Re: Data Summary Report
SMS Instruments Site, Deer Park, NY

Dear Mr. Hoffman:

This letter transmits a copy of the final Data Summary Report, prepared by CDM Federal, Inc., for the SMS Instruments Superfund Site. The Report summarizes all groundwater monitoring data associated with this site from monitoring activities (occurring during two sampling events) occurring during November of 2004 and June of 2005.

Please call me if you have any questions or wish to discuss the report.

Sincerely,

A handwritten signature in black ink, which appears to read "Mark Dannenberg", is written over the printed name. The signature is fluid and stylized, with a long horizontal stroke extending to the right.

Mark Dannenberg

SUBJECT: Data Summary Report-Monitoring Well and Treatment Plant
Sampling, November 2004 and June 2005
SMS Instruments Remedial Action
Deer Park, New York

Dear Mr. Dannenberg:

CDM Federal Programs Corporation (CDM) is pleased to submit the Data Summary Report-Monitoring Well and Treatment Plant Sampling, November 2004 and June 2005, for the SMS Instruments Remedial Action at Deer Park, New York as partial fulfillment of Subtask No. 9.2 of the Statement of Work.

If you have any questions regarding this submittal, please contact Paul Hagerman or myself at (212) 785-9123.

Very truly yours,

CDM FEDERAL PROGRAMS CORPORATION

SMS Instruments Site Data Summary Report November 2004 and June 2005 Sampling

The following data summary report has been prepared as part of the long-term monitoring program of the SMS Instruments Site groundwater treatment system located in Deer Park, Long Island, New York. The field activities were conducted in accordance with the Monitoring Plan for the Site Groundwater Remedial Action (CDM, July 1992). CDM Federal Programs Corporation (CDM) has prepared this report under the RAC II contract work assignment number 125-RARA-02R5. The data presented in this report are for samples collected during the November 2004 and June 2005 events (Attachment A).

Samples were collected from the treatment plant influent (INF-14) and effluent (EFF-14) sample points, and from the system of site monitoring wells numbered as follows:

MW-1 through MW-5, MW-6S, MW-6D, MW-7 (and its duplicate sample assigned the false well location MW-10), MW-8, MW-9, MW-11 through MW-13, MW-13D, MW-14, MW-15, MW-16S, MW-16M, MW-16D, and MW-17.

In addition, groundwater samples were collected from extraction wells EW-1 (and its duplicate sample assigned the false location EW-2) and EW-3.

Pursuant to a discussion held on October 15, 2004 between the US Environmental Protection Agency (EPA) Regional Project Manager Mark Dannenberg and CDM Project Manager Paul Hagerman, sample fractions for target compound list (TCL) semi-volatile organic compounds (SVOCs) and target analyte list (TAL) metals were not collected.

Quality control samples were collected and included: three rinsate blanks, three trip blanks, two environmental duplicate samples as noted above, and one water blank. These samples are discussed below in the data quality section.

All samples were analyzed for low detection limit (LDL) volatile organic compounds (VOCs). All analyses were performed by the US Environmental Protection Agency (EPA) Region II Division of Environmental Science and Assessment (DESA) laboratory. The LDL VOCs were analyzed using DESA method E-132 which is based upon EPA method 524.2.

Sampling Results

Analytical results pertaining to the November 2004 and June 2005 sampling events reflect trends detected during previous series of monitoring events. Extraction well data continue to exhibit the range of concentrations typical of these wells; monitoring well data also continue the previously established trend of decreasing concentrations. Influent and effluent results also continue the trend seen over previous sampling

rounds of generally decreasing concentrations. Attachment A provides a summary of results for all wells sampled in November 2004 and June 2005, including the influent/effluent ports, extraction wells, and the monitoring wells listed above. Attachment B provides a summary of the results for treatment plant influent and effluent samples from all previous rounds of sampling. Attachment C presents results for the monitoring and extraction wells from previous rounds of sampling. Data qualifiers applied during data reduction and validation are found in Attachment D.

Influent and Effluent Sampling

November 2004 Event

Sample analysis of influent sample (INF-14) detected the presence of sixteen target compounds including 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, 1,3-dichlorobenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, 2-chlorotoluene, acetone (a possible laboratory contaminant), chlorobenzene, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, o-xylene, p-xylene+m-xylene, and total xylenes. A summary of the analytical results pertaining to the November 2004 sampling event are included in Attachment A.

Nine of the reported values were detected above the maximum daily discharge criteria of 5.0 micrograms per liter ($\mu\text{g/L}$) (4.7 $\mu\text{g/L}$ is the applicable discharge criteria for 1,2-dichlorobenzene and 1,4-dichlorobenzene). The compounds detected above the maximum daily discharge criteria with concentrations in $\mu\text{g/L}$ listed in parentheses were as follows: 1,2-dichlorobenzene (6.7), 1,2,4-trimethylbenzene (20), 1,3,5-trimethylbenzene at (7.2), 1,4-dichlorobenzene at (9.6), chlorobenzene (110), ethylbenzene (19), o-xylene (12), p-xylene+m-xylene (110) and total xylene (120). Chlorobenzene, p-xylene+m-xylene, and xylene (total) were detected at concentrations greater than 20 times the applicable daily discharge criteria of 5.0 $\mu\text{g/L}$.

The concentration of total target VOCs detected in the November 2004 influent sample was approximately 25 percent greater than the concentration detected during the August 2003 sampling, yet it is typical of the range of influent concentrations detected since 1996. Several targets, including 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene and p-xylene+m-xylene, were detected at concentrations one order of magnitude greater than during the previous sampling event; 1,2-dichlorobenzene was detected at a concentration one order of magnitude less than that exhibited in the August 2003 sample. A summary of the analytical results pertaining to the historic system influent/effluent sampling is provided as Attachment B.

Laboratory analysis of the effluent sample (EFF-14) detected the presence of six target organic compounds including 1,2-dichlorobenzene, 1,4-dichlorobenzene, acetone, chlorobenzene, p-xylene+m-xylene, and total xylene. Five of these six compounds were detected at concentrations below their discharge criteria; chlorobenzene was detected at a concentration of 6.4 $\mu\text{g/L}$, slightly above the maximum daily discharge criteria of 5 $\mu\text{g/L}$.

June 2005 Event

Sample analysis of influent sample (INF-14) detected the presence of fourteen target compounds including 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, 1,3-dichlorobenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, 2-chlorotoluene,

acetone, chlorobenzene, ethylbenzene, isopropylbenzene, naphthalene, o-xylene, p-xylene+m-xylene, and total xylenes. A summary of the analytical results pertaining to the June 2005 sampling event are included in Attachment A.

Six of these fourteen reported values were detected above the applicable maximum daily discharge criteria. These compounds (with concentrations detected in µg/L listed in parentheses) were as follows: 1,4-dichlorobenzene at (9.3), chlorobenzene (110), ethylbenzene (10), o-xylene (13), p-xylene+m-xylene (57) and xylene (total) (69). Chlorobenzene was detected at a concentration equal to 22 times the applicable maximum daily discharge criteria of 5.0 µg/L.

The concentration of total target VOCs detected in the November 2005 influent sample was approximately 50 percent less than the concentration detected during the November 2004 sampling, yet it is typical of the range of influent concentrations detected since 1996. Targets which exhibited the most notable decrease included 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, and p-xylene+m-xylene; no notable individual increases were detected.

Laboratory analysis of the effluent sample (EFF-14) detected the presence of four target VOCs including 1,4-dichlorobenzene, acetone, chlorobenzene and methyl-tertiary butyl ether (MTBE). All compounds were detected at concentrations below applicable discharge criteria.

Extraction Wells

November 2004 Event

Analysis for LDL VOCs of samples collected from extraction wells EW-1, EW-2 (a duplicate sample collected from EW-1) and EW-3 exhibited the presence of eighteen target VOCs including the following: 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, 1,3-dichlorobenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, 2-chlorotoluene (EW-1 and EW-2 only), 4-isopropyltoluene (EW-3 only), acetone, chlorobenzene, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene (EW-3 only), n-propylbenzene (EW-2 and EW-3 only), o-xylene (EW-1 and EW-2 only), p-xylene+m-xylene, sec-butylbenzene (EW-3 only), and xylene (total).

Ten of the eighteen VOCs were detected above the maximum daily discharge criteria, including the following (maximum detections in µg/L within parentheses): 1,2-dichlorobenzene (10), 1,2,4-trimethylbenzene (33), 1,3,5-trimethylbenzene (17), 1,4-dichlorobenzene (12), chlorobenzene (170), ethylbenzene (26), n-propylbenzene (5.6), o-xylene (18), p-xylene+m-xylene (140) and xylene (total) (140). The maximum detected concentration – chlorobenzene in EW-1 and EW-2 at 170 µg/L – represents a value 34 times the applicable maximum daily discharge criteria of 5.0 µg/L.

The quantities of individual targets detected in EW-1 and EW-2 were largely consistent with the most recent results. Differences of note in the EW-1 and EW-2 results (reported detections in µg/L) include only toluene (0.5 and 0.6 to undetected) and acetone (undetected to 1.9 and 1.2). The VOCs detected in the EW-3 sample and the sum of their concentrations was consistent with the VOCs and total concentrations detected in previous samples from EW-3, yet the relative concentrations of the VOCs varied. Notably, VOCs exhibiting an increase of one order of magnitude include 1,2,4-trimethylbenzene (2.3 to 33), 1,3,5-trimethylbenzene (1.4 to 17), isopropylbenzene (0.6 to 4.2) and p-xylene+m-xylene (37 to 140). VOCs decreasing in concentration by one order of magnitude include 1,2-dichlorobenzene (36 to 1), 1,4-dichlorobenzene (19 to 4.6), chlorobenzene (100 to 17), 1,3-dichlorobenzene (3.5 to undetected), 2-chlorotoluene (1.6 to undetected) and o-xylene (18 to undetected). A summary of the November 2004 analytical detections is included in Attachment A. A table of historic detections in extraction well samples is included in Attachment C.

June 2005 Event

Analysis for LDL VOCs of samples collected from extraction wells EW-1, EW-2 (a duplicate sample collected from EW-1) and EW-3 exhibited the presence of fifteen target VOCs including the following: 1,2-dichlorobenzene, 1,2,4-trimethylbenzene, 1,3-dichlorobenzene, 1,3,5-trimethylbenzene, 1,4-dichlorobenzene, 2-chlorotoluene, acetone (EW-1 and EW-2 only), chlorobenzene, ethylbenzene, isopropylbenzene (EW-1 and EW-2 only), naphthalene, n-propylbenzene (EW-2 only), o-xylene, p-xylene+m-xylene and xylene (total).

Ten of the eighteen reported values were detected above the maximum daily discharge criteria, including the following (maximum detections in µg/L within parentheses): 1,2,4-trimethylbenzene (5.4), 1,4-dichlorobenzene (11), chlorobenzene (130), ethylbenzene (11), n-propylbenzene (0.55), o-xylene (15), p-xylene+m-xylene (65) and xylene (total) (79). The maximum detected concentration - chlorobenzene in EW-1 and EW-2 at 130 µg/L - represents a value 26 times the applicable maximum daily discharge criteria of 5.0 µg/L.

The concentrations of individual targets detected in EW-1 and EW-2 (reported values in µg/L within parentheses) were largely consistent with most recent results, except for notable decreases in chlorobenzene (170 to 130 and 120) and p-xylene+m-xylene (84 and 89 to 59 and 65). The sum of VOC concentrations detected in EW-1 and EW-2 were approximately 25-30 percent less than the sample collected during the previous event, yet within the range of concentrations.

The sum of VOC concentrations detected in the sample collected from EW-3 was approximately 43 percent less than the sample collected during the previous event. The VOCs detected were consistent with historic detections. VOCs exhibiting an increase of one order of magnitude include (reported values in µg/L within parentheses) 1,2,4-trimethylbenzene (2.3 to 33), 1,3,5-trimethylbenzene (1.4 to 17), isopropylbenzene (0.6 to 4.2) and p-xylene+m-xylene (37 to 140). VOCs decreasing in concentration by one order of magnitude include 1,2-dichlorobenzene (36 to 1), 1,4-dichlorobenzene (19 to 4.6), chlorobenzene (100 to 17), 1,3-dichlorobenzene (3.5 to undetected), 2-chlorotoluene (1.6 to undetected) and o-xylene (18 to undetected). VOCs decreasing in concentration by one order of magnitude include chlorotoluene

(undetected to 1.1) and o-xylene (undetected to 10). A summary of the June 2005 analytical detections is included in Attachment A; historic detections in extraction well samples are provided in Attachment C.

Monitoring Wells

November 2004 Event

Samples were collected from twenty on-site and off-site monitoring wells (MW-1 through MW-5, MW-6S, MW-6D, MW-7 through MW-9, MW-11 through MW-13, MW-13D, MW-14, MW-15, MW-16S, MW-16M, MW-16D, MW-17) and one false well location (MW-10, duplicate sample of MW-7). Analytical results exhibited the presence of ten VOCs including 1,1-dichloroethane, 1,1-dichloroethene(-ethylene), 1,1,1-trichloroethane, acetone, chloroethane, chloroform, cis-1,2-dichloroethene(-ethylene), methyl tertiary butyl ether, tetrachloroethene(-ethylene), and trichloroethene(ethylene).

Only 1,1-dichloroethane was detected at a concentration (16 µg/L at MW-16S) greater than its applicable maximum daily discharge criterion (5 µg/L). Although this reported value is greater than three times the criterion, it is approximately 50 percent of the value reported during the previous sampling round.

Samples from five monitoring wells (MW-1, MW-3 through MW-5 and MW-15) exhibited no detectable concentrations of target VOCs. Three monitoring wells (MW-2, MW-14 and MW-17) exhibited a detectable concentration of only one target VOC: acetone. In total, analyses of eight groundwater samples detected the presence of acetone. All detections were at concentrations comparable to those detected in one water blank, one field blank and two trip blanks, and are therefore not considered to be indicative of acetone in groundwater.

The results of the November 2004 sampling event showed a continuance of the trend of decreasing VOC detections and concentrations in on-site and off-site monitoring wells, with the observed decrease in concentrations especially apparent in MW-6S. While MW-6S has historically been the location most frequently exhibiting detections and the highest concentrations of contaminants, the previously reported pattern of decreasing contaminant concentrations has continued. Only tetrachloroethene(-ethylene), at a concentration of 1.6 µg/L, was detected during the November 2004 sampling round, in comparison to the August 2003 sampling event when four of the ten VOCs detected surpassed discharge criteria.

June 2005 Sampling Event

Samples were collected from seventeen on-site and off-site monitoring wells (MW-1 through MW-3, MW-6S, MW-6D, MW-7 through MW-9, MW-11 through MW-13, MW-13D, MW-14, MW-15, MW-16S, MW-16M, MW-16D) and one false well location (MW-10, duplicate sample of MW-7). Analytical results exhibited the presence of eighteen target VOCs including 1,1-dichloroethane, 1,1-dichloroethene(-ethylene), 1,1,1-trichloroethane, acetone, chloroethane, chloroform, cis-1,2-dichloroethene(-ethylene), methyl tertiary butyl ether, tetrachloroethene(-ethylene), trichloroethene(ethylene) and xylenes (total).

Six of the VOCs were detected at concentrations greater than the applicable maximum daily discharge criteria, including 1,1-dichloroethane, 1,1-dichloroethene(-ethylene), 1,2,4-trimethylbenzene, chlorobenzene, ethylbenzene and p-xylene+m-xylene. The reported value for xylenes (total) was also above the applicable maximum daily discharge criteria. The highest concentration reported was 1,1-dichloroethene(-ethylene) at 28 µg/L in MW-13, over five times the maximum daily discharge criterion (5 µg/L) and the highest concentration of this compound reported in this well.

The sample collected from MW-8 exhibited no detectable concentrations of target VOCs. Five monitoring wells (MW-1, MW-2, MW-3, MW-11 and MW-12) exhibited a detectable concentration of only one target VOC: acetone. In total, analyses of ten groundwater samples detected the presence of acetone. All detections were at concentrations comparable to those detected in one water blank, three field blanks and two trip blanks, and are therefore not considered to be indicative of acetone in groundwater.

The results of the June 2005 sampling event showed an increase in detections and concentrations in MW-6S and MW-13, along with a decrease of similar magnitude in MW-16S. The VOC concentrations in MW-6S and MW-13 are not previously unseen, and are not indicative of a new release or uncontrolled source. While MW-6S has historically been the location most frequently exhibiting detections and the highest concentrations of contaminants, the previously reported pattern of decreasing contaminant concentrations has continued. These results are consistent with the trend of generally stable VOC detections and concentrations, continually decreasing over time.

Data Quality

A review of the data and related requirements shows evidence of good data quality, as discussed below. Samples were collected in accordance with EPA requirements and the "Quality Assurance Project Plan, SMS Instruments, Inc. Site Remedial Action" (November 7, 2001). No deviations have been noted.

Quality Control Samples

During each sampling event, two field duplicates, labeled MW-10 and EW-2, were collected in association with the samples from locations MW-7 and EW-1, respectively. The data for these duplicate samples show good correlation for both sampling events. Relative percent differences (RPDs) are within the quality control (QC) limit of up to 50 percent for duplicate samples for all duplicate results.

Relative percent difference (RPD) is calculated as follows:

$$RPD = 100 \times 2 |X_1 - X_2| / (X_1 + X_2)$$

Where X_1 and X_2 are the reported concentrations for each sample in the pair.

Table 1 presents the RPDs for the duplicate and corresponding environmental samples for the November 2004 sampling event. Table 2 presents the RPDs for the duplicate and environmental samples for the June 2005 sampling event.

In November 2004, three field equipment rinsate blanks, three trip blanks and one water blank were collected in association with the groundwater monitoring well samples. Acetone (1.6 µg/L) was detected in the water blank, one of the equipment blanks, and two trip blanks. Acetone was also detected at similar concentrations in several of the environmental samples

In June 2005, three field equipment rinsate blanks, three trip blanks and one water blank were collected in association with the groundwater monitoring well samples. Acetone (1.5 µg/L - 4.5 µg/L) was detected in all three of the equipment rinsate blanks, two trip blanks and the water blank, in addition to ten environmental samples. Chloroform, 2-butanone (MEK) and toluene were also detected in the water blank, one trip blank and one field blank; these constituents were detected in one, one and zero environmental samples.

Completeness

For both sampling events, completeness for the samples was achieved for 100 percent of the organic and inorganic sample results. These results meet project goals of 90 to 95 percent.

Accuracy and Precision

The accuracy and precision requirements for analytical parameters were verified according to the criteria specified in the EPA CLP Statements of Work. The data for VOCs were received as validated from the EPA DESA laboratory. Sample results not meeting the specified criteria were reported with the appropriate data validation qualifiers. The data qualifiers are defined in Attachment D.

Representativeness

Representativeness was achieved by the evacuation of monitoring well water column volumes until the water quality parameters of pH, specific conductivity, and temperature had stabilized to within a ten percent variance. This effort assured that fresh formation groundwater was being drawn by the sampling equipment. Also, samples were preserved chemically, as required, and packed with ice sufficient to maintain cooler temperatures less than 4° Celcius until receipt at the laboratories.

Data Usability

Groundwater data collected during the November 2004 and June 2005 sampling events generally were of good quality, and are considered usable for the intended purpose of the data.

Table 1
Relative Percent Difference Values
November 2004

MONITORING WELL	November 2004 Duplicate Samples					
	MW-7	MW-10 (7-dup)	Relative Percent Difference	EW-1	EW-2 (EW-1 dup)	Relative Percent Difference

ATTACHMENT D

SAMPLING DATA QUALIFIERS

SMS INSTRUMENTS SITE

Data Validation Qualifiers

- J - Estimated data due to exceeded quality control criteria.
- B - The compound was also detected in the associated blank (this meaning applies to organic data only).
- B - The analyte was detected below the TAL analytical statement of work contract required detection limits (CRDLs) but above the instrument detection limits (this meaning applies to inorganic data only).
- QG - Continuing calibration check does not meet acceptance criteria.
- QM - Presence of material verified but not quantified.
- R - Data is rejected and is unusable.
- E - The reported value is estimated because of the presence of interference.
- JN - Presumptive evidence for the presence of the material at an estimated value.
- K - The identification of the analyte is acceptable; the reported value may be biased high. The actual value is expected to be less than the reported value.

Please note that this list includes data qualifiers generally assigned to data results, not necessarily the current data set under discussion.
