PROJECT STATUS MEMORANDUM

NO. 08-01

TO: Pamela Tames, USEPA

FROM: Mark M. Goldberg, P.E.

DATE: April 22, 2008

PROJECT: Ground Water Remedial Action
Focused Pump & Treat System
Former Rowe Industries Superfund Site
Sag Harbor, New York
First Quarter (January 17 through March 31, 2008) Status Report

LBG Engineering Services, P.C. (LBG) discontinued operation of the Focused Pump and Treat (FP&T) system on April 3, 2007 because water quality data from the recovery wells in the Former Drum Storage Area (FDSA) indicated that degradation of tetrachloroethylene (PCE) was occurring, as discussed in the First Quarter 2007 Status Report for the FP&T system. Since that time, monitoring data appear to indicate that degradation of COCs increases when the FP&T system is not operating. LBG has been monitoring the water quality at the four FP&T recovery wells (FRW-1, 2, 3 and 4) on a monthly basis while the system has been inactive to determine if the trend in degradation of PCE to daughter products (i.e. 1,2 cis-dichloroethylene (12DCE) and vinyl chloride (VC)) is continuing in the FDSA. The locations of the FP&T recovery wells are shown on Figure 1.

Tables 1, 2, 3 and 4 and Graphs 1, 2, 3 and 4 present the water quality data for FRW-1, 2, 3 and 4, respectively, since the beginning of 2007. The water quality data for the latest quarter indicate that some degradation of PCE is continuing because 12DCE and VC are present in the water samples collected from FRW-1, 2 and 3. The concentration of PCE and daughter products in the ground water varies with each sample round; however, the concentrations of daughter products at wells FRW-1, 2, and 3 continue to be higher when the FP&T system is not operating compared to when the system was running.

The concentration of PCE in the ground water at FRW-1 is variable. The PCE concentrations at FRW-2 during the 1st quarter of 2008 are fairly consistent with PCE concentrations detected in 2007. The PCE concentration at FRW-3 increased this quarter, but it is not above the historical high concentrations. The concentrations of the COCs from the ground water at FRW-4 continue to be low compared to the other three recovery wells.

Table 5 presents ground-water quality field measurements that were collected with a calibrated U-22 Horiba water quality meter (Horiba) on February 5, 2008 and March 10, 2008 for pH, dissolved oxygen (DO), oxidation-reduction potential (ORP), temperature, conductivity and turbidity. The first four parameters (pH, DO, ORP and temperature) are the most important

factors that are measured to determine if the aquifer conditions are favorable for degradation of the COCs. ORP was in the preferred range for degradation in all wells except FRW-1. pH was in the preferred range for degradation of COCs in all wells. Colder ground-water temperatures in the winter will slow down microbial activity and, therefore, will slow down COC degradation.

Table 6 presents DO and temperature measurements collected from different wells in the FDSA. DO and temperature were measured with two different calibrated meters (Horiba U-22 and YSI 560) in March to determine the accuracy of these measurements. The factors under evaluation were the following:

1. Recording measurements at the wells compared to the sample ports in the FP&T trailer; and,
2. Recording measurements from two different meters (to check the accuracy of the Horiba U-22, which is the meter that is normally used for field measurements).

The data in Table 6 suggest that DO and temperature measurements collected for the two meters were similar from the three monitor wells (MW98-01A, 05A, 05B) located in the FDSA (refer to Figure 1 for monitor well locations). Therefore, the data obtained using the Horiba U-22 is judged to be accurate.

However, the DO measurements increase and temperature measurements decrease when samples are collected from the sample ports in the FP&T trailer compared to readings directly from the wells. Furthermore, the low DO concentrations measured at the wells suggest that the conditions in the aquifer may be more anaerobic than previously indicated, which is favorable for degradation of COCs. The increase in DO observed at the trailer is most likely caused by aeration of the water during pumping and the decrease in temperature observed from the well to the trailer (i.e. the solubility of oxygen in water increases with decreasing temperature). This evaluation suggests that DO and temperature measurements collected at the trailer are not representative of DO and temperature measurements in the FDSA ground water and the conditions in the FDSA are more conducive to degradation of the COCs than previously expected. Therefore, while monthly DO readings (along with the other field readings) will continue to be collected and recorded from the sample ports using the Horiba U-22 meter, a more representative measure of DO and temperature in the ground water of the FDSA will be completed during semi-annual sampling events when access to wells is available (i.e. conditions of the access agreement).

Based on the water quality data collected in the first quarter of 2008, there is sufficient evidence to indicate that degradation of the COCs is continuing. Therefore, LBG recommends leaving the FP&T system inactive for the second quarter of 2008 and continuing to monitor the water quality trends at the four wells.

RE: Rowe

Order No.: 0802099

Dear Mark Goldberg:

American Analytical Laboratories, LLC. received 4 sample(s) on 2/7/2008 for the analyses presented in the following report.

Samples were analyzed in accordance with the test procedures documented on the chain of custody and detailed throughout the text of this report.

The limits provided in the data package are analytical reporting limits and not Federal or Local mandated values to which the sample results should be compared.

There were no problems with the analyses and all data for associated QC met laboratory specifications. If there are any exceptions a Case Narrative is provided in the report.

If you have any questions regarding these tests results, please do not hesitate to call (631) 454-6100 or email me directly at lbeyer@american-analytical.com.

Sincerely,

Lori Beyer
Lab Director

American Analytical Laboratories, LLC.

Date: 12-Feb-08

CLIENT: Leggette Brashears & Graham Inc.

CHAIN OF CUSTODY / REQUEST FOR ANALYSIS DOCUMENT

AMERICAN ANALYTICAL LABORATORIES, LLC
56 TOLEDO STREET
FARMINGDALE, NEW YORK 11735
TELEPHONE: (631) 454-6100 FAX: (631) 454-8027

DATA REPORTING QUALIFIERS

For reporting results, the following "Results Qualifiers" are used:

Value	If the result is greater than or equal to the detection limit, report the value.
U	Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.
J	Indicates an estimated value. The flag is used: (1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.) (2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3ug/L was calculated report as 3J. This flag is used when similar situations arise on any organic parameter i.e. Pesticide, PCBs and others.
B	Indicates the analyte was found in the blank as well as the sample report "10B".
E	Indicates the analytes concentration exceeds the calibrated range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at a secondary dilution factor.
P	This flag is used for Pesticide / PCB target analyte when there is >25% difference for detected concentrations between the two GC Columns. The higher of the two values is reported on Form I and flagged with a "P".
N	This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used.
H	Indicates sample was received and/or analyzed outside of the method allowable holding time.

RE: Rowe

Order No.: 0803133

Dear Mark Goldberg:

American Analytical Laboratories, LLC. received 4 sample(s) on 3/12/2008 for the analyses presented in the following report.

Samples were analyzed in accordance with the test procedures documented on the chain of custody and detailed throughout the text of this report.

The limits provided in the data package are analytical reporting limits and not Federal or Local mandated values to which the sample results should be compared.

There were no problems with the analyses and all data for associated QC met laboratory specifications. If there are any exceptions a Case Narrative is provided in the report.

If you have any questions regarding these tests results, please do not hesitate to call (631) 454-6100 or email me directly at lbeyer@american-analytical.com.

Sincerely,

Lori Beyer
Lab Director

DATA REPORTING QUALIFIERS

For reporting results, the following "Results Qualifiers" are used:

Value	If the result is greater than or equal to the detection limit, report the value.
U	Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. "10U". This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.
J	Indicates an estimated value. The flag is used: (1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.) (2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3ug/L was calculated report as 3J. This flag is used when similar situations arise on any organic parameter i.e. Pesticide, PCBs and others.
B	Indicates the analyte was found in the blank as well as the sample report "10B".
E	Indicates the analytes concentration exceeds the calibrated range of the instrument for that specific analysis.
D	This flag identifies all compounds identified in an analysis at a secondary dilution factor.
P	This flag is used for Pesticide / PCB target analyte when there is >25% difference for detected concentrations between the two GC Columns. The higher of the two values is reported on Form I and flagged with a "P".
N	This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used.
H	Indicates sample was received and/or analyzed outside of the method allowable holding time.
