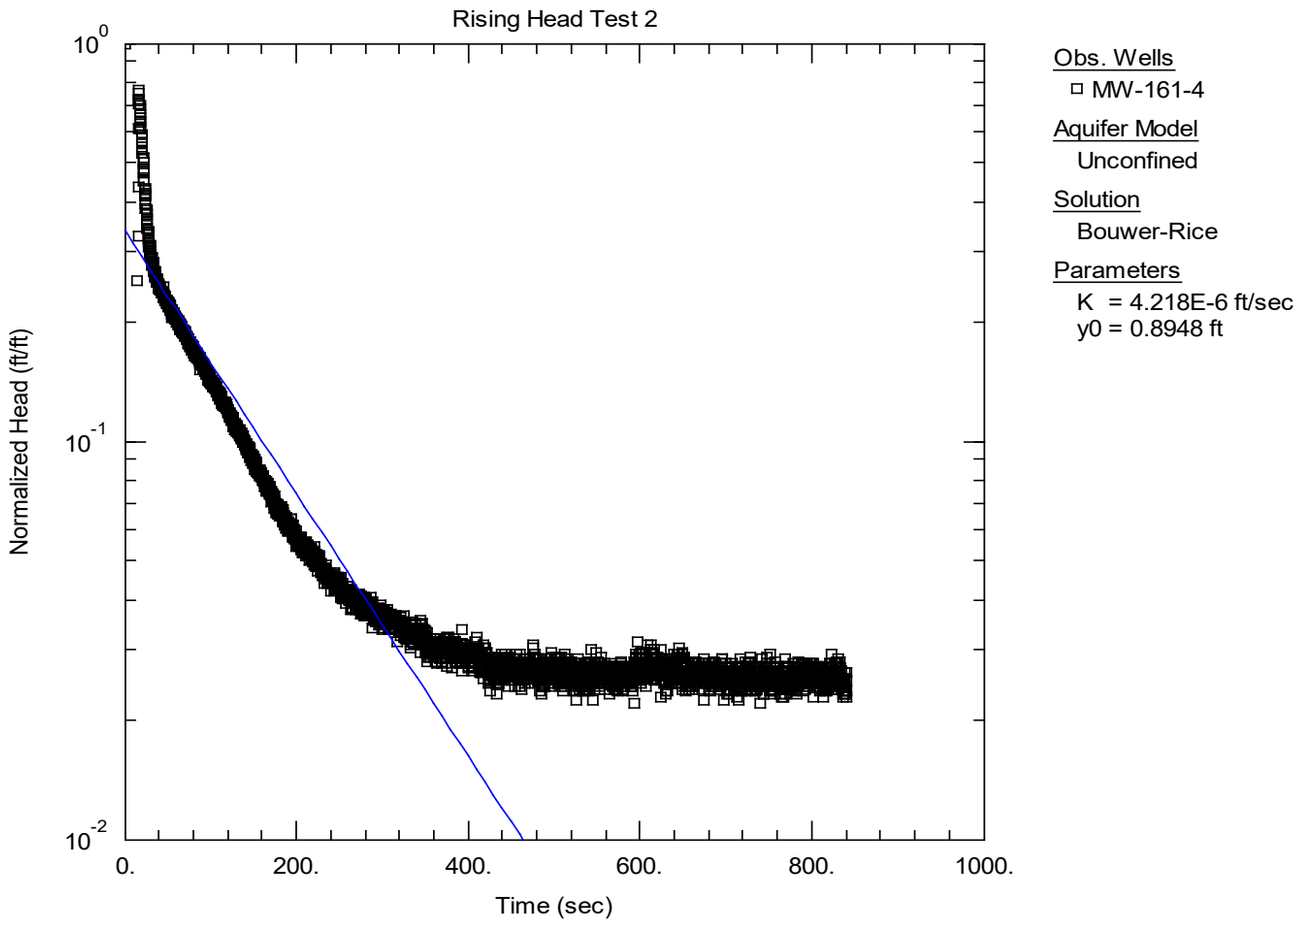
Hydraulic Conductivity using AQTESOLV Pro

MW-161-4 Rising Head Tests



Hydraulic Conductivity (K) = 0.4379 ft/ day

Groundwater Velocity (V*x*) = 1.4145 ft/ day



Hydraulic Conductivity (K) = 0.3644 ft/ day
Groundwater Velocity (V*x*) = 1.1756 ft/ day

Hydraulic Conductivity (K) Average = 0.4012 ft/ day
Groundwater Velocity (V*x*) Average = 1.2951 ft/ day

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: CDM Smith, Inc.
Project/Site: Former Aluminum Louvre

TestAmerica Job ID: 200-40996-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
200-40996-1

Receipt
The samples were received on 11/16/2017 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Receipt Exceptions
The container labels for the following samples did not match the information listed on the Chain-of-Custody (COC): SVI-161-1-IA-20171114 (200-40996-1), SVI-301-1-IA-20171114 (200-40996-4), SVI-301-1-SS-20171114 (200-40996-5), SVI-301-3-SS-20171114 (200-40996-9), SVI-301-3-IA-20171114 (200-40996-11) and SVI-301-2-IA-20171114 (200-40996-12). The container labels list barcoded canister IDs, while the COC lists engraved numbers found on aircans. Used barcoded canister IDs for login.

During the canister pressure check performed upon receipt, the following sample was found to be received at ambient pressure: SVI-301-4-OA-20171114 (200-40996-6), The associated flow controller was evaluated and was found to be within the acceptable flow range as compared to the original set flow rate. The client was contacted, and the laboratory was instructed to proceed with analysis.

During the canister pressure check performed upon receipt, the following sample was found to be received at ambient pressure: SVI-301-3-SS-20171114 (200-40996-9). The associated flow controller was evaluated and was found to be outside the acceptable flow range as compared to the original set flow rate. The client was contacted, and the laboratory was instructed to proceed with analysis.

During the canister pressure check performed upon receipt, it was observed that the following sample was received at an elevated residual vacuum level: SVI-161-3-SS-20171114 (200-40996-13). The associated flow controller was evaluated upon receipt and was found to be within the acceptable flow range as compared to the original set flow rate. The client was contacted, and the laboratory was instructed to proceed with analysis.

Air Toxics
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

List Number: 1
Creator: Hahl, Victoria L

List Source: TestAmerica Burlington

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	Not present
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	Thermal preservation not required.
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	N/A	Thermal preservation not required.
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	ER
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

[1] Batch Certification: The reading is taken on the "batch" canister and this value is used as the initial pressure for all canisters in the batch.

[3] Difference = Final Pressure - Initial Pressure . Acceptance Criteria: (1) The difference must be less than or equal to + 0.25psi. (2) Pressure readings must be at least 24 hours apart.

If time frame was not met, the PM must authorize shipment of canister **PM Authorization** **Date:**

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: CDM Smith, Inc.
Project/Site: Former Aluminum Louvre

TestAmerica Job ID: 200-41045-1

Qualifiers

Air - GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 200-41045-1

Laboratory: TestAmerica Burlington

Narrative

Job Narrative
200-41045-1

Receipt
The samples were received on 11/18/2017 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Receipt Exceptions
The Field Sampler was not listed on the Chain of Custody.

During the canister pressure check performed upon receipt, the following sample was found to be received at ambient pressure: SVI-161-1-OA-20171115 (200-41045-3). The associated flow controller was evaluated and was found to be within the acceptable flow range as compared to the original set flow rate. The client was contacted, and the laboratory was instructed to proceed with analysis.

Air Toxics
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Tetrachloroethene	0.19	J	1.4	0.066	ug/m3	1		TO-15	Total/NA

This Detection Summary does not include radiochemical test results.

Detection Summary

Client: CDM Smith, Inc.
Project/Site: Former Aluminum Louvre

TestAmerica Job ID: 200-41045-1

Client Sample ID: SVI-161-1-OA-20171115 (Continued) — Lab Sample ID: 200-41045-3

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Ethylbenzene	0.16	J	0.87	0.15	ug/m3	1		TO-15	Total/NA
m,p-Xylene	0.38	J	2.2	0.33	ug/m3	1		TO-15	Total/NA
Xylene (total)	0.38	J	3.0	0.17	ug/m3	1		TO-15	Total/NA

This Detection Summary does not include radiochemical test results.

Client Sample ID: SVI-161-2-SS-20171115
Date Collected: 11/15/17 14:45
Date Received: 11/18/17 10:00
Sample Container: Summa Canister 6L

Lab Sample ID: 200-41045-1
Matrix: Air

Method: TO-15 - Volatile Organic Compounds in Ambient Air

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	Not present
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	Thermal preservation not required.
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	N/A	Thermal preservation not required.
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	No analysis requiring residual chlorine check assigned.

[1] Batch Certification: The reading is taken on the "batch" canister and this value is used as the initial pressure for all canisters in the batch.

[3] Difference = Final Pressure - Initial Pressure . Acceptance Criteria: (1) The difference must be less than or equal to + 0.25psi. (2) Pressure readings must be at least 24 hours apart.

If time frame was not met, the PM must authorize shipment of canister **PM Authorization** **Date:**

TestAmerica
THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 480-137530-1

Job Description: Former Aluminum Louvre

For:
CDM Smith, Inc.
11 British American Blvd
Suite 200
Latham, NY 12110

Attention: Amy Picunas

Approved for release.
Becky C Mason
Project Manager II
6/29/2018 10:45 AM

Becky C Mason, Project Manager II
10 Hazelwood Drive, Amherst, NY, 14228-2298

Job Narrative
480-137530-1

Receipt
The samples were received on 6/15/2018 10:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.7º C.

GC/MS VOA
Method 8260C: The following sample was analyzed using medium level analysis and diluted to bring the concentration of target analytes within the calibration range: PDI-7-SO-17-06132018 (480-137530-4). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample were analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside of preparation holding time: PDI-6-SO-14-06132018 (480-137530-1), PDI-6-SO-16-06132018 (480-137530-2), PDI-106-SO-16-06132018 (480-137530-3) and PDI-8-SO-17-061318 (480-137530-5).

Method 8260C: The following samples were analyzed using medium level soil analysis and were diluted due to the nature of the sample matrix: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample was analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside preparation holding time: PDI-7-SO-17-06132018 (480-137530-4).

Method 8260C: The following samples were analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside of preparation holding time: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]).

Method 8260C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 480-420017 and analytical batch 480-420526 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.The following samples are impacted: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Method: 8260C - Volatile Organic Compounds by GC/MS (Continued)

Lab Sample ID: 480-137530-4 MSD
Matrix: Solid
Analysis Batch: 420526

Client Sample ID: PDI-7-SO-17-06132018
Prep Type: Total/NA
Prep Batch: 420017

Surrogate	MSD %Recovery	MSD Qualifier	Limits
1,2-Dichloroethane-d4 (Surr)	109		53 - 146
4-Bromofluorobenzene (Surr)	103		49 - 148
Toluene-d8 (Surr)	97		50 - 149
Dibromofluoromethane (Surr)	102		60 - 140

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F4	MS/MSD RPD exceeds control limits due to sample size difference.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: CDM Smith, Inc. TestAmerica Job ID: 480-137530-1
Project/Site: Former Aluminum Louvre

Laboratory: TestAmerica Buffalo

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	EPA Region	Identification Number	Expiration Date
New York	NELAP	2	10026	03-31-18 *

The following analytes are included in this report, but accreditation/certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

Method 8260C

Volatile Organic Compounds (GC/MS) by Method 8260C

List Number: 1
Creator: Wallace, Cameron

List Source: TestAmerica Buffalo

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	FREEZE TIME 6/15/18 11:00
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	True	
Chlorine Residual checked.	N/A

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F4	MS/MSD RPD exceeds control limits due to sample size difference.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 480-137530-1

Laboratory: TestAmerica Buffalo

Narrative

Job Narrative
480-137530-1

Receipt
The samples were received on 6/15/2018 10:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.7º C.

GC/MS VOA
Method 8260C: The following sample was analyzed using medium level analysis and diluted to bring the concentration of target analytes within the calibration range: PDI-7-SO-17-06132018 (480-137530-4). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample were analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside of preparation holding time: PDI-6-SO-14-06132018 (480-137530-1), PDI-6-SO-16-06132018 (480-137530-2), PDI-106-SO-16-06132018 (480-137530-3) and PDI-8-SO-17-061318 (480-137530-5).

Method 8260C: The following samples were analyzed using medium level soil analysis and were diluted due to the nature of the sample matrix: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]). Elevated reporting limits (RLs) are provided.

Method 8260C: The following sample was analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside preparation holding time: PDI-7-SO-17-06132018 (480-137530-4).

Method 8260C: The following samples were analyzed outside of preparation holding time but within analytical holding time due to the samples being received outside of preparation holding time: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]).

Method 8260C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 480-420017 and analytical batch 480-420526 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.The following samples are impacted: PDI-7-SO-17-06132018 (480-137530-4[MS]) and PDI-7-SO-17-06132018 (480-137530-4[MSD]).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Accreditation/Certification Summary

Client: CDM Smith, Inc.
Project/Site: Former Aluminum Louvre

TestAmerica Job ID: 480-137530-1

Laboratory: TestAmerica Buffalo

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	EPA Region	Identification Number	Expiration Date
New York	NELAP	2	10026	03-31-18 *

The following analytes are included in this report, but accreditation/certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

List Source: TestAmerica Buffalo

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	True	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time (Excluding tests with immediate HTs)..	True	FREEZE TIME 6/15/18 11:00
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Sampling Company provided.	True	
Samples received within 48 hours of sampling.	True	
Samples requiring field filtration have been filtered in the field.	True	
Chlorine Residual checked.	N/A

Job Narrative
480-137801-1

Receipt
The samples were received on 6/21/2018 10:40 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.5º C.

GC/MS VOA
Method 8260C: The continuing calibration verification (CCV) associated with batch 480-421262 recovered outside acceptance criteria, low biased, for Methyl tert-butyl ether. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported. The following sample is impacted: PDI-10-SO-S7-06182018 (480-137801-1).

Method 8260C: The following sample was frozen outside of 48 hours, but analyzed within analytical hold time: PDI-10-SO-S7-06182018 (480-137801-1).

Method 8260C: The continuing calibration verification (CCV) associated with batch 480-421976 recovered above the upper control limit for 2-Butanone, Cyclohexane, Dichlorobromomethane, and Methylcyclohexane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: FB-06192018 (480-137801-2), PDI-11-WG-75-06182018 (480-137801-3), PDI-111-WG-75-06182018 (480-137801-4), PDI-TB-06192018 (480-137801-5) and PDI-10-WG-74-06182018 (480-137801-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: CDM Smith, Inc. TestAmerica Job ID: 480-137801-1
Project/Site: Former Aluminum Louvre

Laboratory: TestAmerica Buffalo

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	EPA Region	Identification Number	Expiration Date
New York	NELAP	2	10026	03-31-18 *

The following analytes are included in this report, but accreditation/certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids

* Accreditation/Certification renewal pending - accreditation/certification considered valid.
