1.0 INTRODUCTION

Past releases from the Liberty Industrial Finishing Site in Brentwood, New York (Site No. 1-52-108) resulted in the contamination of soil and groundwater at the Site and surrounding areas. AECOM Technical Services Northeast, Inc. (AECOM [formerly Earth Tech Northeast, Inc]) has been tasked with collecting three rounds of five-quarterly samples from selected monitoring wells as part of a long-term monitoring plan. AECOM is performing this work under the New York State Department of Environmental Conservation (NYSDEC) Superfund Standby Contract Work Assignment D004445-14.3. Four rounds of groundwater sampling have been conducted to date under this work assignment.

- The first round (Round 1) of sampling was conducted in June 2006.
- The second round (Round 2) of sampling was conducted in August 2007.
- The third round of sampling (Round 3) was conducted in November 2008.
- The fourth round (Round 4) of sampling conducted in March 2010.

This report focuses on the most recent (Round 4) sampling event at the site, but also includes the data from the earlier rounds.

2.0 SITE DESCRIPTION

The Liberty Industrial Finishing Superfund site is located at 550 Suffolk Avenue, Brentwood, Suffolk County, New York (see Figure 1). The Site is bounded to the north by Suffolk Avenue, by the Long Island Railroad to the south, undeveloped land to the east and a gasoline station the west on Suffolk Avenue. Eight monitoring wells are included in the long-term monitoring program at the Site.

3.0 FIELD ACTIVITIES

The monitoring well survey information could not be located at the start of this project. As a part of this long-term monitoring program, each of the eight wells included in the sampling program were re-surveyed by YEC, Inc., a licensed New York State surveyor on March 21, 2007. A summary of well construction data is presented on Table 1.

The fourth round of groundwater sampling at the Liberty Industrial Finishing Site occurred on March 9 and 10, 2010. Sampling was conducted in accordance with the Sampling and Analysis Plan (SAP) prepared by AECOM, dated June 2007. The SAP is comprised of the Field Sampling Plan (FSP), the Quality Assurance Project Plan (QAPP) and the Safe Work Plan (SWP). All field work was performed in Level D personal protection.

3.1 Water Level Survey

Prior to the start of sampling, water levels were measured in each well to provide a synoptic event. Water level measurements were recorded in the Field Notebook and on the Well Sampling Forms included in Appendix A. A summary of groundwater elevation measurements is provided in Table 2. Each location was photo-documented and a hand-held global positioning system (GPS) unit was used to record the coordinates. The groundwater elevation data are shown on Figure 3. As shown on the figure, the water

table elevations are very similar across the entire study area with less than 1.0 ft of change from the highest recorded elevation to the lowest. The total depth of each of the eight wells also varies significantly from 49.3 to 265 ft. It appears that groundwater is flowing to the southeast. This is consistent with previous investigations performed by other consultants, which also determined that the general direction of groundwater flow at the Site was to the southeast.

3.2 Groundwater Sampling

Eight monitoring wells were identified for long term monitoring at the Site. The selected wells included MW-5, MW-6, MW-12, MW-14, MW-18, MW-19, MW-20, and MW-21. Well locations are shown on Figure 2. NYSDEC Monitoring Well Field Inspection Forms were completed for each well and are included in Appendix B.

AECOM used a Grundfos Redi-Flo2 submersible electric pump with polyethylene tubing to purge each monitoring well prior to sampling. Monitoring wells were purged of at least three casing volumes of water prior to sampling. Measurements of pH, specific conductance, temperature, dissolved oxygen, oxygen reduction potential, and turbidity were recorded on the Well Sampling Forms periodically during purging. Well sampling forms are included in Appendix A. Once the minimum volume of water had been evacuated, a dedicated Teflon bailer was used to collect a groundwater sample. The sample was transferred into laboratory supplied containers and stored in an ice-filled cooler. The samples were then transported to Mitkem Laboratory via UPS for overnight delivery. Proper chain-of-custody procedures and requirements were maintained throughout the sampling event in accordance with the QAPP.

4.0 SAMPLING RESULTS

The samples from monitoring wells MW-5, MW-6, MW-12, MW-14, MW-18, MW-19, MW-20, and MW-21 were labeled with the L- prefix to denote they were collected from the Liberty site. Groundwater samples were analyzed for target analyte list (TAL) metals using USEPA Method 6010/7470. The analyses were performed by Mitkem Laboratory of Warwick, Rhode Island, a NYSDOH ELAP certified laboratory (ELAP certification number 11522). The Mitkem data summary packages are included in Appendix C. A table showing the full data set is also included in Appendix C. A summary of the detections is presented in Table 3. The exceedances are also shown on Figure 4. The data are discussed in Section 4.1, below.

In accordance with project plans, formal data validation was not performed. However, An AECOM chemist provided a limited review of the data packages. The review of the Round 4 data is presented in Section 4.2.

4.1 Metals Data

Nine metals were detected above the Class GA criterion in monitoring wells at the Site at least once during the four sampling events. These metals include antimony, cadmium, chromium, copper, iron, manganese, lead, sodium and thallium.

Antimony was detected in six of eight monitoring wells during the June 2006 sampling event; of these, two samples exceeded the Class GA criterion of 3 µg/L (maximum concentration of 3.7 µg/L in MW-5). During the August 2007 sampling event, antimony was detected in five of eight samples, of which all five exceeded the criterion (maximum concentration of 11.2 µg/L in MW-12). During the November 2008 sampling event, antimony was detected in only one sample, MW-18, at a concentration of 9 µg/L, which exceeded the criterion. In Round 4, antimony was detected in three samples (MW-12, MW-18, and MW-20), all of which exceeded the criterion (maximum concentration 13.9 µg/L in MW-12).

During the June 2006 sampling event, cadmium was detected in six of eight samples but none of the concentrations exceeded the Class GA criterion of 5 µg/L. During the August 2007 sampling event, cadmium was detected in all eight samples, three of which exceeded the criterion (maximum concentration of 12.6 µg/L). During the November 2008 sampling event, cadmium was detected in six of eight samples, two of which (MW-12 and MW-14) exceeded the criterion (maximum concentration of 59.1 µg/L). Cadmium was detected in four samples in March 2010, at concentrations ranging from 0.62 to 205 µg/L. The detected concentrations at MW-12 (205 µg/L) and MW-14 (26 µg/L) exceed the Class GA criterion.

Chromium was detected in all eight samples during the June 2006 sampling event, one of which exceeded the Class GA criterion of 50 µg/L (95.8 µg/L at MW-14). During the August 2007 sampling event, chromium was again detected in all eight samples, one of which exceeded the criterion (248 µg/L at MW-14). During the November 2008 sampling event, chromium was detected in six of eight samples, one of which exceeded the criterion (69.6 µg/L at MW-14).

The detected concentrations of copper did not exceed the Class GA criterion of 200 µg/L in any sample from the first three rounds of sampling. In the March 2010 sampling event, the concentration in MW-14 (377 µg/L) exceeded the criterion.

Iron was detected in all eight samples during the June 2006 and August 2007 sampling events. Three samples exceeded the criterion of 300 µg/L during the June 2006 sampling event (maximum concentration of 1,710 µg/L at MW-20). During the August 2007 sampling event, six samples exceeded the criterion (maximum concentration of 10,900 µg/L at MW-12). During the November 2008 sampling event, iron was detected in six of eight samples, three of which exceeded the criterion (maximum concentration of 9,320 µg/L at MW-14). Iron was detected in all eight samples in March 2010 and the concentrations exceeded the criterion in five samples: MW-12, MW-14, MW-18, MW-20 and MW-21. The highest concentration was noted in MW-12 (38,100 µg/L).

Manganese was detected in all eight samples during all four sampling events. There were no exceedances of the 300 µg/L criterion during the June 2006 sampling event. There was one exceedance of the criterion during the August 2007 sampling event, 547 µg/L at MW-18. There was one exceedance during the November 2008 sampling event, 627 µg/L at MW-21. There was one slight exceedance in the March 2010 event, 312 µg/L at MW-18.

Lead was detected in four of eight samples during the June 2006 sampling event but none exceeded the criterion of 25 µg/L. Lead was detected in all eight August 2007 samples, one of which exceeded the criterion, 106 µg/L at MW-12. Lead was detected in four of eight samples during the November 2008

sampling event, of which two exceeded the criterion (maximum concentration of 221 µg/L at MW-14). Lead was detected in five of the eight samples in March 2010; the concentrations in MW-12 (553 µg/L) and MW-14 (76.5 µg/L) exceed the criterion.

Sodium was detected in all eight samples during all four sampling events. During the June 2006 sampling event, four samples exceeded the criterion of 20,000 µg/L (maximum concentration of 31,900 µg/L at MW-14). Four samples exceeded the criterion during the August 2007 sampling event (maximum concentration of 31,100 µg/L at MW-20). During the November 2008 sampling event, four samples exceeded the criterion (maximum concentration of 561,000 µg/L at MW-14). In the March 2010 sampling event, five sample concentrations exceeded the criterion, with a maximum of 39,600 µg/L in MW-20.

Thallium was not detected in any of the eight samples collected during the June 2006 sampling event. Thallium was detected in two samples during the August 2007 sampling event, both of which exceeded the criterion of 0.5 µg/L (maximum concentration of 3.4 µg/L). Thallium was not detected in any of the eight samples collected during the November 2008 or in the March 2010 sampling event.

4.2 Round 4 (February 2010) Data Quality Review

In accordance with the project plans, data generated for this investigation were not subject to formal validation. However, AECOM's quality assurance officer (QAO) reviewed the data for reasonableness and the presence of any anomalies, including issues identified by the laboratory in the case narrative, and other items noted in review of shipping and handling documentation, inconsistencies with previous data, and review of the laboratory QA forms. The QAO also reviewed the field duplicate data.

One site-specific field duplicate pair (LMW-5/LMW-55) was collected from the Liberty site in Round 4. Precision for the field duplicate was good, with relative percent difference (RPD) ranging from 0.7 to 22 percent, with a median of less than 6 percent, for the 12 detected metals.

One laboratory duplicate was analyzed on a Liberty site sample; precision (RPDs) were within QC limits for all metals. One laboratory spike was analyzed on a Liberty site sample; recovery was acceptable for all metals except iron. The spike recovery was slightly low (73 percent; acceptable limits 75 to 125 percent); this is not considered to significantly affect data quality, especially since the sample concentration was three times higher than the spike added.

5.0 SUMMARY AND RECOMMENDATIONS FOR FUTURE SITE REMEDIATION ACTIVITIES

5.1 Summary of Groundwater Sampling Data

Based on a review of the data from the four sampling events, concentrations of antimony, cadmium, chromium, copper, iron, lead, manganese, sodium, selenium and thallium were detected at concentrations above their Class GA criteria.

Iron, manganese and sodium are naturally occurring metals in groundwater on Long Island. The exceedances of these metals found in MW-12, MW-14, MW-18, MW-20, and MW-21 most likely represent background conditions and are not related to previous site activities. The sodium concentration from Round 3 at MW-14 (561,000 µg/L) appears to be anomalously high, as the other three sodium values ranged from 25,400 µg/L to 31,900 µg/L. The sodium concentrations in other wells sampled during the four sampling events ranged from 4,460 µg/L to 39,600 µg/L with the second highest sodium concentration noted at MW-20 during Round 4 (39,600 µg/L).

Antimony was detected in all eight wells at least once during the four sampling events at concentrations ranging from 1.5 µg/L to 13.9 µg/L (Class GA criterion of 3 µg/L). However, the exceedances have been sporadic and inconsistent between sampling rounds. The criterion was never exceeded more than twice in any of the eight monitoring wells. Monitoring wells in which the criterion was exceeded twice include MW-6, MW-12, MW-18 and MW-20. Antimony does not appear to be a concern at the Site.

Cadmium was detected in the majority of the samples collected during the four sampling events (26 out of 32 samples). However, there were only three exceedances in Round 2, two exceedances in Round 3, and two exceedances in Round 4. There does not appear to be any trends in cadmium concentrations with the exception of MW-12, which had exceedances in three of four rounds.

Chromium has been detected in the majority of samples (30 of 32 samples). However there were only five exceedances (Class GA criterion of 50 µg/L) during the four sampling rounds, four of which were in MW-14 with concentrations ranging from 68.6 µg/L to 248 µg/L. An anomalously high concentration (251 µg/L during Round 4) was noted at MW-12 which is adjacent to MW-14 but is screened approximately 50 ft higher in the aquifer; the other three chromium values ranged from 2.5 µg/L to 8.9 µg/L. MW-21 is located downgradient of MW-14 and is screened at a similar depth; however, chromium concentrations have been significantly below the criterion during all four sampling events. Chromium exceedances appear to be an isolated occurrence at MW-14.

Copper was detected in the majority of samples collected during the four sampling events (23 of 32 samples). However, only one sample at MW-12 during Round 4 exceeded the 200 µg/L criterion at a concentration of 377 µg/L. Copper does not appear to be a contaminant of concern at the site.

Lead was detected in 21 of 32 samples collected at the Site during the four sampling events. However, there have only been five exceedances of the 25 µg/L criterion. Three of which have occurred at MW-12 with concentrations: 106 µg/L during Round 2, 83.7 µg/L during Round 3, and 553 µg/L in Round 4. Lead concentrations also exceeded the criterion at MW-14 during the previous two sampling events (221 µg/L and 76.5 µg/L).

Selenium was detected in seven of 32 samples collected at the Site during the four sampling events. MW-12 was the only monitoring well where selenium was detected twice (Rounds 1 and 4) and the only monitoring well where the concentration, 13.4 µg/L, exceeded the 10 µg/L criterion. As this appears to be an isolated occurrence, selenium is not considered to be a contaminant of concern at the Site.

Thallium was only detected twice during the four sampling events. Both occurrences were above the criterion. There does not appear to be any trend in thallium concentrations at the Site.

5.2 Recommendations for Future Work

Exceedances of antimony are inconsistent among sampling events as noted in Section 4.1. No well has exceeded the Class GA criterion during all four sampling events. Due to the inconsistencies in concentrations between events, it does not appear that antimony is a concern at the Site. AECOM recommends continued sampling to verify the concentrations.

Cadmium was detected above the Class GA criterion of 5 µg/L in three monitoring wells during the August 2007 sampling event, two wells during the November 2008 sampling event, and three wells during the March 2010 event. Only one well, MW-12, has had three exceedances during the four sampling events. AECOM recommends continued sampling to verify the concentrations.

Chromium exceeded the Class GA criterion of 50 µg/L in one monitoring well, MW-14, during all four sampling events (68.6 µg/L to 248 µg/L). Chromium concentrations in the adjacent monitoring well MW-12 (screened approximately 50 ft higher in the aquifer) were below the Class GA criterion during the first three sampling events but was anomalously high during Round 4 (251 µg/L). As the chromium concentrations appear to be an isolated occurrence at MW-14, AECOM recommends continued sampling to determine if the contamination is migrating downgradient (MW-21) or to the deeper portions of the aquifer (MW-20).

Lead exceeded the Class GA criterion of 25 µg/L during the August 2007, November 2008, and March 2010 sampling events at monitoring well MW-12; however, the concentration from the June 2006 sampling event was significantly below the criterion. As this appears to be an isolated occurrence, AECOM recommends continued sampling to verify the concentrations.

Thallium was detected in two monitoring wells, MW-14 and MW-19 above the Class GA criterion of 0.5 µg/L during the August 2007 sampling event only. Thallium has not been detected in any sample in the two most recent sampling events (November 2008 and March 2010). AECOM recommends continued sampling to verify the concentrations.

AECOM recommends the collection of both filtered and unfiltered samples during the next sampling event. Filtered metals analysis will us to determine if the presence of antimony, cadmium, chromium, lead, selenium and thallium is in the dissolved phase or is a result of suspended sediment in the samples.

The next scheduled sampling event at the Liberty Site is May 2011.

APPENDIX B

NYSDEC MONITORING WELL FIELD INSPECTION LOGS

SITE NAME: **Liberty Industrial Finishing**

SITE ID.: 1-52-108
INSPECTOR: CF/SB

MONITORING WELL FIELD INSPECTION LOG

DATE/TIME: 03/08/2010 1130
WEll ID.: LMW-5

	YES	NO
WELL VISIBLE? (If not, provide directions below)	X	

WELL COORDINATES? NYTM X 2,206,350.98 NYTM Y 202,308.86 See Report
PDOP Reading from Trimble pathfinder: Satelites:
GPS Method (circle) Trimble And/Or Magellan

	YES	NO
WELL I.D. VISIBLE?		X
WELL LOCATION MATCH SITE MAP? (if not, sketch actual location on back)		X

WELL I.D. AS IT APPEARS ON PROTECTIVE CASING OR WELL:

	YES	NO
SURFACE SEAL PRESENT?	X	
SURFACE SEAL COMPETENT? (If cracked, heaved etc., describe below)	X	
PROTECTIVE CASING IN GOOD CONDITION? (If damaged, describe below)		X

Cap does not close properly. Lid is not flush with casing.

HEADSPACE READING (ppm) AND INSTRUMENT USED	0.0 PID
TYPE OF PROTECTIVE CASING AND HEIGHT OF STICKUP IN FEET (If applicable)	2 FT
PROTECTIVE CASING MATERIAL TYPE:	SS
MEASURE PROTECTIVE CASING INSIDE DIAMETER (Inches):	8

	YES	NO
LOCK PRESENT?		X
LOCK FUNCTIONAL?		X
DID YOU REPLACE THE LOCK?		X
IS THERE EVIDENCE THAT THE WELL IS DOUBLE CASED? (If yes,describe below)		X
WELL MEASURING POINT VISIBLE?	X	

MEASURE WELL DEPTH FROM MEASURING POINT (Feet):	50
MEASURE DEPTH TO WATER FROM MEASURING POINT (Feet):	43.34
MEASURE WELL DIAMETER (Inches):	4
WELL CASING MATERIAL:	PVC
PHYSICAL CONDITION OF VISIBLE WELL CASING:	GOOD
ATTACH ID MARKER (if well ID is confirmed) and IDENTIFY MARKER TYPE	-
PROXIMITY TO UNDERGROUND OR OVERHEAD UTILITIES	-

DESCRIBE ACCESS TO WELL: (Include accessibility to truck mounted rig, natural obstructions, overhead power lines, proximity to permanent structures, etc.); ADD SKETCH OF LOCATION ON BACK, IF NECESSARY.

Overgrown vegetation, accessible by truck mounted rig.

DESCRIBE WELL SETTING (For example, located in a field, in a playground, on pavement, in a garden, etc.) AND ASSESS THE TYPE OF RESTORATION REQUIRED.

located in a field surrounded by overgrown vegetation

IDENTIFY ANY NEARBY POTENTIAL SOURCES OF CONTAMINATION, IF PRESENT (e.g. Gas station, salt pile, etc.):

Capped Area on-site. Gas station to the east of the Site.

REMARKS:

Needs lock, protective casing lid needs to be fixed, should get a new well cap

I attest that the information contained within the report has been reviewed for accuracy and checked against the quaility control requirements for each method. The results relate only to the samples(s) as recevied.

All applicable NELAC or USEPA CLP requirments have been meet.

Mitkem Laboratories is accredited under the National Environmental Laboratory Approval Program (NELAP) and is certified by several States, as well as USEPA and US Department of Defense. The current list of our laboratory approvals and certifications is available on the Certifications page our web site at www.mitkem.com.

Please contact the Laboratory or Technical Director at 401-732-3400 with any questions regarding the data contained in the laboratory report.

Analytical Data Package for AECOM Technical Services, Inc.

Client Project: Multi Site G Liberty – Dzus

SDG# SJ0429

Mitkem Work Order ID: J0429

April 13, 2010

Prepared For:

AECOM Technical Services, Inc.
300 Broadacres Drive
Bloomfield, NJ 07003
Attn: Mr. Paul Kareth

Prepared By:

Mitkem Laboratories
175 Metro Center Boulevard
Warwick, RI 02886
(401) 732-3400

SDG Narrative

Mitkem Laboratories submits the enclosed data package in response to AECOM Technical Services, Inc.'s Multi Site G Liberty – Dzus project. Under this deliverable, analysis results are presented for twenty-two aqueous samples that were received on March 12, 2010. Analyses were performed per specifications in the project's contract and chain of custody forms. Following the narrative is the Mitkem Work Order for cross-referencing sample client ID with laboratory sample ID.

The analyses were performed according to NYSDEC ASP protocols (2000update) and reported per NYSDEC ASP requirement for Category B deliverable.

The following observation and/or deviations are observed for the following analyses:

1. Overall Observation:

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Photocopies of logbook pages are included, with the originals maintained on file at the laboratory. The originals of initial calibrations that are shared among several cases are maintained on file at the laboratory, with photocopies included in the data package.

2. Metals Analysis:

Lab control sample: spike recoveries were within the QC limits.

Matrix spike: matrix spike was performed on samples DMW-18-20100309 and LMW-14-20100309. Spike recoveries were within the QC limits with the exception of manganese for sample DMW-18-20100309 and iron for sample LMW-14-20100309. Iron is flagged with an "N" on data report forms. A post digest spike was performed and reported for iron. The spike recovery for manganese in sample DMW-18-20100309 could not be accurately determined, as the sample concentration was significantly greater than the spike concentration. When the sample concentration is more than four times the spike concentration, it tends to obscure the relatively smaller spike amount; control limits do not apply in this circumstance.

Duplicate: matrix spike was performed on samples DMW-18-20100309 and LMW-14-20100309. Replicate RPDs were within the QC limits with the exception of manganese

for sample DMW-18-20100309. Manganese is flagged with an "*" on the data report forms.

Sample analysis: samples DMW-18-20100309 and LMW-14-20100309. Percent differences were within the QC limits with the exception of nickel and potassium for sample DMW-18-20100309 and aluminum for sample LMW-14-20100309. These elements are qualified with an "E" on the data report forms. No other unusual observation was made for the analysis.

All pages in this report have been numbered consecutively, starting with the title page and ending with a page saying only "Last Page of Data Report".

I certify that this data package is in compliance, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the laboratory manager or his designee, as verified by the following signature.
