SUBJECT: Contract No. DACA51-93-C-0035
Removal/Disposal of Storage Tanks
Transformers and Miscellaneous
Camp Hero, Montauk, New York

New York State Parks Dept.
Montauk Downs
South Fairview Ave
Montauk, New York 11954
Attn: George Larsen

Dear Sir:

Enclosed please find a set of Sampling Results for the PCB Transformers and PCB-contaminated soil and the soil and tank contents from the Underground Storage Tanks (UST's) and drum contents at Camp Hero in Montauk, New York.

This set of sampling results is for your official records. If you have any questions, please contact the undersigned or Mr. Richard McInerney at (718) 352-1888.

Sincerely,

Donald P. Braun
Resident Engineer

CF w/ Encl: NYSDEC
Suffolk County Health Dept.
Construction Division

PHASE II SITE ASSESSMENT
=====

PAGE 1 OF 6

Contractor: GOLD SEAL CORPORATION 3 N. ARLINGTON AVE., E. ORANGE, NJ
Contract Number: DACA51*93*C*0035 Title: REMOVE & DISPOSE OF STORAGE
TANKS, TRANS, & MISCELLANEOUS
Tank Number: 16 & 18 Tank Size (Gallons): 25,000 Each
Product(s) Contained: #2 Oil Volume in tank (Gallons): Residual
Site Location: BLDG. 203, South End
Date: NOV 1994 Weather Conditions: Sunny, 60 D F

FIELD OBSERVATIONS:

1. Are tanks and/or pipes being excavated? Yes.
2. Depth of stained or discolored soil? To bottom of excavation. UST's were approx. 15' in diameter with 2' of cover. Tanks were set in 2" gravel, and this gravel was severely stained. Depth of excavation prior to sides caving in was approx. 17'.
3. Any sheen on water in excavation? Yes, on perch water as well as water that accumulated from rain a few days later.
4. Any sign of leaking pipe joints? Yes, it appears that the majority of the feed and return lines were leaking at their respective joints, majority of piping remains in the ground at approx. 2'.
5. Any localized areas of corrosion? None on tanks, they appeared to be in excellent condition, which was confirmed upon cleaning and demolition. As mentioned previously, pipe joints were corroded and leaking in several places.
6. Any holes or pits in tanks and/or pipes? No holes noticed in either tanks or pipes, see enclosed photographs.
7. Any noticeable odors? Excavation reeks of petroleum products, so strong that workers had to don level C respiratory protection. HNU readings of fumes taken upon UST excavation were 100 to 500 PPM. Once the excavation had a chance to "breathe", readings of ambient air remained at 50 to 100 PPM.
8. Jar test results? None taken, not necessary as contamination was evident through aural and visual observation.
9. Any free product in any monitoring wells? No monitor wells on the site.

Contract Number: DACA51*93*C*0035 Tank Number: 16 & 18

10. Any other abandoned underground tanks or pipe systems on site?

Yes, UST #17 which contained motor oil. All contaminated soil surrounding the former location of this UST was removed. It was located at the Southwest corner of the building. Approximately 50 CYS of contaminated soil was removed from excavation and disposed of at designated TSDF. (See Closure Report for UST #17 for further information.).

FIELD MEASUREMENTS AND ANALYSIS:

1. Which field instruments were used? HNU meter.
2. What were the readings from any areas of visual contamination?

Removal of contaminated soil was conducted on (2) separate occasions, upon UST removal and in the Spring of 1994. No readings were taken at the time of UST removal other than to confirm soil was sufficiently contaminated for disposal at the TSDF. Some of these readings reached 500 PPM on the meter.

Upon excavation of additional contaminated soil in the Spring of 1994, instrument used to perform OVA analysis was a Flame Ionization Detector with significantly greater detection capabilities. Readings observed while excavating soil located between former location(s) of USTS and foundation wall at Northwest corner of building ranged from 35 to over 100 PPM, sample depths from 6 to 10'.

What were the results from headspace analysis from any areas of visual contamination? None taken, there was never any question that the soil was contaminated, hence, the greater degree of accuracy provided by headspace analysis was not necessary.

What were the results from headspace analysis taken from the sidewall, bottom of the excavation, and below the bottom of the excavation? None taken, excavation was not safe to enter. As noted previously, excavation walls began to collapse almost immediately upon removal of the USTS. Severe soil staining was observable prior to excavation collapse as documented on enclosed photographs.

3. Soil sample locations? Results?

See soil sample location map enclosed, very few samples taken for laboratory analysis as HNU and FID readings were enough to confirm that continued excavation and removal of contaminated soil was necessary.*

Contract Number: DACA51*93*C*0035 Tank Number: 16 & 18

4. Groundwater samples? None taken, all water in excavation was either perch water or rainwater. Actual level of groundwater is believed to be at least 20' further below depth of excavation attained at time of UST removal. Excavation of a UST approximately 1,000 feet to the East (UST #8), which required contaminated soil removal to a depth of 20' where groundwater was NOT observed, the top of the tank which was at least 10' closer to sea level than the tops of UST #'s 16 & 18, indicate that groundwater level is approx. at depth listed above, (Below 37').

5. Lab Measurements and Analysis: If lab measurements and analysis is not done, documentation why the site is considered not in an environmentally sensitive area and shows no reason to believe that a release has occurred.

Release has occurred, all laboratory analysis included with this report.

6. Results from lab analysis of samples taken from areas of highest field measurement readings:

None taken, staining and odors made contamination obvious. At the time of excavation, there was never any indication that all remedial work would not be performed under the present scope of the contract.

7. Personnel used to collect samples.

Chris D. Elliott of GSC took all soil samples as per procedures described at the beginning of this report. Phil Giuliani of MEI took all field measurements during initial UST removal, Chris Elliott took readings during second phase of work.

8. Lab methods that were used to test for contamination.

EPA Method 418.1 for Total Petroleum Hydrocarbons, EPA Method 8021 for Volatile Organics, EPA Method 8270 for Polynuclear Aromatic Hydrocarbons, and Total Lead(Pb)..

GENERAL:

1. Total amount of contaminated soil removed for disposal.

Approximately 2,500 CYS.

Contract Number: DACA51*93*C*0035 Tank Number: 16 & 18

2. Method of Disposal, i.e. landfill, recycling, etc...

Disposal facility: Grand Central Landfill, Pen Argyl, PA.
 Soil Remediation of Philadelphia
 See copies of manifests and weight tickets,
 enclosed

3. Site backfilled? No, further excavation necessary, excavation sides (also contaminated), pushed into excavation to reduce safety hazard(s).
4. Monitor wells installed? No.
5. Further action required? Yes, a summary of conditions as they remain is included below. GOLD SEAL CORPORATION (GSC) was ordered to stop the excavation and removal of contaminated soil by the United States Army Corp Of Engineers (USACE) upon observing that a detailed site assessment would be necessary to determine the extent of the remaining contaminated soil and/or groundwater.

Site conditions, 15 SEP 1994:

BLDG. 203 (Generator building) where tanks were previously located has been demolished to approximately 2' below ground level.

Contaminated soil has been removed from the Northwest corner of the building to a depth of approximately 10'.

Contaminated soil was removed from surface area between West side of building to edge of UST excavation to a depth of approx. 5' at Southwest end of building.

There is sufficient evidence as noted by field measurements to indicate that significant if not severe soil contamination remains. There is also reason to believe that not all of the contamination is from pipe leakage. GSC has spoken with several people familiar with the history of the base and there is a very good probability that the area between the South side of the building was used for a dumping ground for whatever cleaning solvents were used at the site. (Odors emanating from the excavation immediately after UST removal resembled solvents.).

Contract Number: DACA51*93*C*0035

There is also sufficient reason to believe that contamination could extend around the base of the building as well as under due to the presence of a french drain system that surrounds the foundation of the building. Also, when liquids are dumped on soil near a wall they tend to hug the wall and are washed down the sides of the wall(s) with each succeeding rainstorm.

Due to the presence of the french drain, the evidence of dumping, and the condition of the generator pit floor after building demolition, GSC recommends that the building be demolished as a portion of the future remedial action to be undertaken at this site.

In reference to the generator pit floor, there are several "pits" where the spring supports for the generators were located. Several gallons of motor oil has collected at the bottom of these pits. Also, there were several thousand gallons of motor oil and water at the bottom of the generator pit which were removed and disposed of at the TSDF. Even though the floor was cleaned (pressure-washed) there is no way of knowing if there are any cracks in the floor through which this oil/water mix could have leaked. Samples taken of these fluids indicate a level of lead over the TCLP limit of 5 PPM (No other contaminants except petroleum).

GSC also recommends that the future site assessment include an investigation of the area located beyond the excavation to the South, East and West. Soil samples taken in these areas indicate the presence of petroleum hydrocarbon and lead contamination.

Glycol contamination: There were several hundred feet of piping containing glycol in the generator building, presumably for cooling the generators. Upon removal of the USTS, a green liquid that appeared to be glycol was observed on the water in the bottom of the excavation. Glycol was also observed along the East wall of the excavation at 5 to 6' depth. There were several drums of glycol on the site at the time of tank removal, and there were approx. 150 gallons of glycol remaining in the pipes upon removal. It is very possible that a pipe could have ruptured and leaked into a floor drain or through a crack in the floor into the surrounding soil. The presence of the glycol in the excavation and excavation wall would indicate the likelihood of such an occurrence.

PHASE II SITE ASSESSMENT

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this commitment are fully and accurately described above by proper shipping name and are classified, packed, marked and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations and state laws and regulations.

If I am a large quantity generator, I certify that I have program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment. If I am a small generator, I have made a good faith effort to minimize my waste and select the best waste management method that is available to me and that I can afford.

Chemical Conservation of Georgia, Inc.

This letter will serve as the Certificate of Disposal for the material received at the Valdosta Facility as indicated below:

GENERATOR:

US ARMY CORPS OF ENGINEERS
ROOM 271 BLDG 200 FORT TOTTEN
FLUSHING, NY 11359-0001

MANIFEST DOCUMENT NUMBER:

10975

GENERATOR CERTIFICATION DATE:

6-3-94

DATE ISSUED:

8-31-94

This material has been properly disposed of in accordance with all required and applicable regulations, laws, permits and licenses.

CHEMICAL CONSERVATION OF GEORGIA, INC.

Facility Manager

1612 James P. Rodgers Circle, Valdosta, GA 31601 / (912) 244-0474

CPC 33578

LABORATORY ANALYSES:
SOIL, GENERATOR PIT SLUDGE, SURFACE SPILL
AREAS, BOTTOM AND SIDE OF UST EXCAVATION,
AND WASTE CLASSIFICATION FOR SOIL REMOVED
AND TRANSPORTED TO TSDF
