Active Industrial Uniform Site (Site No. 1-52-125) Re: D&B Work Assignment No. D004446-01 Quarterly Report No. 16 October 1, 2008 through December 31, 2008

D&B No. 2578

Dear Mr. Long:

The purpose of this letter is to summarize the performance of the groundwater extraction and treatment system for the Active Industrial Uniform Site, located at 63 West Montauk Highway in the Village of Lindenhurst, Suffolk County, New York (see Attachment A, Figure 1), for the period of October 1, 2008 through December 31, 2008. Presented below is a summary of system operations during the quarter, as well as the results of sampling performed in accordance with the work plan for the referenced work assignment.

Groundwater Extraction and Treatment System Operations

During this period, on-site extraction well RW-1 operated at an average rate of approximately 22.8 gallons per minute (gpm). Based on a review of the operation and maintenance logs, RW-1's pumping rate has steadily declined from a high of 84.6 gpm, recorded when D&B restarted the groundwater extraction system on February 23, 2005.

Well rehabilitation activities consisting of pumping and surging with a rubber block were conducted on extraction well RW-1 in December 2007. During the well rehabilitation, it was observed that the pump bearing assembly had been compromised and parts of the pump exhibited corrosion. Samples of sludge attached to the pump were collected, which tested positive for Gallionella ferruginea, an chemolithotropic bacterium. Based on these conditions, and flow rate and water level measurements collected during and subsequent to the well rehabilitation activities, it was recommended that the pump be replaced and the well be treated with the proprietary The work and associated costs were approved via e-mail Aqua Freed process. correspondence by the NYSDEC, and D&B is currently working with Subsurface Technologies, Inc. to sign a subcontractor agreement and will schedule the work soon thereafter.

CONSULTING ENGINEERS

Mr. Payson Long
Division of Environmental Remediation
New York State Department of Environmental Conservation
July 21, 2009

Page 2

During this period, off-site extraction well RW-2 operated at an average rate of approximately 80.30 gallons per minute (gpm). Note that, based on a review of the operation and maintenance logs, RW-2's pumping rate has increased from the average of 70.0 gpm reported during the previous quarter.

During this period, approximately 14,638,890 gallons of treated groundwater was discharged to Little Neck Creek. Note that the groundwater extraction system was inoperative for approximately 31 hours, due to one system alarm condition (high level air stripper #1) and one routine system maintenance event (routine blower maintenance). A summary of system downtime is provided in Attachment B. Copies of system maintenance reports, as prepared by Systematic Technologies, Inc., are provided in Attachment C.

Groundwater Extraction and Treatment System Sampling (Aqueous)

Monthly groundwater samples were collected from the combined influent sample tap (COMB-INF) and from the treatment system discharge sample tap (COMB-EFF) on October 23, November 21 and December 16, 2008. Each sample was analyzed for volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260. The samples collected from the combined influent sample tap were also analyzed for Target Analyte List (TAL) metals by NYSDEC 6/00 Analytical Services Protocol (ASP) Method ILMO4.0 and for pH by USEPA Method 9040.

Quarterly groundwater samples were collected from both extraction well influents (RW-1 and RW-2), the sample tap located between the two air strippers (AS-MID) and from the treatment system discharge sample tap on December 16, 2008. Each sample was analyzed for VOCs by USEPA Method 8260. The treatment system discharge sample was also analyzed for TAL metals by NYSDEC 6/00 ASP Method ILMO4.0.

Semiannual groundwater samples were collected from the treatment system discharge sample tap on December 16, 2008. The samples were analyzed for pH by USEPA Method 9040, chemical oxygen demand (COD) by USEPA Method 410.4/401.2, alkalinity by USEPA Method 310.1, total suspended solids (TSS) by USEPA Method 160.2 and total dissolved solids (TDS) by USEPA Method 1601.1. In accordance with discharge requirements, a grab sample was also collected from the treatment system discharge sample tap and field analyzed for pH, temperature, turbidity, conductivity, dissolved oxygen and total chlorine.

All sample results are summarized in Attachment D.

Based on the influent groundwater sample results, COMB-INF total VOCs ranged from 80.6 micrograms per liter (ug/l) detected on December 16, 2008 to a maximum concentration of 97.6 ug/l detected on November 11, 2008, with cis-1,2-dichloroethene (cis-1,2-DCE), trichloroethene (TCE) and tetrachloroethene (PCE) exhibiting concentrations in exceedance of their respective NYSDEC Class GA groundwater standards or guidance values during all sampling events. COMB-INF iron, manganese, sodium and pH were also detected above their respective NYSDEC Class GA groundwater standard in the COMB-INF sample.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation July 21, 2009 Page 3

Based on the influent groundwater sample results collected from RW-1 and RW-2, RW-1 exhibited concentrations of vinyl chloride (VC), cis-1,2-DCE, TCE and PCE above their respective Class GA standards, while RW-2 only exhibited concentrations of cis-1,2-DCE above its applicable Class GA standard. Compared to the Quarter 15 sampling results from September 12, 2008, the RW-1 influent total VOCs increased slightly from 277 ug/l to 283 ug/l, while the RW-2 influent total VOCs decreased from 39.2 ug/l to 18.0 ug/l. Iron, manganese, sodium and pH were also detected above their respective NYSDEC Class GA groundwater standard in both extraction wells.

The sample results from the air stripper midfluent did not exhibit any site specific VOCs, however methyl-tert butyl ether (MTBE) was detected at a concentration of 1.0 ug/l. Based on the results, the first air stripper is effectively removing all site specific VOCs from the influent groundwater and effectively removing MTBE at a rate of approximately 56.5%.

The sample results from the air stripper discharge are compared to the NYSDEC site-specific effluent limits. Based on the effluent sample results, COMB-EFF VOCs, metals and pH were detected below NYSDEC site-specific effluent limits. It should be noted that while all VOCs were detected below NYSDEC site-specific effluent limits, PCE was detected at a concentration of 1.8 ug/l from the sample collected on October 23, 2008 and 1,2,4-trimethylbenzene was detected at a concentration of 1.6 ug/l from the sample collected on December 16, 2008.

Approximately 9.98 pounds of total VOCs were removed from the extracted groundwater during the reporting period and approximately 1,190 pounds of total VOCs have been removed since start-up of the system. The average total VOC removal efficiency for this quarter was approximately 97 percent. A summary of the extraction and treatment system performance results for this period is provided in Attachment E.

Groundwater Extraction and Treatment System Sampling (Air)

Air samples were collected from the vapor phase carbon adsorption system influent sample tap (VPCV-INF), the sample tap located between the carbon vessels (VPCV-MID) and the effluent sample tap (VPCV-EFF) on October 23, November 21 and December 16, 2008.

The results of the vapor phase carbon adsorption system discharge samples (VPCV-EFF) are compared to the NYSDEC site-specific effluent limits. Sample results are provided in Attachment D. All air discharge results were below NYSDEC site-specific effluent limits for the period.

Groundwater Quality Data

The network of groundwater monitoring wells was sampled to determine groundwater quality at, and in the vicinity of, the site. Samples were collected from eight on-site monitoring wells (MW-101 through MW-108) and three off-site monitoring wells (MW-109, MW-111 and MW-2S) on December 15, 2008. Note that monitoring well MW-110 could not be located and has reportedly been paved over and, as a result, was not sampled. Monitoring well MW-2S is located on the corner of Thompson Avenue and

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation July 21, 2009 Page 4

Lane Street, downgradient of the site. Note that monitoring well MW-2S was not originally sampled as part of D&B's work assignment but was initially sampled in November 2007 as part of a Vapor Intrusion Investigation completed by the NYSDEC and will continue to be sampled as part of this work assignment as per the request of the NYSDEC. The locations of the on-site monitoring wells are shown in Figure 2, provided in Attachment A. The locations of the off-site monitoring wells are shown in Figure 3, provided in Attachment A. Each groundwater sample was analyzed for VOCs by USEPA Method 8260 and for pH by USEPA Method 9040. Groundwater sample results are summarized in Attachment D and are compared to the NYSDEC Class GA groundwater standards and guidance values. A copy of the groundwater sampling results for MW-2S from the November 2007 Vapor Intrusion Investigation is included in Attachment F.

Concentrations of total VOCs detected in the on-site monitoring wells ranged from 2.6 ug/l detected in groundwater monitoring well MW-101 to a maximum concentration of 3,395 ug/l detected in groundwater monitoring well MW-103. Five on-site monitoring wells (MW-103, MW-104, MW-105, MW-106 and MW-107) exhibited one or more of the following VOCs at concentrations above their respective Class GA standards or guidance values; vinyl chloride (VC), cis-1,2-DCE, trans-1,2-dichloroethene, TCE and PCE. The maximum concentrations of VC (260 ug/l), cis-1,2-DCE (3,100 ug/l) and trans-1,2-dichloroethene (35 ug/l), were detected in groundwater monitoring well MW-103, located in the center of the site. The maximum concentration of TCE (110 ug/l) was detected in groundwater monitoring well MW-106, located in the southeast corner of the site. The maximum concentration of PCE (430 ug/l) was detected in groundwater monitoring well MW-104, located in the western portion of the site. Note that VOCs were not detected at concentrations exceeding their respective Class GA standards and guidance values in on-site monitoring wells MW-101, MW-102 or MW-108.

VOCs were detected in off-site monitoring wells MW-109, MW-111 and MW-2S; however, the VOCs were not detected at concentrations exceeding their respective Class GA standards and guidance values in any off-site groundwater monitoring well.

Attachment G includes graphs which summarize historical concentrations of total VOCs, cis-1,2-DCE, PCE, TCE and VC detected in the on-site and off-site monitoring wells from December 2006 through December 2008. Note that VOCs have primarily been detected above their respective standards in on-site monitoring wells MW-104 and MW-106. On-site, historical PCE concentrations have been detected somewhat erratically in MW-104, with concentrations ranging from 8 ug/l to 1,660 ug/l, while in MW-106, PCE concentrations are relatively stable at an average of approximately 120 ug/l. On-site historical cis-1,2-DCE concentrations have also been detected somewhat erratically in MW-106. Historical concentrations of TCE exhibit an increasing trend in both MW-104 and MW-106, with concentrations ranging from non-detect to 60.9 ug/l and 21 ug/l to 610 ug/l, respectively. Historical concentrations of VC exhibit an increasing trend in MW-106, with concentrations ranging from 15 ug/l to 500 ug/l, while in MW-104, VC concentrations have typically been non-detect; however, concentrations detected since January 3, 2008, exhibit a generally increasing trend.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation July 21, 2009 Page 5

Off-site, concentrations of these compounds have historically been detected below their respective groundwater standards in MW-109 and MW-11. A comparison of the concentrations of VOCs detected in MW-2S in November 2007 and this quarter's monitoring data shows a decrease in VOC concentrations.

Data Validation

The data packages submitted by Mitkem Corporation (Mitkem) have been reviewed for completeness and compliance with NYSDEC ASP Quality Assurance/Quality Control (QA/QC) requirements. Mitkem is a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP)-certified laboratory. The analysis of air samples was subcontracted by Mitkem to Centek Laboratories, LLC, a NYSDOH ELAP-certified air laboratory. All sample results have been deemed valid and usable for environmental assessment purposes, except as noted below:

- Trichloroethene was detected in the method and trip blanks for the groundwater monitoring well samples collected at October 23, 2008. Samples MW-101, MW-102, MW-103, MW-105, MW-107, MW-108, MW-109 and MW-2S, were less than five times the blank concentration and are, therefore, qualified as non-detect (U).
- Numerous metals were less than ten times the concentration found in the blanks and are, therefore, qualified as non-detect (U).

Data Validation Checklists, including a discussion of data qualified as estimated based on the validation process, are presented in Attachment H.

Conclusions

Based on the results of performance monitoring conducted during the period, we offer the following conclusions:

- The results of system influent samples show that extraction wells RW-1 and RW-2 continue to capture VOC-contaminated groundwater.
- Due to the presence of iron-oxidizing bacteria, the yield potential of extraction well RW-1 is currently limited. RW-1 is currently pumping at an average rate of 22.8 gpm, which is significantly below the required flow rate range of 80 gpm to 100 gpm, as specified in the Active Industrial Uniform Site Contract Documents. It should be noted that rehabilitation of extraction well RW-1 has been scheduled to occur in April 2009. Extraction well RW-2 is currently pumping at an average rate of 80.3, which is within the required flow rate range of 80 gpm to 100 gpm, as specified in the Active Industrial Uniform Site Contract Documents.
- Extraction well pump RW-1 showed signs of corrosion and wear when it was inspected in December 2007. The results of the sludge samples collected at that time indicated that ironoxidizing bacteria was present within the extraction well, limiting the yield potential of the well.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation July 21, 2009 Page 6

- The results of system effluent (COMB-EFF) samples show that the air stripping towers are effectively removing the captured VOCs to concentrations below the NYSDEC site-specific effluent limits.
- The results of vapor discharge samples show that the vapor phase carbon vessels are
 effectively removing VOCs to concentrations below their respective NYSDEC site-specific
 discharge limits.
- Five of the eight on-site monitoring wells exhibit at least one VOC at concentrations in exceedance of the NYSDEC Class GA groundwater standards and guidance values.
- Off-site monitoring wells MW-109, MW-111 and MW-2S did not exhibit VOCs at concentrations in exceedance of the NYSDEC Class GA standards and guidance values. During the reporting period, VOC concentrations were not detected in off-site groundwater monitoring wells above their respective Class GA groundwater standards and guidance values. As such, it may be warranted to consider a trial shutdown of extraction well RW-2 in an effort to minimize future operational costs. In the interim, VOC concentrations would be closely monitored in the upcoming months and, in the event that this trend continues, recommendations for the shutdown will be subsequently provided to the NYSDEC.
- Based on the fact that the downgradient groundwater monitoring wells continue to exhibit VOC concentrations below the Class GA Standards and Guidance Values, the groundwater extraction and treatment system is functioning as intended by the March 1997 Record of Decision (ROD). However, note that several residences are located between the site and the downgradient monitoring wells.
- Note that no new supply wells have been installed on the Active Industrial property and, based on visual inspection of the immediate area, no new schools or parks have been constructed in the vicinity or downgradient of the Active Industrial property.
- The Class GA Groundwater Standards and Guidance Values and the NYSDEC site-specific
 effluent limits have not changed since system start-up in December 2001. A new DER-10
 document, dated December, 2002, has been implemented since the March 1998 ROD was
 issued.
- The toxicity data, cleanup levels and remedial action objectives, as defined in the March 1997 Record of Decision, remain unchanged.

Recommendations

Based on the results of performance monitoring completed during the period, we provide the following recommendations:

• Continue operation of the groundwater extraction and treatment system to minimize downgradient migration of site-related contaminants currently being captured by the system.

CONSULTING ENGINEERS

Mr. Payson Long Division of Environmental Remediation New York State Department of Environmental Conservation July 21, 2009 Page 7

- In order to reduce the presence of the bacteria and increase the yield potential of extraction well RW-1, it is recommended to rehabilitate the well utilizing the Aqua Freed process. This work is currently scheduled to occur in April 2009.
- Due to the conditions of the extraction pump in extraction well RW-1 observed in December 2007 during well rehabilitation efforts, it has been recommended to remove and replace the extraction well pump, motor and wiring.
- It is recommended to install three new off-site monitoring wells to better assess off-site groundwater contamination. Note that additional details and a figure depicting the proposed well locations have been provided in the draft Active Industrial Periodic Review Report.

Please do not hesitate to contact me at (516) 364-9890, Ext. 3094, if you have any questions.

Very truly yours,

Stoplin

NOTES:

- 1. Total mass of VOC recovered through December 31, 2004 based on information contained in the Fourth Quarter 2004 Operation and Maintenance Report prepared by Blue Water Environmental Inc.
- 2. Estimated through the end of the reporting period.
 3. Extraction well RW-2 restarted on 7/5/05 @16:20. Mass removal rates reflect operation of both extraction wells RW-1 and RW-2.
- 4. Performance results for the reporting period are shaded.
- 5. COMB-INF result approximated as average of 3/16/07 and 7/12/07 results due to laboratory reporting error.

Notes:

Results in microgram per liter (μ g/L) Only detected compounds shown. Samples analyzed for VOCs by EPA Method 8260B QC Code:

FS = Field Sample FD = Field Duplicate

Qualifiers:

U = Not detected at a concentration greater than the reporting limit

J = Estimated value

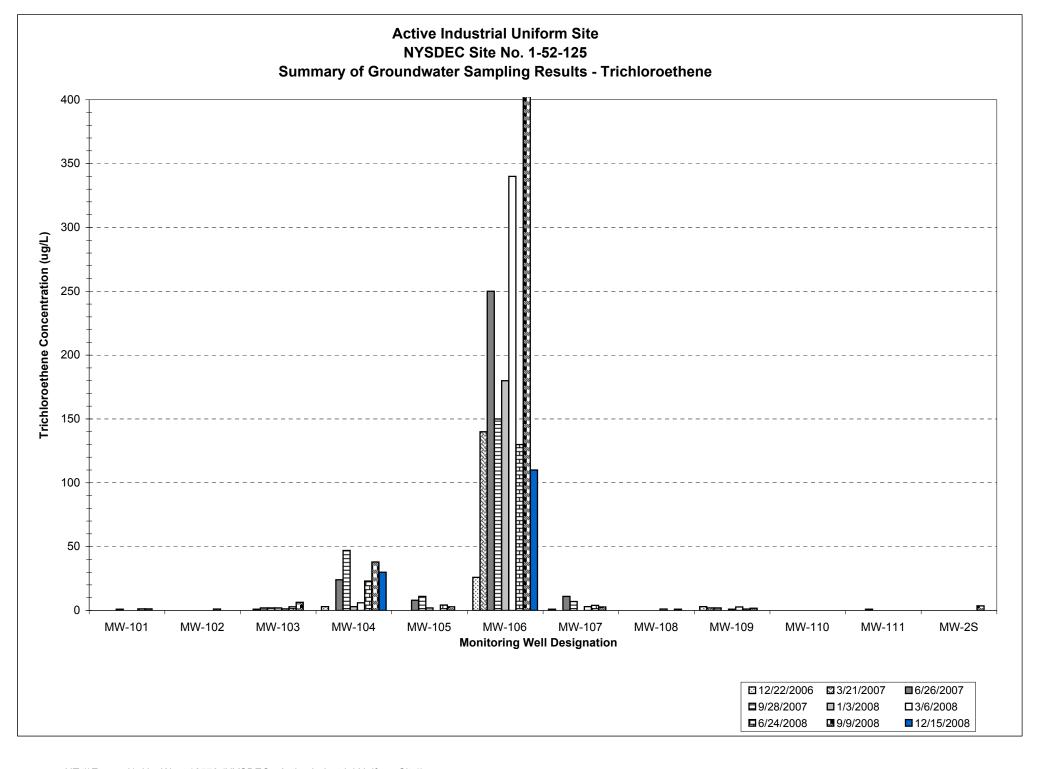

Criteria = Values from Technical and Operational Guidance Series (TOGS) 1.1.1, Ambient Water Quality Standards and Guidance values and Groundwater Effluent Limitations (NYSDEC, 1998). Detections are indicated in **BOLD**

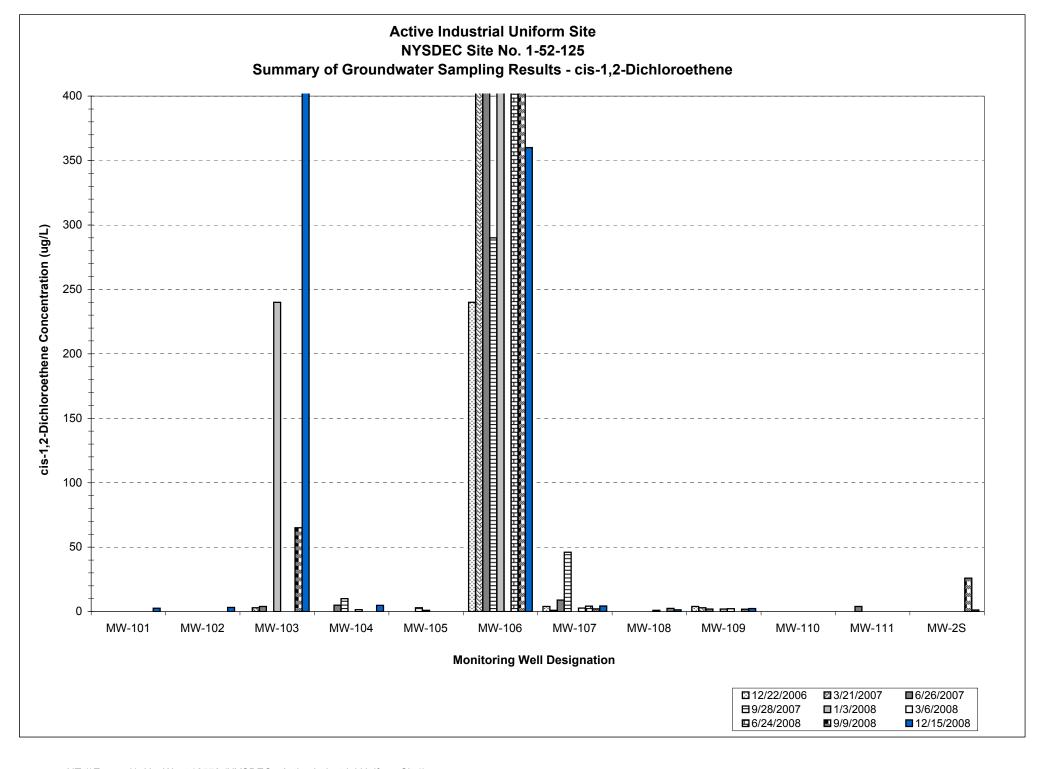

Highlighted results exceed criteria

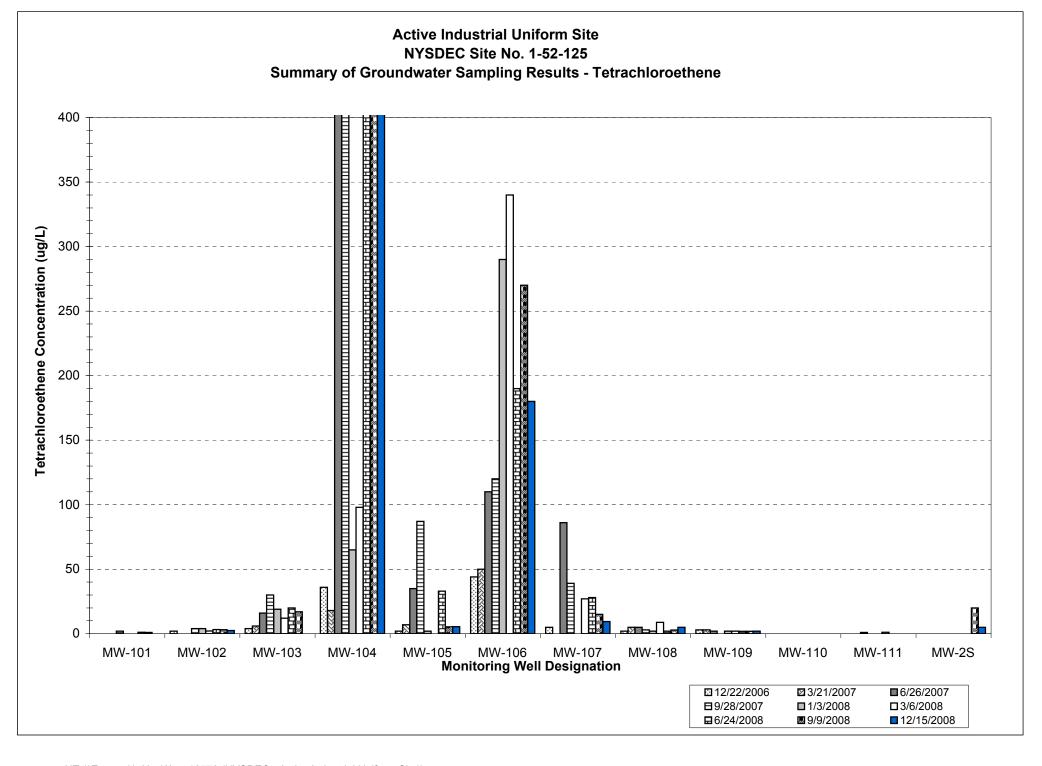

Created By/Date: ASZ 2/4/08 Checked By/Date: ECS 7/11/08

| 14. Field duplicates RPD | | | | | X |

VOCs - volatile organic compounds %R - percent recovery

%D - percent difference

%RSD - percent relative standard deviation

RRF - relative response factor RPD - relative percent difference

Comments:

- 6&7. The %R was below the QC limit of 70 % for 2,2-dichloropropane in the LCS and LCSD. 2,2-Dichloropropane was qualified as estimated (J/UJ) in all samples.
- 12. The %RSD was above the QC limit of 20 % for acetone in the initial calibration. Acetone was not detected in the samples and therefore did not impact the usability of the reported sample results.

13. The %R was above the QC limit of 20 % for dichlorodifluoromethane, chloromethane, 2-butanone, 2,2-dichloropropane, and bromochloromethane in the continuing calibration associated with the samples. The above compounds were qualified as estimated (J/UJ) in all samples.

%R - percent recovery

%D - percent difference

RPD - relative percent difference

Comments:

- 2. The following metals were detected in preparation, initial and/or continuing blanks and detected in the samples at concentration less than ten times the concentration found in the blanks: barium, beryllium, cobalt, copper, nickel, and silver. Therefore, the above metals were qualified as non-detect (U) in COMB-INF.
- 11. The %D was above the QC limit of 10 % for the serial dilution sample for zinc associated with all samples. Zinc was qualified as estimated (J/UJ) in all samples.

| 12. Field duplicates RPD | | | | | X | |

VOCs - volatile organic compounds %R - percent recovery %D - percent difference

%RSD - percent relative standard deviation

RRF - relative response factor RPD - relative percent difference

Comments:

- 6. The %R was below QC limits for trans-1,2-dichloroethene associated with VPCU EFF. The %R was above QC limits for 1,2,4-trichlorobenzene and hexachloro-1,3-butadiene and below QC limits for bromoform associated with VPCU INF and VPCU MID. Trans-1,2-dichloroethene was qualified as estimated (J/UJ) in VPCU EFF. 1,2,4-Trichlorobenzene and hexachloro-1,3-butadiene were qualified as estimated (J) only if detected in VPCU INF and VPCU MID. Bromoform was qualified as estimated (J/UJ) in VPCU INF and VPCU MID.
- 9. The internal standard areas were above QC limits for 1,4-diffuorobenzene and chlorobenzene in VPCU INF and chlorobenzene in VPCU MID. These samples were reanalyzed twice and the internal standard areas were within QC limits for the reported sample results. Therefore internal standard areas did not impact the usability of the reported sample results.

11. The %R was above the QC limit of 30 % for bromoform in the continuing calibration associated with VPCU INF and VPCU MID. Bromoform was qualified as estimated (J/UJ) in VPCU INF and VPCU MID.
