I. EXECUTIVE SUMMARY

Gibbs & Hill, Inc. (G&H) has entered into a consulting services agreement with the New York State Department of Environmental Conservation (NYSDEC) Division of Hazardous Waste Remediation to conduct preliminary investigations (Phase I) and field investigations (Phase II) at inactive hazardous waste disposal sites in New York State. This report presents the results of the Phase II investigation of the Hazardous Waste Disposal (HWD) site (NYSDEC Site ID No. 152113) performed by G&H. A Phase I investigation of this site was completed in July 1988 by Roux Associates, Inc.

The HWD site is located in the Town of Babylon, Suffolk County, New York. The site is owned by Little Joseph Realty, Farmingdale, New York. The property was rented by the realty company to George Lawrence, who operated his company, HWD, Inc., from 1979 to 1982. The site was used to store, treat, and dispose of hazardous waste during this period. A large number of drums containing liquid waste were stored at the site.

During the inspection conducted by the EPA in 1981, approximately 1,900, 55-gallon drums of spent solvents and a

2,500-gallon acid tank were observed at the site. The majority of the drums were leaking. During the site visit conducted by the Suffolk County Department of Health Services in 1982, approximately 840 55-gallon drums containing waste and 420 empty 55-gallon drums were observed at the site. Spills were noted in the storage area.

A Phase II investigation of the site was conducted to gather information to classify the site and to calculate the final Hazard Ranking System (HRS) scores. Field investigations included a site reconnaissance; geophysical survey with a magnetometer; installation of four groundwater monitoring wells; and the collection of five groundwater samples, three surface water/sediment sample pairs, and six soil samples.

The results of the groundwater analysis show evidence of migration of seven chlorinated hydrocarbon contaminants from the site. Results of soil samples show the presence of three of these compound on site.

The final scores for the site based on the results of this Phase II investigation have been calculated as follows:

S_M = 37.82
- S_{gw} = 65.38
- S_{sw} = 2.38
- S_a = 0.00

S_{FE} = Not applicable

S_{DC} = 25.00

The S_M score reflects the potential for harm due to migration of hazardous substances away from the facility. It is the composite of a score for groundwater (S_{gw}), surface water (S_{sw}), and air (S_a) transport routes. The S_{FE} score reflects the potential for harm from substances that can explode or cause fires, and the S_{DC} score reflects the potential for harm from direct contact with hazardous substances.

II. PURPOSE

The objective of a New York State Superfund Phase II investigation is to determine if contaminants are present at an inactive hazardous waste site with a resulting adverse impact on human population and/or the environment.

The goal of this investigation was to collect the information required to classify the site and to develop final HRS scores. This included collecting necessary field data to identify the occurrence and characteristics of contamination and to determine if a release of contaminants from the site has occurred. This information will be used by the NYSDEC to determine if any imminent and/or significant environmental or health hazards exist. These objectives were accomplished through the installation of groundwater monitoring wells and the sampling and analysis of groundwater, surface water, sediment, and soil in accordance with NYSDEC protocols and guidelines.

III. SCOPE OF WORK

A. INTRODUCTION

Gibbs & Hill, Inc. (G&H) entered into a consulting services agreement on October 16, 1986 with the New York State Department of Environmental Conservation (NYSDEC) Division of Hazardous Waste Remediation to conduct preliminary investigations (Phase I) and field investigations (Phase II) at inactive hazardous waste disposal sites in New York State. G&H and its subcontractors completed Phase I investigations of 30 sites and Phase II investigations of 25 sites under the provisions of this agreement.

The original agreement was amended March 20, 1990 to include an additional 20 sites to receive Phase II investigations. This report presents the results of the Phase II investigation of the Hazardous Waste Disposal (HWD) site (NYSDEC Site ID No. 152113) performed by G&H. A Phase I investigation of this site was completed in July 1988 by Roux Associates, Inc.

The Phase II field investigations at the HWD site began in May 1990 and were completed in December 1990. An updated work plan (Appendix A), approved by the NYSDEC, was prepared by G&H to define the scope of drilling and sampling activities at the site. The Phase II investigation consisted of a review of

relevant literature, field investigations, and the preparation of final HRS scores. Field activities included an initial site reconnaissance; a geophysical investigation; the installation of groundwater monitoring wells; groundwater, soil, surface water, and sediment sampling and analysis; and air quality monitoring. The scope of work of the investigation is summarized in Table III-1.

B. GEOPHYSICAL SURVEY

A geophysical survey was conducted at the site during site reconnaissance. A magnetometer was used at proposed monitoring well locations to detect ferromagnetic objects which might be encountered during drilling. Results of the magnetometer survey indicated that there were no buried ferromagnetic objects in the vicinity of the proposed monitoring wells. In order to verify that there are no non-ferromagnetic utility lines buried at the proposed monitoring well locations, the Underground Facilities Protection Organization (UFPO) was also notified about our drilling activities at the site. The UFPO responded that there were no buried lines in the vicinity of the drilling locations.

C. MONITORING WELL INSTALLATION

Four monitoring wells (MW-1 through MW-4) were installed to establish the groundwater quality, stratigraphy, and flow direction of the aquifer beneath the site. The locations of

these wells are shown in Figure I-2. Local flow direction places well MW-1 in the upgradient position; wells MW-2 and MW-3 in the downgradient positions; and well MW-4 in a sidegradient position. Upgradient well samples are designed to provide background water quality, and downgradient water samples to detect contaminants discharged from the landfill into the aquifer.

Monitoring well locations and specifications are shown in the table below.

MONITORING WELL LOCATIONS AND SPECIFICATIONS

Well No.	Location	Boring Depth, ft.	Well Type
MW-1	Upgradient	28.5	Overburden
MW-2	Downgradient	22.5	Overburden
MW-3	Downgradient	22.5	Overburden
MW-4	Sidegradient	22.3	Overburden

The four monitoring wells were installed by drilling with 6¼-inch internal diameter hollow-stem augers. Each well was logged during the drilling activities, and split spoon samples were taken at 5-foot intervals during drilling. Soil samples from the last split spoon sample and one other split spoon from each well were also analyzed for grain size distribution.

Aquifer hydraulic conductivity characteristics were evaluated by means of slug permeability tests. To determine flow direction

of the aquifer, all monitoring wells were surveyed for locations and elevations, and the depths to groundwater relative to an arbitrary datum were measured.

All field procedures, boring logs, well schematics, and grain size analyses are included in Appendix B.

D. SAMPLING AND ANALYSIS

G&H collected four groundwater samples and one duplicate, two surface water/sediment sample pairs, and six soil samples in September 1990. These samples were analyzed for Target Compound List (TCL) inorganics, volatiles, semi-volatiles, and pesticides/PCBs.

H2M Labs (Melville, New York) performed the analyses in accordance with NYSDEC September 1989 Analytical Services Protocols (ASP). Aquatec (South Burlington, Vermont) performed an independent data validation.

The chemical analytical results of the samples are discussed in Section IV and included in their entirety in Appendix C.2, Results. Gibbs & Hill's relevant procedures are outlined in Appendix C.1.

E. AIR SURVEY

In accordance with appropriate health and safety procedures, a photoionization detector (PID), organic vapor analyzer (OVA), and explosimeter were used to monitor the air in the working zone during site activities. In addition, split spoon samples were scanned with a PID immediately upon opening of the split spoon and the results recorded in the drilling log sheets (Appendix B.2).

TABLE III-1

SCOPE OF WORK

Task	Description
Record search and data compilation	Collect and review available information.
Site reconnaissance	Note site changes since NYSDEC initial reconnaissance, assess access to monitoring well and sampling locations, and become familiar with the site.
Geophysical study	Conduct geophysical survey with a magnetometer. Based on the survey results, revise the location of monitoring wells if needed.
Updated work plan	Revise preliminary NYSDEC work plan based on results of record search, site reconnaissance, and geophysical study. Prepare health and safety plan and define drilling and sampling protocols and procedures.
Monitoring wells	Install four monitoring wells to depths ranging between 22.3 and 28.5 feet. Collect split spoon samples at 5-foot intervals. Perform grain size analysis on deepest split spoon samples for each well. Develop wells to at least a turbidity of 50 NTU or lowest possible, and perform permeability tests. Survey all monitoring wells for locations and elevations. Determine the relative depths to groundwater.
Sampling and analysis Groundwater	Collect groundwater samples from each well and one duplicate groundwater sample from a downgradient well. Analyze these samples for TCL inorganics, volatiles, semi-volatiles, and pesticides/ PCBs.

TABLE III-1 (Continued)

Surface water/sediment	Collect two surface water/ sediment pair samples from the recharge basin and two surface water/sediment pair samples from parking lot storm drains. Analyze these samples for TCL inorganics, volatiles, semi-volatiles, and pesticides/ PCBs.
Soil	Collect six soil samples from the site. Analyze these samples for TCL inorganics, volatiles, semi-volatiles, and pesticides/ PCBs.
Investigation Report	Prepare a report containing analytical results from groundwater, surface water, sediment, and soil samples; additional field data, final HRS scores; HRS documentation records; historic literature; and site assessments.

IV. SITE ASSESSMENT

A. SITE DESCRIPTION AND HISTORY

The Hazardous Waste Disposal site is located at 11-A Picone Boulevard, Town of Babylon, Suffolk County, New York. The site is owned by Little Joseph Realty, Farmingdale, New York. The property was rented by the realty company to George Lawrence (Glenwood Landing, New York) who operated his company, Hazardous Waste Disposal (HWD), Inc., from 1979 to 1982. The site was used to store, treat, and dispose of hazardous waste during this period [D.12 and 16].

HWD was in the industrial waste scavenger business which included the transportation and storage of hazardous wastes. These wastes were contained in 55-gallon drums and large holding tanks. HWD was operating an ammonium-hydroxide scrubbing process without a permit and most likely an acid/caustic neutralization process [D.3, D.18].

In March 1981, HWD, Inc. reported a vapor discharge accident to the Suffolk County Department of Health Services (SCDHS). Immediately after the accident, the representatives of SCDHS, accompanied by a representative of the Toxic Waste Handling Group, conducted an investigation of the HWD facilities. At the time of their inspection, there were no visible emissions. However, the East Farmingdale Fire District told them that the accident produced a visible plume 150 to 200 feet high. The

Pront Printing Company, located at 11-D Picone Boulevard, indicated that accidents had been occurring sporadically since September 1980 [D.8 and 9].

In 1981, it was determined by the NYSDEC that HWD, Inc. was operating without the required Part 360 permit and a Siting Board Permit. HWD, Inc. was therefore operating illegally and should have been closed until the permit was received. At the meeting held on April 23, 1981 between the NYSDEC and HWD, Inc., the owner of HWD, Inc. offered to correct any deficiencies of the process as soon as possible [D.11 and 14].

In September 1981, the U.S. Environmental Protection Agency (EPA) conducted a site inspection. During the inspection, HWD, Inc. admitted that the stored waste was hazardous; the waste material was listed in the regulations as a hazardous waste from a nonspecific source; and the facility generated, transported, and treated hazardous waste [D.7].

The inspector identified 1,900 55-gallon drums of spent solvents and a 2,500-gallon acid tank. The majority of the drums were leaking. Management of these stored drums was extremely poor. The whole area was contaminated with spent solvents due to leaks. The storage area was inadequately diked by a two-inch berm on top of which woodchips were placed. At least an inch of liquid wastes were contained by the berm. Liquid wastes were visible and leaving the bermed area. The drums were densely crowded together without aisle space. The storage area was a

potential fire hazard and the wastes were improperly stored [D.20].

In June 1982, the SCDHS revisited the site. A site visit report sketch shows a diked storage area, a neutralization tank and associated pump, and a waste sludge pit covered with plastic [D.18].

In September 1982, the SCDHS visited the site again. The inspector identified 840 55-gallon drums containing waste and 420 empty 55-gallon drums outside the diked area.

Spills were noted in the drum storage area. Neither one of the reports contained a description of the solvent recovery process or a list of stored chemicals [D.17].

HWD removed all wastes from the site and ceased operations in 1984. Waste from on-site drums were emptied into waste sludge pit and after the wastes solidified, they were removed from the pit and transported off-site. This was confirmed during a DEC site inspection, conducted in July 1985. However, during that inspection, several old battered drums were observed on the site and a strong, pungent odor of solvents was present. During the inspection conducted by Roux Associates in July 1987 in association with the Phase I investigation, the site did not show any signs of hazardous materials or conditions [D.19].

In May 1990, G&H conducted a site reconnaissance. At that time,

the site was being rented to J. S. Trucking Company and used as a parking lot. During the site visit, several trucks were parked at the site. The site was approximately 0.5 acre in size and paved by concrete. There was no sign of the previous waste treatment business. All waste storage and waste recovery equipment had been removed and the site was visually clean. In the middle of the parking lot there was a storm drain covered with grating. Drains were connected to a drainage system which was used to discharge water into the recharge basin located northeast of the site [D.10].

B. TOPOGRAPHY

The site is located at latitude 40°44'32"N, longitude 73°25'13"W, amid a commercial and industrial region. The investigated area is on a glacially deposited outwash plain which gently dips south to southeast at a slope of 20 feet per mile, or less than 1 percent.

To the north of the site, up an embankment, there is an unpaved parking area where several drums were observed. During site reconnaissance, the air in these drums was scanned with an OVA instrument, and in most cases, the readings ranged from 20 to 50 ppm. A recharge basin is northeast of the site. A fenced, paved parking lot is east of the site. An abandoned gas station is in the northeast corner of this lot and a building is located in the middle of this lot. To the south of the site across Picone Boulevard is the J. S. Trucking Company office and truck

maintenance facilities. To the west of the site is a fenced, paved parking lot.

C. HYDROGEOLOGY

The stratigraphy and waterbearing characteristics of the geologic units underlying the region of investigation are characterized as highly permeable outwash deposits (sand and gravel). These Pleistocene deposits lie unconformably on the unconsolidated seaward-dipping deposits of Cretaceous age, which in turn lie unconformably on the southeasterly-sloping bedrock. The combined thickness of the unconsolidated deposits is approximately 1,300 to 1,700 feet. Hence, the hydrostratigraphic units in the unconsolidated deposits overlying the bedrock consist of the Cretaceous and Pleistocene series. The Upper Cretaceous series is divided into the Raritan formation and overlying Magothy formation, both of which are composed of non-marine beds of sand, gravel, silt, and clay. The Raritan formation is divided into two members, the Lloyd sand member below (resting on the bedrock) and an overlying clay member. The Magothy formation is the uppermost of the Cretaceous formations on Long Island. It is in part doubtless the equivalent of the Magothy formation in New Jersey, but it may also contain correlatives of other formations. The Magothy overlies the Raritan formation and is in turn overlain by the outwash deposits of Pleistocene age [D.1].

The principal subdivisions of the Pleistocene series from oldest to youngest are the Jameco gravel, the Gardiner's clay, and the Upper Pleistocene outwash deposits. The outwash deposits immediately underlie the land surface of the study site. Based on the four wells installed, the material consists of mainly beds of brown, well-sorted, fine to coarse sand and gravel (Figure. IV-2).

The uppermost zone of the groundwater regime is the Upper Glacial aquifer in the Pleistocene deposits. This unconfined unit lies unconformably on the Magothy and consists of highly permeable upper Pleistocene deposits of sand and gravel. The lower boundary of the Upper Glacial aquifer is defined by the presence of low permeability lenses of silt and clay in the Magothy formation. The Upper Glacial aquifer and the underlying Magothy aquifer are considered hydraulically connected [D.1].

These two aquifers have been considered by this investigation to be the aquifers of concern [D.1].

The Upper Glacial aquifer has been known to yield as much as 1,500 gallons per minute (gpm) with specific capacities commonly 40 to 75 gpm per foot of drawdown. Wells screened in the impermeable to highly permeable Magothy aquifer yield as much as 1,500 gpm with specific capacities ranging from 1 to 49 gpm per foot of drawdown.

Located within a 3-mile radius of the site are over 20 public

supply wells and numerous observation wells. These wells are screened both in the Upper Glacial and Magothy aquifers. A pumping well (S66556) is located hydraulically downgradient, about 1¾ miles southeast of the site. Two public supply wells (NYSDEC Nos. 20041 and 20042) are located approximately 1,400 feet to the northwest (upgradient) of the site. In 1961, the depth to water recorded in both wells was 25 feet below land surface. Regional groundwater flow is south to southeast, away from the topographic and water table high to the north [D.2].

Based on the four wells installed, localized groundwater is flowing towards the south. This flow pattern places well MW-1 upgradient, wells MW-2 and MW-3 downgradient and well MW-4 sidegradient of the site.

D. SITE CONTAMINATION ASSESSMENT

Potential contamination of the environment was assessed by a review of the character of wastes suspected at the site and chemical analyses of the samples. The character of wastes suspected at the site was evaluated by a review of information from historic literature collected in Appendix D.

Tables IV-1 through IV-7 summarize the results of analyses performed at the site for every analyte in the samples if that analyte was detected in concentrations above the Contract Required Quantitation Limit (CRQL). However, an analyte detected below the CRQL in one sample is reported when it is

detected above the CRQL in another sample or is a contaminant of concern at the site.

Groundwater, surface water, and soil assessment, the process by which the analytical data was evaluated, was based on the criteria presented in Appendix C.1.

1. Waste Characteristics

There is no detailed information available for the stored wastes and HWD, Inc. waste recovery process. Historic literature shows that the wastes contained spent solvents, and acids. It is known that an "ammonium hydroxide scrubber" was utilized on site. However, it is not known whether this scrubber employed ammonium hydroxide to neutralize acidic off-gases or was used to remove ammonia vapors released from some wastes (water would have been used in the scrubber to form ammonium hydroxide). In either case the resultant products from the scrubbing process would not have been hazardous. In addition, HWD, Inc. admitted releasing NO_x and HCl vapors suggesting the presence of hydrochloric and nitric acids at the site.

Based on this information, the monitoring of the site would be expected to reveal the presence of methylene chloride (and other chlorinated hydrocarbons), toluene, benzene, methanol, ethanol, and acetone (D.3 and D.7).

If there was a leak from the underground gasoline tank located east of the site, samples collected downgradient in well MW-3 could reveal the presence of benzene, toluene, ethylbenzene, xylene, branch-chain paraffins, cycloparaffins, and aromatics.

2. Groundwater Contamination

Four groundwater samples (GW-1 through GW-4) and one duplicate sample (GW-5) were collected and analyzed for organic and inorganic compounds.

Twelve volatile organic compounds were detected in the samples collected. Of these compounds, the results of analysis indicate that ten compounds were present in significantly high concentrations in downgradient samples.

Toluene (2,300 ug/l), xylene (total)(200 ug/l), and ethylbenzene (440 ug/l) were detected in downgradient sample GW-3 at concentrations more than 80 times the concentrations in upgradient sample GW-1.

Seven chlorinated hydrocarbons were detected in significant concentrations downgradient. Tetrachloroethene (790 ug/l) was detected in downgradient samples GW-2 and GW-3 but not in the upgradient sample. 1,1,1-trichloroethane (150 ug/l), chloroethane (48 ug/l), 1,1-dichloroethane (32 ug/l), chlorobenzene (30 ug/l), methylene chloride

(55 ug/l), and 1,2-dichloroethene (200 ug/l) were detected in downgradient samples at concentrations more than three times the analytical detection limit. These compounds were not detected in upgradient sample GW-1 and are not constituents of gasoline. Therefore, the site can be considered the source of these contaminants migrating into the groundwater. One chlorinated hydrocarbon, vinyl chloride, was also present in downgradient samples, but at a concentration only slightly above the detection limit.

Concentrations of all these contaminants in the downgradient samples, excluding 1,1,1-trichloroethane, exceeded federal and New York State water standards (Table IV-8). Tetrachloroethene and 1,1,1-trichloroethane concentrations exceeded only New York State water quality standards. Trichloroethene, detected at approximately the same concentrations in downgradient and upgradient samples, also exceeded federal and New York State water standards (Table IV-8).

Semi-volatile organic compounds phenol (32 ug/l), naphthalene (65 ug/l), and 2-methylnaphthalene (32 ug/l) were detected in downgradient sample GW-3 at concentrations three or more times the analytical detection limit, but were not detected in the upgradient water sample. However, these contaminants are likely attributable to gasoline. Therefore, the site cannot be considered the sole source of these contaminants migrating into the groundwater

(Table IV-2). The naphthalene level in GW-3 exceeded New York State water quality standards (Table IV-8).

Between three and nineteen definable identified organic compounds (TIC's) were detected in the groundwater samples. Of the TIC's detected, almost all were gasoline constituents which could be attributed to the abandoned gas tank located east of the site. Three chlorinated compounds were detected in GW-3 only.

Inorganic compounds arsenic (125 ug/l) and lead (139.5 ug/l) were detected in downgradient sample GW-4 at concentrations more than 20 times the concentrations found in upgradient sample GW-1 (Table IV-3). Neither of these analytes are contaminants which were suspected of being disposed at the site. The presence of lead in this well could be the result of leaks in the nearby gas tank. Arsenic concentrations may be reflecting natural conditions and the high levels of suspended solids in the sample.

Concentrations of arsenic and lead in downgradient sample GW-4 and aluminum and manganese in the upgradient and downgradient samples exceeded federal and New York State water quality standards (Tables IV-3 and IV-8).

No pesticides or PCB's were detected in any groundwater samples analyzed.

3. Surface Water and Sediment

Surface Water

Three surface water samples (SW-1 and SW-2 from recharge basin and SW-4 from the storm drain located south of the site) were collected and analyzed for organic and inorganic compounds. Sample SW-3 was not collected because there was no water in the proposed sample location during sampling.

Tetrachloroethene (19 ug/l) at concentrations more than three times the detection limit and 1,2-dichloroethene (total)(8 ug/l) at concentrations less than three times the detection limit were detected in sample SW-4 only. Although both were found in sample GW-3, migration of these contaminants from the site appears not to be occurring because neither was detected in the recharge basin at the outfall of the storm drain systems (samples SW-1 and SW-2). No other volatile organic compound was detected in any surface water sample (Table IV-4). Concentrations of these contaminants did not exceed New York State water quality standards (Table IV-8).

No semi-volatile organic compounds, pesticides, or PCBs were detected in any surface water sample.

Inorganic compounds were detected in all surface water samples at the same relative concentrations (Table IV-5). Therefore the presence of these inorganic compounds in

surface water was not a result of activities at this site. Concentrations of iron in all the samples exceeded New York State surface water standards for human and aquatic life, while aluminum and zinc in all samples exceeded New York State surface water standards for aquatic life only (Table IV-8).

Sediment

Three sediment samples (SD-1 and SD-2 from the discharge basin, and SD-3 from the storm drain located on the parking area) were collected and analyzed for organic and inorganic compounds. Sample SD-4 was not collected because there was no access to the proposed sampling location.

Tetrachloroethene (94 ug/l) was detected in sample SD-3 only. No other volatile organic compound was detected in any sediment sample.

Semi-volatile organic compounds phenanthrene (6,000 ug/l), anthracene (1,200 ug/l), fluoranthene (7,900 ug/l), pyrene (6,600 ug/l), benzo(a)anthracene (3,400 ug/l), chrysene (3,800 ug/l), benzo(a)pyrene (2,600 ug/l), indeno(1,2,3-cd)pyrene (1,800 ug/l), and benzo(g,h,i)pyrene (1800 ug/l) were detected in sample SD-3 only (Table IV-4). In addition, six TIC's were detected in SD-3. However, these contaminants are commonly associated with paved parking areas.

Aldrin (67 ug/l) was detected in sample SD-3 only. However, the source of this contaminant in SD-3 is unknown. No other pesticides or PCBs were detected in any other sample.

Metals found in sediment samples did not exceed the typical ranges of concentrations of these metals in non-contaminated soil (Table IV-8).

4. Soil Contamination

Five soil samples and one background soil sample were collected and analyzed for organic and inorganic compounds. Samples B-1, B-2, B-3, and B-5 were collected from depths of two to ten feet beneath the concrete parking area, because hazardous waste was stored and treated in this area by HWD. Sample B-4 was collected at a depth of four to ten feet from adjacent to well MW-3 due to a strong smell present in this well during drilling activities. Sample B-6 was collected from a depth of 2-4 feet, and was the background soil sample.

Chemical analysis detected trichloroethene in two samples (B-1 and B-3), tetrachloroethene in four samples (B-1, B-2, B-3, and B-5), xylene in one sample (B-1), 1,2-dichloroethene in one sample (B-3), and acetone in one sample (B-4)(Table IV-6). None of these contaminants was detected in the background sample. With the exception of

acetone, all of the volatile organics present in the soil samples were also present in groundwater samples at significant levels [Tables IV-1 and IV-6].

Twenty organic TICs were detected in B-1 located on the western portion of the site. However, all the TICs are constituents of gasoline indicating a possible historic spill or former tank location.

Bis(2-ethylhexyl)phthalate, a common laboratory contaminant, was detected in all soil samples and the method blank (Table IV-6) at levels indicating that the laboratory was the source of the contaminant.

Metals found in soil samples were detected in the same range as in the background sample and did not exceed the typical ranges of concentrations of these metals in non-contaminated soil (Tables IV-7 and IV-8).

5. Air Survey

Air quality surveys were conducted with PID, OVA, and explosimeter air monitoring instruments during site reconnaissance and drilling activities. During site reconnaissance, the air in several drums located north of the site was scanned with an OVA instrument, and in most cases, the readings ranged from 20 to 50 ppm.

Diesel fuel smell was detected from wells MW-3 and MW-4 cuttings and holes during drilling events. Lower explosive limit level was 20 percent at well MW-4 and 30-50 percent at well MW-3. OVA and PID instruments indicated no readings above background in the breathing zone.

During soil sampling, PID readings above background were recorded at B-1, B-4 and B-5 holes in the range of 0.5 to 15 ppm. No readings above background were recorded in the breathing zone.

E. CONCLUSIONS

All tasks of the Phase II investigation for the Hazardous Waste Disposal site have been completed. Enough data has been collected to prepare a final HRS score.

The Phase II investigation shows evidence of soil contamination by three organic chlorinated hydrocarbon compounds (trichloroethene, tetrachloroethene and 1,2-dichloroethene) on site and migration of two of these contaminants, tetrachloroethene and 1,2-dichloroethene from the site into groundwater. Five other chlorinated hydrocarbons, although not detected in soil samples, were detected in the downgradient groundwater samples at concentrations suggesting migration from the site. There is no evidence of migration of contaminants from the site into the surface water.

Sample analysis results also showed a pervasive presence of gasoline related compounds in soil and groundwater. These results could be attributed to the abandoned gas station located east of the site. However, this does not mean that several of the compounds (toluene, ethylbenzene and xylene) did not also originate from the site itself.

NOTES TO REGULATIONS

[A] Environmental Protection Agency National Primary Drinking Water Regulations (as of 7/17/89)

Applied to results of all water sample analyses.

[B] Chapter 1 of Title 10 of the Official Compilation of Codes, Rules and Regulations of the State of New York, Part 5, Drinking Water Supplies, Subpart 5-1, Public Water Supplies (as of 11/28/88)

Applied to results of drinking water sample analyses.

[C] Chapter 10 of Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York, Division of Water Resources, Article 2, Part 702, Appendix 31, Ambient Water Quality Standards - "The standards adopted herein relate to the condition of waters as affected by the discharge of sewage, industrial wastes or other wastes." (as of 7/5/85)

For sources of water for drinking, culinary or food processing purposes and human life protection, unless otherwise noted.

Applied to results of surface water sample analyses for surface water that is not a source of drinking water.

[D] Chapter 10 of Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York, Division of Water Resources, Article 2, Part 703.5(a)(2) and (3), Classes and quality standards for groundwaters - "The purpose of these classes, quality standards, and effluent standards and/or limitations is to prevent pollution of groundwaters and to protect the groundwaters for use as a potable water." (as of 7/5/85)

Applied to results of all groundwater sample analyses regardless of groundwater use.

[E] Environmental Protection Agency National Secondary Drinking Water Regulations (as of 9/26/88)

Applied to results of all water sample analyses.

[F] Source: "Review of In-Place Treatment Techniques for Contaminated Surface Soils," Volume 2, EPA-540/2-84-0036, November 1984, except as noted.

Applied to results of soil sample analyses.

[G] Chapter 360 of Title 6 of the Official Compilation of Codes, Rules and Regulations of the State of New York, Solid Waste Management Facilities, Section 360-4.4(a), "Sewage sludge and septage destined for land application" (as of 12/31/88)

Applied to results of soil and sediment sample analyses.

V. FINAL APPLICATION OF HAZARD RANKING SYSTEM

A. NARRATIVE SUMMARY

The Hazardous Waste Disposal site is located on 11-A Picone Boulevard, Town of Babylon, Suffolk County, New York. The site is owned by Little Joseph Realty, Farmingdale, New York. The property was rented by the realty company, to George Lawrence (Glenwood Landing, New York) who operated his company, Hazardous Waste Disposal, Inc., from 1979 to 1982.

The site was used to store, treat, and dispose of hazardous waste during this period. A large number of drums containing liquid wastes were stored at the site. Many drums were observed to be leaking.

The site is located in a mixed residential/industrial/commercial area. The nearest building is the office of the J. S. Trucking Co. located across Picone Boulevard. The nearest residence is approximately 1,300 feet west of the site. Village of Farmingdale wells are the nearest community wells, located within a 1/2-mile north of the site. All residences use the community water system. Nearest surface water other than recharge basin on the site is Massapequa Creek, located about 2 1/4 miles from the site.

Facility name: Hazardous Waste Disposal Site

Location: 11-A Picone Boulevard, Farmingdale, New York 11735

EPA Region: II

Person(s) in charge of the facility: Little Joseph Realty

Vic Emanuelo, Attorney

Name of Reviewer: Alex Kostic Date: March 20, 1991

General description of the facility:

(For example: landfill, surface impoundment, pile, container; types of hazardous substances; location of the facility; contamination route of major concern; types of information needed for rating; agency action, etc.)

The site is owned by Little Joseph Realty, Farmingdale, New York. The site was used to store, treat, and dispose of hazardous waste during 1979 to 1982. During the EPA inspection conducted in 1981, about 1,900 drums of spent solvents and a 2,500-gallon acid tank were observed at the site. The majority of the drums were leaking. During SCDOH inspection in 1982, 840 drums containing liquid waste and 420 empty 55-gallons drums were observed at the site.

Scores: S_M = 37.82 (S_{gw} = 65.38 S_{sw} = 2.38 S_a = 0.00)

S_{FE} = Not applicable

S_{DC} = 25.00

DIRECT CONTACT WORK SHEET

D. UPDATED HRS DOCUMENTATION RECORDS

DOCUMENTATION RECORDS
FOR
HAZARD RANKING SYSTEM

INSTRUCTIONS: As briefly as possible summarize the information you used to assign the score for each factor (e.g., "Waste quantity = 4,230 drums plus 800 cubic yards of sludges"). The source of information should be provided for each entry and should be a bibliographic-type reference. Include the location of the document.

FACILITY NAME: Hazardous Waste Disposal

LOCATION: 11-A Picone Boulevard, Village of Farmingdale, Town of Babylon, Suffolk County, New York

DATE SCORED: March 15, 1991

PERSON SCORING: Jayesh Sanghvi

PRIMARY SOURCE(S) OF INFORMATION (e.g., EPA Region, FIT, etc.):

Analytical data, site visit, NYSDEC file, Phase I investigation report

FACTORS NOT SCORED DUE TO INSUFFICIENT INFORMATION:

Sa - No air sampling data available.

COMMENTS OR QUALIFICATIONS:

None

GROUNDWATER ROUTE

1 OBSERVED RELEASE

Contaminants detected (5 maximum):

1,2-Dichloroethene (total), Tetrachloroethene, Chloroethene, 1,1-Dichloroethane, 1,1,1-Trichloroethene [1]

Rationale for attributing the contaminants to the facility:

Concentrations of these contaminants in downgradient water samples are either ten times or greater than concentrations in upgradient water sample, or greater than three times the detection limit and not detected in upgradient sample. Therefore, there is an observed release.

Score = 45 [2]

* * *

2 ROUTE CHARACTERISTICS

Depth to Aquifer of Concern

Name/description of aquifer(s) of concern:

Upper glacial aquifer consisting of fine to coarse sand and gravel [B.2] overlying the Magothy aquifer consisting mainly of fine and medium sand. Both aquifers are considered hydraulicaly connected. [D.1].

Depth(s) from the ground surface to the highest seasonal level of the saturated zone [water table(s)] of the aquifer of concern:

Depth to water ranging from 5.9 to 18.2 feet was measured in four monitoring wells installed at the site [B.2].

Depth from the ground surface to the lowest point of waste disposal/storage:

5.9 feet. Wastes were allegedly stored at or above land surface [D.16].

Score = 3

Net Precipitation

Mean annual or seasonal precipitation (list months for seasonal):

46 inches [2]

Mean annual lake or seasonal evaporation (list months for seasonal):

30 inches [2]

Net precipitation (subtract the above figures):

16 inches

Score = 3

Permeability of Unsaturated Zone

Soil type in unsaturated zone:

Outwash-plain deposits consisting of stratified sand and gravel [B.2][D.1].

Permeability associated with soil type:

Greater than $1x10^{-3}$ cm/sec [B.2][D.1]

Score = 3

Physical State

Physical state of substances at time of disposal (or at present time for generated gases):

Liquid [D.7]

Score = 3

3 CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

A large number of drums containing liquid waste were stored at the site. Many drums were observed to be leaking and spills were observed heading in the direction of dry well. Drainage system was connected to a nearby recharge basin.

Method with highest score:

Containers leaking and no liner [2].

Score = 3

4 WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated:

1,1,1-trichloroethane, tetrachloroethene, ethylbenzene, chloroethane, 1,1-dichloroethane, chlorobenzene [1].

Compound with highest score:

1,1,1-trichloroethane (12), 1,1-dichloroethane (12).

Score = 12

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (give a reasonable estimate even if quantity is above maximum):

1045 drums

Score = 5

Basis of estimating and/or computing waste quantity:

During site inspection conducted by the EPA in 1981, approximately 1,900 55-gallon drums of waste material (spent solvents and acids) were observed at the site. A majority drums were observed to be leaking. However, the exact quantity of leaking material is unknown. Assuming 55 percent of the drums leaked and that each leaking drum released all its contents, 1045 drums of material could have been released. [D.7, D.20]

5 TARGETS

Groundwater Use

Use(s) of aquifer(s) of concern within a 3-mile radius of the facility:

Drinking water [D.1]

Score = 3

Distance to Nearest Well

Location of nearest well drawing from aquifer of concern or occupied building not served by a public water supply:

Two public supply wells are located north of the site [D.2].

Distance to above well or building:

Approximately 1,400 feet [4]

Score = 4

Population Served by Groundwater Wells Within a 3-Mile Radius

Identified water-supply well(s) drawing from aquifer(s) of concern within a 3-mile radius and populations served by each:

Water District	Serving Population	
Suffolk County		
E. Farmingdale	5,700	
Bethpage	8,300	
Suffolk County Water District	208,593	[4]
Nassau County		
Farmingdale Village	8,446	
Plainview Water District	35,000	
South Farmingdale Water District	44,700	[4]
Total	310,739	
Population served by domestic wells	0	[11]

Computation of land area irrigated by supply well(s) drawing from aquifer(s) of concern within a 3-mile radius and conversion to population (1.5 people per acre):

None

Total population served by groundwater within a 3-mile radius:

310,739 people [4]

Score = 5

Matrix Score = 40

SURFACE WATER ROUTE

1 OBSERVED RELEASE

Contaminants detected in surface water at the facility or downhill from it (5 maximum):

Tetrachloroethene [1]

Rationale for attributing the contaminants to the facility:

The above contaminant was detected in one surface water sample. However, migration of this contaminant from the site does not appear to be occurring because it was not detected in the recharge basin, the outfall of the storm drain systems.

Score = 0

* * *

2 ROUTE CHARACTERISTICS

Facility Slope and Intervening Terrain

Average slope of facility in percent:

Average slope = 0 [10]

Name/description of nearest downslope surface water:

Massapequa Creek, located 2 1/4 miles southwest of the site [10].

Score = 0

Average slope of terrain between facility and above-cited surface water body in percent:

Average slope = 0 [10]

Is the facility located either totally or partially in surface water?

No [10]

Score = 0

Is the facility completely surrounded by areas of higher elevation?

No [10]

1-Year, 24-Hour Rainfall in Inches

2.5 inches [2]

Score = 2

Distance to Nearest Downslope Surface Water

2 1/4 miles [10]

Score = 0

Physical State of Waste

Liquid [D.7]

Score = 3

* * *

3 CONTAINMENT

Containment

Method(s) of waste or leachate containment evaluated:

A large number of drums containing liquid waste were stored at the site. Many drums were observed to be leaking and spills were observed heading in the direction of dry well. Drainage system was connected to nearby recharge basin. [D.15, D.20]

Method with highest score:

Containers leaking and containment structure potentially unsound.

Score = 3

4 WASTE CHARACTERISTICS

Toxicity and Persistence

Compound(s) evaluated

Tetrachloroethene

Compound with highest score:

Tetrachloroethene (12)[3]

Score = 12 [2]

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (give a reasonable estimate even if quantity is above maximum):

1045 drums

Score = 5

Basis of estimating and/or computing waste quantity:

During site inspection conducted by the EPA in 1981, approximately 1,900 55-gallon drums of waste material (spent solvents and acids) were observed at the site. A majority drums were observed to be leaking. However, the exact quantity of leaking material is unknown. Assuming 55 percent of the drums leaked and that each leaking drum released all of its contents, 1045 drums of material could have been released. [D.7, D,20]

* * *

5 TARGETS

Surface Water Use

Use(s) of surface water within 3 miles downstream of the hazardous substance:

Recreational

Score = 2

Is there tidal influence?

N/A

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland if 2 miles or less:

None [5]

Score = 0

Distance to 5-acre (minimum) freshwater wetland if 1 mile or less:

None [5]

Score = 0

Distance to critical habitat of an endangered species or national wildlife refuge if 1 mile or less:

None, although an endangered taxon, sandplain gerardia, was last observed in 1921 in the vicinity of Babylon [7].

Score = 0

Population Served by Surface Water

Location(s) of water supply intake(s) within 3 miles (free-flowing bodies) or 1 mile (static water bodies) downstream of the hazardous substances and population served by each intake:

None [4]

Score = 0

Computation of land area irrigated by above cited intake(s) and conversion of population (1.5 people per acre):

None [12].

Score = 0

Total population served:

None

Score = 0

Name/description of nearest of above water bodies:

N/A

Distance to above cited intakes measured in stream miles:

None

Score = 0

AIR ROUTE

1 OBSERVED RELEASE

Contaminants detected:

HWD, Inc. reported vapor release accident to SCDOH in March 1981. However, no vapor sample was collected for analysis.

Date and location of detection of contaminants:

N/A

Methods used to detect the contaminants:

N/A

Rationale for attributing the contaminants to the site:

N/A

Score = 0

* * *

2 WASTE CHARACTERISTICS

Reactivity and Incompatibility

Most reactive compound:

N/A

Most incompatible pair of compounds:

N/A

Score = 0

Toxicity

Most toxic compound:

Tetrachloroethene

Score = 3

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility, excluding those with a containment score of 0 (give a reasonable estimate even if quantity is above maximum):

1045 drums

Score = 5

Basis of estimating and/or computing waste quantity:

During site inspection conducted by the EPA in 1981, approximately 1,900 55-gallon drums of waste material (spent solvents and acids) were observed at the site. A majority drums were observed to be leaking. However, the exact quantity of leaking material is unknown. Assuming 55 percent of the drums leaked and that each leaking drum released all of its contents, 1045 drums of material could have been released. [D.7, D.20]

* * *

3 TARGETS

Population Within 4-Mile Radius

Circle radius used, give population, and indicate how determined:

0 to 4 mi. | 0 to 1 mi. | 0 to 1/2 mi. 0 to 1/4 mi.

10182 [9 and 10]

Score = 24

Distance to a Sensitive Environment

Distance to 5-acre (minimum) coastal wetland if 2 miles or less:

None [5]

Distance to 5-acre (minimal) freshwater wetland if 1 mile or less:

None [5]

Distance to critical habitat of an endangered species if 1 mile or less:

None, although an endangered taxon, sandplain gerardia, was last observed in 1921 in the vicinity of Babylon [7].

Score = 0

Land Use

Distance to commercial/industrial area if 1 mile or less:

Across the street from the site [10].

Score = 3

Distance to national or state park, forest, or wildlife reserve if 2 miles or less:

Bethpage State Park is about 3/4 mile west of the site.

Score = 2

Distance to a residential area if 2 miles or less:

Approximately 1,400 feet [10].

Score = 3

Distance to agricultural land in production within past 5 years if 1 mile or less:

None [8]

Score = 0

Distance to prime agricultural land in production within past 5 years if 2 miles or less:

None [8]

Score = 0

Is a historic or landmark site (National Register of Historic Places and National Natural Landmarks) within view of the site?

None [6]

Score = 0

FIRE AND EXPLOSION*

1 CONTAINMENT

Hazardous substances present:

Type of containment if applicable:

* * *

2 WASTE CHARACTERISTICS

Direct Evidence

Type of instrument and measurements:

Ignitability

Compound used:

Reactivity

Most reactive compound:

---

*To score Fire and Explosion, either a State or local Marshal must have certified that the facility presents a significant fire or explosion threat to the public or to a sensitive environment, or there must be a demonstrated threat based on field observations. If neither one of these is true, the score cannot be completed.

Incompatibility

Most incompatible pair of compounds:

Hazardous Waste Quantity

Total quantity of hazardous substances at the facility:

Basis of estimating and/or computing waste quantity:

* * *

3 TARGETS

Distance to Nearest Population

Distance to Nearest Building

Distance to Sensitive Environment

Distance to wetlands:

Distance to critical habitat:

Land Use

Distance to commercial/industrial area if 1 mile or less:

Distance to national or state park, forest, or wildlife reserve if 2 miles or less:

Distance to residential area if 2 miles or less:

Distance to agricultural land in production within past 5 years if 1 mile or less:

Distance to prime agricultural land in production within past 5 years if 2 miles or less:

Is a historic or landmark site (National Register of Historic Places and National Natural Landmarks) within view of the site?

Population Within 2-Mile Radius

Buildings Within 2-Mile Radius

DIRECT CONTACT

1 OBSERVED INCIDENT

Date, location, and pertinent details of incident:

No observed incident on record.

Score = 0

2 ACCESSIBILITY

Describe type of barrier(s):

None

Score = 3

* * *

3 CONTAINMENT

Type of containment if applicable:

A large number of drums containing liquid waste were stored at the site. Many drums were observed to be leaking and spills were conveyed to dry wells.

Score = 15

* * *

4 WASTE CHARACTERISTICS

Toxicity

Compounds evaluated:

Tetrachloroethene

Compound with highest score:

Tetrachloroethene

Score = 3

5 TARGETS

Population Within One-Mile Radius

742 people [9 and 10]

Score = 2

Distance to Critical Habitat (of endangered species)

None, although an endangered taxon, sandplain gerardia, was last observed in 1921 in the vicinity of Babylon [7].

Score = 0

DRAFT

MAR 4 1985

Table I is the listing of EPA Hazard Ranking System (HRS) Waste Characteristics Values (Toxicity/Persistence matrix) used by the NPL quality assurance team. These rating factor values are based on the criteria specified in the HRS (toxicity rating assigned to each substance in Sax, Dangerous Properties of Industrial Chemicals, 4th, 5th and 6th editions). The listing shows the matrix values for ground water and surface water and the toxicity value for air. The values shown are "post multiplier" for use on the HRS worksheets. Changes to this list are made, albeit infrequently, as a result of response to public comment and changes in the reference material. Questions should be directed to the NPL quality assurance team via Mr. Steve Caldwell, EPA Headquarters, (202) 475-8103.

Note: As stated in Mitre Course on Apr. 2 & 3 1986

Zn = 12
Mn = 12
Ni ≠ 18 (undecided at this time)
Se ≠ 18 (" " " ") } Try to use other constituents

Di-N-butyl phthalate ≠ 18 (undecided)
will be 12

Table I (cont.)

Chemical/Compound	Ground Water and Surface Water Pathway Values	Air Pathway Values
Naphthalene	9	6
Nickel & Compounds, NOS	18	9
Nitric Acid	9	9
Nitroaniline, NOS	18	9
Nitrogen Compounds, NOS	12	0
Nitroguanidine	12	9
Nitrophenol, NOS	15	9
m-Nitrophenol	15	
o-Nitrophenol	12	
p-Nitrophenol	15	
Nitrosodiphenylamine	12	6
Parathion	9	9
Pentachlorophenol (PCP)	18	9
Pesticides, NOS	18	9
Phenanthrene	15	9
Phenol	12	9
Phosgene	9	9
Polybrominated Biphenyl (PBB), NOS	18	9
Polychlorinated Biphenyls (PCB), NOS	18	9
Potassium Chromate	18	9
Radium & Compounds, NOS	18	9
Radon & Compounds, NOS	15	9
RDX (Cyclonite)	15	
2, 4-D, Salts & Esters	18	9
Selenium	15 ?	9
Sevin (Carbaryl)	18	9
Sodium Cyanide	12	9
Styrene	9	6
Sulfate	9	0
Sulfuric Acid	9	9
2, 4, 5-T	18	9
1, 1, 2, 2-Tetrachloroethane	18	9
Tetrachloroethane, NOS	18	9
1, 1, 2, 2-Tetrachloroethene	12	6

Department of the Interior

National Park Service

National Registry of Natural Landmarks

Great Plains natural region. A variety of successional stages from active dunes to a climax shinnery oak-sand prairie community is represented. (May 1982) Owner: Federal, State, Private

Dona Ana County

KILBOURNE HOLE—26 miles southwest of Las Cruces. An uncommon volcanic feature known as a maar, which is a depression caused by volcanic explosion that emits little volcanic material except gas. (May 1975) Owner: Federal, Private

Harding County

*BUEYEROS SHORTGRASS PLAINS—17 miles east of Bueyeros. An example of the blue grama-buffalograss prairie of the Great Plains considered to be typical of the pre-cattle-grazing era. Two of the three dominant natural grazing animals (antelope and prairie dogs) are still in the area. (February 1980) Owner: Private

Lincoln County

BORDER HILLS STRUCTURAL ZONE—24 miles west of Roswell. One of the several buckles on the Pecos slope located in otherwise gently dipping Permian strata. (February 1980) Owner: Federal, Private

*FORT STANTON CAVE—Seven miles west of Lincoln. The cave is characterized by very long and large open passages containing distinctive examples of selenite needles, starbursts, and velvet flowstone. (May 1974) Owner: Federal

*TORGAC CAVE—20 miles southeast of Corona. Significant because of its abundant and intricate gypsum speleothems. The branching stalactite and helictite are so distinctive that the cave lends its name to the type: Torgac stalactites. (May 1974) Owner: Federal

Rio Arriba County

*GHOST RANCH—South of Canjilon. The tract is predominantly shale and sandstone, and has yielded fossils, including many well-preserved skeletons of *Coelophsis*, the oldest and most primitive carnivorous dinosaur. (January 1976) Owner: Private

VALLES CALDERA (extends into Sandoval County)—30 miles northwest of Santa Fe. A large circular depression, 12 to 15 miles in diameter, with scalloped walls rising from a few hundred, to more than 2,000, feet above the present floor. It is one of the largest calderas in the world. (May 1975) Owner: Private

Sandoval County

VALLES CALDERA (see *Rio Arriba County*)

San Juan County

*SHIP ROCK—35 miles west of Farmington. Ship Rock is an outstanding example of an exposed volcanic neck accompanied by radiating dikes; it towers 1400 feet above the surrounding plain. (May 1975) Owner: Indian trust (Navajo Tribe)

Valencia County

GRANTS LAVA FLOW—Extends 25 miles south from Grants—A classic example of recent extrusive volcanism. It contains lava flows that appear very fresh and unweathered. Its gigantic pressure ridges, collapse depressions and lava tubes are outstanding. (July 1969) Owner: Federal, State, Private

NEW YORK (26)

Albany County

*BEAR SWAMP—Three miles south of Westerlo. A low, swampy woodland consisting of red maple, yellow birch, black ash, white elm, white pine, and hemlock. Its most outstanding feature is the great laurel covering 60 acres of the swamp. (May 1973) Owner: Private

Allegany County

*MOSS LAKE BOG—Two miles southwest of Houghton. The site is a classic example of a postglacial sphagnum bog invading and filling a small kettle lake, with the various stages of bog succession well illustrated. (May 1973) Owner: Private

Cattaraugus County

*DEER LICK NATURE SANCTUARY—Four miles southeast of Gowanda. The area includes a gorge that clearly illustrates exposed stratifications of the Onondaga Escarpment, and supports a mature northern hardwood forest. (November 1967) Owner: Private

Dutchess County

*THOMPSON POND—20 miles east of Kingston. The 75-acre, glacially created pond is not more than four feet deep, fringed by cattail marshes, with reeds and water lillies in deeper water. Well-developed ecosystems from the open pond to the mountain cliffs illustrate great ecological diversity. (May 1973) Owner: Private

Genesee County

*BERGEN-BYRON SWAMP—Between Bergen and Byron, 25 miles west of Rochester. This landmark consists of an area of some 2,000 acres that is unusually rich in plant and animal life. (March 1964) Owner: Private

*FOSSIL CORAL REEF—Four miles northwest of Le Roy. An exposed fossil site in an abandoned limestone quarry surrounded by woodland. It is extremely rich in fossil coral specimens. (November 1967) Owner: Private

*OAK ORCHARD CREEK MARSH (extends into Orleans County)—Iroquois National Wildlife Refuge, seven miles southeast of Medina. The area is a relatively undisturbed marsh that is rare for this part of New York State. (May 1973) Owner: Federal

Herkimer County

MOSS ISLAND—Within the city limits of Little Falls. The island is part of an uplifted fault block of ancient crystalline rock. It contains the best exposure of glacial age potholes eroded by meltwater floods in the eastern United States. (May 1976) Owner: State

Jefferson County

*DEXTER MARSH—Two miles southwest of Dexter. The site is a relatively undisturbed, extensive example of a large bay-head marsh complex at the eastern end of Lake Ontario. (May 1973) Owner: State

*IRONSIDES ISLAND (extends into St. Lawrence County)—In the St. Lawrence River, eight miles northeast of Alexandria Bay. A glacier-scoured granite knoll; the most significant feature is the breeding colony of great blue herons. (April 1967) Owner: Private

LAKEVIEW MARSH AND BARRIER BEACH—20 miles southwest of Watertown. One of the best and most extensive marshlands that lie in protected bays and behind barrier beaches along eastern Lake Ontario. The marsh-swamp-pond complex demonstrates great wetlands diversity. (May 1973) Owner: State

Livingston County

*FALL BROOK GORGE—One and one-half miles south of Geneseo. One of America's finest exposures of Upper and Middle Devonian age strata. Significant fossil remains are found at this site. (January 1970) Owner: Private

Monroe County

*HARTS WOODS—Ten miles southeast of Rochester. A rare remnant of the original beech-maple forest that once occupied a large glaciated area extending from southeastern Wisconsin to north-central New York. (June 1972) Owner: Municipal

*MENDON PONDS PARK—11 miles south of Rochester. A unique complex of glacial features including kames, eskers, esker fans, kettle holes, erratics, bogs, and ponds. (November 1967) Owner: County

Onondaga County

*ROUND LAKE—Green Lakes State Park, two miles northeast of Fayetteville. The site contains one of 11 meromictic lakes reported in the United States, and about 20 acres of outstanding virgin mesophytic forest that adjoin the lake. (May 1973) Owner: State

Orleans County

*OAK ORCHARD CREEK MARSH (see *Genesee County*)

Rockland County

*HOOK MOUNTAIN AND NYACK BEACH STATE PARK—One mile north of Nyack. The area contains a portion of the Palisade Sill. The geological features are deposits characterstic of the filling of basins that developed during rifting and opening of the North Atlantic Basin 180-200 million years ago. (April 1980) Owner: State

*IONA ISLAND MARSH—Two miles south of Fort Montgomery. A brackish estuarine marsh in a near natural state that fringes the Hudson River. Many rare plants are found here. (May 1974) Owner: State

St. Lawrence County

*IRONSIDES ISLAND (see *Jefferson County*)

Saratoga County

*PETRIFIED GARDENS—Four miles west of Saratoga Springs. The area includes the best exposure of fossil reefs made up of calcareous algae, known as cryptozoon,

which constitute a milestone in the evolution of plant life. (April 1967) Owner: Private

Seneca County

*MONTEZUMA MARSHES—Montezuma National Wildlife Refuge, four miles northeast of Seneca Falls. A marsh dominated by broadleaved cattail. A small 100-acre area within the site is one of the best examples of undisturbed swamp woodlands in New York or New England. (May 1973) Owner: Federal

Suffolk County

*BIG REED POND—Three miles west of Montauk Point. The freshwater pond supports a herd of whitetail deer and other wildlife, and has no extensive man-made development along its shoreline. (May 1973) Owner: County

GARDINER'S ISLAND—100 miles east of New York City, in Block Island Sound off Long Island. The island is a breeding ground for osprey and is an important habitat of other fauna, particularly waterfowl and shore birds. (April 1967) Owner: Private

*LONG BEACH, ORIENT STATE PARK—One mile south of Orient. One of the finest remaining examples in New York of a sandgravel spit illustrating succession from salt marsh to maritime forest. The area contains a breeding colony of common and roseate terns, species which are becoming scarce in other North Atlantic breeding grounds. (April 1980) Owner: State

Tompkins County

*McLEAN BOGS—One and one-half miles east-southeast of McLean. The bogs contain rare plant species and one of the best examples of a northern deciduous forest in New York. (May 1973) Owner: Private

Ulster County

*ELLENVILLE FAULT-ICE CAVES—Five miles southeast of Ellenville. The largest known exposed fault system in the United States, along with a series of ice caves formed from fault debris. (November 1967) Owner: Municipal

Wayne County

*ZURICH BOG—Nine miles north of Newark. A good example of northern bog and bog forest vegetation that is uncommon in north-central New York State. (May 1973) Owner: Private

Westchester County

*MIANUS RIVER GORGE—Two miles south of Bedford. An exceptional illustration of piedmont physiography and geomorphology. It contains an excellent climax hemlock forest. (March 1964) Owner: Private

NORTH CAROLINA (11)

Alleghany County

*STONE MOUNTAIN (extends into Wilkes County)—Stone Mountain State Park, nine miles southeast of Sparta. The best example of a monadnock in massive granite in North Carolina. Unique, endemic plants persist on the granite outcrops. (May 1974) Owner: State

Ashe County

LONG HOPE CREEK SPRUCE BOG (extends into Watauga County)—Ten miles north-northeast of Boone. One of the rarest plant communities of North Carolina and the Southeast, including American yew and buckbean. (May 1974) Owner: Private

*MOUNT JEFFERSON STATE PARK—One mile east of West Jefferson. The mountain's uppermost forest is virtually undisturbed northern red oak and represents one of the finest remaining examples of oak-chestnut forest in the Southeast. (May 1974) Owner: State

Beaufort County

GOOSE CREEK STATE PARK NATURAL AREA—Ten miles east of Washington. An excellent example of a gently sloping mainland undergoing rapid ocean transgression. Contains the following diverse ecological units: brackish creeks and marshes, marsh transition areas, river swamp forest, and low pine forests. (April 1980) Owner: State

Brunswick County

GREEN SWAMP—Nine miles north of Supply. The largest and most unique mosaic of wetland communities in the Carolinas. The site is also a refuge for rare animal species. (May 1974) Owner: Private

Dare County

NAGS HEAD WOODS AND JOCKEY RIDGE—One and one-half miles northwest of Nags Head on Bodie Island. The site illustrates the entire series of dune development and plant succession from shifting open dunes to forested stabilized dunes. (May 1974) Owner: State, County, Municipal, Private

Davie County

*ORBICULAR DIORITE—An unusual plutonic igneous rock consisting of hornblende, pyroxene, and feldspars. (August 1980) Owner: Private

Onslow County

BEAR ISLAND—Hammocks Beach State Park, 4 miles south-southeast of Swansboro. The area contains one of the largest and best examples of coastal aeolian landforms in the Atlantic Coastal Plain. Dune movement has created a dynamic landscape of outstanding scenic beauty. (April 1980) Owner: State

Surry County

*PILOT MOUNTAIN—Pilot Mountain State Park, 3 miles south of Pilot Mountain. A classic monadnock that harbors disjunct Blue Ridge Mountain vegetation. (May 1974) Owner: State

Wake County

*PIEDMONT BEECH NATURAL AREA—William B. Umstead State Park, 7 miles northwest of Raleigh. Perhaps the finest example of mixed mesophytic forest in the eastern Piedmont of North Carolina, with unusually fine climax stands of beech in portions of the site. (May 1974) Owner: State

Watauga County

LONG HOPE CREEK SPRUCE BOG (see *Ashe County*)

Wilkes County

*STONE MOUNTAIN (see *Alleghany County*)

Yancey County

*MOUNT MITCHELL STATE PARK—20 miles northeast of Asheville. Mount Mitchell (6,684 feet above sea level) is the highest mountain in the eastern half of the United States. The park has the most extensive stand of Fraser's fir remaining in America. (May 1974) Owner: State

NORTH DAKOTA (4)

Billings County

*TWO-TOP MESA AND BIG TOP MESA—14 miles northwest of Fairfield. Both mesas, one mile apart, are in a badlands terrain of sandstones, siltstones and clay. The mesas are characterized by an unbroken cover of grass on flat relief. (October 1965) Owner: Federal

Cavalier County

*RUSH LAKE—Five miles south of Hannah. A large, shallow, essentially undisturbed prairie pothole lake that is an important staging area for waterfowl. (May 1975) Owner: Private

Kidder County

SIBLEY LAKE—five miles north of Dawson. A large, permanent alkaline lake, it provides a breeding and resting area for one of the largest and most diverse waterbird populations found in pothole lakes in the State. (May 1975) Owner: State, Private

Stutsman County

FISCHER LAKE—25 miles northwest of Jamestown. Highly representative of the glacial moraine and pitted outwash plain surface of North Dakota. The area contains relatively undisturbed grasslands and lush prairie woodlands. (April 1980) Owner: State, Private

OHIO (23)

Adams County

*BUZZARDROOST ROCK-LYNX PRAIRIE-THE WILDERNESS—25 miles west of Portsmouth. The site contains a number of different plant associations, including many rare or uncommon species. Has an almost 50-year history of scientific observations. (April 1967, December 1974, February 1980) Owner: Private

SERPENT MOUND CRYPTOEXPLOSIVE STRUCTURE (extends into Highland and Pike Counties)—31 miles southwest of Chillicothe. A structure of undertermined origin exposed by differential erosion. It is the smaller of two such outstanding cryptoexplosive structures in the Interior Low Plateaus and is the classic American example. (February 1980) Owner: Private

Ashland County

*CLEAR FORK GORGE—Mohican State Park, four miles south of Loudenville. A

Part III

Department of the Interior

National Park Service

National Registry of Natural Landmarks; Annual Supplemental Listing of Natural Landmarks; Notice

DEPARTMENT OF THE INTERIOR

National Park Service

National Registry of Natural Landmarks

AGENCY: National Park Service, Interior.
ACTION: Public notice.

SUMMARY: This notice lists all natural landmarks designated by the Secretary of the Interior between March 1, 1983 and September 30, 1983, and included on the National Registry of Natural Landmarks, The listing published in the Federal Register on March 1, 1983 (48 FR 8682) contains all natural landmarks designated prior to that date and should be retained for reference purposes. Both listings provide information on each landmark's location, natural values, designation date, ownership, and owner agreement status. Federal agencies should consider the existence and location of natural landmarks when assessing the impact of their actions on the environment under Section 102(2)(c) of the National Environmental Policy Act of 1969 (83 Stat. 852; 42 U.S.C. 4321).

FOR FURTHER INFORMATION CONTACT: Mr. Arthur L. Stewart, Acting Chief, Natural Landmarks Branch, Interagency Resources Division, National Park Service, Washington, D.C. 20240, (202) 343-9525.

SUPPLEMENTARY INFORMATION: The Secretary of the Interior established the National Natural Landmarks Program in 1962 to identify and encourage the preservation of the full range of ecological and geological features that are nationally significant examples of the Nation's natural heritage. Potential natural landmarks are identified through studies conducted by the National Park Service (NPS), evaluated by expert natural scientists, and, if judged nationally significant, designated as natural landmarks by the Secretary of the Interior. Once a natural landmark is designated, it is included on the National Registry of Natural Landmarks, which currently lists 548 natural landmarks.

The National Natural Landmarks Program has been administered by NPS since May 18, 1962 with the exception of the period from January 25, 1978 to May 31, 1981 when it was administered by the former Heritage Conservation and Recreation Service.

The act designating an area as a natural landmark is not a land withdrawal and in no way affects the ownership of the site. It does not dictate the type or intensity of activity that may be undertaken in a natural landmark. Natural landmark preservation is often made possible only through the long-term commitment of public and private owners to protect an area's outstanding natural values. The Department of the Interior encourages owners and managers to protect the nationally significant values of their natural landmarks. This cooperation is voluntary and does not restrict the uses to which the land may be put. An owner who enters into a voluntary nonbinding agreement with NPS to protect a natural landmark is eligible to receive a certificate which recognizes the special status of the area. A bronze plaque may also be presented for appropriate display on the site.

Federal agencies should consider the existence and location of natural landmarks when they assess the effects of their actions on the environment under Section 102(2)(c) of the National Environmental Policy Act of 1969 (83 Stat. 852; 42 U.S.C. 4321).

NPS prepares an annual report for the Secretary of the Interior to transmit to the Congress which identifies all natural landmarks with known or anticipated damage or threats to the integrity of their resources (90 Stat. 1940; 16 U.S.C. 1a-5).

National Registry of Natural Landmarks

The National Registry of Natural Landmarks recognizes nationally significant ecological and geological features in 48 States, American Samoa, Guam, Puerto Rico, and the Virgin Islands. Of the 548 landmarks listed on the National Registry of Natural Landmarks, over one-half are administered solely by public agencies, e.g., Federal, State, county, or municipal governments. Almost one-third are owned entirely by private parties. The remaining natural landmarks are owned or administered by a mixture of public and private owners.

The following list contains all natural landmarks added to the National Registry of Natural Landmarks between March 1, 1983 and September 30, 1983. The natural landmarks are arranged alphabetically by State and county. A description of each landmark's location, natural values, designation date and ownership is provided. Each natural landmark's designation date is enclosed in parentheses. Ownership data are arranged in the following arbitrary order and do not reflect the relative amount of land owned by any party: Federal, State, County, Municipal, Private. An asterisk (*) indicates that the owner(s) of a landmark have entered into a voluntary agreement to protect the area's natural values.

Because many natural landmarks are privately owned and/or not managed for public access, landowner permission must be obtained before visits are made to these landmarks. The specific locations of some landmarks are not provided because of owner requests for minimum publicity and/or because of the fragility of the landmark's natural features.

Dated: November 22, 1983.

Russell E. Dickenson,
Director, National Park Service.

CALIFORNIA

Inyo County

*Eureka Dunes—Southern part of Eureka Valley, northwest of Death Valley National Monument. Excellent example of aeolian geological processes. Tallest dune complex in the Great Basin Natural Region of the United States. Contains grass genus listed as an endangered species and the only species capable of surviving on and stabilizing the steep dune slopes. (June 1983) Owner: Federal

NEW JERSEY

Bergen County

*Palisades of the Hudson (see New York)

NEW YORK

Rockland County

*Palisades of the Hudson—Along western bank of Hudson River from Sparkill, New York south 13 miles to below the George Washington Bridge in New Jersey. This is the best example of a thick diabase sill formation known in the United States. Columnar jointing, an olivine zone and thermal metamorphic effects are attributes found in rare combination at this site. The glaciated crest provides impressive evidence of the Pleistocene glacier. (June 1983) Owner: State

NORTH CAROLINA

Hyde County

Salyer's Ridge Natural Area—On western end of Mattamuskeet National Wildlife Refuge, 5 miles north of Swanquarter. Rare example of mature loblolly pine forest in process of succeeding to a deciduous forest. (June 1983) Owner: Federal

OKLAHOMA

Alfalfa County

*Salt Plains National Wildlife Refuge—Four miles east of Cherokee. Largest inland saline basin in the Central Lowlands Natural Region of the United States. Area is used as natural habitat by 75 percent of Nation's whooping cranes. Also one of few remaining habitats for inland least tern, snowy plover, Canadian geese and avocets in southern Central Lowlands. Important area for study of selenite crystal formation. (June 1983) Owner: Federal

TEXAS

Anderson County

Catfish Creek—20 miles northwest of Palestine. Best example of the few remaining undisturbed riparian habitats in the Western Gulf Coastal Plains. The site supports several wildlife species rarely found elsewhere in Texas. (June 1983) Owner: State

FAX (212) 216-6476
Telex 177199

Mr. Burrell Buffington
Information Services
Wildlife Resources Center
700 Troy-Schenectady Road
Latham, N.Y. 12110

Dear Mr. Buffington:

Gibbs & Hill, Inc. has been contracted by the New York State Department of Environmental Conservation to do Phase II Investigations of the following inactive hazardous waste disposal sites:

1. Constantine site, ID #546016 - Troy North, NY Quad.
2. Quaker Road, Mt. Ivy Swamp, ID #344024 - Thellis, NY Quad.
3. Schodack Landfill, ID #442023 - East Greenbush, NY Quad.
4. Ron Lyn, Inc. ID #152112 - Bay Shore West, Amityville, Greenlawn & Huntington, NY Quads.
5. Jack The Stripper, ID #401035 - Niskayuna, NY, Quad.
6. Route 146A Barrel site, ID #546024 - Plattsburgh, NY Quad.
7. Plattsburgh Municipal Lighting Dept., ID #510002 - Plattsburgh, NY, Quad.
8. Rotterdam Town Landfill, ID #447010 - Rotterdam, NY Quad.
9. Durham-Greenville Landfill, ID #420001 - Durham, NY & Greenville, NY Quads.
10. Mattituck Airbase, ID #152038 - Mattituck, NY Quad.
11. NTU Circuits, ID #152086 - Amityville, NY Quad.
12. Hazardous Waste Disposal, ID #152113 - Amityville, NY Quad.

Part of our investigations concern the potentially effected critical habitats and endangered species within a three mile radius of the sites. We need this information in order to rank the sites in the hazardous ranking system.

Included are copies of USGS Quad maps showing the exact locations of the 12 sites we are working on. For our purposes we need to know of any state or federally listed critical habitats, and any endangered species located within a three mile radius of the sites.

It would be appreciated greatly if you could send the information as soon as possible.

Thank you.

Very truly yours,

Dori Davidson
Hydrogeologist

Thomas C. Jorling
Commissioner

January 11, 1991

Dori Davidson
Gibbs & Hill, Inc.
11 Penn Plaza
New York, New York 10001

Dear Ms. Davidson:

We have reviewed the Significant Habitat Unit and the NY Natural Heritage Program files with respect to your request for biological information concerning several Phase II investigations of inactive hazardous waste disposal sites throughout New York State.

Enclosed you will find a computer printout covering the area you requested to be reviewed by our staff. The information contained in this report is confidential and may not be released to the public without permission from the Significant Habitat Unit.

Our files are continually growing as new habitats and occurrences of rare species and communities are discovered. In most cases, site-specific or comprehensive surveys for plant and animal occurrences have not been conducted. For these reasons, we can only provide data which have been assembled from our files. We cannot provide a definitive statement on the presence or absence of species, habitats or natural communities. This information should not be substituted for on-site surveys that may be required for environmental assessment.

This response applies only to known occurrences of rare animals, plants and natural communities and/or significant wildlife habitats. You should contact our regional office(s), Division of Regulatory Affairs, at the address(es) enclosed for information regarding any regulated areas or permits that may be required (e.g., regulated wetlands) under State law.

If this project is still active one year from now we recommend that you contact us again so that we may update this response.

Sincerely,

Burrell Buffington

Time: 10:40 AM

Call by: J. Sanghvi (Name) of Gibbs & Hill (Company)

Answer by: Paul Tenynhuis (Name) of Suffolk Cty Soil & Conservation District (Company)

Contract No: 5066-112

Subject discussed: Agricultural & Prime Agricultural Land in Production within the site.

SUMMARY OF DISCUSSION, DECISIONS AND COMMITMENTS.

Received the following information

(1) There is no agriculture land in production within one mile radius of the site.

(2) There is no prime agriculture land in production within two mile radius of the site.

Population Within a 4-Mile Radius

Place	Population	Mile^2	Population / Mile^2
Bethpage	16,840	3.6	4,678
E. Farmingdale	5,522	5.8	952
S. Farmingdale	16,439	2.2	7,472
Huntington	21,727	8.4	2,587
Babylon	12,388	2.5	4,955
	72,916	22.5	

Radius, mi	Area, mi^2	Population(1)	Note	
0.25	0.196	187	2	(score = 21)
0.5	0.785	748	2	(score = 18)
1.0	3.140	10,182	3	(score = 24)
2.0	12.570	40,728	3	
3.0	28.274	91,637	3	
4.0	50.265	162,910	3	(score = 21)

Note

1. Population = Area x Density
2. Density of E. Farmingdale applied
3. Average density applied
   (Total Population/Total Area = 72,916/22.5 = 3,241)

FACT SHEET
NASSAU/SUFFOLK AQUIFER SYSTEM

In response to a petition the Environmental Protection Agency (EPA) has designated the Nassau/Suffolk Aquifer System as a Sole Source Aquifer pursuant to Section 1424(e) of the Safe Drinking Water Act. As such, no commitment for Federal financial assistance may be entered into for any project which EPA determines may contaminate such aquifer through the recharge zone so as to create a significant hazard to public health.

- Petition Date:	January 21, 1975
- Petitioner:	James T.B. Tripp, Counsel Environmental Defense Fund, Inc. 162 Old Town Road East Setauket, NY 11733
- Location:	The aquifers that underlie the estern end of Long Island, New York, to include all of Nassau and Suffolk Counties.
- Aquifer Description:	Three aquifers composed of Pleistocene deposits of glaciofluvial origin (Upper Glacial) above cretaceous rocks (Magothy, and Lloyd).
- Ground Water Depth:	Depending upon location the aquifer depth will vary.
- Population:	Approximately 1.45 million persons.
- Drinking Water:	100% from Ground Water
- Population Served:	100% by PWS / 0% by Domestic Wells
- Quality:	With the exception of the Lloyd aquifer, water quality has declined, Nitrate exceeds 10 mg/l for some wells of the upper glacial aquifer.
- Vulnerability:	Vulnerability is high due to population density of the area, leaking sewer pipes, past farming practices and present lawn fertilization practices, and possible salt water encroachment.
- Designation Date:	June 21, 1978
- Citation:	43 FR 26611

Telephone Conversation Record

Date: 10/28/91

Time: 3:05 PM

Call by: J. Sanghvi (Name) of Gibbs & Hill, Inc. (Company)

Answer by: Bill Sanok (Name) of Cooperative Extension of Suffolk County (Company)

Contract No: 5066-112

Subject discussed: The source of irrigated water

SUMMARY OF DISCUSSION, DECISIONS AND COMMITMENTS

I asked Mr. Sanok about the source of water for irrigation within 3 miles of the site.

Mr. Sanok informed me that surface water is not being used within 3 mile radius of the Hazardous Waste Disposal Site.

I. IDENTIFICATION	
01 STATE	02 SITE NUMBER
NYD	037056132

II. HAZARDOUS CONDITIONS AND INCIDENTS

01 ☒ A. GROUNDWATER CONTAMINATION — 02 ☐ OBSERVED (DATE: _____) — ☒ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 310739 — 04 NARRATIVE DESCRIPTION

Groundwater is source of water sypply for an estimated 310739 people within the three mile radius.

01 ☒ B. SURFACE WATER CONTAMINATION — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 0 — 04 NARRATIVE DESCRIPTION

Massapequa creek is the nearest surface water which is used for the recreational purposes.

01 ☒ C. CONTAMINATION OF AIR — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: None — 04 NARRATIVE DESCRIPTION

Vapor discharge incident at the site producing a visible plume 150 to 200 feet high was reported to SCDHS.

01 ☒ D. FIRE/EXPLOSIVE CONDITIONS — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: None — 04 NARRATIVE DESCRIPTION

None noted during site reconnaissance.

01 ☒ E. DIRECT CONTACT — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: None — 04 NARRATIVE DESCRIPTION

None expected. Site is covered by concrete.

01 ☒ F. CONTAMINATION OF SOIL — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 AREA POTENTIALLY AFFECTED: 0.5 (Acres) — 04 NARRATIVE DESCRIPTION

Some drums containing waste were reportedly leaking during operation of HWD facilities. In addition, anlytical results showed evidence of soil contamination by organic compounds.

01 ☒ G. DRINKING WATER CONTAMINATION — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: 310739 — 04 NARRATIVE DESCRIPTION

Population using groundwater within the 3-mile radius.

01 ☒ H. WORKER EXPOSURE/INJURY — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 WORKERS POTENTIALLY AFFECTED: None — 04 NARRATIVE DESCRIPTION

None known or reported.

01 ☒ I. POPULATION EXPOSURE/INJURY — 02 ☐ OBSERVED (DATE: _____) — ☐ POTENTIAL — ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: None — 04 NARRATIVE DESCRIPTION

None known or reported.

II. HAZARDOUS CONDITIONS AND INCIDENTS (Continued)

01 ☒ J. DAMAGE TO FLORA — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

None noted or reported.

01 ☒ K. DAMAGE TO FAUNA — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION (Include name(s) of species)

None noted or reported.

01 ☒ L. CONTAMINATION OF FOOD CHAIN — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

None noted or reported.

01 ☒ M. UNSTABLE CONTAINMENT OF WASTES (Spills/Runoff/Standing liquids, Leaking drums) — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
03 POPULATION POTENTIALLY AFFECTED: _____ 04 NARRATIVE DESCRIPTION

Drums containing waste were reportedly leaking during operation of HWD facilities.

01 ☒ N. DAMAGE TO OFFSITE PROPERTY — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Note noted or reported.

01 ☒ O. CONTAMINATION OF SEWERS, STORM DRAINS, WWTPs — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

There were two storm drains on-site when HWD was in operation. Drains were connected to a drainage system which discharged water into a nearby recharge basin.

01 ☐ P. ILLEGAL/UNAUTHORIZED DUMPING — 02 ☐ OBSERVED (DATE: _____) ☐ POTENTIAL ☐ ALLEGED
04 NARRATIVE DESCRIPTION

Facility operated without permit in 1981.

Submitted to	**NYSDEC**	July, 1990

Gibbs & Hill, Inc.

CONTENTS

Phase II Work Plan

Hazardous Waste Disposal, I.D. No. 152113

Village of Farmingdale, Suffolk County

June, 1990

General:

Based on this work plan, a costing sheet is to be developed and attached by our consultant. The work plan and associated costs will be made part of this cost plus fixed fee contract with a limiting upset figure. Unless otherwise stated in this work plan, the work shall conform to the concepts of the Generic Work Plan -- State Superfund Program -- Phase II Investigations (Schedule 4, Exhibit 1) and Schedule 4, Exhibit 3, both of the contract document. As these latter documents are crucial to the proper field implementation of New York State Department of Environmental Conservation (NYSDEC) protocols, a copy of this work plan attached to Exhibits 1 and 3 of the contract must be taken to the field by the consultant's representative during the Phase II field activities. The representative must display, through his actions, thorough familiarity with the provisions of the work plan and exhibits. Failure by the consultant's representative to present these documents upon NYSDEC request or demonstration of inadequate knowledge of their contents are both sufficient ground for NYSDEC to halt the Phase II field operations.

Introduction:

The Hazardous Waste Disposal (HWD) site is a partly paved 1/2 acre lot located in the Village of Farmingdale, Suffolk County. The site is located in an industrial park, the site is surrounded by various commercial and industrial facilities. The site is owned by Little Joseph Realty, Farmingdale, New York. The previous tenant, Mr. George Lawrence of Glenwood Landing, New York, operated his company, HWD, at the site for a period of about three years. HWD was in the industrial waste scavenger business which included the transportation and storage of hazardous wastes. These wastes were contained in 55-gallon drums, large holding tanks and a sludge pit. A detailed industrial survey indicated that the HWD was operating an ammonium-hydroxide scrubbing process on an acid storage tank without a permit. The USEPA conducted a site inspection in September 1981 and identified 1900 55-gallon drums and a 2500-gallon acid tank on-site. Subsequently, HWD removed the above mentioned wastes. Two drywells/storm drains are located on the site. Since poor conditions (leaky drums and spills) has been reported, it is possible that runoff containing spilled wastes were collected by the onsite drywells and emptied into a nearby recharge basin or sump along with wastes from other areas of the industrial sites.

The site is characterized by a relatively flat topography. The HWD site is underlain by approximately 1300 feet of unconsolidated glacial deposits of Pleistocene age and coastal-plain deposits of continental and marine origin of late Cretaceous age. These deposits made up of gravel, sand, silt and clay are underlain by Paleozoic and/or Precambrian bedrock composed mostly of schist and gneiss. Bedrock, due to its low permeability, is considered the base of the ground-water reservoir on Long Island (Pluhowski, et.al 1964 and Jensen, et.al. 1974). The Lloyd aquifer, the Raritan clay, the Magothy aquifer and the Upper Glacial aquifer are the four hydrostratigraphic units which comprise the unconsolidated deposits overlying bedrock. The Lloyd aquifer lies directly on the bedrock surface and is the lowermost water-bearing zone in the ground-water reservoir. This deep artesian aquifer is composed of light-colored sand and gravel with lenses of clay and silty clay. The altitude of the top of the Lloyd in the area of study is approximately 900 feet below sea level (Jensen, 1974 and Pluhowski, et.al. 1964). The Raritan clay consists predominately of clay with varying amounts of silt and sand, and acts as an effective confining unit for the underlying Lloyd aquifer (Pluhowski, et.al. 1964). In the study area (within a 3-mile radius of the site) the Raritan is about 100 feet in thickness with the upper surface of the unit about 800 feet below sea level (Jensen, et.al. 1974). Situated above the Raritan clay is an upper Cretaceous unit composed of permeable lenticular deposits of sand, gravel and clay referred to as the Magothy aquifer. Below the site area the thickness of the Magothy is approximately 900 feet (Jensen, et.al. 1974). The uppermost zone of the ground-water reservoir is the Upper Glacial aquifer. This unconfined unit lies unconformably on the Magothy and consists of highly permeable upper Pleistocene deposits of sand and gravel. The lower boundary of the Upper Glacial aquifer depends on the presence of low permeable lenses of silt and clay in the Magothy aquifer. However, where the upper Magothy consists of permeable deposits, the Upper Glacial and the Magothy aquifers are considered hydraulically connected (Pluhowski, et.al. 1964).

Highly permeable outwash deposits of sand and gravel in the upper part of the principal aquifer (Upper Glacial deposits) yield as much as as 1,500 gallons per minute (gpm) with specific capacities commonly 40 to 75 gpm per foot of drawdown. Wells screened in the impermeable to highly permeable Magothy aquifer yield as much as 1,500 gpm with specific capacities ranging from 1 to 49 gpm per foot of drawdown (Pluhowski, et.al. 1964). Regional ground-water flow is south to southeast, away from the topographic and water-table high to the north. Lateral movement of groundwater within the principal aquifer in the study area will mimic the regional flow direction (Donaldson, et.al. 1979). Located within a 3-mile radius of the site are over 20 public-supply wells and numerous observation wells. These wells are screened both in the Upper Glacial and Magothy aquifers. Downgradient (direction of ground-water movement), about 1-3/4 miles southeast of the site, a pumping well (S66556) is located. Two public-supply wells (NYSDEC #20041 and 20042) are located approximately 1400 feet to the northwest (upgradient) of the site. In 1961, the depth to water recorded in both wells was 25 feet below land surface (Krulikas, R.K. 1981).

Plukowski, J.J. "Hydrology of the Bablyon-Islip Area, Suffolk Co., LI, NY" USGS Water Supply Paper No. 1978 (1964)

Krulikas, R.K., "Hydrogeologic Data from selected wells & Test Holes in Suffolk Co, LI, NY, 1972-80", USGS Open-file report81-500 (1981)

Objectives:

The objective of this Phase II investigation is to collect essential field information required to adequately document the disposal of hazardous waste as defined by 6 NYCRR, Part 371 by direct and indirect evidence and determine whether a significant threat to human health or environment exists, to prepare final Hazard Ranking System (HRS) scores and make recommendations for future actions at the site. Specifically, this will be accomplished by a thorough geophysical investigation, drilling of test borings, installation of groundwater monitoring wells and sampling and analysis of groundwater, surface water, soil, wastes and sediments (where any or all of these media are applicable).

For the purpose of report preparation, the consultant is to compile all data available from the NY State Department of Environmental Conservation and various other agencies including the Phase I report data, which contains a record search of the data sources of various other agencies.

Site Reconnaissance:

A site investigation was conducted by NYSDEC personnel on March 28, 1990. The purpose of the site inspection was to locate the proposed wells and sampling locations. Based on the inspection, a site sketch was prepared showing the proposed boring, wells and sampling locations (Figure 2). Careful examination of the site was made to identify possible access problems for the drilling, sampling activities, preliminary siting of groundwater monitoring wells, and tentative locations for surface water, soil, leachate or waste samples. No access problem for a drilling rig is anticipated. Exact location of all buried power lines, underground gaslines, water mains, sewer lines and storm water pipes, if any, must be obtained by the consultant from the appropriate utility and/or municipal department prior to the arrival of the drill rig and commencement of drilling.

Field Investigation:

The project has been subdivided into specific tasks. Table 1 briefly summarizes each task. Field efforts required to complete this investigation are described as follows:

1. Geophysical Survey:

   The use of geophysical surveys has been established in the Bureau of Hazardous Site Control's Generic Phase II Workplan. The broad considerations are:

   a. location of buried materials
   b. determination of the presence of contaminant plumes
   c. characterization of subsurface conditions.

There are complexities involved in detecting contaminants at a given site and the Bureau's staff should determine if a geophysical survey is needed. Where a survey is needed, the consultant must determine the best geophysical method for meeting the goals of the investigation, and submit a workplan for the Bureau's review.

Generally, the goals of a geophysical survey are:

- to determine existence of contaminant plumes
- to optimize location and number of monitoring wells
- to reduce risks associated with drilling into unknown terrain and waste
- to reduce overall project time and cost, and to improve accuracy of and confidence in the project
- to determine the thickness of and depth to layers of soil and rock
- to determine the depth to water table
- to determine the existence of buried waste and its vertical and horizontal boundaries
- to determine of lateral and vertical anomalies
- to determine direction of groundwater flow

If geophysics is to be performed at the site, the exact method must be specified by the consultant and a workplan prepared by the consultant and submitted to NYSDEC for review. At this site, NYSDEC does not recommend a geophysical survey, but recommends that proposed well locations be screened with magnetometer.

2. Soil gas survey: Due to the size of the site, nature of operation and number of soil borings and monitoring wells planned, it is determined that soil gas survey is not needed for this site.

3. Test Boring and Well Installation:

   Monitoring wells will be installed to provide data pertinent to both water chemistry and characterization of the stratigraphy and groundwater regime at the site. It is anticipatd that four two-inch diameter monitoring wells will be installed at the approximate locations shown in Figure 2. In addition, five on-site test borings will be done up to a depth of 10 feet at the suspected disposal area and five soil samples will be collected for a chemical analysis at a depth of 10 feet or at a point of visible soil contamination, whichever is reached first.

   Based on what is presently known, it appears that the test borings and wells will be completed in overburden. It is anticipated that a 6-1/4" I.D. hollow stem auger will be used in the unconsolidated material.

   A PID (Photoionization detector, e.g. an HNu), an explosimeter to measure lower explosive level and oxygen level, and a dosimeter must be used during all boring activity. A magnetometer must be used to screen for metallic objects at each boring location.

Bolt-on centralizers, one per well, with stainless steel bolts must be used at the base of each screen. This should aid in obtaining plumb alignment for the wells and assure that the sand pack is of uniform radial thickness.

All drill cuttings should be drumed and disposed appropriately.

Installation of the bentonite seal above the groundwater table during monitoring well construction shall be done in accordance with the following. After installation of the filter pack, a slurry of bentonite powder and water mixed to the consistency of pudding (approximately 5 lbs. bentonite powder per 4 gallons of water) shall be pumped into the working space of the well with side discharge tremie pipe. The working space of the well is defined as the space between the outside diameter of the riser pipe and the inside diameter of the casing or augers. A quantity of slurry sufficient to fill the annular space of the boring to one foot above the filter pack is needed. Bentonite pellets should then be added to complete the seal to two feet above the filter pack with continuous measurements of the level. The bentonite pellets must be hydrated before adding grout. The amount of water added to hydrate the pellets and time allowed for hydration shall be determined from the manufacturers recommendations or a slow flowing stream of water should be introduced for one hour. In any event the water should be added continuously during the period of hydration. When the pellets have been given sufficient time to hydrate, a measurement of the thickness of bentonite seal should be taken. Then the grout may be pumped into the working space of the well using a side discharge tremie pipe. Periodic measurement of the grout level should be made during the addition of bentonite grout for every 10 feet rise in the grout level. Well construction should adhere to the NYSDEC protocols enumerated in Exhibit 3 of the consultant contract and also in the Phase II investigation Generic Work Plan. These protocols govern not only well installation and development, but also the proper procedures in regard to decontamination of drilling equipment, split spoon samples, and all downhole materials. The consultant will provide an experienced geologist, engineer or adequately experienced technical staff to be on-site at all times to ensure that these procedures are carried out. The well logs shall be completed by the consultant and submitted with the report. After the development of the well and during sampling, the turbidity of the water from the well shall not exceed 50 NTU's for entire water column in the well.

Each well will be developed as soon as its recovery is complete, but no sooner than 24 hours after construction is finished. The development method used should be powerful enough in pumping rate and pressure to dislodge and remove all fine particles from the

sandpack to achieve the desired low turbidity water. After the development of the well and during sampling, the turbidity of the water from the well shall not exceed 50 NTU's (Nephelometric Turbidity Units) for the entire water column in the well. If the above criteria is not met within two hours, well development must cease and the NYSDEC representative contacted to determine how to proceed. For costing purposes, allow four hours of development per well.

The consultant shall provide cost for additional work associated with performing a downhole geophysical analysis of one down gradient monitoring well location.

The goal is to screen the wells in an area of contamination (e.g. a plume) as evidenced by the downhole geophysical data. The consultant shall provide a contingency cost for additional work associated with performing this survey which will include the following. The drill rig will be set up a minimum of 5 ft. and a maximum of 10 ft. from one of the proposed downgradient monitoring well locations. A borehole will then be advanced to a maximum of 75 feet or a confining layer which ever comes first, with split spoon samples taken at 5 ft. intervals unless otherwise specified by the NYSDEC on-site representative. Two-inch threaded flush joint PVC will then be installed to the full depth of the hole, and the annular space will be pressure-grouted to the surface as the augers are removed. NYSDEC personnel will then log the hole through the PVC casing (approximately 1/2 hour). A steel protective casing with locking cap shall then be placed at the surface to secure the borehole for possible future use. Split spoon samples at the adjacent well site will not be necessary, and split spoon sampling intervals for the remaining well sites will be determined from the lithologies encountered in this trial hole. Well depth estimates given in Table 2 are in accordance with the maximum footage applied to the trial hole for downhole geophysics and thus may be overestimations. Should the downhole geophysical survey reveal nothing, the wells are to be screened so as to sample the upper 10 ft. of groundwater.

It will be the responsibility of the consultant to arrange for the appropriate drilling equipment to be present at the site. Standby time to arrange for additional equipment or a water supply will not be allowed unless caused by unexpected site conditions.

Prior to initiating drilling activities, the drilling rig, augers, split spoons, pertinent equipment, well pipe and screens will be steam cleaned. This cleaning procedure will also be used between each boring. These activities will be performed in a designated on-site decontamination area.

Throughout and after the cleaning processes, direct contact between the equipment and the ground surface will not be permitted. Clean support structures, such as wooden pallets or sawhorses, will be used for the staging of equipment. The drill rig and all equipment will be steam cleaned upon completion of the investigation and prior to leaving the site.

If the borings are not completed as wells the same day they are drilled a mechanism to safeguard their integrity must be devised. The consultant will provide NYSDEC with their plan for this contingency.

During the drilling, a photoionization detector (PID), e.g. HNu or Flame Ionization detector, e.g. OVA will be used to monitor the gases exiting the borehole. Cuttings will be contained if PID meter readings are greater than 5 ppm or the cuttings show visible evidence of contamination. The drilling operation must also be concurrently monitored with an explosimeter/oxygen meter. Soil samples will be collected using a two-inch outside diameter split-spoon sampler advanced in accordance with the standard penetration test procedure (ASTM D-1585). The split spoon sampler will be cleaned prior to each use by one of the following procedures:

- initially cleaned of all foreign matter
- sanitized with a steam cleaner
- rinsed with deionized water (if sample is to be collected for chemical analysis)

OR

- initially cleaned of all foreign matters
- washed with a detergent and water mixture
- rinsed with potable water
- rinsed with 10 percent nitric acid (only if the split spoon sampler is made of stainless steel)
- rinsed with methanol (pesticide grade)
- rinsed with hexane (pesticide grade)
- rinsed with distilled water
- allowed to air dry

A photoionization detector will be used to monitor the gases from each sample as the split spoon sampler is opened. Samples for chemical analysis will be secured should the PID read 5 ppm or greater for any sample. All samples will be placed in precleaned, teflon-lined screw cap glass jars. Samples will be delivered, under chain of custody control, to the designated NYSDEC technically acceptable laboratory.

The split spoon soil samples will normally be taken at five foot intervals. The sampling device will be decontaminated by the above described procedure prior to each sample. Additional samples will be collected where major changes in lithology occur or as deemed necessary by the supervising geologist or engineer. Additional samples can also be requested by the NYSDEC onsite representative at a pre-agreed upon cost per sample basis. A grainsize analysis for non-cohesive materials and an Atterberg limits analysis for cohesive materials will be conducted for each separte soil unit in each well and within the screen interval. If a mixture of cohesive and non-cohesive materials is encountered, only a grain size analysis will be performed. Hydrometer analysis will also be performed on soils if twenty (20) or more percent of the sample passes the No. 200 sieve size. For costing purposes, two grain size analyses should be assumed per boring, depending upon the lithlogy encountered.

All drilling oprations shall be documented by the consultant's on-site representative in accordance with Schedule 4, Exhibit 3, Section II, C9.

Well development will be performed using air surge, a pump, or bottom discharge bailer at each well no sooner than twenty-four (24) hours after the well grouting has been completed or after its recovery is completed (whichever is later). Care must be taken that the device used does not cause cross-contamination of the wells. Where air is used, the compressor must have a recently installed and effective high efficiency carbon filter. Other methods of development will be allowed only if included in the consultant's QA/QC manual and approved by the DEC.

Prior to water and sediment evacuation, static water level and well bottom measurements will be recorded at each well using an electric level sounder or chalked fibreglass or steel tape. These tools will be cleaned prior to and after each use with a steam cleaner or wash procedure as outlined for the split spoons. The well water/sediment volume will also be calculated. Well evacuation will be supplemented by:

- Temperature, pH, and specific conductance measurements
- Evacuation volume measurements
- Measure of water clarity (goal of 50 NTU's) and visual observation of color
- Visual identification of the physical characteristics of removed sediments

The development process will continue until a stabilization of pH, specific conductance, temperature, and clarity of the discharge is achieved. Water levels will be recorded at the completion of development. If a Department representative is not present when the measurements are taken, a signed statement will be provided to the Department that the turbidity was equal to or less than 50 Nephelometric Turbidity Units (NTU) for each well immediately after development.

Permeability testing of the newly installed monitoring wells will be conducted following development. Initial static water level measurements will be made in each well followed by the introduction of a weighted slug of specific volume. An instantaneous head displacement associated with the slug volume will be created and the subsequent decline in water level will be measured with an electronic water level sounder. Once head conditions reach a static state, the slug will be removed and a negative head condition will result relative to the initial state water level. The subsequent rise in water level will be measured with an electronic water level sounder. Data analysis will involve the determination of the coefficient of permeability.

The testing will provide data to be used in the final HRS scoring. This data will be useful in estimating the rate of groundwater flow in the vicinity of the monitoring wells and in evaluating potential migration pathways, potential targets and conceptual remedial activities.

A temporary staff gauge or other surface water elevation measuring device will be established on any nearby surface water body, if any, which may significantly influence groundwater movement. The surface elevation of these water bodies will be checked whenever groundwater elevations are measured.

Surveying and Mapping:

To facilitate accurate water level measurements, a licensed professional land surveyor will be used to establish the locations and elevations of each of the monitoring wells as follows:

- Vertical Control: Elevation measurements will be made to the top of the well casing to the nearest 0.01 foot and the ground surface adjacent to the well to the nearest 0.01 foot. Preliminary measurements will also be made when necessary to assist in placement of downgradient wells. Elevation will be determined relative to a USGS benchmark, or to a permanent immovable site-specific datum if a bench mark is not available within 200 ft.

- Horizontal Control: Wells will be located by ties (location and distance) to at least two nearby permanent objects. The distance between wells will be measured to a foot accuracy. All suficial sampling points and significant site features must be shown on the final site map. USGS benchmarks will be used whenever available. All sampling points will be surveyed to determine relative location.

4. Sampling and analysis:

Four groundwater samples, four surface water samples, four sediment samples and six soil samples should be collected at the locations and depths described in Table 2. Analysis should be performed as detailed in Table 3. If the total metals concentration in the onsite soil and sediment samples are higher than twenty times the maximum concentration for characteristic of EP Toxicity for that metal then it may be necessary to run EP Tox test for that sample. So the soil samples should be preserved for future EP Tox analysis. NYSDEC should be consulted to discuss the need for EP Tox analysis once the total metals results are known.

Sampling and chemical analyses will be performed by the consultant. Field QA/QC Protocol for sample collection and for sample integrity from the field to the laboratory shall be submitted by the consultant. This includes split spoon samples for chemical analysis when it is known or observed that soils are contaminated. When sampling is requested, the consultant must follow the QA/QC and chain-of-custody protocols as referred to in the Generic Wrok Plan and as described in the New York State Services Protocol (ASP) September 1989.

Where determined by NYSDEC or the consultant's field representative that chemical analysis are required for soil samples from well drilling activities, the consultant must be prepared to obtain such samples for shipment to a laboratory. Pricing for this activity must be included. For costing purposes, assume one sample per well for analysis.

All samples for chemical analyses shall be delivered to the laboratory within 24 hours of their collection. Express courier service shall be used to transport the samples, unless the laboratory is close enough to the site for the consultant to make direct delivery.

Where dilution of any Phase II sample is to be done by the chemical analytical laboratory prior to analysis, NYSDEC is to be advised immediately. The concern is that a component of low concentration, but of significant environmental impact, could become so diluted that its presence in the final extract will not be detected.

During this contract, the NYSDEC chemist will discuss alternatives with the laboratory's chemist on how best to conduct the analysis. NYSDEC's chemist is Mr. John Rankin, telephone (518) 457-3252.

Although a method or extra work may be agreed upon by both chemists, clearance for any extra cost must be obtained by the consultant from the NYSDEC contract manager. Such cost will be paid from the contingency amount in the contract, and clearance must be confirmed by NYSDEC in writing.

The consultant shall provide an estimate of the cost for sub-contracting the task of reviewing the CLP QA/QC documents by an independent laboratory not involved with the Phase II investigations under this contract.

Air monitoring, consisting of a perimeter survey with a photoionization instrument such as HNU or OVA shall occur upon arrival at the site. A survey within the boundary of the site shall follow the perimeter survey. The air samples should be taken in the ambient air and in the "breathing zone," normally 4-6 feet above the ground surface. Continuous readings or individual readings at nodal points on a grid pattern throughout the site will be made. This air monitoring is separate from monitoring that is part of the health and safety plan. If a source of air contamination is identified, the air should be sampled using the appropriate equipment to determine the nature and concentration of the contaminant. Upwind air samples must also be analyzed at the same time. Wind direction must be continuously monitored and documented during any sampling and on-site analysis of air samples.

Health and Safety Plan

A site-specific Health and Safety Plan must be developed and followed for each site. A copy of the Health and Safety Plan shall be submitted to NYSDEC.

Health and safety apparel and equipment are expected to be required during the major field activities - initial site investigation, geophysical study, drilling and monitoring well installation, and sampling. For the purpose of costing the investigation, Level D protection is assumed with Level C as back up. The health and safety precautions and procedures will conform to the consultant's generalized Health and Safety Plan. Should protective levels higher than Level D be required for any activity, the consultant shall prepare a site-specific health and safety plan appropriate for the level of protection required.

Report Preparation

Report preparation will involve analysis of the data as well as preparation of the text. Included in this task are the compilation and organization of the data, editing of boring logs, reduction of hydrologic data, preparation of graphical representations, analysis, and calculations, and updating the HRS score for the site. The report shall follow the format detailed in the Generic Phase II Work Plan. Four copies of the draft report shall be submitted. A revised draft will be submitted to the NYSDEC within five weeks of the receipt of the Department's comments on the draft report. Fourteen copies of the final report will be submitted once the revised report is considered acceptable. Draft and final reports must bear the stamp of a professional engineer in accordance with Article 49.

Quality Assurance/Quality Control

The QA requirements for the Phase II investigation must be addressed. Sample control forms attached to the contract amendment as Exhibit 1 must be supplied to the analytical laboratory for completion and inclusion with the data package. The Quality Assurance/Quality Control Plan will be submitted as a separate document.

Table 1
Phase II Work Plan - Task Description
Hazardous Waste Disposal, I.D. No. 152113

Tasks	Description
Task	
II-A Prepare and update work plan	Will be done by NYSDEC
II-B Conduct records search/data compilation	Review all available information.
II-C Site reconnaissance	Collaborate NYSDEC information regarding locations of proposed monitoring wells and test borings, terrain for accessibility by drill rigs, suitability for geophysical surveys and appropriate locations of sampling points.
II-D Conduct geophysical studies	Based on the study (where applicable) revise the location of monitoring wells, if needed which shall be approved by NYSDEC.
II-E Soil Gas Survey	Conduct soil gas analysis (when specified in the text). Based on the soil gas and geophysical studies, revise the location of monitoring wells and test borings, if needed, for approval by NYSDEC.
II-F 1. Install monitoring wells	Install four wells. Wells will be constructed of two-inch PVC pipe.
2. Soil samples during drilling	During drilling, soil samples collected at five-foot intervals, and at changes in lithologies. Perform grain size analysis and Atterberg limits. Where determined by NYSDEC or the consultant's field representative that chemical analyses are required for soil samples from well drilling activities, collect soil sample for chemical analyses. For costing purpose, assume one

	analyses per well. In addition, five soil samples from five borings at the suspected disposal area should be collected at an approximate depth of 10 feet or at a point of visible soil contamination, whichever is reached first.
II-G Surveying	Surveying of the site including monitoring well locations will be done in accordance with Section C.10 of Exhibit 3.
II-H Perform sampling and analysis	Refer to Table 3 and "Sampling and Analysis".
ASP QA/QC documentation	To be reviewed by a sub-contracting laboratory not involved with this contract.
II-I Report preparation	A site contamination assessment will be conducted to complete the final HRS and HRS documentation records.
	Prepare final reports containing significant Phase I information, additional field data, final HRS and HRS documentation records and site assessments.
II-J Project Management	Project coordination, administration and reporting.

Table 2

Phase II Work Plan - Sampling Summaries

Hazardous Waste Disposal, Site I.D. No. 152113

Designation	Location	Aquifer Screened	Approximate Boring Depth (ft.)

Air			
As per section 4 of the Work Plan.			

NOTE: Locations, aquifer screened, approximate boring depth listed are based on existing data. These criteria may change based on the results of the geophysical surveys and/or field conditions.

Table 3

Analyses - Hazardous Waste Disposal, I.D. #152113

	Type of Analysis[1]						
	TCL[2] Metals	TCL[2] Volatiles	TCL[4] Semi-Volatiles	TCL[5] Pesticides/ PCBs	EP TOX	REACT-IVITY	Mat/Spike Dup.[6]
Groundwater[7]	5	5	5	5	--	--	1/1
Surface Water	4	4	4	4	--	--	1/1
Sediment	4	4	4	4	--	--	1/1
Soil (well borings)	4	4	4	4	--	--	---
Soil (borings)	5	5	5	5	5*	5*	1/1
Field Blank	1	1	1	1	--	--	---
Trip Blank	---	1	---	---	--	--	---
Background Soil	1	1	1	1	--	--	---

(1) Complete identification per NYSDEC Generic Work Plan, Section 3(b)(ii)(B). Field pH, conductivity temperature measurements will be conducted on all water samples. Also, pH, specific conductance, Chemical Oxygen Demand (COD), Total Dissolved Solids (TDS), and Total Suspended Solids (TSS) measurements will be made at the laboratory for all water samples.

(2) TCL (Target Compound List, formerly known as Hazardous Substances List) Inorganics - preparation and analysis of the 15 Task 1 and 9 Task 2 inorganic compounds using the specified ASP methods.

(3) TCL Volatiles - Preparation and analysis using the ASP specified GC/MS method for TCL purgeable organics plus a library search for and the quantification of any additional non-TCL compounds (the ASP requires the library search only for the 10 non-TCL compounds of largest apparent concentration).

(4) TCL Semi-Volatiles - Preparation and Analysis using the ASP specified GC/MS method for TCL Extractable Base/Neutral and Acid Organic ompounds plus a library search for and the quantification of any additional non-TCL compounds (the ASP requires the library search only for the 20 non-TCL compounds of largest apparent concentration).

(5) TCL Pesticides/PCBs - Preparation and pre-extraction of the TCL organochloride pesticides and polychlorinated biphenyls using the ASP specified GC-ECD method.

(6) Superfund and Analytical Services Protocol, September 1989, requires at least one spiked sample analysis and one duplicate sample analysis from each group of samples of a similar matrix type for each case of samples or for each 20 samples received, whichever is more frequent.

(7) A duplicate groundwater sample must be obtained from a monitoring well chosen at random (or some other medium if wells are not available). That duplicate sample must not be identified as a duplicate to the laboratory, but must be assigned an identifier similar to other groundwater samples.

The Bureau requires the blind analysis of a duplicate sample for each site by the laboratory, to confirm the integrity of all sampling and analytical activities.

(8) Where applicable samples will also be analyzed for EP (Toxicity), corrosivity (pH), ignitability and reactivity to determine whether they are characteristic hazardous waste.

--- Designates that samples are not to be analyzed for that parameter.

* Analysis will be done for the soil sample collected from the on site borings.

Farmingdale, NY 11735
(516) 249-3400

Mr. Joseph Picone Jr.
Little Joseph Realty
1637 Borad Hollow Road
Farmingdale, NY 11735
516/249-3400

Directions to Site

Take LIE to Exit 49S, Rt. 110 South
Proceed to Hempstead Turnpike and make a U-turn.
Head North 1 block and make a right at Picone Boulevard.
Continue to the end of road, site is on left side.

Adjoining Site Owners

N/A

Site Changes Since DEC Site Reconnaissance

None.

Recommended Relocation of Monitoring Well(s)

MW-1 No Change
MW-4 Recommended relocation of MW-4 northward. See site sketch.

Based on a telephone conversation with Mr. Dave Obrig, SCDHS, the discharge basin north of the site is a suspected area of contamination. Well MW-4 has been located to intercept the groundwater exiting the discharge basin area. Based on the topography and regional groundwater flow patterns, local groundwater flow is expected to be south-southeast.

MW-2 No Change
MW-3 No Change

Recommended Relocation of Soil Samples

B-1 through B-6: No Change

Note: Borings are located in a concrete paved area. Concrete must be broken in order to perform sampling.

Recommended Relocation of Sampling

SW-1/SD-1 No Change
SW-2/SD-2 No Change
SW-3/SD-3 No Change
SW-4/SD-4 No Change

No water observed in dry wells. If water is present in wells during time of sampling, then samples SW-3 and SW-4 will be taken.

Drilling Rig Access to Well Locations

Drilling rig can access all well locations by Picone Boulevard and Sherwood Avenue.

Usable Potable Water Source

There is a hydrant located next to the site on Picone Boulevard. In order to use this hydrant, a permit must be acquired from East Farmingdale Water District.

On the day drilling commences, a $25.00 check must be hand-delivered and made out to the aforementioned district. Other items which must be presented to the Water District are as follows:

A reduced pressure valve

A current test taken on a pressure valve.

The water district is located two blocks north of the site on Gazza Boulevard.

Contact Person: John Ferrari
East Farmingdale Water District
72 Gazza Boulevard
East Farmingdale, NY 11735
516/249-4211

Placement of Drilled Cuttings

It is not recommended that well cuttings and water from monitoring well installation and development be drummed.

Changes to Site Sketch

Addition of telephone and electrical lines and buildings.

Survey with H&S Monitoring Instruments

No meter readings above background level recorded.

Magnetometer Survey

Results of survey were inconclusive due to the presence of stored metal materials, trucks and presumed metal reinforced concrete pavement.

Other Relevant Information

Owner is not cooperative.

IV. DRILLING PROTOCOLS

DRILLING SUMMARIES

- **Well Data**

Well No.	Aquifer Screened	Approximate Boring Depth, ft.	Notes
MW-1	Overburden	75+	
MW-2	Overburden	75+	
MW-3	Overburden	75+	
MW-4	Overburden	75+	

Remarks: (1) Screen Length: ft. 10

See Attachment I

- **Soil Samples During Drilling**

Split Spoon Sample: At 5-foot intervals from each well.

Grain Size Analysis: Two per well (see attached).

Atterberg Limits: Two per well (see attached).

- **Bedrock Core Sample:**

Drilling Cutting Samples: See attached.

- **Drumming of Cuttings and Fluids:** Not recommended.

ATTACHMENT

DRILLING SAMPLES

SPLIT SPOON SAMPLES

A maximum of one split spoon sample will be taken from each monitoring well for chemical analysis. The selection of each sample will be determined as follows:

1. A PID reading shall be recorded for each split spoon sample from each well. Measurements will be taken as close as possible to the sample.

2. If the PID reading of the sample is less than 5.0 units, then the sample shall be discarded in the same manner as the drilling cuttings.

   If the PID reading of the sample is greater than or equal to 5.0 units, then the sample shall be placed in an appropriate container for possible chemical analysis.

3. If all samples obtained from the installation of a well have PID readings less than 5.0 units, then no sample from that well shall be submitted to the laboratory for chemical analysis.

   If one sample obtained from the installation of a well has a PID reading greater than or equal to 5.0 units, then that sample from that well shall be submitted to the laboratory for chemical analysis.

   If more than one sample obtained from the installation of a well has a PID reading greater than or equal to 5.0 units, then that sample from that well that had the greatest reading shall be submitted to the laboratory for chemical analysis. All other samples shall be discarded in the same manner as the drilling cuttings.

Those samples sent to the laboratory for analysis shall not be accompanied by a trip or field blank. The laboratory analysis of these samples shall not include a matrix spike or duplicate.

GRAIN SIZE SAMPLES

Two soil samples shall be collected from each monitoring well to be analyzed for grain size distribution and Atterberg limits (if applicable). These samples shall be taken from the last split spoon sample of each well and from a depth representative of the lithology.

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
ROUND 5 PHASE II SITE INVESTIGATIONS

GIBBS & HILL JOB NO. 5066

MINUTES OF MEETING

DATE: April 13, 1990

PLACE: Gibbs & Hill, New York City Office

PRESENT:

NYSDEC - John Swartwout
Larry Alden
(518)457-0639

ROUX - Jim Worrall
(203)798-6969

AAC - Doug Harm
Perry Refolo
(201)290-7800

ADC - George Carabetta, Jr.
(203)630-1073

EMPIRE - Rich Donnelly
(518)783-1555

G&H - Norman Hinsey
Chris Grande
Alex Kostic
Jayesh Sanghvi
(212)216-7839

YEC - Ed Chen
(914)268-3203

GRB - Rose Barbour
((516)754-5231

SUBJECT: Kickoff meeting to discuss project objectives and clarify project procedures.

Mr. Hinsey described the project organization as follows:

Prime Consultant:	Gibbs & Hill
Subconsultant/Team Memeber:	Roux Associates
Subconsultants(M/WBE):	Aguilar Associates and Consultants
	GRB Environmental Services
	YEC, Inc.
Subcontractors:	Drilling
	Associated Drilling Co., Inc.
	Empire Soils Investigations, Inc.
	Soil Gas Survey
	Layne Geosciences, Inc.
	Surveyor
	Storch Associates
	Grain Size Analysis
	Empire Soils Investigations, Inc.
	Sample Analysis
	H2M Labs, Inc.
	Data Validation
	Aquatec
	Drilling Cuttings Disposal
	Chemical Management Inc.

The M/WBE Subconsultants are free to select their own subcontractors as long as NYSDEC procedures are followed (solicit three written quotes for work less than $10,000 and five written quotes for work greater than $10,000). NYSDEC permits subconsultants to utilize the prime consultant subcontractors as long as the same prices and scope are maintained. Gibbs & Hill will make available to each subconsultant the subcontractor agreements for reference.

Mr. Alden made the following points concerning what NYSDEC expects to accomplish with a Phase II Investigation:

identification of hazardous wastes (RCRA defined) present at the site,

identification of contravened standards for determination of the risk to human health and the environment.

Mr. Alden also clarified the following items:

The assessment of site contamination should be made utilizing the RCRA definition of hazardous waste (the definition recognized by NYSDEC). However, the HRS score should be prepared based on the CERCLA definition of a hazardous substance (the definition recognized by EPA for scoring purposes). In most instances, contaminants fall under both definitions but several metals, notably iron and manganese, are hazardous under CERCLA but not under RCRA.

Conclusions provided in the final report for each site should indicate:

whether enough data have been collected to prepare the final HRS score, and if not, what remains to be determined,

whether contaminants are determined to be present at the site and/or are found to be migrating into the groundwater, surface water and air, and if so

whether further investigations are recommended.

The NYSDEC is responsible for determining whether the site will be delisted or reclassified. The conclusions presented in the report should not be specific concerning methods or techniques or employ terms such as RI or FS which infer a decision concerning the status of the site.

Phase I reports should not be considered infallible and any errors should be corrected in the Phase II report. The Phase I report should not be used as a reference, the original reference cited in the Phase I report should be included in the Phase II report.

The most recent maps and data should be used when preparing the Phase II report. Sources of information identified in the Phase I report should be contacted to determine if any new information has become available since the Phase I investigation was completed.

Work plans prepared by NYSDEC, that formed the basis of the cost estimates prepared for each site, should be updated and/or corrected to reflect any site changes or new information.

The cost estimates for each individual task are considered firm unless extraordinary site conditions are encountered.

The most recent allowable maximum overnight travel rates issued by the NYS Comptroller are as listed in Exhibit F of the NYSDEC-G&H contract, Schedule B of Bulletin 137A.

Concerning drilling procedures and guidelines, the following items were agreed to by the attendees:

Water used for steam cleaning and drilling activities must be obtained from a public potable water source but need not be analyzed for contamination before use.

Drilling equipment decontamination with a steam cleaner should be preceded by mechanical cleaning and washing. The NYSDEC will reimburse the driller for the time required to perform both these operations provided this time is reasonable and effectively spent.

Time required to clean equipment contaminated by the driller (i.e. hydraulic oils spills, etc.) is not a reimbursable item.

If action levels are encountered that necessitate an increase in PPE from level D, work will stop and NYSDEC will be contacted to approve any further activities. Standby time in this instance will be reimbursable to the driller.

Riser and screens must be steam cleaned prior to use regardless of the manner in which they may have been packaged.

Split spoon samplers need only be rinsed with potable water between samples collected from each well. However, these items must be steam cleaned before being used on the next well.

As long as the driller can insure that a bentonite seal can be properly placed above the sand pack without being compromised by bridging, a slurry layer of bentonite need not be placed in the well.

The present decontamination procedure, when steam cleaning is not possible or practical, approved by NYSDEC is as follows:

1. detergent wash
2. potable water rinse
3. menthanol rinse
4. hexane rinse
5. deionized water rinse
6. air dry

The recipe for cement-bentonite grout is 94 lb cement (one bag), 5 lb bentonite powder, 6 1/2 gal water.

Equipment should be decontaminated above the ground, preferably on saw horses. Clean equipment should be placed apart from the cleaning area on clean pallets. Clean equipment should be moved in such a manner as to avoid contamination (e.g. handled with clean hands or wrapped in plastic and transported in a clean truck).

Submersible centrifugal pumps are permitted for downhole development provided it can be demonstrated that the decontamination of the pump will prohibit cross contamination between wells.

ATTACHMENT 1

The installation of monitoring wells shall adhere to the procedures of this attachment. Deviation from these procedures shall be permitted only after prior approval has been granted by the New York State Department of Environmental Conservation (NYSDEC). The provisions of NYSDEC "Division Technical/Administrative Guidance Memorandum: Phase II Investigation Oversight Guidance," (TAGM), dated May 9, 1988 and NYSDEC "Exhibit 3; Guidelines for Exploratory Boring, Monitoring Wells Installation, and Documentation of these Activities," (Exhibit 3), shall also apply to the installation of monitoring wells. In cases of conflict, this Attachment shall have precedence over the TAGM and Exhibit 3, and the TAGM shall have precedence over Exhibit 3.

ALL WELLS AND BORINGS

1. The Engineer, during the initial site reconnaissance, determines the the owner or owner's representativeof the nearest source of potable water suitable for drilling activities. The driller is responsible for contacting the appropriate person to arrange for obtaining water required during drilling. The driller is responsible for obtaining all required permits and providing all required hoses, valves and connections. Charges for permits or for water are considered reimbursable costs.

2. The Engineer, during the initial site reconnaissance, evaluates drilling rig accessibility to each well and boring location. The driller is provided with this evaluation, however the driller is solely responsible for assessing and providing equipment suitable for each location. In cases where special equipment (bulldozers, etc.) is required to provide access to drilling locations, the driller shall be responsible for obtaining this equipment. Well locations will not be changed due to inappropriate drilling equipment. Charges for special equipment are considered reimbursable costs.

3. Prior to initiating drilling activities, and between each well, all drilling and sampling equipment must be properly steam cleaned and/or dedicated (see TAGM 9.b and 13 for specific cleaning procedures). These activities shall be performed in a designated on-site decontamination areas located apart from the area where cleaned equipment is stored. Throughout and after the cleaning processes, direct contact between the equipment and the ground surface shall not be permitted and persons handling equipment shall have clean hands or clean gloves. Clean support structures, such as wooden pallets or sawhorses, shall be used for the staging of equipment. The drill rig and all equipment shall

be cleaned upon completion of the investigation and prior to leaving the site.

4. If a well cannot be completed the same day that it is drilled, a mechanism to safeguard its integrity must be devised. The driller must provide their plan for this contingency for NYSDEC approval prior to starting drilling at the site.

5. Well development shall be performed for each well with air surge, a pump, or bottom discharge bailer no sooner than 24 hours after grouting or recovery has been completed (whichever is later). Submersible pumps are not permitted. Development of the well will continue until a stabilization of pH, specific conductance, temperature and clarity (goal of less than 50 NTU) of the discharge is achieved. If, after two hours, the above criteria are not met, a NYSDEC representative must be contacted to determine how to proceed.

OVERBURDEN WELLS

1. A surface split spoon sample shall be obtained (0-2 feet). This, and all subsequent split spoon samples, shall be obtained in accordance with ASTM D-1585 test procedures and placed in precleaned, teflon-lined screw cap, glass jars.

2. Augers or cable tools (minimum 6 1/4-in ID) are advanced to a depth up to 50 feet below the water table (depths greater than 10 feet below the water table are possible at sites where NYSDEC performs geophysical testing on an exploratory boring). Split spoon samples shall be taken every 5 feet and at every major change in lithology. Split spoon samples from wells adjacent to Exploratory borings (see below) need not be collected except from depths where possible contamination was detected.

3. Slotted screen (5 to 15 feet; usually 10 feet) and riser are placed in the hole. Screen and riser shall be 2-in ID flush-joint threaded PVC for wells shallower than 75 feet and 4-in ID for deeper wells. One PVC well casing centralizer with stainless steel bolts shall be used on each well at the bottom of the hole. The riser shall stick up 2 feet above the ground surface and be fitted with a vented cap.

4. Sand packing shall be placed to a depth two feet above the top of the screen. Sand shall be either tremied or packed in accordance with NYSDEC 11/9/88 L.J. Alden Memorandum. Sand pack and screen size shall be determined in accordance with NYSDEC 9/16/1988 M. Chen letter.

5. A slurry of pure bentonite powder and water, mixed to the

the procedures for the installation of overburden wells. The driller may employ any method to accomplish the following:

The drill rig shall be set up a minimum of five feet and a maximum of ten feet from one of the downgradient monitoring well locations. A borehole will then be advanced to a maximum depth 50 feet below the water table or to a confining layer, whichever is shallower. Split spoon samples shall be collected at five-foot intervals and changes in lithology, unless otherwise specified by the NYSDEC on-site representative or the work plan (cleaning of the split spoon sampler and downhole equipment, tools and materials is not required). Two-inch threaded flush joint PVC shall be installed to the full depth of the hole with at least 2 1/2 feet of stick up, and the annular space will be pressure-grouted to the surface as the augers are removed. NYSDEC personnel will log the hole through the PVC riser. After being logged, a steel protective casing with locking cap shall be cemented at the surface.

BEDROCK WELLS

Two varieties of bedrock wells will be encountered: wells completed in bedrock formations that are either overlain by an unconsolidated layer ("overburden/bedrock") or not ("bedrock outcrop").

Overburden/Bedrock

1. A surface split spoon sample shall be obtained (0-2 feet). This, and all subsequent split spoon samples, shall be obtained in accordance with ASTM D-1585 test procedures and placed in precleaned, teflon-lined screw cap, glass jars.

2. Augers or cable tools (minimum 6 1/4-in ID) are advanced to refusal. Split spoon samples shall be taken every 5 feet and at every major change in lithology.

3. Successive 5-foot NX-sized cores are taken until the NYSDEC on-site representative determines that the hole has been advanced at least five feet into competent bedrock.

4. The hole is reamed out with a 6-in. roller bit and all rock chips are removed. This shall be accomplished with water-rotary techniques. Air-rotary is acceptable only with oil-free compressed air.

5. Bentonite pellets (1/4-in.) are introduced into the bottom of the hole and water added. The amount of water added to the pellets and time allowed for hydration must follow the manufacturer's recommendations. If these are not available, water shall be introduced on the pellets in a manner to

insure proper hydration (e.g. a continuous stream) for at least one hour. A 4-in. threaded-joint PVC riser with a plug is set into the wet pellets to the bottom of the hole to form at least a two foot bentonite seal. The riser shall stick up 2 feet above the ground surface and be fitted with a vented cap.

6. Bentonite-cement grout (50 lb cement, 5 lb bentonite powder, 5 gal water) shall be pumped into the working space of the well with a side-discharge tremie pipe. The top of the grout layer shall be 2 1/2 feet from ground surface.

7. A cement-gravel (1/4-in.) mix shall be used to set a 5-foot protective casing (6-in. square) into the well so that it sits 2 1/2 feet below and above the ground surface. The protective casing shall be steel and equipped with a hinged, lockable top. The top, if not an integral part of the casing, shall be welded into place. Tops that are fastened with set screws only are not permitted.

8. After the grout has been given time to set (minimum of 24 hours), NX-sized coring is advanced through the bottom of the 4-in. riser to a depth that results in 10 feet of standing water in the well (at least 10 feet of NX-sized core hole). If water-rotary methods are employed, the hole must be pumped dry every ten feet, and sufficient time allowed to determine if the water table has been reached. (Pumping equipment requirements are the same as for well development.)

9. A cement-gravel pad shall be constructed around the wellhead at least 18 inches square and 4 inches thick. The material for the pad and the cement-gravel seal shall be Portland Cement concrete consisting of a mixture of two and one-half bage of Portland Cement per cubic yard, with gravel in equal proportions by volume. Water shall be added in the amount required to obtain a slump of seven to nine inches.

Bedrock Outcrop

1. NX-sized coring is advanced from the ground surface until the NYSDEC on-site representative or the Engineer determines that the hole has been advanced at least five feet into competent bedrock (minimum depth of seven feet).

2. The hole is reamed out with an 8-in. roller bit and all rock chips are removed. This shall be accomplished with water-rotary techniques. Air-rotary is acceptable only with oil-free compressed air.

3. Well completion follows the same procedures as Overburden/Bedrock wells as described in items 5. through 9.

REVISED SAMPLING PROCEDURES

Analyses of unfiltered groundwater samples from previous site investigations indicated concentrations of metals which suggested that sediment material had a significant impact on reported results. In order to clarify this impact, an additional sample will be collected in the field to be filtered at the laboratory and in certain instances, analyzed for TCL inorganics. The specific procedure for groundwater sampling is as follows:

- Immediately upon arrival at the site for sampling, or, if possible, the day prior to sampling, all groundwater levels will be measured and wells will be purged. Each dedicated disposable bailer will be tied off in the well above the static water level and the well secured.

- All other samples (soil, leachate, waste, surface water and sediment), if any, will be collected, and any other required site activities performed, to allow time for groundwater in purged wells to recover and for any solids to settle into the bottom of the well.

- Sampling of wells will proceed in the order in which they were purged. The first several bailers of groundwater will be obtained from the uppermost portion of standing water in the well so as to obtain the least turbid groundwater possible for samples analyzed for volatiles and inorganics.

- Volatile sample bottles will be filled first. Sample bottles for unfiltered inorganics analysis will be filled second and sample bottles for filtered inorganic analysis will be filled third. The remaining sample bottles need not be filled in any particular order.

- Filled sample bottles will be either delivered to the lab the morning after sampling by overnight mail or dropped off the same day by the consultant performing the sampling.

- The lab will filter the appropriate samples and place them in storage. The unfiltered inorganic samples will be analyzed for TCL inorganics with full CLP deliverables.

- Upon receipt and review of the results summary for the site (including TSS and TDS), the consultant will request the lab to analyze the filtered samples if sediment material may have effected the results. The lab will perform the analyses per CLP but will report the results as "informational" without CLP deliverables. These results will be sent directly to the consultant be used to assess the unfiltered sample results and will not be validated.

Field blank samples for each groundwater matrix of each site will be replaced by one blank from a disposable bailer from each lot of bailers. This "bailer blank" analysis for each lot will be reported, with full deliverables, with each appropriate site package. G&H will provide the laboratory with one bailer from each lot and the lab will produce and analyze the blanks for full TCL. The consultant collecting samples will note on all chain-of-custody forms the lot number from which the bailers were obtained.

VI. HEALTH & SAFETY PLAN

SITE SPECIFIC HEALTH AND SAFETY PLAN

A. GENERAL INFORMATION

SITE NAME: Hazardous Waste Disposal NY ID. NO.: 152113

LOCATION: Farmingdale, Suffolk County

CONTACT (name, address, phone no.):

Victor Emanuelo, Attorney
1637 Broad Hollow Road, Farmingdale, NY 11735
516/249-3400

G&H's PROJECT MANAGER:

Name: Norman Hinsey
Phone No.: (212) 216-7839

NYSDEC CONTACT:

Name: Lawrence Alden
Phone No. (518) 457-0639

B. SITE CHARACTERISTICS

FACILITY FUNCTION: Industrial waste scavenger business included transportation and storage of hazardous waste.

PHASE I COMPLETED: YES X NO _____

STATUS: Active _____ Inactive __X__ Unknown: _____

POSSIBLE CONTAMINANTS/HAZARDS:

Ammonium hydroxide, hydrochloric acid and other unknown hazardous wastes.

RECOMMENDED LEVEL OF PROTECTION: Level A _____ Level B ____
Level C _____ Level D __X__

WORKING ZONE: 20 ft around monitoring wells

Site Secured Yes __X__ No _____

SITE SPECIFIC CONCERNS: (buried lines, radioactive waste, etc.)

Possibly buried lines.

MONITORING EQUIPMENT REQUIRED

Instrument	Model	Note
Photoionization Detector (PID)	HNU-PI101	1
Flame Ionization Detector (FID)	OVA-128	1
Combustible Gas Indicator (CGI)	MSA-260	3
Radiation Detector	RM 750	2

NOTES

1) In the event air monitoring results in the breathing zone indicate a steady state increase of 5 units for HNu and 20 ppm for OVA above background of total organic vapor, all work activities will cease, the NYSDEC will be notified, and a joint decision will be made on the altering of the SOP.

2) A walkover survey with a radiation instrument (to measure gamma and beta radiation) will be conducted in the vicinity (20-foot radius) of each boring and sampling location prior to activity. In the event steady state readings indicate greater than 1.5 millirem/hr, all work activities will cease, the NYSDEC will be notified, and a joint decision will be made on the altering of the SOP.

3) Continue on site monitoring with extreme caution if the measurement level is 10% to 25% LEL (lower explosive limit). Withdraw from the area immediately if the level is higher than 25% LEL. Withdraw from the area when the 0_2 level falls below 19.5%. Withdraw from the area when the O_2 level is higher than 25% (fire hazard potential).

   Note: Explosion hazard - the gas indicator alarms at 50% LEL.

C. GIBBS & HILL STANDARD HEALTH AND SAFETY PLAN

G&H'S STANDARD HEALTH AND SAFETY PLAN IS A PART OF THE HEALTH AND SAFETY PLAN FOR THIS PHASE II INVESTIGATION. A COPY OF THE G&H's STANDARD HSP IS REQUIRED DURING THE FIELD ACTIVITIES.

B.1 PROCEDURES

1. Drilling and Well Installation

Monitoring wells were drilled and installed to provide data pertinent to both water chemistry and characterization of the stratigraphy and groundwater regime at the site. Drilling was performed by Empire Soils Investigations. One upgradient well was drilled to provide representative samples of the groundwater flowing into the area. Three additional monitoring wells were drilled to monitor flow direction and water quality.

The overburden monitoring wells were installed by drilling with 6¼-inch I.D. hollow-stem augers. A 10-foot section of #10 slotted PVC well screen (2-inch I.D.) was installed at the bottom of wells MW-2 and MW-3, and a 15-foot section of #10 slotted PVC screen was installed at the bottom of wells MW-1 and MW-4 and were connected to the surface with a 2-inch, flush joint, Sch. 40 PVC riser. A sand pack was extended to approximately 2 feet above the screen. A 2-foot bentonite pellet seal was placed on top of the sand pack. The remaining annular space was filled with a cement/bentonite grout. Steel protective casings (with locking covers) were set over MW-1 and MW-4 monitoring well risers and secured into the ground with concrete. Wells MW-2 and MW-3 were installed flush with the ground (see Appendix B for schematic diagrams).

Split spoon samples were collected at 5-foot intervals for the purpose of soil characterization. Soil sample descriptions, sampler blow counts, and soil recovery records for all wells are shown in the boring logs (B.2).

Well Development

Each well was developed by pumping water to remove the maximum practical quantity of sediment and other fine materials from the screen pack in order to produce a satisfactory amount of sediment-free water. Wells were developed for less than 1 hour each. A nephelometer was employed to measure the clarity of groundwater during development. The recommended turbidity of 50 NTU was reached for all wells.

2. Slug Test

A slug test was performed to measure in situ saturated hydraulic conductivity (K) characteristics of the aquifer in the vicinity of the screen or otherwise open portion of the well. A standard method of performing a slug test consists of quickly lowering the water level in the well and measuring its subsequent rate of rise over time as it approaches equilibrium. A dedicated polyethylene bailer with a polypropylene suspension cord was used to remove a bailer's volume of water from the well.

The rate of the groundwater level change was recorded by measuring the depth to the water below the top of the casing as a function of time after the start of the test until the original level of the water table was restored.

Groundwater elevation was measured and recorded prior to any testing. All water elevation measurements were obtained with an electronic water level indicator.

The Hvorslev method was used to calculate the permeability, K (cm/sec.):

$K = [r^2 \ln L/R]/[2LTo]$

Where:

r= radius of a PVC riser, cm

L= length of screen beneath static water level, cm

R= radius of sand pack, cm

To= elapsed time, t, at (H-h)/(H-Ho) = 0.37, sec.

H= reference datum, cm

Ho= water level at instantaneous displacement, cm

H= water level at equilibrium, cm

h= water level at time, t, cm

t= elapsed time, sec.

(R. Allan Freeze and J.A. Cherry, Groundwater, Prentice Hall Inc., pg. 339)

3. Grain Size Analysis

Grain size distribution analyses were performed by Geo-Tech Associates (Fanwood, New Jersey). Analyses were conducted on the last split spoon samples collected from each overburden well. All analyses were performed in accordance with ASTM Method Number D422. The percentage of each grain size component was determined. Results of these analyses were plotted on a particle size distribution graph.

As the samples have less than 20 percent silts and clays (i.e., material passing through a No. 200 sieve), hydrometer analyses were not performed.

Because direct permeability data is sparse, the interrelationship between grain size and hydraulic conductivity can prove to be useful for the estimation of conductivity values. An empirical relation based upon Masch and Dennis (1966) "Determination of Saturated Hydraulic Conductivity from Grain Size Gradation Curves for Unconsolidated Sands" and Morris and Johnson's (1967) "Representative Values of Hydraulic Conductivity" was used to estimate conductivity values and correlate them to observed values in the field.

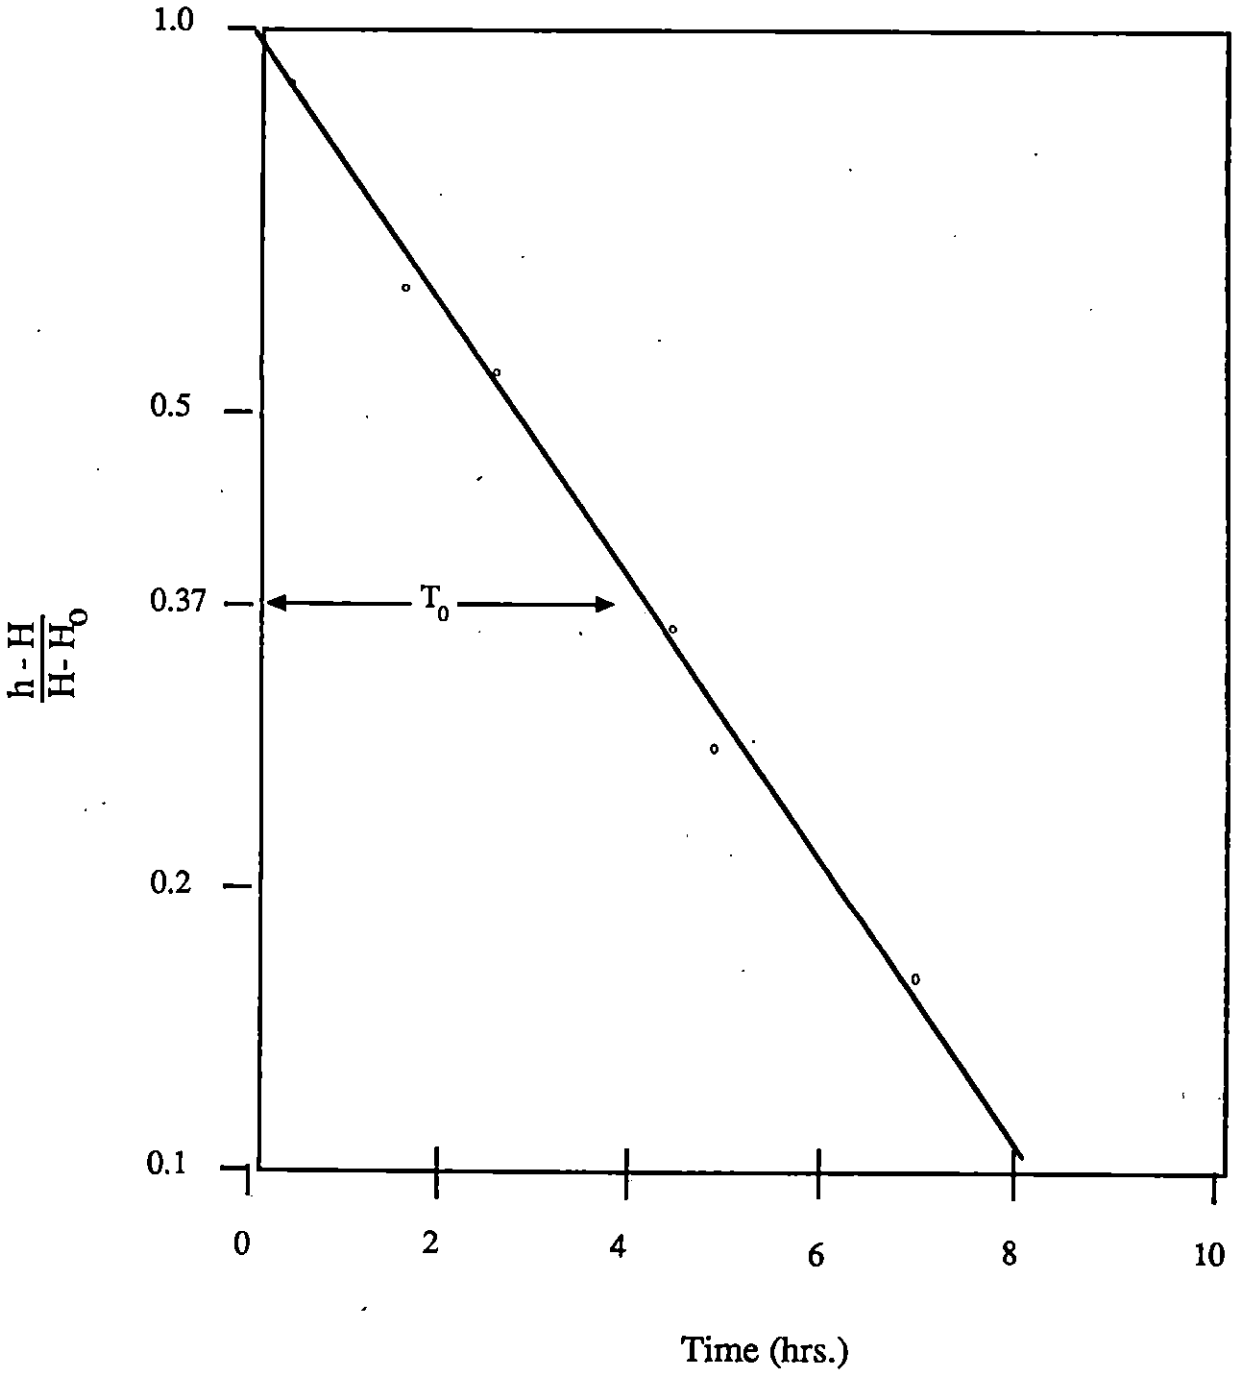
HVORSLEV HYDRAULIC CONDUCTIVITY METHOD OF ANALYSIS



B.2 RESULTS

DRILLING SUMMARY REPORT

Site Name: Hazardous Waste Disposal Site

Site No.: 152113

Date: 9/5/90 to 9/14/90

Site Personnel: A. Kostic (G&H)

Driller: Empire Soils

WELL DATA

Well No.	Boring Depth, ft	Depth to Water, ft
MW-1	28.5	20.49*
MW-2	22.5	5.92*
MW-3	22.5	8.70*
MW-4	22.3	10.00*

Depth to water refers to feet from top of casing.

*Measurements made 5/8/91 by J. Sanghvi and C. Grande.

WELL DEVELOPMENT

Well No.	NTU Readings
MW-1	3.33
MW-2	6.00
MW-3	10.50
MW-4	16.00

IN SITU CONDUCTIVITY TEST

Immediate recovery (less than 5 sec) recorded. Conductivity greater than $1x10^{-3}$ cm/sec.

Notes:

1. Diesel fuel smell was detected from wells MW-3 and MW-4 cuttings and holes during drilling events.

2. LEL (lower explosive limit) level was 20 percent at well MW-4 hole (depth of 8 ft) and 30-50 percent at well MW-3 hole (depth of 5-10 ft). No readings in the H_2S instruments were recorded in the breathing zone.

3. OVA and HNU instruments indicated no readings above background in the breathing zone.

APPENDIX C

SAMPLING AND ANALYSIS

C.1 PROCEDURES

1. Sampling Methodology

The sampling plan was prepared by G&H as a part of the updated work plan. It identifies the number of each sample type to be collected and describes collection methods to be utilized. The sampling plan specifies each sampling location and gives a sketch with roughly indicated sampling locations for illustrative purposes. The sampling locations were given code numbers for identification.

In order to ensure a smooth and proper sampling process in the field, the following preparations and steps were taken:

- Coordination with the laboratory to ensure an adequate number of laboratory cleaned containers were provided with the necessary preservatives according to appropriate protocols.

- All instruments to be used in the field were checked to ensure they were in working order. All instruments were calibrated before going to the site.

- Sampling equipment was cleaned in accordance with the cleaning procedure outlined at the end of this paragraph.

During the sampling events, the following elements were implemented:

- Chain of custody procedures were followed.
- An accurate sampling log was maintained.
- No sampling containers other than those provided by the laboratory were used.
- Disposable polyethylene bailers and polypropylene suspension cords were used to collect groundwater samples.
- A trip blank accompanied the samples.
- Well purging was performed. Three well volumes of water were evacuated or purged dry, whichever occurred first.
- Each groundwater sample was analyzed for temperature, specific conductance, and pH.
- Groundwater samples were collected from the well that had been purged first and had the longest time to settle out any suspended solids. Subsequent wells were sampled in decreasing order based on the time since purging.
- Volatile sample bottles were filled first. Care was taken to minimize the potential for volatilization during transfer of the sample from the bailer to the bottle. No headspace or air bubbles were allowed in the samples for VOA.

- Inorganic sample bottles (first the unfiltered samples if the well was not developed to less than 50 NTU) were filled next. Other sample bottles were filled in no particular order.
- Samples were capped, labeled (well no., site location, type of sample, collection date, and time), and placed in ice filled coolers.
- All samples were stored and maintained at a temperature less than 4°C and delivered to the laboratory within 24 hours.

Cleaning Procedure

When steam cleaning was not possible or practical, all sampling equipment was thoroughly cleaned before use in accordance with the following procedures:

1. Non-phosphate detergent and tap water wash
2. Potable water rinse
3. Methanol rinse
4. Deionized water rinse
5. Air dry

After this procedure was accomplished, the sampling equipment was wrapped in aluminum foil, placed in a plastic bag, and kept in its wrapping until use.

2. Chemical Analysis

A quality assurance program was developed in the Work Plan to ensure that the precision and accuracy of the groundwater sample analyses were not impacted by sampling, sample handling, and equipment decontamination procedures. This program was based on the collection of field blank samples for laboratory analysis and the maintenance of a trip blank.

A trip blank determines if sample bottles (empty or full) have been exposed to airborne contaminants in transit or on-site. A trip blank (an aliquot of deionized, analyte-free water which was placed in a container and sealed at the laboratory) accompanied the sampler to each sampling site and was transported in the same manner as the other groundwater samples. The trip blanks were handled as routine samples in the laboratory and analyzed for volatile organic parameters.

The field blank sample typically prepared for each groundwater matrix of each site was replaced by one blank from a disposable bailer from each lot of bailers. G&H provided the laboratory with one bailer from each lot, and the laboratory analyzed the blank for full TCL. The "bailer blank" analysis for each lot was reported with full deliverables with each appropriate site package.

All sample analyses were performed by H2M Laboratories following the procedures outlined in the NYSDEC Analytical Service Protocol (ASP) of September 1989. The analyses included are the following:

- TCL (Target Compound List) Inorganics - Preparation and analysis of inorganic compounds using the specified ASP methods.

  In order to clarify the impact of sediment in the samples on reported results of inorganics, two samples for inorganic analysis were collected from each well that could not be developed to less than 50 NTU. The laboratory filtered and stored one of these samples and analyzed the unfiltered samples for TCL with full ASP deliverables. Results of the analyses were reported as total metals and were validated. Upon receipt and review of the results (including TSS and TDS), G&H did not request the laboratory to analyze the filtered samples.

- TCL Volatiles - Preparation and analysis using the ASP specified Gas Chromatograph/Mass Spectrometer (GC/MS) method for TCL purgeable organics plus a library search for and the quantification of any additional non-TCL compounds (the ASP requires the library search only for the ten non-TCL compounds of largest apparent concentration).

- TCL Semi-Volatiles - Preparation and analysis using the ASP specified GC/MS method for TCL extractable base/neutral and acid organic compounds plus a library search for the quantification of any additional non-TCL compounds (the ASP requires the library search only for the 20 non-TCL compounds of largest apparent concentration).

- TCL Pesticides/PCBs - Preparation and pre-extraction of the TCL organo-chloride pesticides and polychlorinated biphenyls using the ASP specified Gas Chromatograph/ Electron Capture Detection (GC/ECD) method.

The following quality control measures were employed:

- A duplicate sample was obtained from a monitoring well chosen at random. That sample was not identified as a duplicate to the laboratory, but was assigned an identifier similar to other groundwater samples. The Bureau of Hazardous Site Control requires the blind analyses of a duplicate sample for each site by the laboratory to confirm the integrity of all sampling and analytical activities.

- ASP requires at least one spiked sample analysis and one spiked duplicate sample analysis from each group of

samples of a similar matrix type for each case of samples or for each 20 samples received, whichever is more frequent.

- A method blank for each matrix was used to assess the level of possible laboratory background contamination. A method blank must contain no greater than five times the CRQL of the following common pollutants: methylene chloride, acetone, toluene, and 2-butanone (for volatile analysis) and the phthalate esters (for semi-volatile analysis). For all other pollutants not listed above, the method blank must contain less than the CRQL of any single organic pollutant and less than the Instrument Detection Limit (IDL) of any single inorganic pollutant. If a method blank exceeds this criterion, the analytical system is "out-of-control." All samples processed with an "out-of-control" method blank were reanalyzed by the laboratory.

- Aquatec performed the validation of data submitted by H2M Laboratories. For validation of analytical data, the ASP guidelines for validation of laboratory data were followed. Data quality met the established validation criteria, and therefore they were accepted. Aquatec validated sample results with full ASP deliverables. Results of soil samples collected during drilling

("informational soil samples") were not reported with ASP and therefore were not validated by Aquatec.

3. Guidelines for Evaluating Chemical Analyses

The assessment of a chemical analysis is made to determine the existence and magnitude of contamination problems.

To determine whether or not quantitative evidence exists of an "observed release," a sample must indicate a significant increase in the hazardous substance concentration relative to the background concentration. The concentration of a hazardous substance is considered to be significantly above background levels under the conditions presented in the following table:

CONDITIONS NECESSARY TO QUANTIFY AN OBSERVED RELEASE

(No Contamination in Trip and/or Field Blanks)

If Background Concentration is:	Observed Release Quantified If Detected Concentration is:
Below CRQL	Greater than or equal to three times the CRQL
Greater than or equal to the CRQL	Greater than or equal to ten times the applicable background concentration

Trip and field blanks (disposal bailer blank) are evaluated as if they are "true" samples. If the field (bailer) or trip blank concentration is greater than the CRQL, the concentration of a

hazardous substance detected in a water sample is considered to be significantly above the blank or background sample if the detected concentration of a contaminant is:

- Greater than or equal to ten times the applicable blank or background concentration, whichever is greater. This criterion was employed for common laboratory contaminants: methylene chloride, acetone, toluene, and 2-butanone for volatile analysis and the phthalate esters for semi-volatile analysis. This criterion was also applied to a method blank containing acceptable levels of these contaminants.

- Greater than or equal to five times the applicable blank concentration or greater than or equal to ten times the background concentration, whichever is greater. This criterion is applied for all other contaminants not listed above.

To determine the relative impact on the environment and/or human population of groundwater or surface water contamination problem, sample results are compared to the following federal and New York State water quality standards or guidelines:

- Environmental Protection Agency National Primary Drinking Water Regulations (as of 7/17/89).

Applied to results of all water samples analyses.

- Chapter 1 of Title 10 of the Official Compilation of Codes, Rules, and Regulations of the State of New York, Part 5, Drinking Water Supplies, Subpart 5-1, Public Water Supplies (as of 11/28/88).

  Applied to results of drinking water sample analyses.

- Chapter 10 of Title 6 of the Official Compilation of Codes, Rules, and Regulations of the State of New York, Division of Water Resources, Article 2, Part 702, Appendix 31, Ambient Water Quality Standards - "The standards adopted herein relate to the condition of waters as affected by the discharge of sewage, industrial wastes, or other wastes" (as of 7/5/85).

  Applied to results of surface water sample analyses for surface water that is not a source of drinking water.

- Chapter 10 of Title 6 of the Official Compilation of Codes, Rules, and Regulations of the State of New York, Division of Water Resources, Article 2, Part 703.5(a)(2) and (3), Classes and Quality Standards for Groundwaters - "The purpose of these classes, quality standards, and effluent standards and/or limitations is to prevent

pollution of groundwaters and to protect the groundwaters for use as a potable water" (as of 7/5/85).

Applied to results of all groundwater sample analyses regardless of groundwater use.

To determine the relative impact of soil and sediment contamination, analysis results are compared to the common range of inorganics in uncontaminated soils as listed in the USEPA publication, Review of In-Place Treatment Techniques for Contaminated Surface Soils (EPA-5400/2-84-0036, November 1984, p. 79).

- Chapter 360 of Title 6 of the Official Compilation of Codes, Rules, and Regulations of the State of New York, Solid Waste Management Facilities, Section 360-4.4(a), "Sewage sludge and septage destined for land application" (as of 12/31/88).

  Applied to results of soil and sediment sample analyses.

4. Air Survey

Air monitoring instruments (PID, OVA, and explosimeter) were used to monitor the presence of volatile organic contaminants in the ambient air during field activities at the site. The

measurements were evaluated to determine the proper health and safety requirements to be implemented during site reconnaissance and drilling activities.

All split spoon samples were scanned with a PID to assess the potential for high levels of volatile organic contamination. The results of these readings are included in the boring log of each well. An explosimeter has been used during the installation of monitoring wells primarily to monitor the accumulation of explosive gases in the hole.

The air monitoring instruments were calibrated before each day in accordance with the manufacturer's procedures. Organic vapor emanating from the surface was determined by holding the probe 6 to 12 inches above the surface for 30 seconds. During the drilling procedure, each split spoon soil sample was tested by holding the probe at approximately 1 inch from the soil sample. Readings were registered when the instrument stabilized.

Groundwater Field Test Data

Sample No.	Spec. Cond., umho/cm	pH	Temp.°C
GW-1	130	7.4	18.5
GW-2	130	5.6	20.0
GW-3	6,000	10.4	19.0
GW-4	2,000	6.3	19.0

Dedicated disposal bailers (Lot No. 3) were used to collect groundwater samples.

Designation Numbers of Samples

GW-1, GW-2, GW-3, GW-4, and GW-5 (duplicate of GW-2), SW-1, SW-2, SW-4, SD-1, SD-2, and SD-4

Notes:

1. Soil samples (B-1 through B-6) were collected during drilling activities.
2. See site sketch (Figure I-2) for sampling locations.
3. Diesel smell was detected from wells MW-3 and MW-4 during sampling events.
4. Representative of Eastern Chemical Disposal Co. collected groundwater and surface water (from the basin only) samples immediately after Gibbs & Hill, Inc. had finished collection of samples from each sampling point.

SOIL SAMPLING

Six split spoon soil samples (including background sample, G-6) were taken during drilling activities from the depth of 2 to 10 ft. HNU readings above background were recorded at B-1, B-4, and B-5 holes in the range of 0.5 to 15 units. No readings above background were recorded in the breathing zones. See Figure I-2 for locations of samples.

FOR SAMPLES:
GW-1
GW-2 (GW-2DL)
GW-3 (GW-3DL)
GW-4 (MS & MSD)
GW-5 (GW-5DL)
SW-1
SW-2 (MS & MSD)
SW-4
SD-1 (MS & MSD)
SD-2
SD-3
TRIP BLANK

All quality control and calibration criteria were met for this data package with the following exceptions:

Some compounds in the matrix spike blanks were outside the allowable percent recoveries however these same analytes were within for the MS/MSD's of the samples.

The matrix spike of sample GW-4 and SW-2 had high percent recoveries for several compounds. The RPD's for these samples were outside the limits for several compounds (All RPD's outside for GW-4).

The percent recoveries and RPD's were all within the allowable limits for SD-1.

Samples GW-2, GW-3 and GW-5 were re-analyzed at a dilution since one or more targeted compounds exceeded the highest calibration standard. Both sets of data are included for your review.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

CASE NARRATIVE FOR BASE NEUTRAL ACID EXTRACTABLES
GIB055
DATE RECEIVED: 12/03/90

FOR SAMPLES:	GW-1	SW-1
	GW-2	SW-2 MS/MSD
	GW-3	SW-4
	GW-4 MS/MSD	SD-1 MS/MSD
	GW-5	SD-2
		SD-3

QC DATA

Surrogate recoveries were not in compliance for samples SW-1 and SW-2 and its spike duplicates. The samples were re-extracted but not enough sample material was available to repeat the matrix spike samples.

Recoveries for two compounds were under 75% for the MSB for water and ten compounds were under the limit for the MSB for soil.

Matrix spike accuracy and precision data were acceptable for the spiked soil samples. Six of eleven recoveries for the spiked water sample exceeded the advisory limits. It appears that one of the fractions had lost solvent before analysis.

CALIBRATION AND TUNING

All criteria for tuning and calibration were met with the following exceptions:
3-Nitroaniline on 9/27/90 slightly exceeded 35% RSD.

The continuous calibration on 10/6/90 and 10/30/90 did not meet the limit of 25% D for several polar compounds. None exceeded a % D of 50 and these compounds were also not found in the samples analyzed.

SAMPLE ANALYSIS

Holding times for all first extractions were within the specified limits. Two samples had to be re-extracted due to low phenol surrogate recoveries.

SOW87

CASE NARRATIVE FOR PESTICIDES/PCB's
GIB055

For Samples: GW-1
GW-2
GW-3
GW-4
GW-5
SW-1
SW-2
SW-2
SW-4
SD-1
SD-2
SD-3

QC DATA

Even though the recovery limits for DBC are not mandatory, sample GW-1, with a DBC recovery of zero, was re-extracted and re-analyzed. (It is suspected that the surrogate spike was not added for the original extract.) Both reports are submitted.

Acceptable accuracy and precision data were obtained for all spiked samples and blanks. Data met QC limits with the following exceptions: The recovery for the water spiked blank was low for two compounds.

An interference, coeluting with Aldrin, caused results to be above QC limits for Aldrin. The high recoveries for the soil spikes are suspected to be due to some solvent evaporation of the extracts.

CALIBRATION AND SYSTEM PERFORMANCE

All system performance and calibration criteria were met for the primary column sequence from 10/08/90 and 10/16/90 as well as for the secondary column sequences from 10/15/90.

A problem was encountered with the confirmatory sequence starting 10/17/90. Remedial action had to be taken on 10/19/90 for breakdown. A subsequent run of EVAL B satisfied the requirements but the following continuous calibration no longer met the limits for RPD. No data are submitted for the runs after the last compliant standard.

The re-extract of GW-1 was analyzed in the sequence of 11/06/90, which was not in compliance for the last continuous calibration of IND A for 4,4-DDT. The sample affected by this deviation (not from this group), was re-analyzed.

SGW12

H2M LABS, INC.

SAMPLE ANALYSIS

Sample GW-4 contained technical chlordane. The g and a-isomers were under CRQL. Some chlordane isomers were identified as single pesticides. The peak areas were corrected for the contribution of the chlordane, and then were under reporting limit.

The data system applies a 1 % window for tentative identification. The data are reviewed by the analyst and the following codes are used to indicate reasons for rejections of identifications:

L1 smaller than the contract required reporting limit on primary column

L2 smaller than the contract required reporting limit on the secondary column

W1 outside the actual retention time window established on primary column

W2 outside the actual retention time window on secondary column

I PCB isomer interfering with pesticides. (Raise reporting limit for pesticide)

Q2 Quantification on secondary column due to interference coeluting on primary column

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

QUALIFIERS FOR REPORTING ORGANICS DATA

Value - If the result is a value greater than or equal to the quantification limit, report the value.

U - Indicates compound was analyzed for but not detected. Report the minimum quantification limit for the sample with the U (e.g., 10U) based on necessary concentration/dilution actions. (This is not necessarily the instrument detection limit). The footnote should read: U-Compound was analyzed for but not detected. The number is the minimum attainable quantification limit for the sample.

J - Indicates as estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed or when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified quantification limit but greater than zero (e.g.: If limit of quantification is 10 ug/l and a concentration of 3 ug/l is calculated, report as 3J).

C - This flag applies to pesticide parameters where the identification has been confirmed by GC/MS. Single component pesticides >= 10 ng/ul in the final extract should be confirmed by GC/MS.

B - This flag is used when the analyte is found in the blank as well as a sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action.

E - This flag identifies compounds whose concentrations are outside the calibration range of the analysis. If one or more compounds have a response greater than full scale, the extract must be diluted and reanalyzed, according to the specifications in Exhibit D. All compounds with a response greater than full scale should be flagged with an "E" on the original report of analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate Forms I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number. NOTE: for total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak should be considered seperately.

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag.

X - This flag indicates compounds with spectra that do not meet identification criteria as detailed in Exhibit(E)E-61 section 6.1.3 but are believed to be present.

Z - Indicates analyte was present at the reported concentration in the pre-screening analysis.

HRA LABS INC.
575 Broad Hollow Road, Melville, N.Y. 11747
(516) 694-3040 FAX: (516) 694-4122

QUALIFIERS FOR METALS ANALYSIS

E - The reported value is estimated because of the presence of interference. An explanatory note is included in the case narrative.

M - Duplicate injection precision not met.

N - Matrix spiked sample recovery not within control limits.

S - The reported value was determined by the Method of Standard Additions.

+ - Correlation coefficient for the MSA is less than 0.995.

W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

* - Duplicate analysis not within control limits.

Concentration Qualifiers

B - Entered if the reported value is less than the Contract Required Detection Limit (CRDL) but greater than the Instrument Detection Limit (IDL).

U - Entered if the analyte was analyzed for but not detected, less than the IDL.

	B-4	Trip Blank 9/7/90 9008250
	B-5	Trip Blank 9/10/90 9008547

QC Data

All quality control and calibration criteria were met for the above data. The matrix spike and matrix spike duplicate of sample B-3 was re-analyzed at a lesser amount of sample since tetrachloroethylene was above the calibration range in the initial analysis. Both sets of data are included.

Sample Analysis

Several samples were re-analyzed at a lesser amount of sample since tetrachloroethylene was above the calibration range in the initial analysis. Both sets of data are included for your review.

Sample B-2 was analyzed after sample B-1 which had a high concentration of tetrachloroethylene. 64 ug/kg of tetrachloroethylene was detected in sample B-2. To confirm its presence in the sample (not carryover from previous run) the sample was re-analyzed. 56 ug/kg of tetrachloroethylene was detected in the re-analysis. Both sets of data are included for your review.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

ENVIRONMENTAL and INDUSTRIAL ANALYTICAL LABORATORY

Case Narrative for Base Neutral/Acid Extractables
Gibbs & Hill 50 & 51
Rec'd.: 9/7/90 & 9/10/90

For Samples:		
	B-1	B-4
	B-2	B-5
	B-3 MS & MSD	B-6

QC Data

All quality control and calibration criteria were met for the above samples with the following exceptions. The matrix spike blank recoveries were not within the 75-125 % limits however, they were all within the allowable range for sample recoveries and all sample B-3 MS and MSD percent recoveries and RPD's were within the allowable ranges.

Low levels of bis 2 ethyl hexyl phthalate were detected in the method blank. This compound was flagged with the "B" qualifier when detected in the samples.

Tuning Criteria/Calibration

All initial and continuous calibration SPCC and CCC criteria was met. One compound, 3-nitroaniline was above the 35 percent RSD in the initial calibration of 9/27/90. This compound was not detected in any samples.

Several compounds had percent D's above 20 percent in the continuing calibrations. All percent D's were below 50 percent and none of these analytes were detected in any samples.

Sample Analysis

Samples B-3; B-3 MS & MSD; B-4 and B-5 were originally extracted on 9/10/90. One or more surrogate standards were outside the allowable limits. These samples were re-extracted and all surrogates were within the allowable limits. Only the re-extracted samples are included in this data package.

ENVIRONMENTAL and INDUSTRIAL ANALYTICAL LABORATORY

CASE NARRATIVE FOR PESTICIDES/PCB's
Gibbs & Hill 50
Received 9/7/90

For Samples: B-1
B-2
B-6

QC Data

The surrogate standard DBC was very low in two of the five extracts. The areas are not recorded because they were under the area reject. The cause of the problem appears to have been a spiking error.

This group of samples did not include a sample to be analyzed for the matrix spike duplicates.

Two blanks were analyzed with this group of samples, one underwent GPC cleanup (B-938) and the other (B-936) was not subject to GPC cleanup. No compounds interfering with any of the targeted analytes were observed in either of the two blanks.

Calibration and System Performance

The primary sequence, started on 9/26/90, was only acceptable up to run AC11579 (Ind A injected at 06:16 9/29/90), because the next EVAL B standard showed breakdown problems. This EVAL B standard and the previous five samples were not included in the sequence.

The secondary sequence, started on 9/26/90, is only valid up to run BC11567 (Ind B injected at 22:01 on 9/28/90) because the next standard run, an EVAL B, had breakdown of DDT greater than 20%.

The linearity requirements were not met for the confirmatory column sequence of 9/26/90. No compounds had to be qualified from the secondary column.

The reextract of B-1 were analyzed in sequences started on 10/24/90. The confirmatory sequence did not meet criteria for the continuous calibration for INDA. The sequence is only acceptable up to the last standard that met QC criteria, EVALB. The samples before the INDA were reanalyzed.

Sample Analyses

All samples were extracted and analyzed within their holding times. Two of the samples B-6 and B-1 and one of the blanks

ENVIRONMENTAL and INDUSTRIAL ANALYTICAL LABORATORY

CASE NARRATIVE FOR PESTICIDES/PCB's
Gibbs & Hill 50
Received 9/7/90

B-938 were GPC cleaned. The reporting limit for these 3 extracts was raised by a factor of two.

A low level PCB was found in B-1, but the concentration was under contract required reporting limits and therefore not reported (protocol D-IV-47, 6.2.1)

Because the surrogate standard for B-1 was not recovered (or not spiked) the sample was reextracted. The reextract was not subject to GPC cleanups reesulting in lowere reporting limits. The quantities found for the aroclor match the level found in the original extract. Both sets of data are submitted.

The data system applies a 1% window for tentative identification. The data are reviewed by the analyst and the following codes are used to indicate reasons for rejections of identifications:

L1 smaller than the contract required reporting limit on primary column

L2 smaller than the contract required reporting limit on the secondary column

M1 outside the actual retention time window established on primary column

M2 outside the actual retention time window on secondary column

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Case Narrative for Pesticides/PCB's
Gibbs & Hill 51
Received 9/10/90

For Samples:	B-3 MS/MSD	9008544 MS/MSD
	B-4	9008545
	B-5	9008546

QC DATA

The recoveries for the surrogate standard DBC were all within the advisory QC limits. Good accuracy and precision data were achieved for the spiked sample and blank. The QC limits were met for all compounds in the MS, MSD and MSB.

Two blanks were extracted with Group Gibbs and Hill 51. One of the two blanks, blank 942 was subjected to GPC cleanup. No compounds interfering with any of the targeted analytes were observed in either of the two blanks.

Calibration and System Performance

The primary sequence, started on 9/26/90, was only acceptable up to run AC11579 (Ind A injected at 06:16, 9/29/90), because the next EVAL B standard showed breakdown problems. This EVAL B standard and the previous five samples were not included in the sequence.

The secondary sequence, started on 9/26/90, is only valid up to run AC11567 (Ind B injected at 22:01 on 9/28/90) because the next standard run, an EVAL B had breakdown of DDT greater than 20 percent.

The linearity requirements were not met for the confirmatory column sequence of 9/26/90. No compounds had to be qualified from the secondary column.

Sample Analyses

All samples were extracted and analyzed within their holding times. All extracts, except for the MSB and blank B-940, were GPC cleaned. Because of the aliquot taken, the reporting limits were raised by a factor of 2.

DATE REC'D: 9/07/90

For Samples: B-6
B-2
B-3 MS/MSD
B-4
B-5

The instruments used for metals analysis include a Perkin-Elmer 5100/HGA-600 and a Varian Spectra-30/GTA-96 for furnace AA technique. A Perkin-Elmer 2380 was used for flame AA and mercury cold vapor techniques. ICP analysis was performed using an ARL 3560.

The lead and manganese matrix spike recoveries for sample B-3 are not within 75-125%. Lead and manganese data are reported flagged with an "N" on Forms I and V(a) for all samples associated with sample B-3.

The arsenic post digestion spike recovery for sample B-3 and the selenium post digestion spike recoveries for samples B-3 and B-3 duplicate are not within 85-115%. Arsenic and selenium data are flagged with a "W" on the B-3 data sheet.

The iron and aluminum duplicate analyses of sample B-3 have RPD's that exceed 20% while the results are greater than 5X CRDL. The silver, manganese and chromium duplicate analyses of sample B-3 have absolute differences that exceed their CRDL's while the results are less than 5X CRDL.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

(516) 694-3040 FAX: (516) 694-4122

QUALIFIERS FOR REPORTING ORGANICS DATA

Value - If the result is a value greater than or equal to the quantification limit, report the value.

U - Indicates compound was analyzed for but not detected. Report the minimum quantification limit for the sample with the U (e.g., 10U) based on necessary concentration/dilution actions. (This is not necessarily the instrument detection limit). The footnote should read: U-Compound was analyzed for but not detected. The number is the minimum attainable quantification limit for the sample.

J - Indicates as estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed or when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified quantification limit but greater than zero (e.g.: If limit of quantification is 10 ug/l and a concentration of 3 ug/l is calculated, report as 3J).

C - This flag applies to pesticide parameters where the identification has been confirmed by GC/MS. Single component pesticides >= 10 ng/ul in the final extract should be confirmed by GC/MS.

B - This flag is used when the analyte is found in the blank as well as a sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action.

E - This flag identifies compounds whose concentrations are outside the calibration range of the analysis. If one or more compounds have a response greater than full scale, the extract must be diluted and reanalyzed, according to the specifications in Exhibit D. All compounds with a response greater than full scale should be flagged with an "E" on the original report of analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate Forms I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number. NOTE: for total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak should be considered seperately.

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag.

X - This flag indicates compounds with spectra that do not meet identification criteria as detailed in Exhibit(E)E-61 section 6.1.3 but are believed to be present.

Z - Indicates analyte was present at the reported concentration in the pre-screening analysis.

H2M LABS, INC.

575 Broad Hollow Road, Melville, N.Y. 117
(516) 694-3040 FAX: (516) 694-4122

QUALIFIERS FOR METALS ANALYSIS

E - The reported value is estimated because of the presence of interference. An explanatory note is included in the case narrative.

M - Duplicate injection precision not met.

N - Matrix spiked sample recovery not within control limits.

S - The reported value was determined by the Method of Standard Additions.

+ - Correlation coefficient for the MSA is less than 0.995.

W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

* - Duplicate analysis not within control limits.

D - Matrix spiked sample required dilution beyond the instrument detection limit due to background interference. An analytical spike was performed and recovery is within 85-115%.

P - Matrix spiked sample required dilution beyond the instrument detection limit due to background interference. An analytical spike was performed and recovery is not within 85-115%.

Concentration Qualifiers

B - Entered if the reported value is less than the Contract Required Detection Limit (CRDL) but greater than the Instrument Detection Limit (IDL).

U - Entered if the analyte was analyzed for but not detected, less than the IDL.

BAILER 4 (9009473)

QC DATA

All QC requirements were met for this data package.

TUNING CRITERIA/CALIBRATION

All tuning criteria were met for this data package. All QC requirements were met for the initial calibration performed 09/13/90. Two continuing calibration check standards were analyzed on 09/14/90 to meet the initial calibration. The CCC analyte vinyl chloride still failed to meet required QC limits of < 25% D. This analyte was not detected in any analyzed samples and this deviation is not believed to effect the quality of the data submitted.

SAMPLE ANALYSIS

All samples were analyzed within the contract specified holding time.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

QC DATA

Phenol-d6 exceeded surrogate recovery limits for samples Bailer 1,3,6,7. Six spiked analytes failed QC recovery limits for the MSB extracted 10/18/90.

TUNING CRITERIA/CALIBRATION

All tuning requirements for this data package were met. All QC requirements for the initial calibration performed 10/23/90 were met. Ten analytes exceeded a % difference of 20% for the calibration standard analyzed 1024/90.

The response factors from the calibration standard analyzed 10/24/90 were not updated in the ID file. All calculated valves reflect the response factors from this standard.

The quantitation ion of 4-Nitrophenol was changed from 139 to 65 due to interference from Dibenzofuran.

SAMPLE ANALYSIS

All samples originally extracted 9/19/90 were re-extracted 10/18/90 due to the extracts being contaminated with toluene. It is suspected that the batch of solvent was the source of contamination. There was insufficient sample volume to repeat the MS/MSD extraction.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Date Reported: 1/21/90

CASE NARRATIVE FOR PESTICIDES/PCB's
GIB054

FOR SAMPLES:	Bailer-1 MS/MSD	9009470 MS/MSD
	Bailer-2	9009471
	Bailer-3	9009472
	Bailer-4	9009473
	Bailer-5	9009474
	Bailer-6	9009475
	Bailer-7	9009476

QC DATA

Surrogate recoveries for DBC was exceeded in one of the eleven extracts. recovery data for matrix spike and matrix spike duplicate met the QC limits. In the matrix spike blank three of the six spiked compound recoveries were under 75%. One blank was extracted and analyzed with this group of samples; no compounds interfering with the targeted analytes were observed.

CALIBRATION

System performance checks and continuous calibration for primary sequence, started on 10/08/90, were in compliance with the protocol. Response for 4,4-DDT was not linear, but none of the sample contained DDT.

The confirmatory sequence, started on 10/09/90, was valid up to the EVAL B standard injected on 10/12/90 at 00:41. The next standard injected, an individual STD A did not meet the continuous calibration criteria. All samples analyzed after the last compliant standard were reanalyzed in a different confirmatory sequence, started on 10/15/90. In this sequence all system performance checks were in compliance with the protocol.

SAMPLE ANALYSIS

All samples were extracted and analyzed within holding times. None contained targeted analytes.

The data system applies a 1 % window for tentative identification. The data are reviewed by the analyst and the following codes are used to indicate reasons for rejections of identifications:

H2M LABS, INC.

L smaller than the contract required reporting limit on primary column

M outside the actual retention time window established

N PCB isomer interfering with pesticides (Raise reporting limit for pesticide)

Q2 Quantification on secondary column due to interference coeluting on primary column

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

QUALIFIERS FOR REPORTING ORGANICS DATA

Value – If the result is a value greater than or equal to the quantification limit, report the value.

U – Indicates compound was analyzed for but not detected. Report the minimum quantification limit for the sample with the U (e.g., 10U) based on necessary concentration/dilution actions. (This is not necessarily the instrument detection limit). The footnote should read: U–Compound was analyzed for but not detected. The number is the minimum attainable quantification limit for the sample.

J – Indicates as estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed or when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified quantification limit but greater than zero (e.g.: If limit of quantification is 10 ug/l and a concentration of 3 ug/l is calculated, report as 3J).

C – This flag applies to pesticide parameters where the identification has been confirmed by GC/MS. Single component pesticides >= 10 ng/ul in the final extract should be confirmed by GC/MS.

B – This flag is used when the analyte is found in the blank as well as a sample. It indicates possible/probable blank contamination and warns the data user to take appropriate action.

E – This flag identifies compounds whose concentrations are outside the calibration range of the analysis. If one or more compounds have a response greater than full scale, the extract must be diluted and reanalyzed, according to the specifications in Exhibit D. All compounds with a response greater than full scale should be flagged with an "E" on the original report of analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration range in the second analysis, then the results of both analyses shall be reported on separate Forms I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number. NOTE: for total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak should be considered seperately.

D – This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag.

X – This flag indicates compounds with spectra that do not meet identification criteria as detailed in Exhibit(E)E-61 section 6.1.3 but are believed to be present.

Z – Indicates analyte was present at the reported concentration in the pre-screening analysis.

H2M LABS, INC.

575 Broad Hollow Road, Melville, N.Y. 11747
(516) 694-3040 FAX: (516) 694-4122

QUALIFIERS FOR METALS ANALYSIS

E - The reported value is estimated because of the presence of interference. An explanatory note is included in the case narrative.

M - Duplicate injection precision is not met.

N - Matrix spiked sample recovery is not within control limits.

S - The reported value was determined by the Method of Standard Additions.

+ - Correlation coefficient for the MSA is less than 0.995.

W - Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance.

* - Duplicate analysis not within control limits.

Concentration Qualifiers

B - Entered if the reported value is less than the Contract Required Detection Limit (CRDL) but greater than the Instrument Detection Limit (IDL).

U - Entered if the analyte was analyzed for but not detected, less than the IDL.

Hydrology of the Babylon-Islip Area Suffolk County Long Island, New York

GEOLOGICAL SURVEY WATER-SUPPLY PAPER 1768

Prepared in cooperation with the Suffolk County Board of Supervisors, Suffolk County Water Authority, and the New York State Water Resources Commission

INTRODUCTION

PURPOSE

The rapid expansion of population and industry in southwestern Suffolk County, particularly since 1950 (fig. 2), has resulted in sharply increased withdrawals from the ground-water reservoir which, at present, supplies all water used in the area. However, the fact that there is substantial streamflow from the area indicates that additional development of the water resources is possible. Because an adequate water supply is essential to the continued growth of the area, knowledge of the occurrence, quality, and availability of water, both underground and in streams, is required by industry and the public. Because the source of all water on Long Island is precipitation, evaluation of the water potential of the area requires following the path of water from its inception as precipitation to its ultimate return to the atmosphere.

The objectives of the investigation were (a) to evaluate and summarize present data on quantity, quality, and availability of both ground water and surface water; (b) to determine the interrelation of ground water and surface water; (c) to evaluate the water balance for the ground-water reservoir, and (d) to evaluate any existing or potential water-supply problems.

This report is part of a continuing cooperative program sponsored jointly by the U.S. Geological Survey, the Suffolk County Water Authority, the Suffolk County Board of Supervisors, and the New York State Water Resources Commission.

LOCATION AND EXTENT OF AREA

The report area includes the Town of Babylon, virtually all of the Town of Islip, and small parts of the Towns of Huntington, Smithtown, and Brookhaven in southwestern Suffolk County, and a small area in the southeastern part of Nassau County (fig. 1). The area comprises about 270 square miles, of which 190 square miles are on the main part of Long Island; the barrier beaches, islands, and Great South Bay comprise the remainder. The area is roughly rectangular in shape; it is about 20 miles long and from 11 to 13 miles wide. The western boundary is mainly along the interstream ground-water divide west of Carman Creek near Amityville (pl. 7). The eastern boundary is mainly along the interstream ground-water divide east of Tuthills Creek near Patchogue (pl. 7). Both eastern and western boundaries extend south to the barrier beaches. The northern boundary is along the main ground-water divide that traverses Long Island and the southern boundary is the Atlantic Ocean.

1.2.12

METHODS OF INVESTIGATION

Fieldwork began in July 1958 and was completed in March 1961. Well and geologic data were obtained from the files of the New York State Water Resources Commission and from records collected in the field. During the summer of 1958, 44 water-table observation wells were driven in areas where data were scanty. Water-level measurements were obtained at all available observation wells and at several public, industrial, and institutional supply wells. Water samples were collected from the observation wells and analyzed for selected constituents. In October 1958, a water-temperature and water-stage recorder was installed at Champlin Creek at Islip. In November 1958, four temporary recorders were placed in operation on streams for which continuous records of stage were not previously available. The partial-record stream-gaging program in Suffolk County was expanded to include several streams that had never been measured. Three streams, Santapogue River at Lindenhurst, Sampawams Creek at Babylon, and Champlin Creek at Islip, were selected for seepage studies, and discharge measurements were obtained bimonthly at selected sites. In December 1958, a three-element thermograph was placed in operation at Sampawams Creek at Babylon to obtain stream, air, and ground-water temperatures simultaneously.

During May 1959, three lines of shallow observation wells, each line consisting of four wells, were driven adjacent to Champlin Creek to study the relation of ground water to surface water. In addition, three wells were driven directly into the streambed at selected sites to study vertical changes in hydraulic head below the stream. Another line of four wells was driven, in October 1960, just upstream from the gaging station to aid in preparation of a water-table map and to provide additional sampling points for obtaining data on quality of water. To study the effect of ground-water evapotranspiration, a shallow water-table well was dug in August 1960 adjacent to Sampawams Creek, and a recorder was installed to detect water-level fluctuations.

Water samples were collected from selected wells and streams in August 1959, March 1960, September 1960, and March 1961 for determination of synthetic-detergent content. Water samples from four selected wells tapping different aquifers were collected for chemical analysis.

To facilitate office computations of streamflow data, the records of six primary gaging stations in the area and the records for Massapequa Creek at Massapequa in Nassau County were processed by an electronic computer. The processed data included duration tables of daily flow by water years and minimum-mean discharges [illegible]

PREVIOUS INVESTIGATIONS

A study of the water resources of Long Island by Veatch and others (1906), contains some descriptive data on ground water and surface water in the Babylon-Islip area. Maps of the water table of Long Island including the report area have been prepared by Burr and others (1904), Veatch (1906), Suter (1937), Jacob (1945), and Lasczynski and Johnson (1952). A map of the surficial geology of Long Island (Fuller, 1914) and contour maps of the subsurface formations (Suter, deLaguna, and Perlmutter, 1949) contain geologic data on the report area. A report on the geology and hydrology of the nearby Towns of Huntington and Smithtown (Lubke, 1961) has been freely drawn upon for data in the parts of those towns included in the area covered by this report. Perlmutter and Crandell (1959) have described geologic conditions and the occurrence of ground water beneath the barrier beaches. Many of the well logs utilized in the subsurface mapping of geologic units are included in publications of the New York State Water Resources Commission (Leggette and others, 1938; Roberts and Brashears, 1945; and Johnson and others, 1952). Water-level measurements for some observation wells, records of daily discharge for gaging stations, and results of discharge measurements made at partial-record sites, are published in annual water-supply papers and open-file reports of the U.S. Geological Survey.

ACKNOWLEDGMENTS

The writers acknowledge the assistance of well drillers, the New York State Department of Public Works, and the Suffolk County Water Authority, in furnishing hydrologic and geologic data. The New York State Department of Health, the Suffolk County Department of Health, the Suffolk County Water Authority, and several privately owned laboratories furnished much of the chemical data included in the report. R. L. Barnell, formerly of the U.S. Geological Survey, supervised the construction of observation wells, and prepared a preliminary map of the water table.

GEOGRAPHY

TOPOGRAPHY

The Babylon-Islip area lies within the Atlantic Coastal Plain physiographic province and may be subdivided into a small northern region of irregular hills and a large southern region composed of a broad gently sloping plain. These topographic features are mostly [illegible]

geologic units mapped as Ronkonkoma terminal moraine and Mannetto Gravel (pl. 1). The highest land surface altitude on Long Island, about 400 feet above sea level, is on the Ronkonkoma terminal moraine, about 3 miles southwest of Huntington Station. Summit altitudes on the terminal moraine and adjacent hills are commonly as much as 150 feet or more above the outwash plain, which abuts the hills at an altitude of about 120 feet above sea level. The outwash plain is characterized by a gently rolling land surface, which slopes southward at about 20 feet per mile.

Marshlands, at or slightly above mean sea level, fringe the south shore of the area, adjacent to Great South Bay. The bay, which separates the main part of Long Island from the narrow low-lying barrier beaches, is generally less than 3 feet deep in the western part of the area and less than 10 feet deep in the eastern part. In boat channels the depth may be as much as 30 feet.

POPULATION

The substantial population upsurge in Suffolk County since 1950 is primarily the result of migration from New York City. Figure 2 illustrates the rate of population growth in the Towns of Babylon and Islip. The combined population of both towns was 117,021 in 1950, and 315,268 in 1960, an increase of nearly 170 percent. The Town of Babylon had a slightly greater rate of growth than the Town of Islip between 1950 and 1960, which was probably due to its closer location to New York City. The major factor contributing to urbanization of western Suffolk County is the improved rail and highway transportation.

With the exception of the northwestern part which is largely an area of cemeteries, population density in the Town of Babylon is fairly uniform (pl. 6). Centers of greatest population are near the south shore and in eastern parts of the town. In the Town of Islip, population density is greatest west of Connetquot River. Pilgrim State Hospital, the largest hospital in the world, is in the extreme northwestern part of the Town of Islip. Another center of high population density is Central Islip State Hospital, northeast of the headwaters of Champlin Creek. Large areas adjacent to and east of Connetquot River are still in their natural state. The extensive construction activity in western Suffolk County has just begun to reach the eastern part of the Town of Islip, which is still predominantly rural (1961).

INDUSTRY

Industrial growth in the Towns of Babylon and Islip has paralleled population growth. Industrialization of the area has resulted in large [illegible] from [illegible] tion [illegible] New [illegible] City [illegible] re.

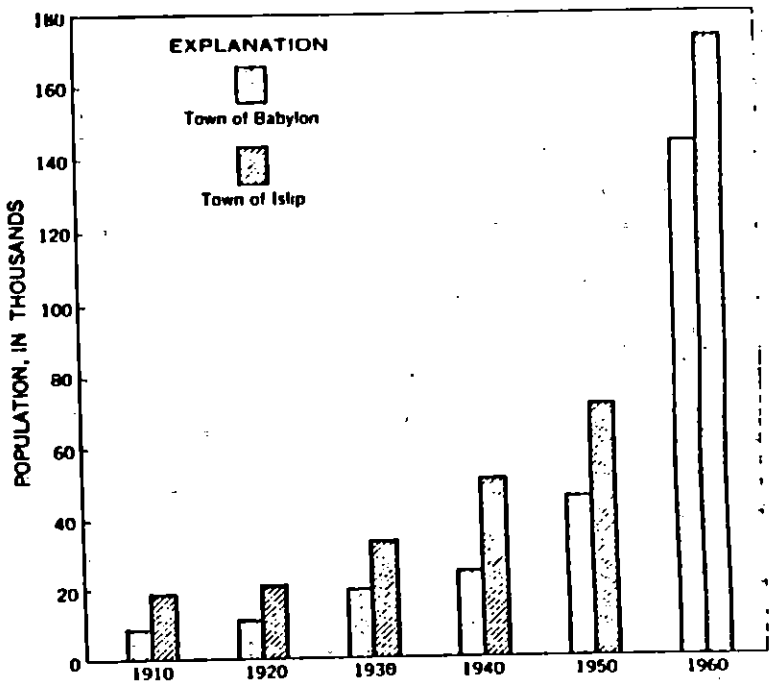

FIGURE 2.—Population of the Towns of Babylon and Islip, 1910-60.

Nearly two-thirds of the companies in the area have been established since the end of World War II. Most concerns are small, employing fewer than 100 people; however, two large plants, Republic Aviation Corp. and Fairchild Engine and Aircraft Co., each employ several thousand. Republic Aviation Corp., which is in the northwestern part of the Town of Babylon, is the largest industrial concern in Suffolk County, and employed 16,000 persons in 1958. Of the 625 industrial plants in Suffolk County in June 1956, nearly 60 percent were in the Towns of Babylon and Islip (Leonard and Stonier, 1956, p. 51).

The major industries in Suffolk County are aviation, instruments, electronics, and fabrication of metals; smaller industries include furniture, printing and publishing, textiles, and apparel. The aviation industry has been well established on Long Island since the end of World War I. Production of scientific and professional instru- [illegible] adjust to the aviation industry. Similarly [illegible]

the development of the all-metal airplane created a need for metal-fabricating shops. The post-World War II boom in electronics and electrical equipment found Suffolk County well prepared for the new industry owing to its established aviation firms, and the presence of the required skilled personnel.

AGRICULTURE AND VEGETATION

Although the value of crops produced and marketed in Suffolk County ranks highest of all the counties in New York State, agricultural production in the Babylon-Islip area is relatively small. The soils in the southern and eastern parts of the area have been classified by Lounsberry and others (1928, p. 13) as Sassafras Sandy Loam and Dukes Loamy Sand. These soils are not as productive as the soils in the northern and eastern parts of the county. The Sassafras Loam soils in the northwestern and north-central parts of the area are fairly productive. Proximity of this area to metropolitan markets spurred the development of numerous truck farms. The major crops produced by these farms are tomatoes, cauliflower, corn, string beans, peas, and cucumbers. Intensive urbanization, however, has reduced farm acreage so sharply that only a few farms remained in 1961.

Extensive tracts of natural vegetation are limited principally to the northern and eastern parts of the area. Much of the hilly area of the Ronkonkoma terminal moraine is forested with well-developed stands of deciduous trees. Low moisture retention characterizes the sandy, well-drained soils of the eastern part of the area and thereby precludes extensive forest development. Stands of scrub oak or pitch pine are common here in conjunction with an undergrowth of huckleberry, sweetfern, and wintergreen.

GEOLOGY

The composition, thickness, and geologic history of the deposits underlying the Babylon-Islip area determine the water-bearing characteristics, and the lateral and vertical extent of aquifers and aquicludes that form the hydrologic environment. The stratigraphy of the geologic formations is known almost exclusively from well records and samples, as outcrops, especially those of Cretaceous age, are rare.

STRATIGRAPHY

The Babylon-Islip area is underlain by unconsolidated sediments of Cretaceous, Tertiary, and Quaternary age, which lie on crystalline

member. Above the Raritan Formation is a thick sequence of deposits of late Cretaceous age which is in part, correlative with the Magothy Formation of New Jersey, but also includes some formations that are younger than the Magothy (Perlmutter and Crandell, 1959, p. 1066). Pending a more specific identification, these beds are referred to as the Magothy(?) Formation. Deposits of Quaternary, and possibly Tertiary age overlie the Cretaceous deposits. These consist, from oldest to youngest, of the Mannetto Gravel of doubtful Tertiary (Pliocene ?) age, the Gardiners Clay, and the upper Pleistocene and Recent deposits.

TABLE 1.—*Summary of stratigraphy of the Babylon-Islip area*

Era	Period	Epoch	Geologic unit		Remarks
Cenozoic	Quaternary	Recent	Recent deposits		Stream, beach, and marsh deposits; small areal extent
		Pleistocene	Upper Pleistocene deposits		Till and outwash deposits of the Wisconsin Glaciation
			Gardiners Clay		Fossiliferous marine clay of probable Sangamon age
	Tertiary(?)	Pliocene(?)	Mannetto Gravel		Formerly believed to be an outwash deposit but now regarded as a stream-terrace deposit; small areal extent.
Mesozoic	Cretaceous	Late Cretaceous	Magothy(?) Formation		Interbedded sand, silt, and clay
			Raritan Formation	Clay member	Dominantly clay but may contain some silty and sandy zones locally.
				Lloyd Sand Member	Sand, gravel, and interbedded clay and silt.
Precambrian and early Paleozoic(?)			Bedrock		Schist and gneiss containing some granitic intrusions

THE BEDROCK

No wells in the Babylon-Islip area have reached bedrock. However, information obtained from wells in nearby parts of Long Island (Suter and others, 1949, p. 30-32, pls. 8 and 9) suggests that the bedrock in the area consists chiefly of schist and gneiss and contains some granitic intrusions. The bedrock is probably correlative in part with igneous and metamorphic rocks of Connecticut.

The bedrock surface dips southeastward at a rate of approximately 50 to 100 feet per mile. The altitude of the surface ranges from about 1,200 feet below sea level in the northwestern part of the area to about 1,800 feet below sea level in the extreme southeastern part. This bedrock surface represents the lower limit of the ground-water

RARITAN FORMATION

The Raritan Formation of Late Cretaceous age directly overlies the bedrock. It is divided into the Lloyd Sand Member below and an unnamed clay member above, and has been correlated with the Raritan Formation of New Jersey on the basis of lithology and stratigraphic position. Because the Raritan Formation has been penetrated by only one test well in the area, its lithology, thickness, and altitude are inferred from data obtained in adjacent areas.

LLOYD SAND MEMBER

The Lloyd Sand Member of the Raritan Formation lies directly on the bedrock surface. It has an estimated thickness of 150 to 300 feet, and is thickest in the southern part of the area. The altitude of the top of the Lloyd is estimated to be approximately 800 to 1,500 feet below sea level, being lowest in the southeast, under Fire Island. It is inferred from examination of cores from wells N3355 [1] and S6409 (1¾ miles northwest of the northwest corner of the Town of Babylon, and approximately 15 miles east of Lake Ronkonkoma, respectively), and the log of well S42 (pl. 1) that the Lloyd Sand Member underlying the area is probably composed of light-colored sand and gravel and lenses of clay and silty clay. Logs of several wells in eastern Suffolk County, indicate that the Lloyd Sand Member may be more clayey in that area, possibly because of a facies change along the northeasterly strike of the formation.

CLAY MEMBER

On the basis of descriptions of samples from wells in other parts of Long Island and the log of well S42 in the area, the clay member of the Raritan Formation probably consists of 170 to 300 feet of gray, blue, black, red and white clay, silt, and some very fine to fine sand. The altitude of the top of the clay member at well S42 in the northwest corner of the Town of Islip is 670 feet below sea level, and under Fire Island the clay member may be as much as 1,300 feet below sea level.

MAGOTHY(?) FORMATION

The Magothy(?) Formation of Late Cretaceous age has been completely penetrated by only one well (S42) in the area; therefore, its thickness and the nature of its contact with the underlying clay member of the Raritan Formation is known only approximately. The Magothy(?) is about 600 to 700 feet thick in the northern part of the area, and 1,000 to 1,200 feet thick in the southern part. The

[1] Wells in each county on Long Island are numbered serially by the New York State Water Resources Commission. The well number is prefixed by the initial letter of the county in which the well is located. Thus, well N3355 is in Nassau County and well S6409 is in Suffolk County.

altitude of the top of the formation ranges from 200 feet above to more than 100 feet below sea level. Relief on the Magothy(?) surface is due to stream erosion, mostly during late Pliocene and Pleistocene time. Contour lines on the Magothy(?) surface are shown on plate 2.

The Magothy(?) Formation consists mostly of nonfossiliferous beds and lenses of gray and white fine quartz sand, clayey and silty sand, and clay. However, the upper 50 to 200 feet of the formation beneath the barrier beaches consists of beds of fossiliferous green and gray glauconitic clay and sandy clay, which have been tentatively correlated with the Monmouth Group of New Jersey (Perlmutter and Crandell, 1959, p. 1066). Layers of lignite, pyrite, and iron-oxide concretions are common. Medium to coarse sand occurs in lenses irregularly throughout the formation, particularly in the upper and lower zones. West and north of the Babylon-Islip area, where the formation has been more fully explored, a gravel-bearing zone as much as 200 feet thick is found in the lower (basal) zone of the Magothy(?). Records of a few wells suggest that the gravelly zone occurs also in the area.

MANNETTO GRAVEL

The Mannetto Gravel, which consists of stratified and crossbedded quartz gravel, containing some highly weathered erratic material, was considered by Veatch (1906) and Fuller (1914) to represent the earliest deposit of Pleistocene age on Long Island. Currently it is considered to be of doubtful Tertiary (Pliocene(?)) age (Suter and other, 1949, p. 9) and probably correlative with the Bryn Mawr terrace-gravel deposits of Pennsylvania (Cooke, Gardiner, and Woodring, 1943).

The Mannetto Gravel has been recognized only in the northwestern part of the Babylon-Islip area where it crops out in the West and the Half Hollow Hills. It is difficult to distinguish the Mannetto in drillers' logs from the overlying glacial deposits, and its subsurface distribution is not well known.

PLEISTOCENE DEPOSITS

Deposits of Pleistocene age comprise the uppermost 50 to 150 feet of sediments in most of the area. The Jameco Gravel, a major aquifer in western Long Island, is not found in the Babylon-Islip area. The oldest formation of Pleistocene age is the Gardiners Clay, an interglacial deposit. The Gardiners Clay is overlain by upper Pleistocene deposits of Wisconsin age.

GARDINERS CLAY

The Gardiners Clay is a marine interglacial deposit of probable Sangamon age and has been recognized in wells along the south shore

of the area (pl. 2). Generally it is not found more than a mile north of Great South Bay, although it occurs in the middle of Long Island, at Brookhaven National Laboratory (Weiss, 1954), 11 miles east of the Babylon-Islip area. The Gardiners Clay is overlain by upper Pleistocene deposits of Wisconsin age. It is difficult to determine the lower boundary of the Gardiners Clay from drillers' logs in some places because the underlying Magothy(?) Formation contains beds of similar lithology. The abundance of biotite and chlorite and the presence of foraminifers are used to differentiate the Gardiners from the Magothy(?) Formation where samples are available.

The Gardiners Clay is generally 20 to 40 feet thick, and the altitude of the top of the formation ranges from about 50 to 110 feet below sea level (p. 2). The formation consists of dark-colored clay, lenses of green silt and very fine sand, and thin layers of fine gravel. The layers of clay and silt are generally fossiliferous.

UPPER PLEISTOCENE DEPOSITS

The upper Pleistocene deposits include (a) outwash deposits of stratified medium to coarse sand and gravel, (b) terminal moraine deposits consisting of till and ice-contact deposits of stratified sand and gravel, (c) till, composed of unstratified clay, sand, gravel, and boulders in the form of ground moraine (not exposed), and (d) glaciolacustrine deposits of clay and silt (not exposed). The surficial distribution of the till and outwash deposits is shown on Plate 1.

Outwash is the most extensive upper Pleistocene deposit in the area. The outwash is underlain by the Gardiners Clay and Magothy(?) Formation, and is partly overlain by younger glacial and Recent deposits. The thickness of the outwash ranges from zero where it abuts Cretaceous and Tertiary sediments in the northwestern part of the area, to more than 100 feet in the eastern part. In parts of the area as much as 120 feet of poorly to well stratified ice-contact deposits are found above the outwash. These deposits form the bulk of the Ronkonkoma terminal moraine, a discontinuous ridge marking the maximum advance of a continental glacier. Quartz is by far the most abundant mineral in the outwash and ice-contact deposits; however, igneous and metamorphic rock particles, muscovite, biotite, and some heavy minerals are common in many beds.

A buried till sheet probably underlies the outwash deposits north of the Ronkonkoma moraine, but the till has not been definitely identified (Lubke, 1961, p. 38). A glacial clay, which underlies much of the Town of Smithtown (Lubke, 1961, p. 39), extends into the northeastern part of the area, but the data are too scanty to define the southern limit.

RECENT DEPOSITS

Deposits of Recent age are found along stream channels, in marshes and ponds, on the barrier beaches, and under Great South Bay. Stream channel deposits consist of a veneer of discontinuous reworked outwash deposits. Beds of very fine sand, silt, and clay are accumulating in marshes and ponds, and under Great South Bay. The barrier beaches consist of beach and dune sands as much as 50 feet thick. The Recent deposits commonly contain shells of mollusks.

GEOLOGIC HISTORY

A knowledge of the geologic history is important in understanding the nature and distribution of the geologic formations. The following summary is adapted largely from a report by Suter, and others (1949, p. 29–46).

During the Cretaceous Period, sediments derived from highlands in northeastern North America were deposited on a relatively flat bedrock surface sloping in a general southeasterly direction. The sediments thus deposited form a part of the present-day coastal plain extending from Long Island to the Gulf of Mexico. Long Island, which was approximately at the strand line of the Cretaceous sea, received mostly continental deposits. The great thickness of sediments deposited near sea level suggest concurrent depression of the bedrock surface during deposition. The variable and lenticular nature of the Cretaceous sediments indicates that deposition took place in shifting river channels, flood plains, swamps, and marshes.

The apparent absence of deposits of Tertiary age on Long Island, except for the nonmarine Manetto Gravel, suggests either nondeposition or deposition followed by extensive erosion. The present distribution of the Manetto Gravel is a remnant of the formerly extensive stream deposit.

Large continental glaciers, which were formed at the beginning of the Pleistocene Epoch, resulted in a general lowering of sea level. This lowering, in turn, caused stream rejuvenation and widespread erosion of pre-Pleistocene sediments and deepening of existing valleys. The area was drained then, as now, primarily by southward flowing streams, which cut partly into the Magothy(?) deposits but probably nowhere removed them completely. The eroded surface of the Magothy(?) is shown by contours on plate 2. The high area on the Cretaceous surface in the northwestern part of the area is a remnant of a dissected former divide between northward- and southward-flowing streams.

It is generally believed that the Pleistocene Epoch included four major glaciations, and therefore four cycles of eustatic sea level changes. The first three glacial advances did not reach Long Island

The only evidence of their presence near Long Island is the Jameco Gravel, an outwash deposit found in some parts of the island, but not in the Babylon-Islip area. The Gardiners Clay was deposited in shallow water during an interglaciation (Sangamon) when sea level was relatively high, but about 50 feet below its present altitude. The final, or Wisconsin glaciation of the Pleistocene Epoch, consisted of the Ronkonkoma and Harbor Hill stades. During the first Wisconsin ice advance, meltwater deposited outwash, which was partially overridden by the ice until stagnation occurred. During this stagnation period, stratified sand and gravel in the form of outwash was deposited south of the glacier by meltwater streams, and stratified ice-contact deposits were deposited along the southern terminus of the glacier to form the Ronkonkoma terminal moraine. Melting of the ice left a thin sheet of unstratified ground moraine, which was subsequently buried by younger outwash. The second Wisconsin ice advance did not move as far south as the first. Meltwater streams from the second advance deposited stratified sand and gravel north of the Ronkonkoma terminal moraine and, in places, breached the moraine so that Harbor Hill outwash may be found above the outwash of the Ronkonkoma Stade from which it cannot be distinguished readily.

Some of the large streams in the area did not erode their present valleys, but occupy valleys eroded by streams which issued from glaciers during the Pleistocene Epoch. The largest valleys in the area, those of Carlls River, Connetquot River, and Sampawams Creek, can be traced northward to breaches in the Ronkonkoma moraine (pl. 1).

Melting of the continental glaciers was accompanied by a rise in sea level to its present position. Erosion by stream and wave action is presently occurring simultaneously with deposition by these same agents.

HYDROLOGY

HYDROLOGIC ENVIRONMENT

Water in the Babylon-Islip area occurs in the interstices of unconsolidated sediments and in streams and ponds. The ground-water reservoir consists of saturated unconsolidated deposits ranging in thickness from 1,300 to 1,800 feet. The water table, which forms the boundary between the zone of saturation and the overlying zone of aeration (unsaturated zone), is the upper limit of the reservoir, and the impervious bedrock is the lower limit. Water in marshes, ponds, or streams in the Babylon-Islip area is nearly always hydraulically connected with the water table. The availability of ground water and surface water for man's use is controlled to a large extent by the physical characteristics of the aquifers, streams, and ponds. These characteristics include the capacity of ponds, size and gradient of streams, and the extent, nature of boundaries, and water-bearing properties of aquifers.

AQUIFERS

Three aquifers of wide areal extent are recognized in the deposits underlying the Babylon-Islip area: (a) a shallow water-table aquifer, (b) an intermediate artesian aquifer, and (c) a deep artesian aquifer. Perched water may occur locally in the northern part of the area in lenses of sand and gravel separated from the main water table by deposits of clay or glacial till. The hydrologic environment of perched-water bodies is similar to that of the water-table aquifer, except that perched-water bodies are small and localized and generally are not a dependable source of supply.

WATER-TABLE AQUIFER

The water-table aquifer is composed almost entirely of highly permeable upper Pleistocene deposits that constitute the uppermost zone of the ground-water reservoir. The upper surface of this aquifer is the water table, or top of the zone of saturation. The configuration of the water table (pl. 3) is controlled by the topography, and by the thickness, water-bearing properties, and quantity of recharge to and discharge from the aquifer.

The water table is a subdued replica of the topography. A conspicuous "high" on the water table occurs under the West Hills, south of Huntington Station, where the land surface reaches altitudes as high as 400 feet. Another "high" northeast of Lake Ronkonkoma is coincident in part with the Ronkonkoma terminal moraine where the land surface altitude is commonly as high as 300 feet. The saddle in the ground-water divide south of Hauppauge is probably largely the result of substantial quantities of ground-water discharge into the relatively deep valleys of the Nissequogue and Connetquot rivers, situated north and south of the divide, respectively.

Depth of the water table below land surface is shown on plate 4. In general, the depth to water increases northward from zero along Great South Bay and stream channels to as much as 200 to 300 feet beneath parts of the Ronkonkoma terminal moraine, West Hills, and Half Hollow Hills. The southern half of the area is drained by many effluent streams and depths to water are commonly 25 feet or less.

The lower boundary of the water-table aquifer is defined in most of the area by the occurrence of beds of predominantly low permeability in the upper part of the Magothy(?) Formation. Where the upper part of the Magothy(?) is composed of permeable material, these beds form a part of the water-table aquifer, and the lower surface of the

aquifer is at the first impermeable zone below the top of the Magothy(?). In the extreme southern part of the area, the Gardiners Clay forms the lower boundary of the water-table aquifer.

The water-table aquifer is present everywhere in the Babylon-Islip area, but it very thin in some places and contains salt water in others. In the northwestern part of the area, the water table is mainly in the Magothy(?) Formation rather than in upper Pleistocene deposits. As a result, the water-table aquifer is thin, owing to the clayey nature of most of the saturated beds. The Recent and upper Pleistocene deposits which compose the water-table aquifer beneath Great South Bay contain only salt water. Beneath the barrier beaches, fresh water in the water-table aquifer occurs in small discontinuous lenses in beach and dune deposits of Recent age. These fresh-water lenses are underlain by salt water.

The approximate thickness of the water-table aquifer may be determined by subtracting algebraically the altitude of the top of the Magothy(?) Formation, or Gardiners Clay where it is present (pl. 2), from that of the water table (pl. 3). The thickness of the water-table aquifer ranges from almost zero in the northwestern part of the Babylon-Islip area to more than 100 feet in the eastern part. The average thickness is about 75 feet. Wells screened in the outwash deposits yield as much as 1,500 gpm (gallons per minute). Specific capacities may be as high as 135 gpm per foot of drawdown, but are commonly 40 to 75 in thoroughly developed, large-diameter wells. The specific capacity of a well is a useful parameter for estimating water-bearing properties of an aquifer. Coefficients of transmissibility estimated from specific capacities (Theis and others, 1954) were used to compute the approximate coefficients of permeability of the outwash deposits given in the following table:

Estimated permeabilities of outwash deposits in the water-table aquifer

Well	Screened zone (ft below land)	Yield (gpm)	Specific capacity (gpm per ft)	Approximate thickness of aquifer (feet)	Field coefficient of permeability (gpd per sq ft)
S10,787T	39-81	820	37	72	800
S11,181	50-81	80	20	84	300
S12,018	50-88	1,625	93	97	2,200
S12,021	54-78	360	45	70	1,000
S12,710	60-79	1,800	100	78	1,600
S12,873	78-103	1,212	76	91	1,100
S13,478	85-60	330	42	70	800
S16,178	81-117	1,670	71	85	1,200
S16,608	110-140	1,000	77	88	1,200

The hydraulic coefficients of the water-table aquifer at one well near Central Islip State Hospital are given below:

Hydraulic coefficients of outwash deposits in the water-table aquifer

[Determination by the Hydrologic Laboratory, U.S. Geol. Survey]

Well	Depth (feet)	Specific retention (percent)	Specific yield (percent)	Porosity (percent)	Coefficient of permeability (gpd per sq ft)
S16,603	27-32	2.3	25	27.2	700

Because of the high permeability of the beds and generally shallow depth to the water table, wells are both productive and economical in most of the area underlain by outwash deposits (pl. 1). The water-table aquifer presently (1961) supplies approximately 84 percent of the total pumpage of ground water in the Babylon-Islip area.

INTERMEDIATE ARTESIAN AQUIFER

The intermediate artesian aquifer is composed of lenticular permeable deposits of the Magothy(?) Formation. The upper surface of the clay member of the Raritan Formation defines the lower boundary of the aquifer. Clayey and silty lenses in the upper part of the Magothy(?) Formation and the Gardiners Clay, where present, constitute the upper boundary. Unlike the top of the water-table aquifer, the upper boundary of the intermediate artesian aquifer generally is not a sharply defined surface such as the water table, but is a transitional zone of relatively low permeability. Where clayey confining beds are replaced by sandy zones, hydraulic continuity exists between the water-table and intermediate artesian aquifers.

Because permeable zones in the Magothy(?) Formation are lenticular, it is difficult to predict their occurrence and thickness, except for a basal zone. As in many parts of western Long Island, an extensive zone of sand and gravel about 100 feet thick probably lies immediately above the clay member of the Raritan Formation in the Babylon-Islip area but the data are too scanty to permit mapping the zone as a separate unit. (See well S42, pl. 1.) Test drilling is generally necessary to locate permeable zones which can yield as much as 1,500 gpm to individual wells. Specific capacities of wells range from 1 to 49 gpm per foot of drawdown. Those wells tapping zones composed chiefly of sand and gravel commonly have specific capacities ranging from 20 to 40 gpm per ft. The method of computing transmissibilities

from specific capacities (Theis and others, 1954) yields only approximate values for the intermediate artesian aquifer because of the unknown effects of partial penetration and the heterogeneous nature of the aquifer. However, in the absence of other laboratory or field determinations, the specific capacity is used as a means of estimating the coefficients of transmissibility of the aquifer. Coefficients of transmissibility estimated from specific capacities of four wells screened in various zones of the aquifer were used to compute the coefficients of permeability listed in the following table:

Estimated permeabilities of water-bearing zones in the intermediate artesian aquifer

[Thickness of water-bearing zone determined from well log]

Well	Screened zone (feet below mean sea level)	Thickness of water-bearing zone (feet)	Specific capacity (gpm per ft)	Field coefficient of permeability (gpd per sq ft)
S11279	276-308	32	2.6	400
S14583	106-132	26	15.9	400
S15775	180-220	40	31.7	800
S16256	800-843	76	35.7	1,200

Wells S15775 and S16256 are screened in coarse sand and gravel whereas wells S11279 and S14583 are screened in fine to medium sand. Hence on the basis of data in the above table, approximate coefficients of permeability of 1,000 gpd (gallons per day) per square foot and 400 gpd per sq ft may be assumed for coarse sand and gravel and for fine to medium sand, respectively. The aquifer also consists of lenses of very fine to fine sand, silt, and clay, for which an average permeability of 20 gpd per sq ft may be assumed (Wenzel, 1942, p. 13). Based on the geologist's log of well S42 (Leggette and others, 1938, p. 30–32) 29 percent of the intermediate aquifer is sand and gravel, 52 percent is predominantly sand, and 19 percent is fine sand, silt, and clay. On the basis of these data, the average coefficient of permeability of the intermediate aquifer is estimated to be about 500 gpd per sq ft.

DEEP ARTESIAN AQUIFER

The deep artesian aquifer is the lowermost water-bearing zone in the ground-water reservoir. Its boundaries coincide with those of the Lloyd Sand Member of the Raritan Formation. Although no wells penetrate the deep artesian aquifer, it probably underlies the entire area. The bedrock, which contains only small quantities of water, marks the lower limit of the deep aquifer. The upper limit is at the base of the clay member of the Raritan Formation which acts as an effective confining unit for the deep artesian aquifer.

Specific capacities of 10 to 20 gpm per ft of drawdown are com- repe[illegible]or [illegible]appi[illegible]Ll[illegible]nd[illegible]er i[illegible]au

County. Test wells screened in the Lloyd in central Suffolk County at Brookhaven National Laboratory had specific capacities of only 2.0 and 2.5 gpm per ft. If the Lloyd becomes increasingly clayey to the east (as the scanty data suggest), specific capacities of wells may range from about 10 to 20 gpm per ft in the western part of the area and 5 to 15 gpm per ft in the eastern part.

STREAMS AND PONDS

Surface-water resources have played a significant role in the growth of Long Island since its original settlement. Early industrial requirements focused on a need for power to operate sawmills and gristmills. The first gristmill in the Babylon-Islip area was constructed about 1860 on Connetquot River (Sander, 1954, p. 64). Artificial ponds were developed on many streams to supply the head required to drive water wheels. When steam and electric power came into use, gristmills and sawmills were abandoned, and now the principal use of streams and ponds is for recreation.

To meet demands for water by New York City, the surface-water resources of Nassau County were intensively developed in the early 1900's. A plan was proposed shortly thereafter to tap about 10 large streams in Suffolk County for additional supplies. The plan was abandoned only after strong protests were voiced throughout the county, especially by officials who envisioned the day when this invaluable resource might be required for local use. A county-wide plan is now in effect to purchase and preserve, in its natural state, land bordering on the few remaining undeveloped streams to be used for recreation and conservation.

All major streams in the area flow in a southerly direction, and, in general, are less than 3 miles long. The largest streams are Carlls River in the Town of Babylon, and Connetquot River in the Town of Islip. Both streams have fairly well developed tributary systems, and extend approximately 5 miles above the head of tidewater. All streams have gentle gradients that average about 2 feet per 1,000 feet.

With the exception of Lake Ronkonkoma, almost all ponds in the area are manmade. In the late 1800's ponds were utilized for industrial purposes; however, most are used only for recreation at present. Lake Ronkonkoma occupies a kettle hole whose bottom extends about 60 feet below the water table. The lake has a surface area of about 220 acres. The total area of all ponds and lakes is about 1.1 square miles or 0.7 percent of the total Babylon Islip area.

HYDROLOGIC CYCLE

The term "hydrologic cycle" denotes the general circulation [illegible] water in its various states (liquid, solid, or gaseous) from ocean to

atmosphere, from the atmosphere over and through the ground, and back to the ocean again.

Atmospheric water vapor will, if favorable conditions exist, condense into tiny droplets which increase in size until they can no longer be supported by air currents. If temperatures are above freezing, water vapor will precipitate as rain. If temperatures are at or below freezing during the condensation process, water vapor will precipitate as snow, sleet, or hail.

The time required for precipitation to return to the atmosphere depends principally upon the nature of the incident surface. Impervious or water-saturated surficial deposits cause precipitation to flow overland into streams or ponds. Precipitation falling upon and retained by vegetal surfaces will evaporate and return directly to the atmosphere. Some of the precipitation reaching the land surface will also evaporate; however, a substantial part will infiltrate into the ground if the soil is permeable. The first demand the infiltrating water must satisfy is that of the soil. Soil moisture is depleted primarily by vegetation and direct-surface evaporation. After soil-moisture requirements are fulfilled, residual water percolates slowly downward through interstices in the earth materials underlying the soil zone until it reaches the ground-water reservoir. While in the ground-water reservoir, the water moves slowly down gradient and is discharged into streams, bays, and the ocean. After discharge into the ocean, water completes the hydrologic cycle by eventually returning to the atmosphere by evaporation.

QUANTITATIVE HYDROLOGY

One of the principal objectives of this report was to evaluate the water balance for the ground-water reservoir. The accomplishment of this objective requires the collection and interpretation of data on precipitation, ground-water levels, and streamflow. These data are [illegible] throughout the area.

In evaluating the water balance, the inflow or recharge to the ground-water reservoir is equated to the outflow or discharge, plus or minus changes in the reservoir storage. Recharge is essentially equal to discharge if the period of study selected is long enough to minimize the effect of changes in ground-water storage. The hydrologic factors affecting the water balance include precipitation, ground-water runoff, direct runoff, evapotranspiration, and underflow.

Precipitation, the largest factor, is fortunately the easiest to measure. Five U.S. Weather Bureau cooperative stations in or near the area have records of sufficient length to be of value in determining average precipitation. The average streamflow of the area was computed

from the existing network of primary, secondary, and partial-record gaging stations. That part of total streamflow which reflects direct runoff was computed from an analysis of the discharge hydrographs of the primary gaging stations; the remainder of the streamflow represents ground-water runoff. Precipitation and streamflow are the factors most amenable to quantitative analysis. Estimates of evapotranspiration losses are much more difficult to obtain. These estimates depend on studies made in nearby areas where geologic conditions do not preclude computing evapotranspiration indirectly. Ground-water evapotranspiration was computed from an analysis of water-table fluctuations in a part of the area where such losses are significant. The only unknown factor in the water-balance equation for the area is underflow at the north shore of Great South Bay (submarine outflow) which, therefore, may be computed from the equation.

To evaluate the various hydrologic factors, it is desirable to compute data for a period common to all. Too, as previously noted, it is essential to choose a period of sufficient length to eliminate the effect of change in storage in the ground-water reservoir. The period selected for study was the 1944–59 water years which corresponds to the length of the longest streamflow record in the Babylon-Islip area. Hence, all computations represent the averages for this period and may be assumed to be approximately equivalent to the true long-term averages.

PRECIPITATION

Precipitation in its various forms is the source of all water on Long Island. A favorable geographic location with respect to available sources of moisture provides Long Island with an abundant and fairly uniform supply of precipitation throughout the year. The two principal meteorological factors which produce precipitation on Long Island are the active extra-tropical cyclonic disturbances prevalent from November through April, and local convective summer storms. A secondary source of precipitation is tropical cyclones, often of spectacular size, but fortunately of infrequent occurrence. The primary sources of moisture for all storms affecting Long Island are the Gulf of Mexico and the southwestern part of the North Atlantic Ocean.

There are no long-term rainfall stations within the Babylon-Islip area; however, the records for Farmingdale, Babylon, and Brentwood (pl. 7), are of sufficient length to be of value in computing the mean annual precipitation for the base period. In addition, the rainfall stations at Patchogue (pl. 7) and Setauket (fig. 1), although outside the area, are considered to be sufficiently close that their records may be given some weight in determination of mean annual precipitation. With the

exception of the records for Setauket, which data back to 1886, the records of these stations go back less than 25 years.

Precipitation is heaviest in the south-central part of the Babylon-Islip area, as comparison of the mean annual precipitation at Babylon with other stations in or near the area shows (table 2). Somewhat heavier precipitation than that recorded at Babylon may occur in the hilly region of the northern part of the area; however, owing to lack of data, the orographic influence is not known. The apparent heavier rainfall at Babylon may be due to any one, or to a combination of, the following reasons: (a) proximity to the ocean, (b) local effects such as rain-gage exposure, or (c) to chance. A comparison of the mean annual precipitation at New York City and Setauket for the base period (1944–59 water years) with the long-term averages in table 2 indicates only slight variations. For example, average precipitation during the base period was about three-quarters of an inch greater than that for the long-term period at New York City, and less than a quarter of an inch lower than at Setauket. It may be inferred, therefore, that a water balance computed for the base period will be representative of the long-term averages. For the Babylon-Islip area, the mean annual precipitation for the base period was computed to be 46.3 inches by the Thiessen method (Williams, 1950, p. 276–278). Only slight weight was given to the Setauket record in the computations and none at all to that of New York City, which is too distant from the area.

TABLE 7.—*Mean, maximum, and minimum annual precipitation, in inches, for selected stations*

Station	Period of record	Mean	Maximum	Minimum	Mean for base period (1944–59)
New York City	1826–1959	42.3	59.7	28.8	43.0
Setauket	1886–1959	45.0	69.3	33.6	44.8
Farmingdale	(1)	45.9	65.6	29.4	[2] 46.3
Babylon	1939–59	48.6	66.7	35.7	46.7
Brentwood	1942–59	44.0	60.0	30.4	45.9
Patchogue	1936–59	45.0	58.8	36.0	45.0

[1] 1871–72, 1928–33, 1940–59.
[2] Adjusted to base period.

On the basis of the records for Setauket and New York City for the period 1886–1960, annual precipitation may be expected to range from 30 to 60 inches in the area (fig. 3). If the 74-year record at Setauket is considered representative of average precipitation in the area, the curve in figure 3 may be used to predict future rainfall. For example, the probability is about three chances in five that annual precipitation in any one year will be between 40 and 50 inches.

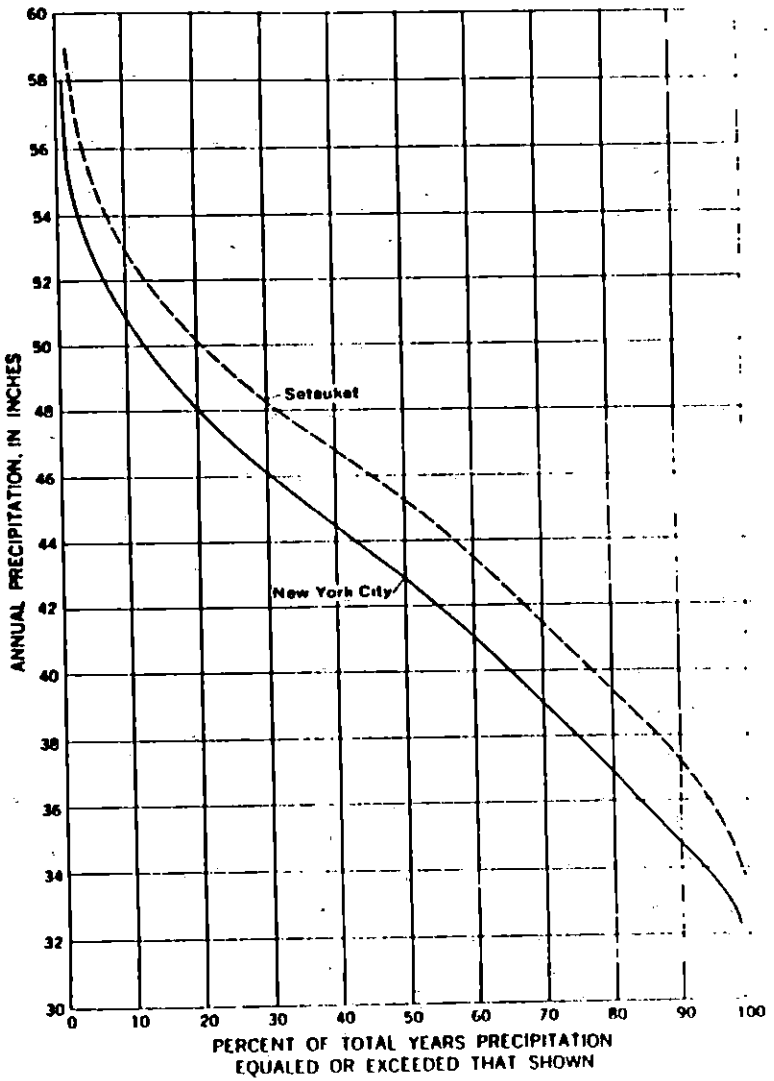

FIGURE 3.—Annual precipitation duration curves for New York City and Setauket, 1886–1960.

1981

Table 2. *Hydrogeologic units and well completion data from selected wells and test holes in Suffolk County, New York.*

EXPLANATION OF COLUMNAR DATA AND ABBREVIATIONS

Well Number

Well numbers are assigned by the New York State Department of Environmental Conservation. A prefix letter S, which designates Suffolk County, is omitted from the well number; thus, the official number of well 40161, for example, is S 40161. Wells are listed in numerical order.

Location of Well

Locations of wells are given by map coordinates, based on latitude and longitude, as shown on plate 1. Map coordinates are based on a latitude and longitude grid system established for Long Island (Veatch and others, 1906; Jensen and Soren, 1971). In this system, 5-minute intervals of latitude are lettered consecutively from south to north, and 5-minute intervals of longitude are numbered consecutively from west to east. The grid coordinates for Suffolk County are shown along the margins of plate 1. Thus, a well whose map coordinates are D15 is in the grid square bounded by lat 40°45' and 40°50'N and long 72°55' and 72°50'W.

Wells are also numbered according to the national well-numbering system of the U.S. Geological Survey. This system locates wells to the nearest second of latitude and longitude and gives a sequence number to the well to denote the chronological order in which wells within a 1-second quadrangle were recorded. For example, in well number 404707N0731905.01 (S 18075), the first six numbers indicate latitude 40°47'07" North; the remaining numbers before the period indicate longitude 073°19'05". The 01 after the period is the sequence number. Thus this well was the first one recorded in the 1-second quadrangle defined by the latitude and the longitude.

Well depth

The figures give well depth or total depth of the drilled test hole, in feet below land surface.

Hydrogeologic Unit Penetrated and Elevation of Unit Surface

Elevations of the tops of the hydrogeologic units penetrated by wells are given in feet above or below National Geodetic Vertical Datum of 1929. A minus (-) sign preceding the elevation figure indicates that the elevation is below National Geodetic Vertical Datum of 1929. The number in the "upper glacial aquifer" column is the elevation of the land surface at the well site. Absence of an elevation figure indicates that the test hole did not penetrate the unit.

Table 2.--Explanation (continued)

Year Completed

Year completed refers to the year in which the well was reported to have been completed or accepted by the original well owner. It may not always be the year in which the well was actually drilled.

Elevation of Land-Surface Datum (LSD)
(feet above National Geodetic Vertical Datum of 1929)

The elevation of land surface at the well was estimated from U.S. Geological Survey 7-1/2-minute quadrangle topographic maps.

Use of Water

The following abbreviations indicate the primary purpose in 1977 for which the water from the well was reported to be used.

ARCD	air conditioning	IND	industrial
COM	commercial	IRR	irrigation
DOM	domestic	OTHR	other
FRPT	fire protection	P.S.	public supply
INST	institutional		

Use of Well

The following abbreviations indicate the principal use of the well or the purpose for which the well or hole was drilled.

DEST	well destroyed	TEST	test hole
OBS	observation well	UNSD	well unused
RECH	recharge water	WTDR	withdrawal of water

Screen Setting and Total Screen Length

The elevations of the top and bottom of the screened interval are given in feet above or below (-) National Geodetic Vertical Datum of 1929. The total length of screen or perforated pipe in that interval is given in feet. In some wells, screen was set at two or more intervals; in such cases the difference between the elevations of the two screen settings is different from the total screen length.

Diameter of Well

The diameter of the well is the inside diameter of the smallest casing at land surface, in inches.

Table 2.--Explanation (continued)

Water Level (feet below land-surface datum)

The water level given is the reported original static water level, in feet above or below land surface, when the well was completed.

Date of Measurement

The date of water-level measurement is given by month (M), day (D), and year (Y).

Lift Type

The following abbreviations indicate the type of pump or other conveyance known or assumed to have been used in 1977 to bring water to the surface.

CENT	centrifugal	TURB	turbine
JET	jet	NONE	no pump in well
SUBM	submersible	OTHR	some other type of lift

Aquifer Developed

The following abbreviations indicate the hydrogeologic unit that yields water to the well. Where two or more units yield water to the well, the probable principal unit is given.

UPGLAC	Upper glacial aquifer
GARD	Gardiners Clay
MONMOUTH	Monmouth greensand
MAGOTHY	Magothy aquifer
RARITAN	Raritan clay
LLOYD	Lloyd aquifer

Table 2.--Explanation (continued)

Specific Capacity

The value in this column is the number of gallons per minute pumped from the well per foot of drawdown in the well, as reported by drillers.

Abbreviations

COORD	coordinates
D	day
DIAM	diameter
FT	feet
GPM/FT	gallons per minute pumped per foot of drawdown in the well
IN	inches
LSD	land surface datum
M	month
MEAS	measurement
NGVD	National Geodetic Vertical Datum of 1929.
Y	year

Continued Recorded Existing Conditions Noted by Inspector 3/17/81

Visited HWD and spoke with Andrew Conley Gen'l. Manager, who was very cooperative in supplying information on the plant. It was determined that there exists an Ammonium-Hydroxide emulsion process on an acid storage tank that is operating without a certificate to operate. A violation was issued to Mr. Conley for operating without that permit.

A tour of the grounds further disclosed that only 3 of the 6-10 large steel cylinder tanks remained refused to by D. O'Brien in his report of 3/11/81 were remaining at the location indicated by Mr. O'Brien. None of the 55 gal. drums were there. There was liquid waste in one of the tank and sludge waste in the other 2. The liquid + sludge waste were going to be transferred to 55 gal. drums for further transfer to a waste treatment plant in New Jersey via to the yard foreman.

Alan Dreyer

RCRA TREATMENT, STORAGE AND DISPOSAL FACILITY INSPECTION FORM
FOR TSD FACILITIES ONLY

COMPANY NAME: HAZARDOUS WASTE DISPOSAL, INC.

EPA I.D. Number: NYT [illegible]

COMPANY ADDRESS: 11A PICONE BLVD. FARMINGDALE, N.Y. 11735

COMPANY CONTACT OR OFFICIAL: MR. GEORGE R. LAWRENCE

OTHER ENVIRONMENTAL PERMITS HELD BY FACILITY: ☐ NPDES ☐ AIR ☑ OTHER NYS 364 PERMIT, HAULERS PERMIT

TITLE: PRESIDENT

INSPECTOR'S NAME: [illegible]

DATE OF INSPECTION: 9-2-81

BRANCH/ORGANIZATION: SOLID WASTE

TIME OF DAY INSPECTION TOOK PLACE: 2:10 P.M.

(1) Is there reason to believe that the facility has hazardous waste on site?

a. If yes, what leads you to believe it is hazardous waste? Check appropriate box:

☑ Company admits that its waste is hazardous during the inspection.

☑ Company admitted the waste is hazardous in its RCRA notification and/or Part A Permit Application.

☑ The waste material is listed in the regulations as a hazardous waste from a nonspecific source (§261.31)

☐ The waste material is listed in the regulations as a hazardous waste from a specific source (§261.32)

☐ The material or product is listed in the regulations as a discarded commercial chemical product (§261.33)

☐ EPA testing has shown characteristics of ignitability, corrosivity, reactivity or extraction procedure toxicity, or has revealed hazardous constituents (please attach analysis report)

☐ Company is unsure but there is reason to believe that waste materials are hazardous. (Explain)

	YES	NO	DON'T KNOW
b. Is there reason to believe that there are hazardous wastes on-site which the company claims are merely products or raw materials?	✓		

Please explain:
COMPANY CLAIMS THAT A LOT OF THE SOLVENT IS USED AS AN ALTERNATE FUEL SUPPLIES.

c. Identify the hazardous wastes that are on-site, and estimate approximate quantities of each.
SPENT SOLVENTS AND ACIDS.
1000 DRUMS, PLUS A 2500 GAL. ACID TANK.

	YES	NO	DON'T KNOW
(2) Does the facility generate hazardous waste?	✓		
(3) Does the facility transport hazardous waste?	✓		
(4) Does the facility treat, store or dispose of hazardous waste?	✓		

4.2.22

VISUAL OBSERVATIONS

(5) SITE SECURITY (§265.14)	YES	NO	DON'T KNOW
a. Is there a 24-hour surveillance system? *24-HOUR SECURITY GUARDS - 7 DAYS PER WEEK.*	✓		
b. Is there a suitable barrier which completely surrounds the active portion of the facility? *FENCE*	✓		
c. Are there "Danger-Unauthorized Personnel Keep Out" signs posted at each entrance to the facility? *THERE IS A WARNING SIGN, BUT IS NOT THE ONE REQUIRED BY THE REGULATIONS.*		✓	
(6) Are there ignitable, reactive or incompatible wastes on site? (§265.27)	✓		

a. If "YES", what are the approximate quantities? *1900 DRUMS COMPOSED OF IGNITABLE AND NONIGNITABLE WASTE.*

	YES	NO	DON'T KNOW
b. If "YES", have precautions been taken to prevent accidental ignition or reaction of ignitable or reactive waste? *ALTHOUGH BONDING WIRES AND EXPLOSION-PROOF WIRES ARE USED, THE STORED DRUMS ARE LEAKING AND EXPOSED TO THE ENVIRONMENT.*		✓	

c. If "YES", explain

d. In your opinion, are proper precautions taken so that these wastes do not:

	YES	NO	DON'T KNOW
- generate extreme heat or pressure, fire or explosion, or violent reaction?		✓	
- produce uncontrolled toxic mists, fumes, dusts, or gases in sufficient quantities to threaten human health?		✓	
- produce uncontrolled flammable fumes or gases in sufficient quantities to pose a risk of fire or explosions?		✓	
- damage the structural integrity of the device or facility containing the waste?		✓	
- threaten human health or the environment?		✓	

Please explain your answers, and comment if necessary.

e. Are there any additional precautions which you would recommend to improve hazardous waste handling procedures at the facility? *YES, A COMPLETE RENOVATION OF THE STORAGE AREA. ONE IMPRESSION IS THAT THE OWNER OF THE FACILITY SIMPLY PUT THE DRUMS WHEREVER THERE IS AVAILABLE SPACE, WITH MINIMAL ATTEMPTS TO SAFEGUARD HIS EMPLOYEES' SAFETY, PUBLIC HEALTH AND THE ENVIRONMENT.*

(7) Does the facility comply with preparedness and prevention requirements including maintaining: (§265.32)

4.3.22

	YES	NO	DON'T KNOW
- an internal communications or alarm system?	✓		
- a telephone or other device to summon emergency assistance from local authorities?	✓		
- portable fire equipment?	✓		
- adequate aisle space?		✓	
- in your opinion, do the types of wastes on site require all of the above procedures, or are some not needed? Explain. ALL OF THE ABOVE PROCEDURES ARE NEEDED.	✓		

In your opinion, do the types of wastes on site require all of the above procedures, or are some not needed? Explain.

ALL OF THE ABOVE PROCEDURES ARE NEEDED

*(8) Have you inspected to verify that the groundwater monitoring wells (if any) mentioned in the facility's groundwater monitoring plan (see no. 19 below) are properly installed? N/A. FACILITY IS NOT A LANDFILL. HOWEVER, A DAY WELLS LOCATED WITHIN OR ALL OF THE STORAGE AREA If you have, please comments as appropriate.		✓	
(9) a. Is there any reason to believe that groundwater contamination already exists from this facility? If "YES", explain.		✓	
b. Do you believe that operation of this facility may affect groundwater quality?	✓		

c. If "YES", explain. THE LOCATION OF THE DAY WELL IS SUCH THAT ANY HEAVY (OR HEAVY) PRECIPITATION WILL RESULT IN GROUNDWATER OR CONTAMINATION ASSUMING GROUND WATER TO EXIST UNDER THE FACILITY. ADDITIONALLY, THE SMALL DISTANCE BETWEEN THE STORAGE AREA AND THE DAY WELL IS SIMPLY UNACCEPTED GROUND.

RECORDS INSPECTION

(10) Has the facility received hazardous waste from an off-site source since Nov. 19, 1980 (effective date of the regulations)?	✓		
a. If "YES", does it appear that the facility has a copy of a manifest for each hazardous waste load received?	✓		
b. How many post-November 19 manifests does it have? (If the number is large, you may estimate) COMPANY RECEIVES WASTES A FEW TIMES PER WEEK.			
c. Does each manifest (or a representative sample) have the following information?			
- a manifest document number	✓		

* [illegible] effective after November 19, 1980

4.4.22

	YES	NO	DON'T KNOW	
(13) PERSONNEL TRAINING ($265.16)				
a. Is there written documentation of the following:				
- job title for each position at the facility related to hazardous waste management and the name of the employee filling each job?	—	—	—	INADEQUATE; NOT OBTAINED
- type and amount of training to be given to personnel in jobs related to hazardous waste management?	—	—	—	
- actual training or experience received by personnel?	—	—	—	
(14) Does the facility have a written contingency plan for emergency procedures designed to deal with fires, explosion or any unplanned release of hazardous waste? ($265.51)	—	—	—	
a. Does the plan describe arrangements made with local authorities?	✓	—	—	
b. Has the contingency plan been submitted to local authorities?	✓	—	—	
How do you know?				
c. Does the plan list names, addresses, and phone numbers of Emergency Coordinators?	✓	—	—	
d. Does the plan have a list of what emergency equipment is available?	✓	—	—	
e. Is there a provision for evacuating facility personnel?	✓	—	—	
f. Was an Emergency Coordinator present or on call at the time of the inspection?	✓	—	—	
(15) Does the owner/operator keep a written operating record with: ($265.73)	—			
- a description of wastes received with methods and dates of treatment, storage or disposal?	✓	—	—	
- location and quantity of each waste?	✓	—	—	
- detailed records and results of waste analysis and treatability tests performed on wastes coming into the facility? NOT AT THIS PLANT. A SECOND FACILITY (ARTESIA INTERMEDIATE STORAGE) KEEPS DETAILED RECORDS OF ALL ANALYSES. LOG IS AVAILABLE THERE.	—	—	—	
- detailed operating summary reports and description of all emergency incidents that required the implementation of the facility contingency plan?	✓	—	—	
*(16) Does the facility have written closure and post-closure plans? ($265.110) FACILITY IS UNDER COURT ORDER TO SHUT DOWN, CURRENTLY SATISFYING CLOSURE REQUIREMENTS (SEE ATTACHED COURT ORDER)	—	✓	—	
a. Does the written closure plan include:				
- a description of how and when the facility will be partially (if applicable) and ultimately closed?	—	—	—	

* Effective date for this requirement is May 19, 1981.

4.5.22

	YES	NO	DON'T KNOW
- an estimate of the maximum inventory of wastes in storage or treatment at any time during the life of the facility?	—	—	—
- a description of the steps necessary to decontaminate facility equipment during closure?	—	—	—
- a schedule for final closure including the anticipated date when wastes will no longer be received and when final closure will be completed?	—	—	—
b. What is the anticipated date for final closure?	—	—	—
†c. Does the owner/operator have a written post-closure plan identifying the activities which will be carried on after closure and the frequency of these activities?	—	—	—
d. Does the written post-closure plan include:			
- a description of planned groundwater monitoring activities and their frequencies during post-closure?	—	—	—
- a description of planned maintenance activities and frequencies to ensure integrity of final cover during post-closure?	—	—	—
- the name, address and phone number of a person or office to contact during post-closure?	—	—	—
*(17) Does the owner/operator have a written estimate of the cost of closing the facility? ($265.142) What is it? ORAL ESTIMATE BY MR. LAWRENCE IS $200,000	—	✓	—
*(18) Does the owner/operator have a written estimate of the cost for post-closure monitoring and maintenance? What is it? ($265.144)	—	—	—
*(19) Has a groundwater monitoring plan been submitted to the Regional Administrator for facilities containing a surface impoundment, landfill or land treatment process? (This requirement does not apply to recycling facilities.) ($265.90) N/A	—	—	—
a. Does the plan indicate that at least one monitoring well has been installed hydraulically upgradient from the limit of the waste mangement area? N/A	—	—	—
b. Does the plan indicate that there are at least three monitoring wells installed hydraulically downgradient at the limit of the waste management area? N/A	—	—	—

SEE CLOSURE OPINION

† This section applies only to disposal facilities.

* Effective date for this requirement is May 19, 1981.

4.6.2

SITE-SPECIFIC

Please circle all appropriate activities and answer questions on indicated pages for all activities circled. When you submit your report, include only those site-specific pages that you have used.

STORAGE	TREATMENT	DISPOSAL

Other _____	Chemical, Physical p. 13 and Biological Treatment (other than in tanks, surface impoundment or land treatment facilities)	
	Other _____	

CONTAINERS (§265.170)

	YES	NO	DON'T KNOW
1. Are there any leaking containers? If "YES", explain. MAJORITY OF CONTAINERS WERE LEAKING (SEE COMMENTS IN GENERATOR INSPECTION FORM, P. 4.)			
2. Are there any containers which appear in danger of leaking? If "YES", explain.	✓		
3. Do wastes appear compatible with container materials?		✓	
4. Are all containers closed except those in use?		✓	
5. Do containers appear to be opened, handled or stored in a manner which may rupture the containers or cause them to leak?	✓		
6. How often does the plant manager claim to inspect container storage areas?			
7. Does it appear that incompatible wastes are being stored in close proximity to one another? If "YES", explain.			✓
8. Are containers holding ignitable or reactive wastes located at least 15 meters (50 feet) from the facility's property line?	✓		

9. What is the approximate number and size of containers with hazardous wastes?

1900

4.7.22

TANKS ($265.190)	YES	NO	DON'T KNOW
1. Are there any leaking tanks? If "YES", explain.		✓	
2. Are there any tanks which appear in danger of leaking. If "YES", explain.		✓	
3. Are wastes or treatment reagents being placed in tanks which could cause them to rupture, leak, corrode or otherwise fail? If "YES", explain.			✓
4. Do uncovered tanks have at least 2 feet of freeboard or an adequate containment structure?	N/A		
5. Where hazardous waste is continuously fed into a tank, is the tank equipped with a means to stop this inflow?	✓		
6. Does it appear that incompatible wastes are being stored in close proximity to one another, or in the same tank? If "YES", explain.	✓		
7. How often does the plant manager claim to inspect container storage areas?	DAILY		
8. Are ignitable or reactive wastes stored in a manner which protects them from a source of ignition or reaction? If "YES", explain.	N/A		
9. What is the approximate number and size of tanks containing hazardous wastes? ONE 2500 GALLON ACID TANK.			

SURFACE IMPOUNDMENTS ($265.220) N/A	YES	NO	DON'T KNOW
1. Is there at least 2 feet of freeboard in the impoundment?			
2. Do all earthen dikes have a protective cover to preserve their structural integrity? If "YES", specify type of covering.			
3. Is there reason to believe that incompatible wastes are being placed in the same surface impoundment? If "YES", explain.			

4.8.2?

	YES	NO	UNKN
4. Are ignitable or reactive wastes being placed in surface impoundments without being treated to remove these characteristics? If "YES", explain.	—	—	—
5. Are there any leaks, failures or is there any deterioration in the impoundments? If "YES", explain.	—	—	—
6. Give the approximate size of surface impoundments (gallons or cubic feet).			

WASTE PILES (§265.250) N/A

1. Is the waste pile protected from wind erosion?	—	—	—
a. Does it appear to need such protection?	—	—	—
b. Explain what type of protection exists.			
2. Does it appear that incompatible wastes are being stored in the same waste pile? If "YES", explain.	—	—	—
3. Is leachate run-off from a pile a hazardous waste? If "YES", explain this determination and answer (a) and (b) below.	—	—	—
a. Is the pile placed on an impermeable base that is compatible with the waste?	—	—	—
b. Is the pile protected from precipitation and run-on?	—	—	—
4. In your judgment, are ignitable or reactive wastes managed in such a way that they are protected from any material or conditions which may cause them to ignite? Please explain or indicate if no such wastes are present.	—	—	—
Are they placed on an existing pile so that they no longer meet the definition of ignitable or reactive waste? Please explain.	—	—	—
5. How many waste piles are on site, and approximately how large are they?			

LAND TREATMENT (§265.270) N/A

1. Can the facility operator demonstrate that the hazardous waste has been made less or non-hazardous by biological degradation or chemical reactions occurring in or on the soil? Please explain.	—	—	—

4.9.22

	YES	NO	DON'T KNOW
*2. Is run-on diverted away from the active portions of the land treatment facility?	—	—	—
*3. Is run-off collected?	—	—	—
4. Are food chain crops being grown on the facility property?	—	—	—
a. If "YES", can the facility operator document that arsenic, lead and mercury:			
- will not be transferred to the crop or ingested by food chain animals or	—	—	—
- will not occur in greater concentrations in the crops grown on the land treatment facility than in the same crops grown on untreated soils.	—	—	—
b. Has notification of the growing of the food chain crops been made to the Regional Administrator?	—	—	—
5. Is there a written and implemented plan for unsaturated zone monitoring?	—	—	—
6. Are there records of the application dates, application rates, quantities and location of each hazardous waste placed in the facility?	—	—	—
7. Do the closure and post-closure plans address:			
a. control of migration of hazardous wastes into the groundwater?	—	—	—
b. control of run-off, release of airborne particulate contaminants?	—	—	—
c. compliance with requirements for the growth of food-chain crops (if they are present)?	—	—	—
8. Is ignitable or reactive waste immediately incorporated into the soil so the resulting waste no longer meets that definition? If "YES", explain.	—	—	—
9. Are incompatible wastes placed in the same land treatment area? If "YES", explain.	—	—	—
10. What is the area of the land receiving hazardous waste treatment?	—	—	—

LANDFILLS (§265.300) N/A

†1. Is run-on diverted away from the active portions of the landfill?	—	—	—
†2. Is run-off from active portions of the landfill collected?	—	—	—

* Effective date for these requirements is May 19, 1981.

† These requirements are effective November 19, 1981.

4.10.2

	YES	NO	DON'T KNOW
3. Is waste which is subject to wind dispersal controlled? Explain.			
4. Does the owner/operator maintain a map with:			
- the exact location and dimensions of each cell			
- the contents of each cell and approximate location of each hazardous waste type			
5. Do the closure and post-closure plans address:			
- control of pollutant migration via ground water?			
- control of surface water infiltration?			
- prevention of erosion?			
6. Is ignitable or reactive waste treated before being placed in the landfill? Explain how you know.			
7. Are precautions taken to insure that incompatible wastes are not placed in the same landfill cell? If "NO", explain.			
8. Are bulk or non-containerized wastes containing free liquids placed in the landfill? If "YES",			
a. Does the landfill have a liner which is chemically and physically resistant to the added liquid?			
b. Is the waste treated and stabilized so that free liquids are no longer present?			
*9. Are containers holding liquid waste or waste containing free liquids placed in the landfill?			
10. Are empty containers (e.g. those containing less than 1/2 inch of liquid) placed in the landfills?			
If so, are they crushed flat, shredded or similarly reduced in volume before they are buried?			
11. What is the approximate area of the hazardous waste landfill?			

* Effective date for this requirement is November 19, 1981.

4.11.22

INCINERATORS AND THERMAL TREATMENT (§§265.340 and 265.379) N/A

	YES	NO	DON'T KNOW
1. What type of incinerator or thermal treatment is at the site (e.g. waterwall incinerator, boiler, fluidized bed, etc.)?			
2. Was hazardous waste being incinerated or thermally treated during your inspection? If "YES", answer all following questions. If "NO", answer only questions 3 and 7.	---	—	—
3. Has waste analysis been performed (and written records kept) to include:			
- heating value of the waste	—	—	—
- halogen content	—	—	—
- sulfur content	—	—	—
- concentration of lead	—	—	—
- concentration of mercury	—	—	—
NOTE: Waste analysis need not be performed on each waste load if if there are documented data available to show waste characteristics that do not vary. If there are such documented data available, check here [ ]			
4. Does it appear that the owner/operator brings his thermal treatment process to steady state (normal) conditions of operation before introducing hazardous wastes?	---	—	—
5. Did it appear during your inspection that there was adequate monitoring and inspection by owner/operator every 15 minutes during hazardous waste incineration for:			
- waste feed	—	—	—
- auxiliary fuel feed	—	—	—
- air flow	—	—	—
- incinerator temperature	—	—	—
- scrubber flow	—	—	—
- scrubber pH	—	—	—
- relevant level controls	—	—	—
Every hour for:			
- stack plume (color and opacity)	—	—	—
5. Is there open burning of hazardous waste?	-----	—	—

4.12.22

a. If "YES", what is being burned? (only burning or detonation of explosives is permitted)

b. If open burning or detonation of explosives is taking place, approximately what is the distance from the open burning or detonation to the property of others?

	YES	NO	DON'T KNOW
6. Does the incinerator appear to be operating properly? (Do emergency shutdown controls and system alarms seem to be in good working order?) Please explain.			
a. Is there any evidence of fugitive emissions?			
7. Is the residue from the incinerator treated by the owner as a hazardous waste? Please explain.			

8. What types of air pollution control devices (if any) are installed on the incinerator?

CHEMICAL, PHYSICAL AND BIOLOGICAL TREATMENT (§265.400) N/A

	YES	NO	DON'T KNOW
1. Does the treatment process system show any signs of ruptures, leaks, or corrosion? Please explain.			
2. Is there a means to stop the inflow of continuously-fed hazardous wastes?			
3. Is there ignitable or reactive waste fed into the treatment system?			
If "YES", has it been treated or protected from any material or conditions which may cause it to ignite or react? If so, explain how.			
Are the incompatible wastes placed in the same treatment process? If "YES", explain.			

5. Describe the treatment system at this facility.

MEMORANDUM

TO: James C. Maloney, P.E.

FROM: John V. Soderberg, P.E.

DATE: March 12, 1981

RE: Hazardous Waste Disposal (H.W.D.)

On March 11, 1981 the writer was requested to accompany representatives of the Toxic Waste Handling Group in their investigation of the above premises.

At the time of my inspection there were no visible emissions occurring from the process tank in question. However, the East Farmingdale Fire District indicated a visible plume of from 150 to 200' in vertical height on or about noon of that date.

As part of my inspection, I spoke with representatives of Pront Printing (11D Picone Boulevard, Farmingdale). They indicated that the situation has been occurring sporadically since last September and was particularly severe last Summer. Concerning the specific incident, they were unsure about specifics and reported no property damage or lost time that they can contribute directly to the incident.

I recommend first that a detailed industrial survey be made of the premises and secondly that the firm be placed under routine surveillance for at least three months.

JVS:mew

MEMORANDUM

TO: JAMES C. MALONEY

FROM: JOHN V SODERBERG

DATE: MARCH 16, 1981

RE: H W D.

In follow up to my memo concerning the March 11, 1981 investigation of the above firm, an air pollution emission inspection was not performed at that time (due to inclement weather and potential safety hazard).

The water pollution file contains no information either confirming of denying the presence of such sources (only the H. W. D. environmental check-list submitted by them to Babylon Town indicating no process emissions).

I have therefore requested that such a survey be performed.

4.20.2

INFORMATION OBTAINED FROM MR. JOSEPH PICONI, OF JOSEPH PICONI & SON INC. AT #1637 BROAD HOLLOW RD. FARMINGDALE.

I INTERVIEWED MR JOSEPH PICONI ON MAY 5, 1981 BETWEEN 1[05] - 3[45] IN THE AFTERNOON AT HIS OFFICE AT 1637 BROAD HOLLOW RD. FARMINGDALE.

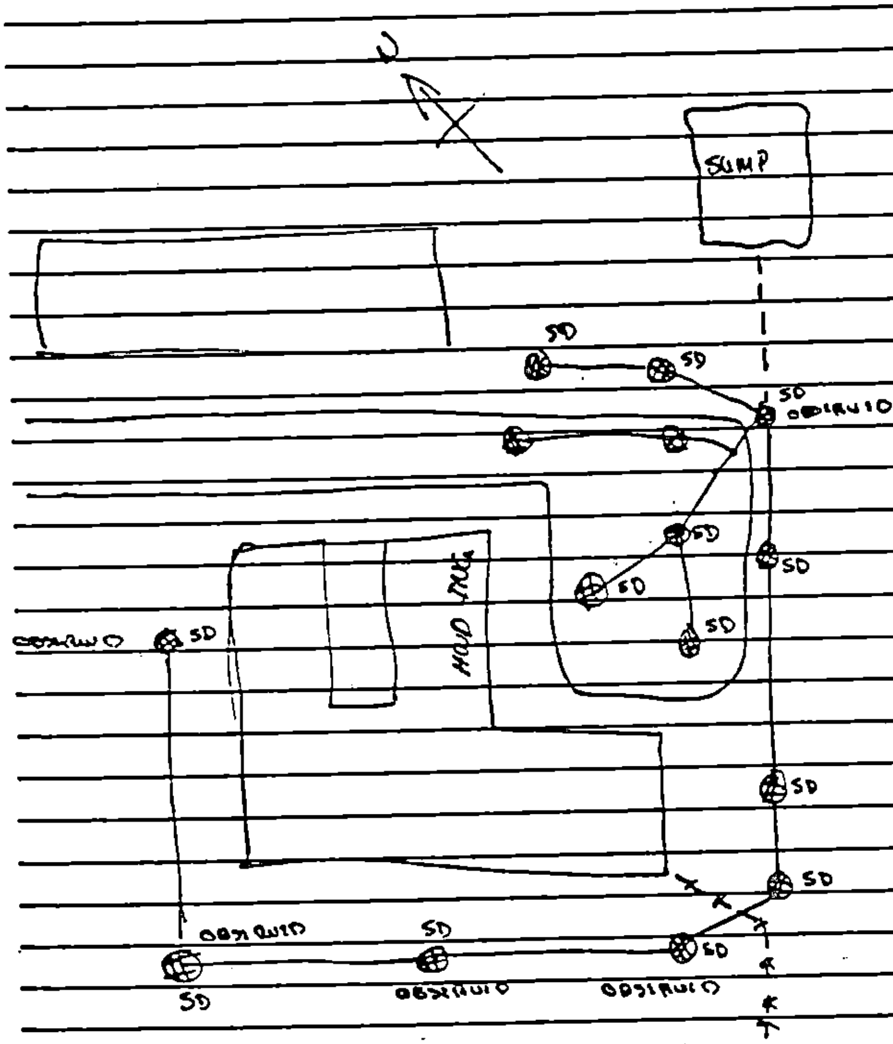
THE INFORMATION REQUESTED WAS THE CONSTRUCTION DETAILS CONCERNING THE STREET STORM DRAIN SYSTEM LOCATED ON PICONI BLVD, FARMINGDALE.

MR. PICONI TOLD ME THAT HE INSTALLED THE STORM DRAIN SYSTEM HIMSELF. WE THEN LEFT MR PICONI'S OFFICE AND BY CAR INSPECTED THE AREA IN QUESTION. WE DID NOT GO TO THE IMMEDIATE VICINITY OF HWD INC. BECAUSE THE ROAD WAS BLOCKED BY TRUCKS. HOWEVER MR. PICONI STATED THAT ALL THE STORM DRAINS IN THAT VICINITY DO RUN INTO A COMMON PIPE WHICH RUNS INTO THE SMALL SUMP LOCATED TO THE NORTH EAST OF HWD INC. [redacted]. AT ONE TIME THE PIPE ACTUALLY ENTERED THE SUMP, BUT HAS BEEN FILLED IN AND THE END OF THE PIPE COVERED. MR. PICONI SAID THAT THE DRAINAGE SYSTEM STILL WORKS BECAUSE ONLY DURING THE HEAVIEST OF RAIN DO THEY HAVE ANY RUN-OFF PROBLEMS.

MR. PICONI ALSO STATED THAT THERE HAS ANY PLANS. HE HAD ASKED HWD. INC. TO VACATE THEIR EASEMENT BY JUNE 1, [19]81

D-66

CONTINUED: INSPECTORS OBSERVATIONS OR INTERVIEWS 4.21.22



FILE UNDER HWD INC.

4.22.27

CONTINUED: INSPECTORS OBSERVATIONS OR INTERVIEWS

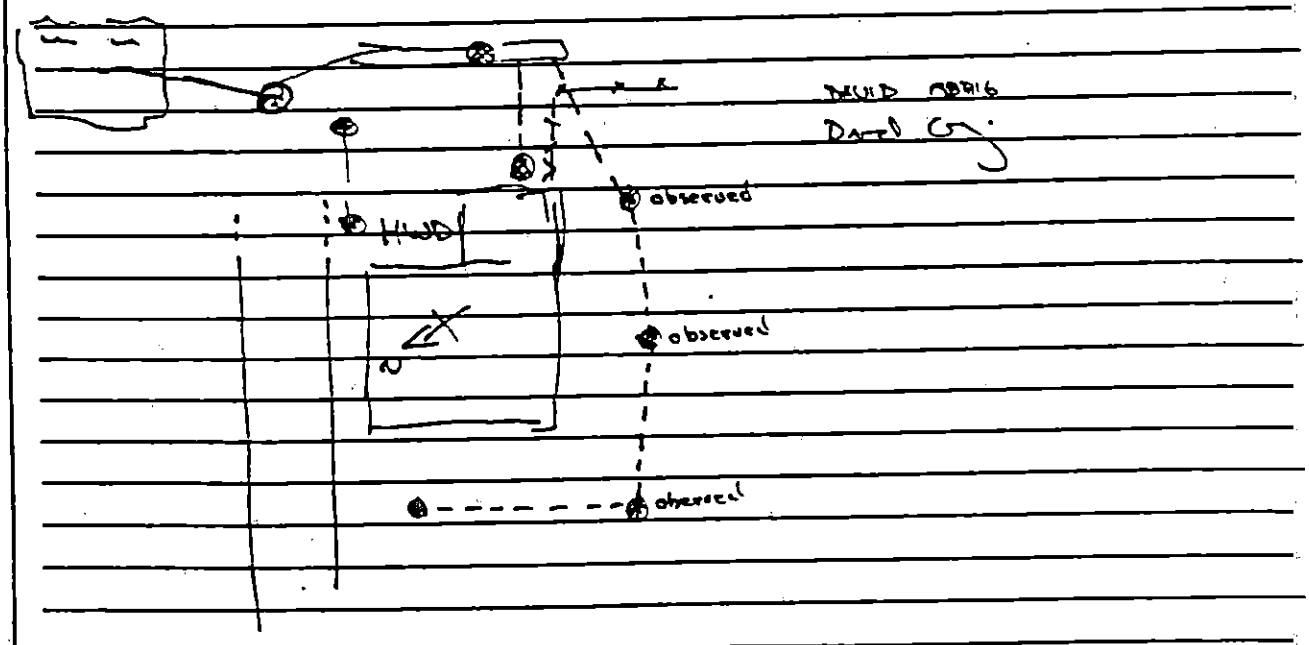
5 MAY 81 JOSEPH PICONE & SON INC. 249-5800 1^10 pm - 3^05 pm

Information obtained from interview with Mr. Joseph Picone, of the Picone Paving Inc. located at Rt 110, Farmingdale. (163 Broadhollow Rd.)

The storm drain system was installed by Mr. Picone himself on Picone Blvd. in the vicinity of HWD Inc.

I accompanied Mr. Picone to the location and he pointed out the various drains and how they ran. We did not go to the immediate vicinity of HWD Inc. because the road was blocked by trucks. However Mr. Picone stated that all the storm drains in that vicinity do run into a corrugated pipe which runs towards the small sump located to the North East of the HWD Inc. property. At one time the pipe actually entered the sump, but the sump has been filled in and the end of the pipe has been covered. Mr. Picone said the the system still works because only during the heaviest of rain do they have any run off problems.

Mr. Picone also stated that thru his lawyer he has asked HWD Inc. to vacate their establishment by June 1, 1981.



New York State Department of Environmental Conservation

MEMORANDUM

TO: D. Middleton
FROM: A. Machlin
SUBJECT: Monthly Report - Environmental Quality, April 1981

DATE: April 28, 1981

A. Accomplishments

1. Town of Oyster Bay - Solid Waste

A meeting was held with the Town and representatives of DEC, NCDH, and USEPA on the Town's proposed resource-recovery facility to expedite necessary permits including the PSD permit being handled by USEPA.

In addition, the Town has submitted a report on wastewater management for the proposed resource-recovery project, as well as landfill leachate and incinerator discharges, which were reviewed at a meeting with the Town, its consultants (Lockwood, Kessler & Bartlett), and NCDH.

2. Town of North Hempstead/PASNY/Resource Recovery

PASNY is preparing a proposal to build a resource-recovery facility which will be presented to the Town on or about June 1, 1981. This Department has been involved in meetings with PASNY, USEPA, NCDH, and the Town to expedite necessary permits, including the PSD permit presently being handled by USEPA.

3. Groundwater Management Program

Continued progress was made towards completion of early work tasks of the project and initiation of intermediate technical tasks. The final draft report of Criteria for Defining Groundwater/Water Supply Problems was transmitted to USEPA.

4. 208 Projects

Meetings were held on 4/23/81 with USEPA consultants and Region staff, local agencies, and DEC staff to initiate Consumer Products, Spill Response, and Fertilizer/Pesticides projects in terms of contract preparations, work plans, etc., and to determine the nature and extent of involvement of USEPA consultants in the projects.

5. Beach Erosion & Hurricane Protection Program

The Tidal Wetlands permit was issued for the Moriches Inlet breach repair revetment project.

6. Air Resources - Agreements with NCDH and SCDHS

Memoranda of Agreement for carrying out DEC programs by NCDH and SCDHS have been completed.

A9-4

2. Applied Environmental Services (AES) and Hazardous Waste Disposal (HWD) Corp.

On 4/14/81, a meeting was held between representatives of the Bureau of Hazardous Waste and this Region concerning the carrying out of that program in this Region. It was indicated that Region 1 had the most commercial hazardous waste facilities in the State. Also, a major part of the discussion related to HWD in Farmingdale and AES in Glenwood Landing. Since HWD was not a pre-existing facility and commenced operation in July of 1979 without a Part 360 Permit, it was determined that it was operating illegally and should be closed until a permit is received. On the other hand, AES was a pre-existing facility but does not yet have a completed Part 360 application which would allow it to operate legally. It was determined that an Order on Consent would be utilized to allow the continued operation of AES, with a three-month milestone to allow for completion of the application and continued cleanup. If the application is completed at that time, the Order on Consent would continue to be utilized to allow the operation until the permit process was completed.

On 4/23/81, a meeting was held with representatives of AES and HWD to inform them of this Department's determinations. The owner of the firm indicated that, if HWD was closed, the firm could not afford to keep AES open since the operations were interdependent. The owner offered to correct any deficiencies on HWD as soon as possible if DEC would allow continued operation. The Division of Solid Waste attorney stated that he would bring this matter to the attention of this Department's Executive Staff for a review and determination within the week.

3. Water Quality Accidents

There were forty-four new spills reported: twenty-eight in Nassau County and sixteen in Suffolk County

4. Sheridan Industrial Waste Oil Corp.

Nassau County Department of Public Works has indicated that it cannot temporarily accept the oil-contaminated water that is removed from Sheridan's waste oil collection operation, as originally hoped, because it is considered a hazardous waste by USEPA and would need an extensive effort on their part to meet USEPA regulatory requirements. Since Sheridan presently has no disposal point for this material, it is not picking up this material which will probably result in increased illegal disposal.

[illegible] Solid Waste

[illegible] and a conference has been scheduled for 5/6/81 on this matter.

[illegible] Solid Waste

[illegible] Permit issued to the Town calls for involvement in resource recovery.

DATE	COMMENTS
June 10th	Asked to speak to owner of HWD, Joseph Picone. He (Vic Emanuelo) told me that HWD is owned by Little Joseph Realty, Inc. He wants me to mail him letters of authorization before he lets me set up a visit to the site. He wanted to know if I was in contact with the DEC, and who at the DEC. He says he will call back after recieving the letters.

Mr. William R. Southard
Assistant Regional Director
Interstate Commerce Commission
Suite 501
150 Causeway Street
Boston, Massachusetts 02114

Dear Mr. Southard:

Please be advised that Hazardous Waste Disposal, Inc. has been operating without the required Part 360 Permit, pursuant to Article 27, Title 7, of the New York State Environmental Conservation Law. They have also been operating without a Siting Board Permit, as required under Section 27-1105.

They are, therefore, operating illegally and I am attaching hereto, a copy of the Department's Notice of Hearing and Complaint. I would suggest that you consider these facts in reviewing their temporary Permit to Operate.

Very truly yours,

JOAN B. SCHERB
Regional Attorney

7/15	In reference to the alledge sludge pit. Mr. Obrig informed me that the cement lined pit was used during clean-up operations. Wastes from on-site drums were emptied into this pit and after wastes solidified they were removed from pit and transported off-site.
	Storm drains — the 2 storm drains empt. into the nearby sump. This was proven when a dye test was performed by Mr. Obrig and the local fire department.
	Mr. Obrig also stated that very early samples were taken from the on-site storm drains and high concentrations of Styrene found.

OPERATOR DURING USE...: 1 Shore Rd., Glenwood Landing, NY 11547
OPERATOR ADDRESS.....: 1 Shore Road, Glenwood Landing
PERIOD ASSOCIATED WITH HAZARDOUS WASTE: From about 1979 To 1983

SITE DESCRIPTION:
A paved and fenced in lot in a small industrial park. Site was used as a temporary storage facility for hazardous wastes picked up by a formerly permitted transporter. Site inspection was done by DEC July 1985. Several old battered drums were observed on site and a strong pungent odor of solvents was present.

In 1984 the site owner removed all wastes from site and ceased operations. A DEC site inspection in July 1985 confirmed this. The site is currently used as a parking lot.

CHECK IF FACILITY IS ALSO A TSD FACILITY /✓/

DATE OF INSPECTION: 9-2-81

	YES	NO	DON'T KNOW
(1) Is there reason to believe that the facility has hazardous waste on site?	✓		

a. If yes, what leads you to believe it is hazardous waste? Check appropriate box:

/✓/ Company admits that its waste is hazardous during the inspection.

/✓/ Company admitted the waste is hazardous in its RCRA notification and/or Part A Permit Application.

/✓/ The waste material is listed in the regulations as a hazardous waste from a nonspecific source (§261.31)

/ / The waste material is listed in the regulations as a hazardous waste from a specific source (§261.32)

/ / The material or product is listed in the regulations as a discarded commercial chemical product (§261.33)

/ / EPA testing has shown characteristics of ignitability, corrosivity, reactivity or extraction procedure toxicity, or has revealed hazardous constituents (please attach analysis report)

/ / Company is unsure but there is reason to believe that waste materials are hazardous. (Explain)

RECEIVED

OCT 26 1981

DIRECTOR'S OFFICE
DIVISION OF SOLID WASTE

OCT [illegible] 81
NEW YORK, N.Y. 10007

	YES	NO
b. Is there reason to believe that there are hazardous wastes on-site which the company claims are merely products or raw materials?	✓	

Please explain: ALTERNATE FUEL SUPPLIERS FROM WASTE OILS AND SOLVENTS.

c. Identify the hazardous wastes that are on-site, and estimate approximate quantities of each.
1900 DRUMS (55-GAL) CONTAINING IGN. TABLES AND NON-IGNITABLE. PLUS ONE 2500 GALLON ACID TANK.

d. Describe the activities that result in the generation of hazardous waste.
RESIDUES FROM THE RECOVERY OF ALTERNATE FUEL.

(2) Is hazardous waste stored on site? ✓

a. What is the longest period that it has been accumulated?
USUALLY 72 HOURS.

b. Is the date when drums were placed in storage marked on each drum? ✓ ✓
NOT ALL OF THEM. DRUMS ARE STORED UNPROTECTED FROM ELEMENTS, WITHOUT AISLE SPACING. MOST DRUMS ARE CORRODED AND LEAKED. HOWEVER, THIS IS ALSO A SURFACE FAC

(3) Has hazardous waste been shipped from this facility since November 19, 1980? ✓

a. If "yes," approximately how many shipments were made?
A FEW TIMES PER WEEK

(4) Approximately how many hazardous waste shipments off site have been made since November 19, 1980?

a. Does it appear from the available information that there is a manifest copy available for each hazardous waste shipment that has been made? ✓

b. If "no" or "don't know," please elaborate.

	YES	NO	DON'T KNOW
c. Does each manifest (or a representative sample) have the following information?			
– a manifest document number	✓		
– the generator's name, mailing address, telephone number, and EPA identification number	✓		
– the name, and EPA identification number of each transporter	✓		
– the name, address and EPA identification number of the designated facility and an alternate facility, if any:	✓		
– a description of the wastes (DOT)	✓		
– the total quantity of each hazardous waste by units of weight or volume, and the type and number of containers as loaded into or onto the transport vehicle	✓		
– a certification that the materials are properly classified, described, packaged, marked, and labeled, and are in proper condition for transportation under regulations of the Department of Transportation and the EPA	✓		
(5) Were there any hazardous wastes stored on site at the time of the inspection?	✓		
a. If "yes," do they appear properly packaged (if in containers) or, if in tanks, are the tanks secure?			

NO. DRUMS ARE CORRODED AND THEY LEAK. THERE IS INADEQUATE BERM AND INADEQUATE CONTAINMENT. RUNOFF IS VISIBLE LEADING (BUT NOT ENTERING) TOWARD DRY WELL. POTENTIAL TO ENTER SEEMS TO EXIT IF HEAVY PRECIPITATION OCCURS.

b. If not properly packaged or in secure tanks, please explain.

SOLID WASTE STORAGE AREA

c. Are containers clearly marked and labelled? NOT ALL OF THEM. SOME LABELS ARE INDISTINCT DUE TO LEAKS (SEEPING WASHED AWAY PAINT.		✓	
d. Do any containers appear to be leaking? MAJORITY OF CONTAINERS ARE LEAKING	✓		

e. If "yes," approximately how many?

MAJORITY OF VISIBLE CONTAINERS WERE LEAKING

*(6) Has the generator submitted an annual report to EPA covering the previous calendar year? N/A

a. How do you know?

(7) Has the generator received signed copies (from the TSD facility) of all manifests for wastes shipped off site more than 35 days ago? ✓

a. If "no," have Exception Reports been submitted to EPA covering these shipments?

(8) General comments.

MANAGEMENT OF STORED DRUMS IS EXTREMELY POOR - CAN BE DESCRIBED AS A DISASTER AREA. THE WHOLE AREA IS CONTAMINATED WITH SOLVENTS AND OTHER CHEMICALS STORED IN DRUMS (DUE TO LEAKS). YOU CAN SEE ALL THE COLORS OF THE RAINBOW IN THE POOL OF LEAKED SOLVENTS THAT HAD ACCUMULATED ON THE GROUND. THE STORAGE AREA IS INADEQUATELY DIKED BY A TWO-INCH BERM ON TOP OF WHICH WOODCHIPS WERE PLACED. AT LEAST AN INCH OF LIQUID WASTES WERE CONTAINED BY THE BERM. LIQUID WASTES WERE VISIBLE AND WERE ESCAPING THE BERMED AREA AND HEADING IN THE DIRECTION OF A DRY WELL. THE OPENING OF THE DRY WELL WAS PROTECTED BY AN OIL RETAINING COLLAR. DRUMS WERE EXPOSED TO THE ELEMENTS, DENSELY CROWDED TOGETHER WITHOOT AISLE SPACE. THE STORAGE AREA IS A POTENTIAL FIRE HAZARD AND THE WASTES ARE IMPROPERLY STORED.

* The effective date for this requirement is March 1, 1982.
