PROJECT: Rowe Industries Superfund Site
Ground-Water Recovery and Treatment System
July 2003 Status Report
Sag Harbor, New York

LBG Engineering Services, P.C. (LBG) commenced operation of the ground-water remediation system at the above-referenced site on December 17, 2002. This status report presents a summary of the operation, maintenance and monitoring activities for the site from July 1, 2003 through July 31, 2003. The report includes a summary of system operational parameters, tasks completed during the reporting period, anticipated tasks for the following month, analytical results for ground-water and system effluent samples, air quality results, and a summary of stream/estuary, wetland, and ground-water monitoring data.

SUMMARY OF SYSTEM OPERATION

(July 1, 2003 through July 31, 2003)

Reporting Period: 31 days

Total Flow During Period: 15,297,600 gallons

Average Effluent Flow: 374 gallons per minute (gpm) while operating

Mass of VOCs Recovered: 7.2 pounds

Cumulative VOCs Recovered: 68.0 pounds

Hours of Operation: 558 hours during reporting period (75 percent)
(based on number of hours registering flow from RW-1)

Alarm Conditions: See Table 1 : Maintenance Log

Discharge Criteria: Effluent water and air quality criteria met

SCHEDULE

Completed Tasks

During the July 2003 reporting period, LBG completed the following tasks:

- monitored system operations by completing routine inspections;
- completed ground-water recovery and treatment system troubleshooting and maintenance;
- collected ground-water samples from recovery wells (7/23/03);
- completed air sampling events for carbon units;
- replaced transducer in RW-9 on 7/30/03;
- cleaned RW-8 and RW-9 flowmeters;
- prepared monthly project status report;
- completed project management administrative duties; and
- ran computer model with modified well flow to determine capture zone.

Upcoming Tasks

During the next reporting period, LBG anticipates completing the following tasks:

- monitor system operations by completing routine inspections;
- complete ground-water recovery and treatment system maintenance;
- collect ground-water samples from recovery wells;
- measure fluid levels and evaluate drawdown in aquifer;
- conduct monitoring of streams, estuary, wetlands, and ground water;
- complete air sampling events for carbon units;
- calculate contaminant recovery totals for the system;
- prepare monthly project status report;
- complete project management administrative duties;
- troubleshoot water level transducers in RW-6 and RW-7;
- troubleshoot air stripper blower air flowmeter; and
- clean flowmeters and piping in recovery well vaults.

GROUND-WATER RECOVERY SYSTEM STATUS SUMMARY

The following table summarizes select recovery well parameters for the reporting period. Additional well operation information is included on the weekly operation reports, which are attached as Appendix I. A graph depicting the individual well flowrates over time is attached as Graph 1. RW-4 flow is not accurate due to a sensor power source malfunction, but is estimated in the table. Graph 2 shows individual well pressures over time. Recovery well RW-6 average flow is reduced due to an increase in backpressure in the combined recovered water pipeline. The average flow for other wells is less than associated design values because flow adjustments were made in order to extend bag filter life. A computer model was run with lower well flows to evaluate the long term effect of the lower flows on remediation of the aquifer, including capture zones and remediation time. A discussion is presented later in this report.

Based on analytical results for samples collected from the influent to the air stripper and water flow totalizer readings, approximately 7.2 pounds of volatile organic compounds (VOCs) were recovered by the system in July. The cumulative recovery of VOCs by the system since the start of operation is 68.0 pounds. The VOC recovery calculation for July is attached as Appendix II and is based on four sampling events. A graph of the VOC recovery over the period of remediation is also included in Appendix II. Laboratory analytical reports are attached as Appendix III.

GROUND-WATER TREATMENT SYSTEM STATUS SUMMARY

System Operation

The two major components of the ground-water treatment system are the three multi-unit bag filter units and the packed-tower air stripper.

The filter units, with eight filter bags per unit, are located downstream of the equalization tank and upstream from the air stripper. The multi-bag filter units operate in parallel. The average flow from the equalization tank transfer pumps into the bag unit system was 381 gpm during the reporting period. The inlet, outlet and differential pressures for each filter unit are recorded on an hourly basis. Graph 3 illustrates the differential pressure readings over time across each of the three units. As indicated on this graph and as shown in the operations log, filter bag changeouts were conducted about three times a week. Alternate bag filter operating scenarios have been tried during the past reporting period to increase the lifespan of the filter bags and minimize system maintenance requirements. The scenario that is most effective at increasing the life-span of the bag filters is to remove the filter bag from the last housing in each bank of filters, so filter bags are in the first seven housings in each bank of the filters. This approach reduced required change-outs of the filter bags from daily to approximately three times a week.

The average airflow rate through the air stripper during the reporting period was 3,371 scfm (standard cubic feet per minute) according to the booster blower airflow meter. Previous

measurements of airflow through the tower have been collected at the air stripper blower airflow meter. It has been determined that this airflow meter has been reading the airflow incorrectly since startup due to a meter calibration error. The meter was measuring air flow at approximately 1,000 cfm less than actual air flow through the tower. The correct airflow measurement have been recorded by the airflow meter located after the booster blower. The airflow measurements have been verified using a TSI Velocicalc airflow meter. Previous reports detailing carbon loading rate are unaffected by this because all carbon loading and remediation system performance calculations have been utilizing these booster blower airflow since system start-up. Troubleshooting of the air stripper blower airflow meter is planned for September 2003. A graph of the air stripper blower air flow rate, air stripper blower pressure and booster blower airflow over time is attached as Graph 4. The acid backwash system was not utilized during the reporting period. The water discharge from the air stripper was sampled weekly. As shown on the attached Table 2, the treated ground water met the water-quality requirements set forth in the SPDES criteria. Graph 5 illustrates that the daily system effluent flowrate in gallons per day (gpd) was below the SPDES limit of 1,023,000 gpd.

AIR TREATMENT AND EMISSIONS MONITORING

Air sampling was conducted during the reporting period to ensure that VOC emissions do not exceed limits and to monitor the granular activated carbon units for breakthrough. The air stripper off-gas is treated by two carbon units, which are currently being operated in series. During system start-up, photoionization detector (PID) readings and air samples for laboratory analysis were collected from the effluent from the stripper, carbon unit 1 and carbon unit 2 on a weekly basis. Table 3 summarizes the air quality results for the initial system testing phase and all sampling done during the system operation. As shown in the table, the PCE laden air from the air stripper was effectively treated by the carbon units; therefore, no carbon changeout activities were conducted during the reporting period. According to the calculation in Appendix IV, the air emission rate from the carbon units (based on the July 11th analytical data) was 0.00163 pounds per hour. Trichloroethene was not detected and chloroform was below limits in the effluent vapor stream from the carbon unit system; therefore, the allowable concentrations of these compounds corresponding to the Ambient Guideline Concentration (AgC) at the property line were not exceeded.

GROUND-WATER SAMPLING

Ground-water samples were collected from the nine recovery wells on July 23, 2003. The samples were collected to estimate VOC mass recovery rates from each well. Table 4 summarizes the VOC analytical data for all ground-water samples collected during the operation of the system. The highest tetrachloroethene concentration for the most recent sampling round was 200 micrograms per liter in RW-4. Ground-water quality trends will be analyzed throughout the duration of the remedial action to evaluate the effectiveness of the pump and treat system in reducing the VOC concentration ion the aquifer. A comprehensive evaluation of ground-water quality (and ground-water levels) will be presented in the 2003 Annual Report.

STREAM/ESTUARY SALINITY MONITORING

Salinity and temperature levels were not measured during this reporting period.

WATER-LEVEL MONITORING

Monitor well static water-levels were measured on June 30, 2003 and are summarized in Table 5. Drawdown data for the nine recovery wells are approximated using data log files collected by the computer. The recovery well drawdowns presented in Table 5 are an average of the calculated drawdowns while the system was operating. Negative or very low drawdown is believed to be the result of the collection of drawdown measurements during high tide conditions. Also presented in Table 5 are the simulated drawdowns according to the numerical ground-water flow model. Based on the comparison of the calculated drawdowns in the recovery wells and the modeled drawdowns, the ground-water recovery system is capturing the plume.

Graphs 6 through 14 show calculated drawdown for each of the nine recovery wells for the month of July. The calculated drawdowns in the recovery wells have remained stable throughout the period of operation. The decreasing trend and negative numbers observed in the graphs are a result of seasonal fluctuation of the water table. The static ground-water elevations, which are used to calculate the drawdown, are only updated periodically resulting in the negative drawdown values when the system is not recovering ground water.

Graph 15 presents the PCE concentrations detected in recovery wells since system start-up.

COMPUTER MODEL

LBG utilized the existing three-dimensional ground-water flow model (developed to simulate the ground-water flow system in the project area) to aid in the evaluation of the ground-water recovery system at the Row Industries Superfund Site. The model was developed using the "Modular Three-Dimensional Finite-Difference Ground-Water Flow Model" (MODFLOW), by McDonald and Harbaugh (1988). MODFLOW was utilized for this analysis because the model allows the incorporation of leakage to and from surface water bodies. In addition, MODFLOW is a well documented and widely accepted ground-water flow model.

The model was calibrated using data from 1996 aquifer tests of Recovery Wells No. 6 and No. 2. Details of model development and calibration are presented in "Rowe Industries superfund site Sag Harbor, New York, Ground-Water Remediation Design 95% Design Submittal, Volume 1 of V" (LBG, 1998). The modeling analysis was completed to verify that capture and containment of the VOC plume (on and adjacent to the site) is achieved at the withdrawal rates currently obtained from the recovery wells.

Analysis

As a part of the analysis, a steady-state average conditions simulation was run in which recovery wells RW-1 through RW-9 were operated at a combined pumping rate of 326 gpm. The simulated pumping rate for each of the recovery wells is listed below for the steady-state condition were set equal to their average withdrawal rate from January through July 2003.

RW-1 (gpm)	RW-2 (gpm)	RW-3 (gpm)	RW-4 (gpm)	RW-5 (gpm)	RW-6 (gpm)	RW-7 (gpm)	RW-8 (gpm)	RW-9 (gpm)	Total (gpm)
26	26	23	13	42	28	54	46	68	326

The simulation utilized the same recharge, stream and river data developed during the steady-state model calibration (LBG, 1998). These data reflect the June 10, 1996 surface-water stage and recharge data. This period was selected for the analysis because the magnitude and orientation of the water table were consistent with the conditions typically seen in the aquifer.

The water from the nine (9) recovery wells was simulated to be discharged to two recharge basins located east of the property. As with the recovery wells, the recharge basins were simulated using the well package in MODFLOW. The total recharge rate for the basins was simulated at 326 gpm, a value equal to the combined pumping rate of the recovery wells. This rate was evenly distributed over each node defined within the simulated recharge ponds and added as recharge wells to the MODFLOW well file.

To verify that the plume is contained and captured, simulated heads and fluxes from the model were analyzed using MODPATH. MODPATH is a post-processor that uses the simulated heads and fluxes from MODFLOW to establish horizontal and vertical path lines.

The result from this analysis verifies that the VOC plume can be captured at the withdrawal rates that have been observed in the field. Figure 1 shows a plan view of the ground-water flow paths in the aquifer; the path lines from each model layer are superimposed. Therefore, the figure shows the combined capture zones of the nine (9) existing recovery wells at combined average withdrawal rate of 326 gpm.

CALCULATION OF VOC RECOVERY BY THE GROUND-WATER RECOVERY SYSTEM

Calculated by: Paul Jobmann

Checked by: Alfred N. Kovalik

STATEMENT OF PROBLEM:

Calculate the quantity of VOCs recovered from the ground-water recovery system. VOC concentrations are from samples collected from system influent. Concentrations reported as below the method detection limit are shown as 0.

PROBLEM CONSTRAINTS:

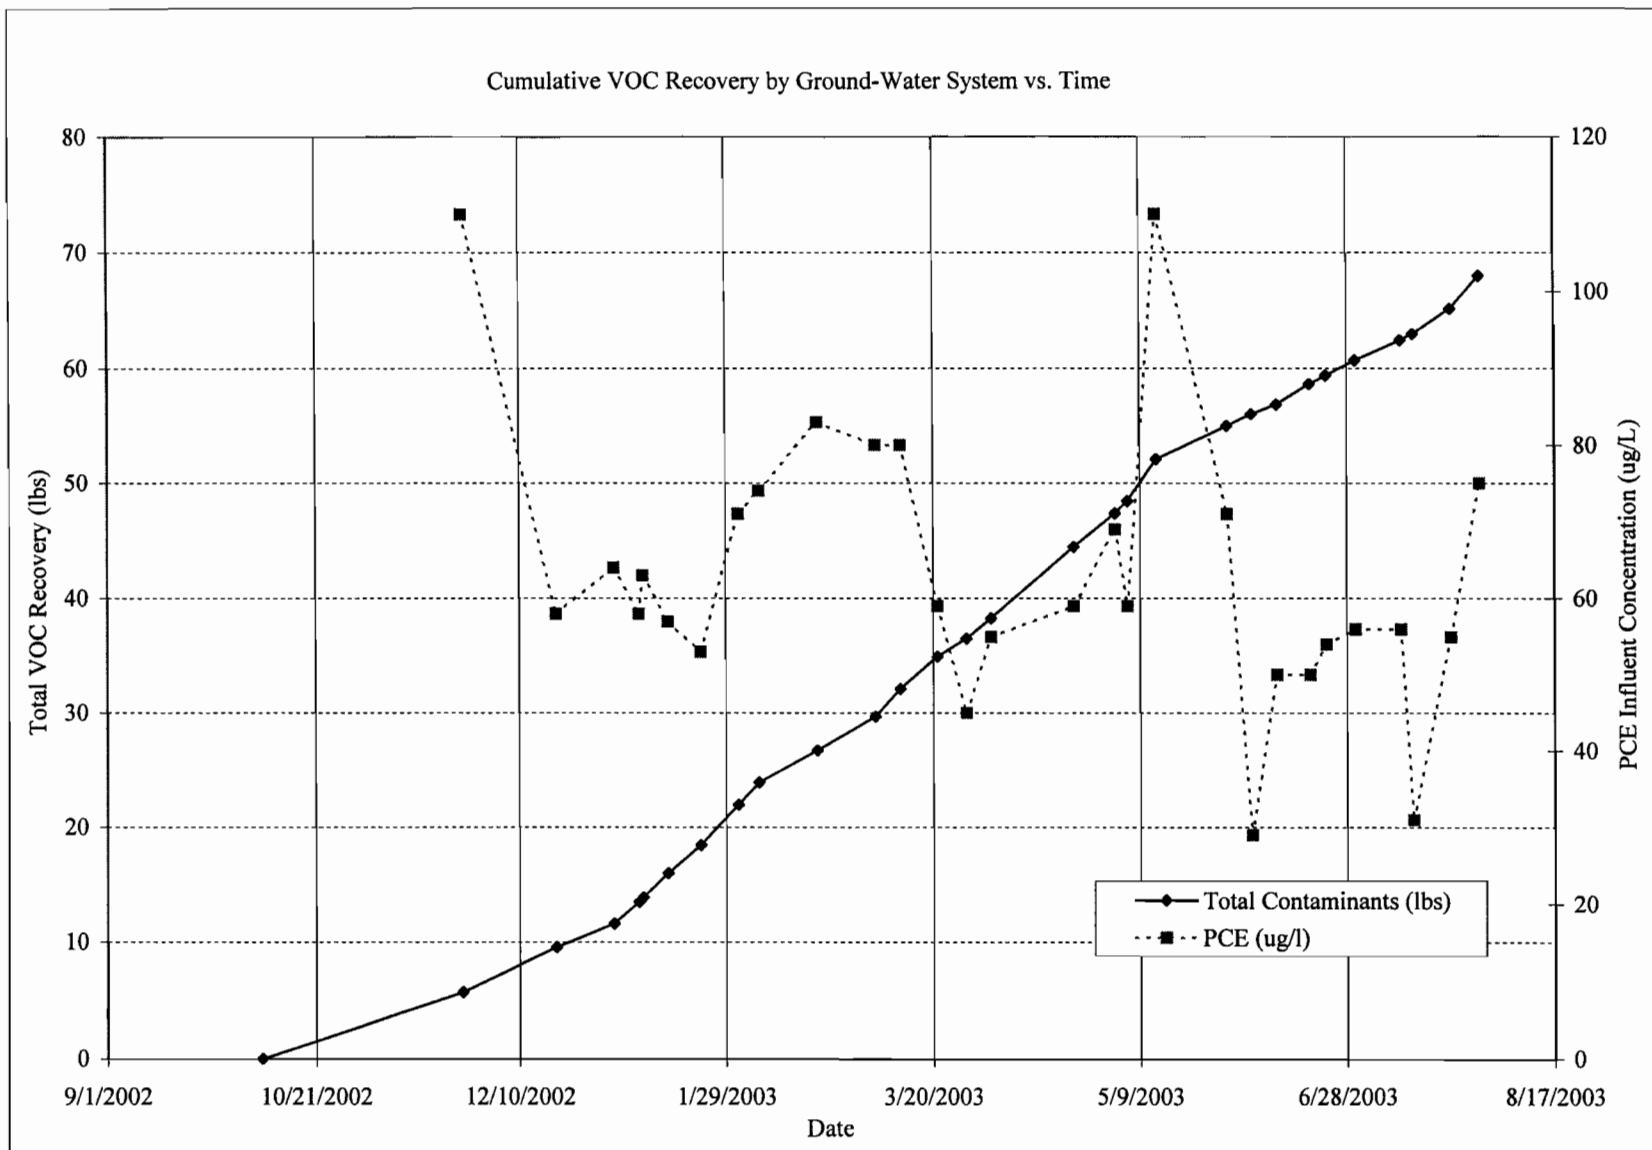

Date	PCE (ug/l)	TCE (ug/l)	TCA (ug/l)	cis-1,2-dichloroethene (ug/l)	Isopropyl benzene (ug/l)	Chloroform (ug/l)	Toluene (ug/l)

7/23/2003	55	0.7	2.2	0	0	0	0
7/30/2003	75	2.6	2.3	0	0	0	0

CALCULATION:

$$\text{Recovery (lbs)} = \text{Concentration (ug/l)} \times \text{Volume Pumped (gal)} \times 1 \text{ lb}/453,590,000 \text{ ug} \times 3.785 \text{ l/gal}$$

Date	Volume Pumped (gal)	PCE (lbs)	TCE (lbs)	TCA (lbs)	cis-1,2-dichloroethene (lbs)	Isopropyl benzene (lbs)	Chloroform (lbs)	Toluene (lbs)	Total Contaminants (lbs)	Cumulative VOC's (lbs)

DATA REPORTING QUALIFERS

For reporting results, the following "Results Qualifiers" are used:

Value	If the result is greater than or equal to the detection limit, report the value
U	Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.
J	Indicates an estimated value. The flag is used: (1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.) (2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3ug/L was calculated report as 3J. This flag is used when similar situations arise on any organic parameter i.e. Pesticide, PCBs and others.
B	Indicates the analyte was found in the blank as well as the sample report "10B".
E	Indicates the analytes concentration exceeds the calibrated range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at a secondary dilution factor.
P	This flag is used for Pesticide / PCB target analyte when there is >25% difference for detected concentrations between the two GC Columns. The higher of the two values is reported on Form I and flagged with a "P".
N	This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used.

REPORT COMMENTS

- 1) All pages of this report are integral parts of the analytical data. Therefore, this report should be reproduced only in its entirety.
- 2) Soil, sediment and sludge sample results are reported on a "dry weight" basis except when analyzed for landfill disposal or incineration parameters. All other solid matrix samples are reported on an "as received" basis unless noted differently.
- 3) Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.
- 4) The test results for the noted analytical method(s) meet the requirements of NELAC. Lab Cert. ID# 10604
- 5) According to 40CFR Part 136.3, pH, Chlorine Residual and Dissolved Oxygen analyses are to be performed immediately after aqueous sample collection. When these parameters are not indicated as field (e.g. pH Field) they were not analyzed immediately, but as soon as possible on laboratory receipt.

Glossary of flags, qualifiers and abbreviation

Inorganic Qualifiers (Q-Column)

- U Analyte was not detected at or above the reporting limit.
- < Not detected at or above the reporting limit.
- J Result is less than the RL, but greater than or equal to the method detection limit.
- B Result is less than the CRDL/RL, but greater than or equal to the IDL/MDL.
- S Result was determined by the Method of Standard Additions.

Inorganic Flags (Flag Column)

- ICV,CCV,ICB,CCB,ISA,ISB,CRI,CRA,MRL: Instrument related QC exceed the upper or lower control limits.
- * LCS, LCD, MD: Batch QC exceeds the upper or lower control limits.
- + MSA correlation coefficient is less than 0.995.
- 4 MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
- E SD: Serial dilution exceeds the control limits.
- H MB, EB: Batch QC is greater than reporting limit or had a negative instrument reading lower than the absolute value of the reporting limit.
- N MS, MSD: Spike recovery exceeds the upper or lower control limits.
- W PS: Post-digestion spike was outside 85-115% control limits.

Organic Qualifiers (Q - Column)

- U Analyte was not detected at or above the reporting limit.
- ND Compound not detected.
- J Result is an estimated value below the reporting limit or a tentatively identified compound (TIC).
- Q Result was qualitatively confirmed, but not quantified.
- C Pesticide identification was confirmed by GC/MS.
- Y The chromatographic response resembles a typical fuel pattern.
- Z The chromatographic response does not resemble a typical fuel pattern.
- E Result exceeded calibration range, secondary dilution required.

Organic Flags (Flags Column)

- MB,EB, MLE: Batch QC is greater than reporting limit.
- * LCS, LCD, CCV, MS, MSD, Surrogate, RS:Batch QC exceeds the upper or lower control limits.
- A Concentration exceeds the instrument calibration range or below the reporting limit.
- B Compound was found in the blank and sample.
- D Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution will be flagged with a D.
- H Alternate peak selection upon analytical review
- I Indicates the presence of an interference, recovery is not calculated.
- M Manually integrated compound.
- P The lower of the two values is reported when the % difference between the results of two GC columns is greater than 25%.

STATEMENT OF PROBLEM:

Calculate the quantity of VOCs discharged from the vapor-phase carbon units based on vapor concentrations and flow rates.

PROBLEM CONSTRAINTS:

Emission Limits: Total VOCs = 0.022 lb/hr

(Acceptable stack discharge concentrations for meeting AgC concentrations at property boundary are included in table below. Allowable concentrations calculated in Appendix IV of the December report.)

CONCLUSIONS:

Emissions from the carbon units were below the VOC emission limit of 0.022 lbs/hr.
 Concentrations of PCE,TCE and chloroform at the stack were also below the allowable emission rates of those compounds corresponding to the AgC at the property line.
