EXECUTIVE SUMMARY

AECOM-Tidewater JV is conducting a Comprehensive Environmental Restoration, Compensation, and Liability Act (CERCLA) Remedial Investigation (RI), Feasibility Study, Proposed Plan, and Decision Document, at Camp Hero, a formerly used defense site (FUDS). This work is being completed under contract number W912DR-13-D-0016 for the United States Army Corps of Engineers (USACE). The RI for this site is being completed in two phases, with Phase I having been completed in June 2016. This Phase I Investigation Field Report provides: (1) a documentation of the field activities, (2) details on any significant deviations from the work plan that may have occurred, and (3) all the raw data collected.

Camp Hero State Park is located on the eastern tip of the south fork of Long Island, New York (NY), approximately 5 miles east of the Village of Montauk. The former Camp Hero was established in early 1942 as a Coastal Defense Installation and the facility changed ownership within the military multiple times over the course of the following decades. Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies, and the facility was permanently closed in 1982. The area is now used as Camp Hero State Park and is owned by the New York State Parks Commission.

Former Department of Defense (DoD) activities at Camp Hero may have resulted in contaminated material or an environmental release from these materials at certain Areas of Concern (AOCs). The RI technical approach consists of two phases of field sampling investigation (Phase I and Phase II). The primary objective of the Phase I investigation was to determine the presence or absence of contamination at the Camp Hero AOCs. The primary objectives of the Phase II investigation is to determine the nature and extent of target constituents in soil, groundwater, surface water, and sediment at the Camp Hero AOCs where the presence of contamination above applicable screening criteria is established following the Phase I investigation and to determine if there are unacceptable risks to human health and ecological health associated with exposure to related constituents.

Forty-five AOCs were identified in the RI Work Plan (WP), including former waste disposal and coal storage areas, abandoned drum locations, and former storage tanks (AECOM-Tidewater JV, 2016). Two additional AOCs were established by the USACE and the AECOM-Tidewater JV team during the Phase I investigation, for a total of forty-seven AOCs investigated during the Phase I activities. The locations are shown on site wide **Figure 1-2** and individual AOC Figures are presented as **Figures 4-2 to 4-37** (Appendix A).

Phase I investigation activities included a geospatial survey utilizing archived aerial photography, digital geophysical mapping of select AOCs, a botanical survey for the protection of rare and threatened species, field sampling, and surveying. The geospatial survey (aerial photography archival research) of the former Camp Hero, performed by the U.S. Army Geospatial Center, evaluated Camp Hero for the potential presence of waste disposal areas which may have been

utilized during DoD activities at Camp Hero. The geospatial survey was conducted as part of the June 2016 Final RI WP and results are presented in that document; however, the results are also included as Appendix E to this Phase I Investigation Field Report for reference.

The Phase I investigation was generally completed to the scope that was provided in the WP. Any deviations to the RI WP are provided in detail within this report. The most significant deviation consisted of the inability to collect groundwater samples at some of the AOCs due to a lack of groundwater from the perched aquifer. Temporary wells were installed and visited multiple times in an attempt to obtain sufficient quantities of groundwater for sample collection. This lack of available groundwater in some locations required a prioritization of analytical parameters due to the large number of sample containers required as a result of the long list of constituents that were being analyzed. Another significant deviation from the WP was at the Battery 112 AOC, which could not be investigated due to the lack of safe access. Lastly, tables which compare the analytical data to project screening levels and determinations of whether each AOC requires further investigation during Phase II are not included in the Phase I Field Investigation Report. To provide a more thorough analysis, tables and recommendations will instead be provided as part of an addendum to the RI WP that will describe the activities to be completed during the Phase II RI (referred to as the RI WP Addendum).

This Phase I Investigation Field Report describes the investigation activities and provides analytical results of the Phase I investigation. The Phase II RI sampling activities will be detailed in the WP Addendum, which will describe specific activities and sampling protocols for the Phase II RI. The RI WP Addendum will be provided to the project team for review, comments, and concurrence with recommendations.

The information and data collected during the Phase II RI will serve as the basis for a baseline Human Health Risk Assessment (HHRA) and Screening-Level Ecological Risk Assessment (SLERA). The objectives of the baseline HHRA and the SLERA are to evaluate whether concentrations of constituents from the AOCs pose unacceptable risks to human health and the environment, and to develop site-specific preliminary remediation goals, if necessary.

1.0 INTRODUCTION

Under contract to the United States Army Corps of Engineers (USACE), AECOM-Tidewater JV is conducting a Comprehensive Environmental Restoration, Compensation, and Liability Act (CERCLA) Remedial Investigation (RI), Feasibility Study, Proposed Plan, and Decision Document, at Camp Hero, a formerly used defense site (FUDS) under Contract Number W912DR-13-D-0016, Order Number DB01. A Camp Hero general location map is provided as **Figure 1-1** in Appendix A. The areas of concern (AOCs) at Camp Hero established in the June 2016 RI Work Plan (WP) are based on 1) the Camp Hero Feasibility Study/Hazardous Materials Survey prepared by NY State Parks contractor Cashin Associates in 1998 (hereinafter, "Cashin Report") and 2) a historical records search conducted in 2016 in preparation of this RI (AECOM, 2016). AOCs include former waste disposal areas, coal storage areas, abandoned drum locations, and former storage tanks. A site map with AOC locations is provided as **Figure 1-2** in Appendix A. The RI scope of work for this project is limited to the investigation and characterization of these sites (i.e., no remediation).

The RI technical approach consists primarily of two phases of investigation, Phase I and Phase II. The Phase I investigation was intended to confirm either the presence or the absence of suspected DoD waste at an AOC. A Phase II investigation will be conducted to define the nature and extent of the waste constituents at the AOCs where the presence of contamination above applicable screening criteria is established during the Phase I investigation. AECOM-Tidewater JV prepared this Phase I Investigation Field Report under Contract Number W912DR-13-D-0016, Order Number DB01, to provide: (1) a documentation of the field activities, (2) details on any significant deviations from the work plan that may have occurred, and (3) all the raw data collected.

1.1 Facility Background

The Camp Hero State Park Site consists of 469 acres located on the eastern tip of the South Fork of Long Island, NY, approximately 5 miles east of the Village of Montauk in Suffolk County, NY (**Figure 1-1** in Appendix A). Camp Hero State Park is split into two large subareas: the former Military Area (the Site) and the "Sanctuary Area." The Site is bounded by Montauk Highway (Route 27) to the north, the Atlantic Ocean to the south, Montauk Point State Park to the east, and Camp Hero State Park's undeveloped sanctuary area to the west.

The former military facility Camp Hero was established in early 1942 as a Coastal Defense Installation to defend the approaches to New York and was named in honor of Major General Andrew Hero. Three self-sufficient batteries (Battery 112, 113, and 216) and supporting facilities were constructed which included barracks, mess halls, hospital facilities, a motor repair shop, a recreation facility, sentry boxes, and water supply and sewage facilities. A total of 600 enlisted men and 37 officers were stationed at Camp Hero.

Camp Hero was a sub-installation of the 11th Coast Artillery Regiment (Harbor Defense) located at Fort H.G. Wright, Fischers Island, Block Island Sound, New York. Fort H.G. Wright was under the control of the Eastern Defense Command. Elements from the 11th Coast Artillery Regiment, along with elements from the 242nd Connecticut National Guard Coast Artillery Regiment (Harbor Defense), which augmented the 11th Coast Artillery Regiment at Fort H .G . Wright.

Battery 216 (identified as Bunker 216 on Figure 1-2) contained two 6-inch shielded guns, a mechanical power room, and powder room for storage of ammunition and powder charges. Battery 113 (identified as Bunker 113 on maps) consisted of two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. A requirement for war reserve allowances of ammunition for the batteries also existed. However this ammunition was stored outside of Camp Hero installation boundaries at an unknown central depot location under the control of the Chief of Ordnance. Batteries 112 and 113 had a battle allowance of 200 16-inch 2,240-lb projectiles and a war reserve allowance of 300 16-inch 2,240-lb projectiles. Battery 216 had a battle allowance of 200 6-inch 90-lb HE (high explosive) rounds and 300 6-inch 105-lb AP (armor piercing) rounds and a war reserve allowance of 300 6-inch 90-lb HE rounds and 400 6-inch 105-lb AP rounds (USACE 2000).

Additionally, 37-millimeter (mm) weapons and .50-caliber antiaircraft weapon platoons were assigned to protect the Camp from air attack. The Camp's weaponry was periodically fired to practice over water but was never fired as a result of an act of hostility. It is presumed that the antiaircraft weapon ammunition for Camp Hero and nearby facilities was also stored within the battery ammunition storage facilities of Camp Hero, as no other historical or physical evidence is present to display a separate storage facility for these items. This was conceivably possible due to the storage capacity of 400 rounds of ammunition in Batteries 112 and 113, and a battle allowance requirement of only 200 rounds of ammunition (USACE 2000).

The Camp was placed on inactive status on July 31, 1947 and ultimately declared surplus by the Department of the Army on December 31, 1949. In 1949, approximately 97 acres of Former Camp Hero was transferred to the Department of the Air Force for an aircraft control and warning station. On January 24, 1951, the former Camp Hero was withdrawn from surplus and designated for use as a firing range and field exercise area for antiaircraft artillery from Fort Totten, NY. Arrangements were made for an Army cadre at the Camp and 90 mm and quad .50-caliber antiaircraft artillery began firing exercises from firing positions established in the southern bluff overlooking the Atlantic Ocean near Bunker 216. Tow target planes and radio controlled aircraft were utilized to gauge firing accuracy (later towed barges were also used). Due to limited facilities for the training units,

the units bivouacked at the Camp. Ammunition for training exercises, when required, was stored in the internal bunkers of the now unused Battery 216 (USACE 2000).

In 1952, the Air Force property was renamed the Montauk Air Force Station and was occupied by the Aircraft Control and Warning Squadron (ACWS). The Former Montauk Air Force Station portion of Former Camp Hero has been shown on Figure 1-1. Army unit training continued using 90 mm and 120 mm guns, 3.5-inch rockets, and .50 caliber guns until 1957. The facility was active until October 1958 when the ACWS was re-designated as the Radar Squadron with a new mission to provide surveillance data of air traffic in the area. In order to accomplish this mission, an advanced Specific Frequency Diversity Search Radar was built in late 1960 (Army-Navy/Fixed-Pulse Radar-Surveillance [FPS]-35 Radar Tower and Antenna).

Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies and the ACWS facility was permanently closed in 1982. The area is currently operated by the NY State Office of Parks, Recreation, and Historic Preservation and is operating as Camp Hero State Park. The park landscape includes wooded areas, freshwater wetlands, and sea-side bluffs, complete with hiking trails and roadways leading to former military buildings, picnic areas, and recreational areas.

In 2002, the AN/FPS-35 Radar Tower and Antenna was listed under the National Register of Historic Places (NRHP). Camp Hero State Park as a whole is potentially eligible for listing on the NRHP, according to the NY State Historic Preservation Office.

1.2 Scope and Objectives

The RI technical approach consists of two phases of investigation, Phase I and Phase II. The Phase I investigation is intended to confirm either the presence or the absence of suspected CERCLA DoD waste at an AOC. A Phase II investigation will be conducted to define the nature and extent of the waste constituents at the AOCs where the presence of contamination above applicable screening criteria is established during the Phase I investigation.

This Phase I Field Report documents the Phase I RI activities at Camp Hero during May and June 2016. The objectives of this Field Report are to provide the following information:

- A summary of the Phase I RI activities at each AOC.
- Details on any significant deviations from the work plan that may have occurred.
- Raw data that was collected both in the field and from the off-site analytical laboratory.

1.3 Phase I Investigation Field Report Organization

This Field Report is organized into the following sections:

- Section 1.0: Introduction – provides an introduction to the project including the scope and objectives, installation background, and organization of this Field Report.
- Section 2.0: Technical Approach – provides the regulatory framework, description of the phased RI approach, descriptions of general field investigation operations, and information on data analysis and validation.
- Section 3.0: Background Sampling – provides the approach and results for the Camp Hero background soil sampling.
- Section 4.0: AOC Investigations – presents brief historical information, reason for concern, and the Phase I RI activities for each AOC at Camp Hero.
- Section 5.0: References – lists the references utilized in this Field Report.

The following appendices are included in this Field Report:

- Appendix A contains the figures referred to in this Field Report.
- Appendix B contains the tables referred to in this Field Report.
- Appendix C contains key correspondence with stakeholders prior to the field effort.
- Appendix D contains the Camp Hero Army Geospatial Center (AGC) Report. As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for features associated with possible solid waste disposal areas within the former Camp Hero boundary.
- Appendix E contains the Camp Hero Geophysical Survey Report. Digital Geophysical Mapping (DGM) surveys were conducted at select AOCs in attempt to locate and identify subsurface historic infrastructure to streamline subsequent sampling activities. The Geophysical Survey Report presents the geophysical survey results and provides metal detection summary figures for each AOC investigated.
- Appendix F contains the Community Air Monitoring results. Continuous air monitoring was completed during Phase I RI activities downwind of the Geoprobe® rig during intrusive activities, in accordance with the modified generic NY State Department of Health (NYSDOH) Generic Community Air Monitoring Plan (CAMP), Attachment 1A of the NYSDEC Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation.

- Appendix G contains the laboratory analytical data results, laboratory investigation-derived waste report, and the data validation reports.
- Appendix H includes contains the Daily Reports completed during Phase I RI Field work.
- Appendix I contains a Photograph Log of the Phase I RI activities and AOCs at Camp Hero.

This page intentionally left blank.

2.0 TECHNICAL APPROACH

2.1 Regulatory Framework

The RI work was conducted in accordance with CERCLA and the FUDS ER-200-3-1 (USACE 2004). New York State Department of Environmental Conservation (NYSDEC) is the lead regulator for this RI and will provide review and concurrence pursuant to CERCLA. The criteria established for constituents of concern in New York Codes, Rules, and Regulations (NYCRR) Subpart 375-6, "Remedial Program Soil Cleanup Objectives" will be utilized for screening criteria (NYCRR 2015a). For those areas of this project strictly addressing releases of fuels from formerly removed or used storage tanks, the following NYCRR will be applied: 6 NYCRR 613.9 (b), Closure of Tanks Permanently Out of Service (NYCRR 2015b) and NYSDEC DER-10, Technical Guidance for Site Investigation and Remediation.

In accordance with NYSDEC policy CP-51, soil samples at suspected petroleum storage tank AOCs were analyzed for petroleum compounds by the NYSDEC Spills, Technology, and Remediation Services (STARS) list for either fuel oil or gasoline, which include volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and lead analyses (based on the suspected fuel type). Groundwater samples at suspected petroleum tank AOCs were analyzed for VOCs, SVOCs, and lead (based on the suspected fuel type). Soil and groundwater analyses at non-petroleum AOCs include a more comprehensive analytical list, depending on the concern at each AOC, which are detailed by AOC in Section 4.0.

- **Human Health Screening Criteria:** The project screening levels (PSLs) for soil are obtained from the following criteria: United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Residential Soil (USEPA 2016a), 6 NYCRR Part 375-1 Soil Cleanup Objectives (NYCRR 2015a), and NYSDEC CP-51/Soil Cleanup Guidance (NYSDEC 2010a). The PSLs for soil are the lowest of each of the criteria listed.

  The PSLs for groundwater are obtained from the following criteria: USEPA Regional Screening Level for Tap Water (USEPA 2016a), USEPA MCL criteria (USEPA 2016b), NYSDEC Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values (NYSDEC 2004), and New York State Department of Health Maximum Contaminant Level (MCL) criteria (NYCRR 2011).

  In order to meet PSL data quality objectives, SVOCs in soil and groundwater were analyzed by Method 8270D with Selected Ion Mass Spectrometry (SIM).

- **Ecological Screening Levels:** Ecological screening level guidance and references are detailed in the RI WP. Data from the surface soil samples, as well as information from the

Phase 1 RI to assess surface water flow directions, wetlands, and ecological receptors, will be used to identify ecological data gaps to be addressed in the Phase 2 RI sampling. A summary of chemicals of potential environmental concern and the areas of concern where surface soil contamination was detected above the ecological screening criteria will be identified in the WP Addendum.

2.2 Phased Approach

The RI technical approach consists of two phases of investigation, Phase I and Phase II. The Phase I investigation was intended to confirm either the presence or the absence of suspected DoD waste constituents at an AOC. Based on Phase I findings confirming waste constituents at an AOC, a Phase II investigation will be conducted to define the nature and extent of the contamination.

- **Phase I RI:** The primary objective of the Phase I RI is to determine the presence or absence of contamination at the Camp Hero AOCs. Phase I RI activities included aerial photography archival research, digital geophysical mapping of subsurface anomalies, a botanical survey, Geoprobe® soil borings, piezometer and temporary well installations, and field sample collection. Sample collection for the Phase I investigation included surface soil [defined as soil between 0 to 1 foot (ft) bgs], subsurface soil (greater than 1 ft bgs), wipe samples of concrete and building materials, concrete chip samples, and groundwater sampling.

  The purpose of this Field Report is to summarize the Phase I field activities and provide the analytical data. The original Project Work Statement scoped the Field Report to provide all the raw data collected and details on any deviations from the work plan. The RI WP mistakenly added scope to the Field Report by indicating tables would be produced and recommendations would be made regarding which AOCs will be included in the Phase II investigation. A WP Addendum will be prepared to detail the Phase II investigation approach. The RI WP Addendum will be provided to the project team for review, comments, and concurrence. A technical review meeting will be conducted with the project stakeholders to obtain consensus with the proposed Phase II investigation activities.

- **Phase II RI:** For AOCs requiring further investigation, the primary objective of the Phase II RI is to determine the nature and extent of target constituents in soil and groundwater at the Camp Hero AOCs and to determine if there are unacceptable risks to human health and ecological receptors associated with exposure to AOC-related constituents.

  The Phase I RI sampling results will be used as a basis for determining the locations of Phase II samples and analyses in order to: 1) determine the nature and extent of contamination at the Camp Hero AOCs and 2) determine the concentration of a contaminant that may be contacted by a receptor at a site to conduct risk assessment. The Phase II data may include:

concrete chip samples, liquid samples from containers, surface soil (0 to 1 ft bgs), subsurface soil (greater than 1 ft bgs), surface water, sediment, and groundwater samples from temporary or permanent monitoring wells.

2.3 Coordination with Stakeholders

Project kick-off meetings were held to initiate coordination with stakeholders. Activities were coordinated with the Camp Hero State Park Superintendent, Mr. Tom Dess, to ensure activities did not impact park visitors or conflict with seasonal work restrictions. Additionally, activities were coordinated with the State Historic Preservation Officer and other interested parties and stakeholders, in accordance with Section 106 of the National Historic Preservation Act of 1996, as amended and 36 Code of Federal Regulations (CFR) 800. Appendix C of this Field Report contains key correspondence related to coordination with stakeholders.

The NYSDEC Natural Heritage and NYS Office of Parks, Recreation, and Historic Preservation (OPRHC) were consulted regarding Camp Hero RI activities, with particular focus on the botanical survey of rare and endangered species (see Section 2.4.3. below).

Coordination letters were submitted to the NYDEC Region 1 Office, the United States Fisheries and Wildlife Service (USFWS) New York Field Office, and the Shinnecock Nation regarding planned Camp Hero activities. The coordination letters indicated the USACE's intent to conduct a RI at the former Camp Hero, with the purpose of assessing if the former DoD activities may have results in adverse environmental conditions. The letters additionally explained the scope of the project and stated that care will be taken to minimize impacts to vegetation and local threatened and endangered species (see Appendix C). The NYDEC and the USFWS both indicated that they did not have any threatened or endangered species concerns for this project.

2.4 General Phase I Investigation Operations

The Phase I Investigation at Camp Hero included aerial photography archival research, digital geophysical mapping of subsurface anomalies, a botanical survey, Geoprobe® soil borings, piezometer and temporary well installations, and field sample collection. Details of each activity are provided in the sections below.

2.4.1 Aerial Photography Archival Research

As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for site features which could be associated with solid waste disposal within the former Camp Hero boundary. Their report is included in this Field Report as Appendix D and contains a summary of potential disposal locations, along with a list of spatial data collected from 1940 to 1982 (USACE 2016). The report concluded that there was no

photographic evidence of debris accumulation suggestive of a solid waste disposal areas in the spatial data collected for this project. However, four areas were identified where solid waste disposal could have taken place, described as access points to cleared areas near or along the bluff. The four areas were designated "AGC Sites 1, 2, 3, and 4" for this RI. AGC Site 3 corresponds to the "Camp Hero State Park Bluffs" AOC, which was already established as an AOC as part of the RI investigation.

2.4.2 Digital Geophysical Mapping

Prior to the Phase I sampling activities, Digital Geophysical Mapping (DGM) surveys were conducted at select AOCs to locate and verify suspected underground storage tanks (USTs) and subsurface historic infrastructure to optimize sampling activities. DGM was conducted at the following AOCs:

- Suspected Tank A – Building 0020 – Fire Department, suspected former UST location(s)
- Suspected Tank B – Building 0022 – Kitchen/Office, suspected former UST location(s)
- Suspected Tank C – Building 0002 – Barracks, suspected former UST location(s)
- Suspected Tank D – Building 104R – Commissary, suspected former UST location(s)
- Suspected Tank E – Building 3001 – AT&T/Lilco, suspected former UST location(s)
- Suspected Tank F – Well Pump House, suspected former UST location(s), hazardous materials
- Suspected Tank G – Well Pump House, suspected former UST location(s)
- Fuel Pump House Distribution Line – distribution line from the Fuel Pump House (connected to AST-35) identified on historic drawings connecting to former Building 203
- Battery 216 – potential underground vaults, unknown use, potential storage
- Plotting Room 113 – waste area, potential storage or waste dump site

The intent of the geophysical surveys at each of the above sites was to: (a) verify the outline of a tank (if still exists), (b) identify the extent of residual subsurface features, and (c) examine the general vicinity to support safe subsurface sampling within close proximity to the structures.

The DGM field survey methods consisted of a combination of electromagnetic (EM) and magnetic (MAG) Analog Geophysical Mapping (AGM) metal detection surveys, at 5-ft increments, within the bounds of accessible areas of each pre-marked survey area. The DGM was completed using the Geonics EM61-MK2 instruments in relatively open areas, while AGM, using a Schonstedt® GA-72cd, was reserved for vegetated areas not accessible using DGM methods. After each sweep of the AOC

area, significant DGM instrument readings were relocated, marked, and annotated as to whether a surface feature coincides with the instrument reading.

Additional information is available in the Camp Hero Geophysics Report (Appendix E), which presents results and provides metal detection summary figures for each AOC investigated. Results are discussed by AOC in Section 4 of this Field Report.

2.4.3 Botanical Survey

A botanical survey for rare and threatened species at Camp Hero State Park was completed in May 2016, in conjunction with the Geophysical Surveys, prior to any vegetation removal activities. The NYSDEC Natural Heritage Program identified four rare plant species which have been historically reported within the Camp Hero RI project area, including: Little-leaf Tick-trefoil, Fringed boneset, Blunt mountain-mint, and Southern arrowwood.

Prior to the botanical survey field activities, the AECOM botanist researched the habitat requirements, phenology, critical diagnostic characteristics, and morphologically-similar congeners for the target plant species identified as potentially occurring in the vicinity of the Project survey area by the NYSDEC Natural Heritage Program. Botanical references and regional field manuals were consulted for the northeastern United States as well as Flora of North America.

During field preparation for the remedial investigation, each AOC and background soil sampling location was surveyed for the four rare plant species. If any rare plant species were identified, they were marked with red and white checkerboard flagging. The USACE and AECOM-Tidewater JV team was consulted to determine the best method to avoid destruction of any protected plants by subsequent investigative procedures, including brush clearing and use of heavy equipment.

The Camp Hero sites were surveyed by the AECOM botanist and USACE project ecologist in May 2016. Findings indicated that the upland forests consisted of a mixed hardwood canopy dominated by *Quercus* species. Also present in the canopy to a lesser degree were *Fagus grandifolia*, *Tilia americana*, *Nyssa sylvatica*, *Prunus serotina*, and *Acer rubrum*. The upland forest understory was dominated by *Hamamelis virginiana*, *Ilex opaca*, *Vaccinium corymbosum*, *Smilax rodundifolia*, and in some areas, *Viburnum dentatum* var. *venosum*. Forested wetlands were dominated by an *Acer rubrum* canopy with a *Lindera benzoin* and *Vaccinium corymbosum* understory.

Upland successional shrub lands were often dominated by *Morella pensylvanica*, *Amelanchier canadensis*, *Prunus serotina*, *Toxicodendron radicans*, *Vaccinium corymbosum*, and in some areas- *Viburnum dentatum* var. *venosum*. Many upland successional shrub land sites were also heavily infested with *Lonicera morrowii* and *Elaeagnus umbellata*.

Additionally, a few AOCs were located on anthropogenically-altered or regularly disturbed sites, including turf areas and hardscape which contained herbaceous weeds.

Regarding the four target rare plant species, the three herbaceous species, *Desmodium ciliare, Eupatorium torreyanum*, and *Pycnanthemum muticum*, were not encountered. It is likely that it was too early in the season for these three species to have emerged.

The fourth target rare plant species, *Viburnum dentatum* var. *venosum (*Southern arrowwood*),* was encountered with great frequency throughout Camp Hero; in some areas, it was co-dominate in the forested understory or upland successional shrub lands and it appears the population is stable and thriving. While all larger specimens were flagged, a small number of sites also had numerous seedlings that are almost impossible to avoid without employing extraordinary measures. In consultation with the NYSDEC Natural Heritage and NYS OPRHC, it was concluded that the destruction of a few seedlings during the course of further remedial investigation at Camp Hero would be acceptable in light of the large and stable population of *Viburnum dentatum* var. *venosum*. Copies of key correspondence with the OPRHC regarding the Southern arrowwood are included in Appendix C.

2.4.4 Field Sampling

Sample collection for the Phase I investigation included surface soil (defined as soil between 0 to 1 ft bgs), subsurface soil (greater than 1 ft bgs), concrete chip, and groundwater sampling. After sample collection and/or field screening, samples were transferred to the appropriate sample container for laboratory analysis and placed in a cooler on ice. The required sample containers, preservatives, and holding times were specified in the Uniform Federal Policy (UFP) Sampling and Analysis Plan (SAP), Attachment B to the RI WP (AECOM 2016). Sample locations were marked with a pin flag with sample identification number, photo-documented, and recorded with a hand-held global positioning system unit. The collected coordinates were utilized to produce sample location maps for this RI Field Report and are available for use in sample location mapping for future documents. The non-disposable sampling equipment (i.e., hand auger) was decontaminated between sample locations.

Surface and Near-Surface Soil: A clean (decontaminated) hand auger or disposable scoop was used to collect surface and near-surface soil samples. In some locations, the Direct Push Geoprobe® rig was used to collect a small, 5–foot core, from which the 0 to 1 foot surface soil sample was collected. As defined in the WP, surface soil samples were considered to be 0 – 1 ft bgs, where near-surface samples were considered to be 1 – 2 ft bgs. VOC samples were collected directly from the recently-exposed soil using a sampling corer (Terra Core kits). For the other analyses, the soil was removed and transferred to a disposable, re-sealable plastic bag and was

then homogenized, which consisted of mixing the soil until the sample is a uniform color, texture, and particle size. Any non-homogenous particles, organic matter, and debris were removed from the soil samples. Soil samples at pre-selected locations were field-screened with the PID while in the plastic bag prior to the homogenization of the soil. After sample collection and/or field screening, the sample was transferred to the appropriate sample container for laboratory analysis and placed in a cooler on ice.

Subsurface Soil: Subsurface soil samples were collected using a Direct Push Geoprobe® drill rig. A Geoprobe® dual-tube sampling system was used to collect continuous soil cores by advancing a 5-ft (60-inch) coring barrel fitted with the dedicated, disposable polyvinyl chloride (PVC) liners to the target depth, as established in the RI WP. Borings were either advanced to the depth of the perched water table or to 25 ft bgs, with the exception of the borings at AOC H-17, which were advanced to 35 ft bgs in an attempt to reach groundwater. Specific depths of the borings at each AOC are provided in Section 4.0.

Soil cores were screened for VOCs immediately upon opening the sleeve with a PID utilizing an 11.7 electron-Volt bulb. Screening results, lithologic descriptions, and other observations and measurements were recorded on a soil boring log by the field geologist. At a minimum, depth interval, recovery thickness, PID concentrations, moisture, relative density, color (using a Munsell soil color chart), and texture using the Unified Soil Classification System were recorded. Additional observations recorded may have included detectable odors, groundwater or perched water depth, organic material, cultural debris, or color changes indicating staining. Photographs were also taken of significant boring cores.

Two subsurface soil samples were generally be collected from each Geoprobe® location unless otherwise specified in the RI SAP. Samples were collected from depth intervals where field screening or observations (i.e., highest VOC concentration measured with the photo-ionization detector, odor, staining) indicated the potential presence of contaminants, the depth of the structure being evaluated, or at the depth of groundwater, as established in the RI WP. VOC samples were collected directly from the recently-exposed soil using a sampling corer (Terra Core kits). For the other analyses, the soil was removed and transferred to a disposable, re-sealable plastic bag and was then homogenized, which consisted of mixing the soil until the sample is a uniform color, texture, and particle size. Any non-homogenous particles, organic matter, and debris were removed from the soil samples.

Concrete Coring: Concrete coring was necessary prior to boring at locations with asphalt or cement. A 4-inch diameter core barrel was advanced through the concrete using a stand mounted core drill to

access soils for direct push sampling. Once drilling and sampling activities were finished, the core and lag holes were patched with concrete.

Groundwater Sample Collection from Temporary Wells (Grab Sample): Groundwater samples were collected from temporary wells installed during the DPT drilling activities at locations where groundwater was encountered in the borings. If groundwater was encountered at the location, a Peristaltic Geopump with disposable tubing was used to collect a grab groundwater sample. A YSI 6920® water quality meter with a multi-parameter cell was used to obtain one set of groundwater parameter readings after the grab sample was collected, if sufficient groundwater was left in the well. Water quality parameters included temperature, pH, specific conductivity, dissolved oxygen, reduction-oxidation potential, and turbidity.

Recharge in some wells was insufficient to collect the required volume for all planned analyses. Multiple attempts were made to sample these wells and the collected volume was submitted for laboratory analysis of a shortened analyte suite, if all bottleware could not be filled. If within 24 hours, groundwater recharge had not produced any water in the temporary well, no groundwater sample was collected during Phase I.

Concrete Chip Samples: The surface of the sample location was broken up using a rotary hammer drill with a decontaminated 1-inch bit. Multiple holes up to 2 centimeters (cm) in depth were created within the sampling area, in order to fill the full 8-ounce (oz) required volume. An effort was made to avoid scattering pieces out of the general sampling area. The chipped/pulverized concrete pieces and powder were collected using dedicated gloves and transferred directly into the laboratory-provided sample container.

Wipe Sampling for polychlorinated biphenyls (PCBs): Prior to sampling, the gauze pad was saturated with hexane. A 10 cm × 10 cm sample area was prepared at the sample location. The sample area was thoroughly wiped from left to right and again from top to bottom. Once the area had been wiped, the gauze pad was placed back into the sample jar and allowed to air-dry prior to sealing the jar.

Sample Identification. The sample identification numbers consisted of an alphanumeric designation related to the AOC, event, media type, and consecutive number, according to the following conventions:

AOC Identification (ID): **203** = Building **203** *(see Table 2-1 for AOC IDs)*
Location ID, which consists of:
Media Type: **SB** = **S**urface **B**oring *(see Table 2-1 for Media Type Codes)*
Consecutive Number: 01, 02, 03, etc.

For groundwater samples, "-GW" at the end of the location ID
For soil samples, depth of sample (in ft): 01, 02, 03 etc.

For example, the sample identification number for the first soil boring sample collected at Building 203 from 2 to 3 ft bgs was 203-SB01-03. The sample identification number for the groundwater sample collected from the same boring was 203-SB01-GW. Duplicate sample identification numbers were followed with a "DUP". MS sample identification numbers were followed with a "MS" and MSD sample identification numbers were followed with a "MSD."

Sample Handling, Storage, and Shipment: Samples were collected into laboratory-supplied bottleware and placed in a cooler on ice. Sample times, dates, and analyses were recorded on boring logs, field sample forms, and field team logbooks. Samples were then quality-control checked by the site Sample Manager and recorded on chain-of-custody (COC) records prior to being packed in coolers on fresh ice and transported daily via overnight commercial carrier to the laboratory. Original COCs were included in the coolers with their respective samples; carbon-copies of the COCs were kept on-site by the Sampler Manager and emailed to the laboratory and project chemist each night, along with tracking numbers for the shipped coolers.

Water Level Measurement: Water level measurements were collected from temporary wells prior to the collection of samples using an electric measuring tape. Additionally, three piezometers were installed in the vicinity of former Building 203 to obtain information on the direction of groundwater flow. The piezometers were constructed as standard PVC wells with filter-pack and a bentonite seal, as necessary, but were not grouted in place. No analytical samples were collected from the piezometers.

Borehole and Temporary Well Abandonment: DPT borings and temporary wells were abandoned at completion of sampling activities. The PVC pipe was removed and backfilled with sand at the locations with temporary wells, whereas borings in grass or sand were abandoned by backfilling with bentonite chips. Borings in asphalt or concrete were abandoned by backfilling with bentonite chips to approximately 6 inches bgs, and the remainder of the borehole was patched with asphalt cold patch or hydraulic concrete. The surface at each location was restored to match the surrounding area.

Temporary wells at AOCs AST-35, FPH, and former Building 203 (including the piezometers) were left in place with the permission of the USACE and NYS Parks Service. These temporary wells are located in gated areas off-limits to the public and may need to be utilized due to the discovery of free product at former Building 203.

2.4.5 Anomaly Avoidance

An Unexploded Ordnance (UXO) Probability Assessment for Intrusive Investigation at Former Camp Hero completed by USACE Baltimore District determined that the Camp Hero RI activities had a low probability of encountering munitions and explosives of concern (MEC), except for areas H and K, which would not be entered at any point during RI field activities. However, as a precautionary measure, anomaly avoidance was conducted in accordance with EM 385-1-97 by a UXO Technician II during intrusive Phase I RI activities with a hand-held magnetometer. "Anomaly avoidance" is defined as the avoidance of surface MEC and any subsurface anomalies where the specific activity can be moved to another location.

Additionally, all field personnel, including AECOM-Tidewater JV employees and subcontractors, completed Ordnance Recognition Training prior to the start of field activities.

2.4.6 Community Air Monitoring

Continuous air monitoring was completed downwind of the Geoprobe® rig during intrusive activities, in accordance with the modified generic NYSDOH Generic CAMP, Attachment 1A of the NYSDEC Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation. The CAMP establishes air monitoring activities that were to be implemented to protect the community from any potential airborne releases that could result from field activities associated with the RI or interim remedial action efforts, as necessary (NYSDEC 2010b). No exceedances were observed during Phase I RI activities. Data from Phase I RI air monitoring are included as Appendix F to this Field Report.

2.4.7 Surveying

The horizontal and vertical position of temporary well locations were surveyed to a horizontal accuracy of 0.1 ft and a vertical accuracy of 0.01 ft. However, no permanent benchmark was available near RI activities in Camp Hero State park; therefore, the vertical positions were based on an arbitrary benchmark of 80 feet at the 1st well surveyed (H17-SB01), near the Commissary Building). Surveyed locations were collected relative to an initial arbitrary benchmark with the following exceptions: Building F100C (UST 34) locations F100C-SB01 and F100C-SB02 and Waste Disposal System locations WDS-SB01, WDS-SB02, and WDS-SB03. The vertical position of temporary wells at these AOCs were surveyed relative to the other temporary wells within the AOC. The temporary wells at these two AOCs were not surveyed relative to the Phase I arbitrary benchmark (H17-SB01) due to their "remote" location relative to the other AOCs. The vertical positions of the temporary well locations and depth to groundwater data were utilized to estimate the direction of groundwater flow at each AOC. A surveyed benchmark with known elevation will be acquired by licensed surveyors during permanent monitoring well installation as part of the Phase II investigation.

2.4.8 Investigation-Derived Waste (IDW) Management:

AECOM-Tidewater JV managed IDW generated during the Phase I field activities pursuant to applicable Federal, State, and local regulations and guidance, including the USEPA Management of Investigation-Derived Wastes during Site Inspections (USEPA 1992), USACE guidance (2013), and NYSDEC Technical Guidance for Site Investigation and Remediation (2010b).

In accordance with NYSDEC Technical Guidance for Site Investigation and Remediation (2010b), soil cuttings and purged groundwater were disposed at the site within the corresponding borehole to within 24 inches of the ground surface with the remainder of the borehole filled with bentonite. An exception to this was when volatile organic field screening instruments detected measurements from soil or groundwater that were above background or visual discoloration of soil or olfactory evidence of contamination were noted. In general, minimal groundwater IDW was generated as most of the purged groundwater was utilized for analytical samples.

IDW was stored in 55-gal drums, which were properly labeled indicating the generator, contact information, contents, and date of generation. The drums were stored at the Camp Hero State Park Motor Pool building, with the permission of State Park Superintendent Mr. Tom Dess. Analytical samples of both the soil and liquid IDW were collected on 20 September 2016 and submitted to RTI Laboratories for hazardous waste determination, including Toxicity Characteristic Leaching Procedure (TCLP). Both soil and liquid IDW were determined to be non-hazardous. Table 2-1 (Appendix B) presents the IDW analytical results compared to TCLP regulatory levels (40 CFR § 261, 1993). The analytical laboratory package of results from the liquid and solid IDW samples are included in Appendix G.

2.5 Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples were collected to ensure field and laboratory protocols resulted in consistent and valid data. The following types of QA/QC samples were collected:

Field Duplicates: One additional set of sample containers were collected along with the normal sample. The duplicate was analyzed as a normal sample at the laboratory. Duplicates were collected at a frequency of one duplicate per ten samples.

Matrix Spike/Matrix Spike Duplicates (MS/MSD): Two additional sets of sample containers were collected along with the normal sample. A Matrix Spike and Spike Duplicate (MS/MSD) are representative but randomly chosen samples with known concentrations of analytes of interest added to the samples prior to sample preparation and analysis. They are processed along with the same un-spiked sample.

Equipment Blanks: One equipment blank was collected from the hammer drill used to collect the concrete chip samples. The equipment blank was collected by pouring Type II deionized water over the decontaminated drill bit and collecting the water in the appropriate sample containers.

Trip Blanks: Trip blanks for VOC analysis were provided by the laboratory. One trip blank was included in each cooler with VOC samples for VOC analysis.

2.6 Data Validation

Data validation was conducted on the Automated Data Review (ADR) output for the Phase I analytical data. All analytical data packages were validated to ensure compliance with specified analytical, QA/QC requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria. This includes, but is not limited to, the following:

- Sample preservation and holding times;
- Blanks (method and rinse);
- Matrix spikes and spike duplicates;
- Laboratory and field sample duplicates;
- Surrogates; and
- Laboratory control samples.

Analytical results were assessed for accuracy and precision of laboratory analysis to determine the limitations and quantity of data. The quality of the data collected in support of the sampling activity was considered acceptable.

The data validation process assigned data qualifiers to results that did not meet specified laboratory protocols but were still considered acceptable via the data validation process. Some data that required qualifiers included samples which were subject to cooler delivery issues resulting in samples arriving out of temperature, samples exceeding specified hold times, and samples requiring multiple dilutions for the SIM PAH method. Samples falling within these qualification scenarios are detailed below.

Sampling and Cooler Delivery Issues. The cooler containing sample H17-SB02-GW was received outside temperature (at 22°C) due to delayed delivery via Federal Express package delivery company. For the VOC analyte group, non-detect results were qualified “R” (rejected value) and the detects were qualified “J” (estimated value). All other analytes in the sample (SVOCs and PCBs) were qualified “J” (estimated value) for detected values and “UJ” (value under detection limit; estimated value) for non-detected values. Samples H14-SB01-GW, H14-SB03-GW, and MP-SB03-

GW were also received outside temperature due to a cooler delivery delay; however, the samples were recollected at a later date and the recollected samples were delivered to the laboratory without temperature or hold time concerns and no results required qualification.

Hold Time Issues. Several Camp Hero samples were qualified due not meeting the recommended method hold times, as detailed in Table 2-2 (Appendix B). Analyte detects were qualified "J" (estimated value) and non-detected values were qualified "UJ" (value under detection limit; estimated value) in the samples.

Multiple Dilutions for PAH SIM method. Multiple dilutions were required for some samples utilizing the SIM PAH analysis. These samples had compounds that were being reported over calibration. The laboratory had to run several dilutions to capture concentrations within the calibration range. Some of the samples had to be analyzed three times. Data from all dilutions were evaluated and compound results were reported from the lowest dilution that exhibits lack of interference.

For example, samples FPH-SB02-GW, FPH-SB03-GW, FPH-SB04-GW, and FPH-SB04-GW DUP were run for several SIM PAH dilutions, as well as regular PAH Method 8270. Due to the very high dilutions in SIM PAH, results were reported from the regular PAH Method 8270.

This page intentionally left blank.

3.0 BACKGROUND SAMPLING

Background soil samples were collected in Phase I to establish park-wide background levels for naturally occurring constituents and anthropogenic impacts. A total of 62 background soil samples (30 surface and 32 subsurface) were collected from four different locations (BG-01 through BG-04) representing two different soil types, Whitman Sandy loam (outwash deposits of stratified sand and gravel) and Montauk loam (glaciofluvial deposits of stratified sand and gravel in forms of kames). These two soil types represent the soil types where most of the Camp Hero RI AOCs are located, excluding urban soil complexes, which are not representative of background conditions. A soil survey map of Camp Hero is included as **Figure 3-1** (Appendix A).

Background samples were analyzed for metals and polycyclic aromatic hydrocarbons (PAHs) by method 8270D in SIM mode. PAHs were included in the background analysis because they may be ubiquitous to the environment and may be derived from non-anthropogenic and anthropogenic influences not directly related to former military activities at Camp Hero.

Phase I Background Field Operations. A total of 16 soil borings were advanced for background sampling. Eight borings were located in the Whitman Sandy Loam (4 borings at 2 locations) and eight borings were located in the located in the Montauk Loam (4 borings at 2 locations). Sample locations were spaced a minimum of 25 ft apart. Borings were advanced to 10 ft bgs or the depth of the perched aquifer, whichever was encountered first. Two subsurface soil samples were collected per boring: 4 to 5 ft bgs and 9 to 10 ft bgs or 1 to 2 ft above the depth to ground water, whichever was encountered first. One surface soil sample was collected from 0 to 1 ft from each boring. Fourteen additional surface soil samples were collected between the four background locations. All four background soil sampling locations are shown on the site map (**Figure 1-2**) and individual background location maps are provided as **Figures 3-2**, **3-3**, **3-4**, and **3-5**, respectively (Appendix A).

Per this methodology, the sample sizes for the background soil samples are as follows:

- n = 15 for surface soil in Montauk Loam (at locations BG-02, BG-04)
- n = 15 for surface soil in Whitman Sandy Loam (at locations BG-01, BG-03)
- n = 16 for subsurface soil in Montauk Loam (at locations BG-02, BG-04)
- n = 16 for subsurface soil in Whitman Sandy Loam (at locations BG-01, BG-03)

The location and need for groundwater, sediment and surface water background data, and the methods that will be used to determine whether site concentrations are within background levels for these media, will be defined in the RI WP Addendum prior to Phase II sampling.

This page intentionally left blank.

4.0 AOC INVESTIGATIONS AND RESULTS

The AOCs investigated as part of the Phase I RI were a combination of sites previously identified in the 1998 Camp Hero FS (Cashin 1998) and others identified during the 2016 records review conducted in preparation of the RI, as described in the Phase I RI WP (AECOM-Tidewater JV, 2016). The locations of the AOCs are shown on the Site Map in **Figure 1-2**. Groundwater elevations across the facility are presented in **Figure 4-1**.

Analytical results from the Phase I sampling are provided in Appendix G (Laboratory Analytical Reports). Tables with analytical results compared to PSLs will be provided as part of the WP Addendum for those AOCs included in the Phase II sampling, and in the final RI Report for all AOCs. The field operations and results for the Phase I Investigation are provided for AOC in the subsections below and also documented in the Daily Reports (Appendix H). **Table 3-1** (Appendix B) provides a summary of the Phase I investigation activities and the analytical samples collected at each AOC. Photographs of the AOCs are included in the Photograph Log (Appendix I).

4.1 Battery 113

Battery 113 has historically been referred to as Bunker-1 and Battery Dunn. Battery 113 historically contained two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. The Camp Hero FS (Cashin 1998) noted a cluster of tanks of various sizes and shapes inside Battery 113, the prior purpose of which is unknown. These included two cylindrical red-painted tanks suspended from the wall; three vertical tanks standing on the floor, which have heavily rusted exteriors; and what was suspected to be one or more tanks in a wooden enclosure on the floor. These tanks were thought to be part of a single system, or multiple systems, possibly including fire suppression, hydraulic fluids, emergency water supply, or emergency fuel supply. Waste drums were also noted. During the records review of archived NY State Park Service drawings of Battery 113, the two cylindrical red-painted tanks suspended from the wall are identified as 150 gallon diesel fuel tanks.

Additionally, the Cashin Report notes Battery 113 to have had oil staining under electrical equipment in the old electrical room. This location was sampled for PCBs, and results showed a PCB level of 24,200 ppb (Cashin 1998).

Phase I Field Operations: A site survey of Battery 113 was conducted during Phase I field activities to identify the presence of tanks and waste drums, assess if standing water was present in pits, and identify visual evidence of potentially PCB-contaminated stained concrete. Prior to entering the building, the team conducted demolition of the sealed entryway to Battery 113 to create an entrance for the team, using a hammer drill and sledge hammer. Four team members

entered the battery to complete the survey. Team members wore tyvek suits, rubber booties, nitrile gloves, full or half-face respirators with P100/OV cartridges, hardhats, and head lamps. The buddy system was utilized while inside the Battery and at least one team member was stationed outside the entrance of the Battery at all times.

Two sub-slab pits with standing water were observed in Battery 113. Additional pits, open manholes, and trenches were observed throughout the Battery, but no others contained standing water. One liquid characterization sample was collected from one of the open pits (B113-LC02-01) for laboratory analysis of VOCs, SVOCs, PCBs, and metals. A second sample was not collected from the other pit with water because it appeared to contain human waste.

The Power Room was identified during the site survey and two diesel storage tanks (identified as 150-galllon Tanks 3 and 4 in site records) were still present on the wall in good condition. No labels were present on the tanks. The field team was able to determine that fluid was still present in the Tanks and one liquid characterization sample (B113-LC01-01) was collected for fuel analysis, ignitability, and toxicity for purposes of disposal characterization. Approximately 16 L of volume was collected for fuel characterization and volume was still present in the tanks; however, the field team could not determine the remaining volume in the tanks. A level meter was present on the wall adjacent to the tanks, which indicated the tanks volume was 3/4 full; however, the field team could not verify the meter's purpose or whether it was still working.

Three extremely rusted, unlabeled cylinders were present below Tanks 3 and 4; however, the cylinders appeared to be empty. Additionally, trenches with piping were present in the Power Room; some of the trenches were covered with metal plate covers and others were covered with wooden planks. The wooden planks were rotting and falling apart in most places. No tanks or storage units were observed in the trenches. Additionally, the Cashin report had mentioned drums present in the power room near Tanks 3 and 4 (Cashin 1998), however, no drums were present in the Power Room at the time of the field survey.

An electric room on the North side of the Power Room was identified, containing portions of a former transformer labeled as Marcus Transformer Company, Inc., and four severed single conductor electric breakout cables mounted on the wall. Dried oil was observed on parts of the transformer carriage and oil staining was noted on the concrete floor in this area. One wipe sample (B113-WP01-01) was collected from the oil-stained surface and one concrete chip sample (B113-CC01-01) was collected at the location of the stained concrete, using the hammer drill with a decontaminated drill bit. Additionally, an equipment blank was collected from the decontaminated drill bit after sampling. The wipe sample, concrete chip sample, and equipment blank were submitted for laboratory analysis of PCBs.

Phase I sampling locations at Battery 113 are shown on **Figure 4-2**.

Deviations from the RI WP: Per the RI WP, if liquid was present in the tanks or drums in Battery 113 during the site survey, a liquid characterization sample was to be collected for VOCs, SVOCs, PCBs, and metals at RTI Laboratories. Because the liquid present in the Battery 113 tanks appeared to be weathered fuel, samples were instead collected for fuel analysis (ignitability and toxicity) for purposes of disposal. Samples were submitted to AB Environmental (Bohemia, NY) via subcontract with CGE.

4.2 Battery 112

Battery 112, also known as Bunker-3, is also associated with UST 36 and UST 37, which were located outside the battery. Battery 112 consisted of two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. Battery 112 had a battle allowance of 200 16-inch 2,240-lb projectiles.

The Cashin Report noted that the "as-built" plans for Battery 112 show that the floor plan for Battery 113 and Battery 112 (Bunker 3) are identical; however, no tanks or waste drums were observed in Battery 112 in the Cashin Report.

Phase I Field Operations: A site survey was recommended in the RI WP to confirm that ASTs are not present in Battery 112 and to complete a visual inspection for evidence of PCB-contaminated stained concrete.

Deviations from the RI WP: It was noted in the Project Kick-Off Meeting in October 2015 that Battery 112 is sealed and access inside the building was not feasible. Access to Battery 112 was assessed during the Phase I field operations; however, Mr. Tom Dess, NY State Park Superintendent, indicated that the building was completely sealed and that safe access was not available, and therefore the site survey was not completed.

4.3 Building 107

Building 107 is also known as Building 5 (Cashin Report) or the Electrical Substation. The Cashin Report noted that transformers were in the basement of the building and may have contained or contain PCBs. Archive pictures of Building 107 show multiple electrical conduits in a concrete trench with metal covering that extended to the power generating building 203.

In an August 2000 environmental assessment, a stained area was noted in the northeast comer of the basement of Building 5, which was three feet by five feet in area. At that time, there was an opening to the outside approximately three to four feet above the floor. No floor drains were

observed in the basement where the four transformers are still mounted on the wall. A concrete chip sample was collected from the stained area (Weston 2000).

Analytical results indicated that PCBs were present within the observed oil stain at a level above the Toxic Substances Control Act (TSCA) unrestricted use limit of 1 milligram per kilogram (mg/kg). Based on the depth of the PCBs in the concrete, it appeared that the oil had not migrated outside the building at that time. The findings indicated that no significant ecological or human health threats existed via migration.

Phase I Field Operations: Access to the basement of Building 107 was available for the field team upon arriving on-site; a hole was present in the Northeast corner of the building. The field team performed a visual survey Building 107. Parts of the wall-mounted transformer were still present in the basement. The field team attempted to verify if fluids are present in the transformers but was not able to open the pieces of the transformer which were still present. However, dried oil was running down the side of the wall-mounted portions of the transformer and minimal staining was noticed on the concrete. Three samples were collected for analysis of PCBs: one sample of the dried fluid (107-LC01), one wipe sample on the surface of the stained transformer (107-WP01), and one concrete chip sample within the stained area (107-CC01). The Phase I sampling locations at Building 107 are shown on **Figure 4-3**. The integrity of the original building was not be impacted during the sampling effort.

Deviations from the RI WP: None.

4.4 Building 201

Building 201 is also known as Building 1 (Cashin Report), Building #P-201, the Radar Tower, and AN/FPS-35. Building 201 is a 5-story radar tower with 2-foot thick concrete walls and was sealed off by USACE and NYS Parks to prohibit entrance. The building has a large steel radar dish, which was a prime component of the DoD early detection radar systems. Building 201 was associated with UST 20, which was removed and included in NYSDEC Spill Report #93-12038.

The Cashin Report recommended further investigation for possible oil leaks and PCB releases. In an August 2000 Data Collection Report (Weston 2000), the first floor of the Radar Tower contained a stained area, which was approximately four feet by six feet in area. The stained area was present below several pipes extending from the ceiling labeled "refrigerated water return." The stained area was reported as not darkly stained and adjacent to a six-inch diameter floor drain. The concrete was not stained below 0.5 inches. One chip sample (from the stained area), four surficial soil, and one subsurface soil sample was obtained at the Radar Tower for PCB analysis (Weston 2000).

PCBs were detected in the surface soil only at sample location (SS-14) at the Radar Tower. Aroclor 1254 was detected at 1.4 mg/kg, which is just above the TSCA unrestricted use limit of 1 mg/kg. Based on the data provided in the 2000 report, the area of contamination appears to be minimal, as no PCBs were detected above the regulatory criteria in adjacent samples collected within 50 ft of that location (Weston 2000).

Additionally, analytical results indicated that PCBs were present within the observed concrete oil stain at a level above the TSCA unrestricted use limit of 1 mg/kg in the Radar tower. Based on the depth of the PCBs in the concrete, it appeared that the oil had not migrated outside the building. The findings indicated that no significant ecological or human health threats existed via migration. Weston recommended that the stains addressed by concrete removal, painting, or controlling building access (Weston 2000).

A structure adjacent to the Radar Tower was also noted in the Data Collection Report, which appeared to be a cesspool. A cesspool was also identified on sanitary drawings obtained during the records research for this RI WP.

In 2002, the Radar Tower was listed on the National Register of Historic Places through the Department of the Interior. The NY State Office of Parks, Recreation, and Historic Preservation and the Department of Interior were contacted prior to beginning the Phase I investigation at this AOC. Sampling at this located was minimally-invasive during Phase I to ensure the preservation and conservation of the Radar Tower and Antenna.

Phase I Field Operations: One Geoprobe® boring was conducted adjacent to the former Radar Tower cesspool to 25 ft bgs. Water was not encountered in the boring. The soil core was screened with a PID; no readings above 0.0 parts per million (ppm) were observed and there were no visual indicators of staining. Two soil samples were obtained from the boring, from 9 to 10 ft bgs and from 24 to 25 ft bgs, and submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals, which may have been released to the cesspool from historic activities at the Radar Tower.

A temporary well was placed in the boring with a 10-foot screen; however, the well was dry upon gauging four days later and a groundwater sample could not be collected. The Phase I sampling location at Building 201 is shown on **Figure 4-4**.

Deviations from the RI WP: A site survey of the bottom floor of the Radar Tower where transformers and staining was observed during previous assessment (Weston 2000) was proposed in the RI WP. However, safe access inside the Radar Tower was not available during Phase I RI activities. Mr. Tom Dess, NY State Park Superintendent, indicated that the building was completely sealed, the structures and stairwells inside are not stable, and he did not believe it is safe for

anyone to enter. As such, a site survey inside the Radar Tower was not completed and the proposed PCB wipe sample was not collected.

4.5 Battery 216

The Records review revealed concern for potential buried metal debris, unknown USTs, or underground vaults around Battery 216. The RI WP recommended a geophysical survey around the building and Geoprobe® borings if underground anomalies were identified.

Phase I Field Operations: A geophysical survey was conducted around the Battery to confirm the absence or presence of underground anomalies. The geophysical survey results indicated mostly debris or infrastructure, as identified on the geophysical survey map in Appendix E. No responses of significant size to be considered vaults or storage facilities or unique features which would require new sampling locations were identified. No borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.6 Plotting Room 113

Records review revealed concern for potential buried metal debris or unknown USTs around Plotting Room 113. The RI WP recommended a geophysical survey around the building and Geoprobe® borings if underground anomalies were identified.

Phase I Field Operations: A geophysical survey was conducted around Plotting Room 113 in May 2016 to confirm the absence or presence of underground anomalies. The geophysical survey results indicated a potential waste area on the north side of the building, with concentrated subsurface metal debris, as identified on the geophysical survey map in Appendix E.

In June 2016, three borings were conducted to the depth of the perched aquifer within the subsurface anomaly area (P113-SB01 through -SB03). The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were collected per boring from P113-SB01 and -SB02: one from the upper portion and one just above the soil-groundwater interface. Only one sample was collected from P113-SB03 because the groundwater was encountered at 1 ft bgs. Soil samples were submitted for laboratory analysis of the NYSDEC STARS lists for fuel oil and gasoline VOCs, SVOCs, and lead.

A temporary well was installed in each boring. One grab groundwater sample was collected from each boring and submitted for laboratory analysis of VOCs, SVOCs, and lead. Phase I sampling locations at Plotting Room 113 are shown on **Figure 4-5**.

Deviations from the RI WP: None.

4.7 Building 2010 (UST 30)

Building 2010 was formerly operated as a groundwater supply well pump house. The well house contained a power generator for groundwater pump operation which was connected to UST 30. A 100-gallon gasoline UST was removed from the southeast corner of Building 2010 in October 1993. The excavation was 4.5 ft by 7 ft by 4.5 ft deep. The NYSDEC Tank Removal Form indicated that no release had occurred from the UST. Low levels of petroleum were detected in soil samples from the excavation; however, lead was reported to be as high as 600 ppm (NYSDEC Tank Removal Form, December 1994).

Phase I Field Operations: To determine the presence or absence of lead in soil and groundwater, two Geoprobe® borings (2010-SB01 and -SB02) were advanced adjacent to the former 100-gallon UST excavation at the southeast corner of Building 2010 to a depth of 7 ft bgs. Four soil samples were collected from each boring, from the 0 – 4 ft bgs, 4 – 5 ft bgs, 5 – 6 ft bgs, and 6 – 7 ft bgs intervals, for laboratory analysis of lead.

A temporary well was set in 2010-SB02 and a grab groundwater sample was collected for laboratory analysis of lead. Phase I sampling locations at Building 2010 are shown on **Figure 4-6**.

Deviations from the RI WP: A temporary well was not placed at 2010-SB01 and thus a groundwater sample was not obtained from this boring; the on-site USACE and AECOM geologists agreed that the formation was too tight to produce sufficient water for sample collection.

4.8 Building F100C (UST 34)

Building F100C has previously been referred to in the Cashin Report as Building 40 and formerly operated as a groundwater well supply pump house. UST 34 was a 275 gallon gasoline tank removed from the south side of Building F100C in October 1993. Ten yards of petroleum-impacted soil was removed from around the UST at that time. Low levels of petroleum were detected in soil samples from the excavation and lead was reported to be as high as 549 ppm (NYSDEC Tank Removal Report, December, 1994).

Phase I Field Operations: To confirm the presence or absence of lead above regulatory concentrations in soil and groundwater, two Geoprobe® borings were advanced immediately adjacent to the former 100-gallon UST excavation at the south of Building F100C to a depth of 7 ft bgs. Four soil samples were collected from each boring, from the 0 – 4 ft bgs, 4 – 5 ft bgs, 5 – 6 ft bgs, and 6 – 7 ft bgs intervals, for laboratory analysis of lead.

Temporary wells were set in the borings and one grab groundwater grab sample was collected from each boring for laboratory analysis of lead. Phase I sampling locations at Building F100C are shown on **Figure 4-7**.

Deviations from the RI WP: None.

4.9 AST-35 (H-13)

One aboveground storage tank (AST) at Camp Hero (AST-35, also identified as H-13 in the Cashin Report) did not have complete closure documentation at the time of records review. The H-13 location was identified in the Cashin Report as a sewage holding tank; however, the Cashin Report and archive drawings indicated that a 200,000-gallon diesel fuel AST was located at this site (Cashin 1998). The archive research indicated that there was a 1,000-gallon release from this tank; however, the available documentation is incomplete.

Phase I Field Operations: Four Geoprobe® borings (AST35-SB01 through -SB04) were advanced to 10 ft bgs (just past the depth of the perched water table) around the concrete containment unit for the former AST, in compliance with 6 NYCRR 613.9(b). The soil cores were screened with a PID; no readings above 0.0 ppm were observed. However, elevated PID readings were observed at the adjacent Fuel Pump House (FPH) AOC (see below). Two soil samples were collected from each boring above the groundwater-soil interface. Soil samples were submitted for laboratory analysis of petroleum compounds by the NYSDEC STARS list for fuel oil VOCs and SVOCs.

A temporary well was installed in each boring and one groundwater sample was collected from each boring for analysis of VOCs and SVOCs. Phase I sampling locations at AST-35/H-13 are shown on **Figure 4-8.**

Deviations from the RI WP: The RI WP recommended that one of the four Geoprobe® borings were to be located within the containment unit of the former AST. However, access inside the containment wall was not available for the Geoprobe® rig, and the four borings were conducted around the accessible portions of the containment wall.

Additionally, the RI WP proposed two piezometers upgradient and downgradient of AST-35 to determine groundwater flow direction around AST-35, the FPH, and Building 203. However, piezometers were not needed within in the AST-35 AOC because the temporary wells installed at AST-35 and the FPH provided sufficient coverage of the area. However, three piezometers were installed at the Building 203 AOC to assist in determining groundwater flow direction.

4.10 Fuel Pump House and Distribution Line for AST-35

Archive drawings indicated that a fuel pump house is located on the northwest side of the former AST-35 pad and that a fuel line may have extended from the former AST-35 location to the former generators at Building 203. No additional information about the fuel line is available. During the January 2016 site walk, fuel odor was noticed inside the Fuel Pump House.

Phase I Field Operations: A geophysical survey was conducted around the fuel pump house in May 2016 to confirm the absence or presence of the fuel pipeline. The geophysical survey results identified the fuel pipeline extending southwest from the fuel pump house, as shown on the geophysical survey map in Appendix E. In June 2016, the fuel pump house distribution line was further traced with a hand-held magnetometer. Hand digging along the distribution line confirmed that the distribution line had been cut and removed after approximately 6-feet from the fuel house. Soil excavated from around the existing fuel line did not indicate noticeable staining or petroleum odor.

Four Geoprobe® borings (FPH-SB01 through -SB04) were conducted to 10 ft bgs around the FPH building and remaining portion of the distribution line, in compliance with 6 NYCRR 613.9(b) (NYCRR 2015b). The soil cores were screened with a PID; elevated PID readings were observed at locations FPH-SB02 (maximum of 13.0 PPM) and FPH-SB04 (maximum of 203 PPM). Water was encountered between 1 ft bgs and 5 ft bgs in the borings; two soil samples were obtained from each boring above the soil-water interface. Sample intervals were biased to depths where there were elevated PID readings or visual indicators of staining were observed. Soil samples were submitted for laboratory analysis of petroleum compounds by the NYSDEC STARS list for fuel oil VOCs and SVOCs.

A temporary well was installed in each boring and one groundwater sample was collected from each boring for analysis of VOCs and SVOCs. Petroleum odor was observed in the purge water from all four temporary wells. Phase I sampling locations at the FPH and Distribution Line for AST-35/ H-13 are shown on **Figure 4-9**.

Deviations from the RI WP: The RI WP proposed nine soil borings at the FPH (three at the building, six along the distribution line to Building 203), at locations based on the results of the geophysical survey. However, because the fuel pipe was cut approximately 6 ft from the FPH, only four borings were conducted around the FPH and the remaining portion of the fuel line.

Additionally, the RI WP proposed that one of the borings would be conducted inside the FPH. However, access inside the FPH was not available and the Geoprobe® rig would not have been able to clear the ceiling of the FPH if access had been available. Therefore, borings were not completed inside the building but relocated immediately adjacent to the building.

4.11 Building 203

Former Building 203, the former power building, housed four large generators which supplied electrical power to Camp Hero. USTs outside of Building 203 were utilized to supply fuel and lubricants to the generators.

Previous Actions and Investigations: In 1994, UST 16 (25,000 gallon #2 fuel oil), UST 18 (25,000 gallon #2 fuel oil), and UST 17 (1000 gallon lube oil) were removed from the perimeter of former Building 203. USTs 16 and 18 were located on the south side of the building and UST 17 was located on the southeast side of the building. Upon removal of USTs 16 and 18, a green liquid that appeared to be ethylene glycol was observed on the sidewalls of the excavation and on water standing in the bottom of the excavation at 17 ft bgs. A solvent odor was present and it was suspected that solvents had been dumped around the building based on visual evidence of surface soil staining and elevated volatile and semivolatile laboratory results of soil. The area behind former Building 203 and adjacent to the USTs was described as a dumping ground for waste oil and spent solvents. A French drain was also observed during excavation activities to surround the Building 203 foundation. The French drain was suspected of acting as a conduit to allow hazardous liquids to migrate around the foundation of the building and into the subsurface soil (NYSDEC Spill Report 93-09575 1993).

Additionally, several drums of glycol were identified at the site during the 1993 UST removal action and several hundred feet of piping containing 150 gallons of ethylene glycol were noted in the former power generator building, presumably used for cooling the generators (NYSDEC Spill Report 93-09575 1993). However, ethylene glycol is a clear, colorless, and viscous liquid that is miscible in water and rapidly biodegrades in soils. It is very likely that ethylene glycol in soils would not be detected at this time decades after it was released. In addition, the soils and foundation around former Building 203, which likely contained ethylene glycol, were excavated during decommission of the building.

In 1995, the single excavation pit for USTs 16 and 18 was over-excavated and 2,500 yards of soil were removed. A Site Assessment Report was submitted for the site to NYSDEC in June 1995 (USACE, 1995). Nine Geoprobe® borings were conducted surrounding the USTs excavation and two Geoprobe® locations were conducted near the center of the excavation. The Geoprobe® location near the center of the excavation was advanced to 53 ft bgs in an attempt to reach groundwater; however, no groundwater was intercepted to this depth. Dense clay was found at depth and surrounding the UST excavation. A soil sample was taken at 53 ft bgs with analysis results below screening criteria. A temporary well was installed to 21 ft below grade, which slowly recharged with groundwater overnight. The results of the soil samples and the groundwater sample taken from the Geoprobe® boreholes were below screening criteria. However, the laboratory method detection limits utilized in the assessment at that time are roughly 10 orders of magnitude higher than what is currently required to evaluate human health risk. The Spill Report Case was closed by the NYSDEC in July 1995.

In 2000, during additional site-wide environmental assessment at Camp Hero by the USACE, a surface water sample was obtained from a drainage area below Building 203 near where a small ditch leading from Building 203 was observed to outfall (Weston 2000). The sample was analyzed for PCBs, SVOCs, and metals. No PCBs or SVOCs were detected in the surface water sample. Two metals, zinc and arsenic, were detected in the sample but were below screening criteria.

Phase I Field Operations: Five Geoprobe® borings (203-SB01 through -SB05) were advanced within the area of the former Building 203 and UST excavation to the depth of the perched aquifer or to 25 ft bgs, whichever was encountered first. Building 203 and USTs have been excavated and replaced with clean fill; the borings were located just beyond the excavation and fill zones to the extent possible. The soil cores were screened with a PID; no readings above 0.0 ppm were observed in borings 203-SB01 through -SB03, but elevated readings of up to 11.3 ppm and 402.8 ppm were observed in borings 203-SB04 and -SB05, respectively. A dense clay layer was encountered between 2 and 20 ft bgs across the AOC; the Phase I RI soil sampling was focused on the layer just above the clay as a potential contaminant transport zone from former Building 203 and the USTs.

Two subsurface soil samples were collected from each boring above the sand-clay interface, with the exception of 203-SB02, because the clay layer was encountered at 2 ft bgs. Sample intervals focused on those with the largest PID readings, if elevated PID readings were observed. Soil samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals.

Temporary wells were installed in the borings and grab groundwater samples were collected for laboratory analysis of VOCs, SVOCs, PCBs, and metals. However, recharge in some of the wells was insufficient to collect the required volume for all planned analyses. The wells were visited multiple times by the sampling team and the collected volume was submitted for laboratory analysis of a shortened analyte suite: VOCs, metals, and one liter for SVOCs were submitted.

Additionally, three piezometers were installed upgradient and downgradient of the Building 203 UST 16 and 18 excavations (PZ-1 through PZ-3) to help determine radial groundwater flow and direction information in the vicinity; analytical samples were not collected from these piezometers. Phase I sampling locations and piezometer locations at Building 203 are shown on **Figure 4-10**.

Upon gauging the piezometers, approximately 5 ft of light non aqueous phase liquid (LNAPL) was observed in piezometer PZ-3. The LNAPL appeared to be weathered petroleum product. Thickness was physically measured to be 8.00 ft to 13.30 ft with 5 ft measured using an interface probe. A petroleum release at AOC Building 203 was made to the NYSDEC hotline by USACE (Ms. Megan Cullen). Pollution Complaint Number PC-1602757 was assigned to the reported release. Mr. Dess

(NYS Camp Hero Park Superintendent) was also notified that a release at former Building 203 had been reported to NYSDEC.

Deviations from the RI WP: As detailed above, an abbreviated analytical suite was submitted due to recharge of groundwater in the temporary wells. Additional piezometers were installed to help determine groundwater flow direction, which were not in the RI WP.

4.12 Suspected Tank A

Seven suspected tanks were identified during the records review (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. The suspected UST located behind former Building 20 (former Fire Department) was designated Suspected Tank A.

Phase I Field Operations: A geophysical survey was conducted around former Building 20 to confirm the absence or presence of Suspected Tank A. The geophysical survey results indicated subsurface anomalies, including inferred utility junctions, documented culvert end-points, and confirmed fence-line and building infrastructures, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations.

Because no tank-sized features were identified in the geophysical survey, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.13 Suspected Tank B

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at Building 22 was designated Suspected Tank B.

Phase I Field Operations: A geophysical survey was conducted around Building 22 to confirm the absence or presence of Suspected Tank B. The geophysical survey results identified two possible tanks on the east side of Building 22, as identified on the geophysical survey map in Appendix E. The location the first of the two anomalies was consistent with location of the suspected tank identified in historical records (Suspected Tank B). The second tank-like anomaly was just north of Building 109. This anomaly was designated as Suspected Tank H and was

investigated as a separate AOC (see below). Signals received to the west side of Building 22 were considered to be likely associated with subsurface utilities.

In June 2016, small "test holes" were conducted at the Suspected Tank B location using shovels. Miscellaneous building debris was uncovered, but no evidence of a tank was identified. However, a petroleum odor was noted in the uncovered soil; therefore, four borings (STB-SB01 through -SB04) were advanced to 10 ft bgs (just below the depth of the water table) in the vicinity of the petroleum odor. The soil cores were screened with a PID; no readings above 0.1 ppm were observed. One sample was collected from each boring just above the soil-water interface. An additional three surface soil samples were collected (STB-SS05 through -SS07) from 0 to 1 ft bgs in the vicinity of the borings. Soil samples were submitted for analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs.

Temporary wells were placed in the borings. Because a tank was not present in the subsurface, grab groundwater samples were only collected from two of the borings: one up-gradient and one down-gradient of the soil with petroleum odor (STB-SB01 and -SB03, respectively). Groundwater samples were submitted for analysis of VOCs and SVOCs. Phase I sampling locations at Suspected Tank B are shown on **Figure 4-11**.

Deviations from the RI WP: The RI WP proposed collection of two samples per boring and no separate surface soil samples; because no tank was located, only one sample was collected per boring and an additional three surface soil samples were collected. Surface soil samples were added based on the observation of petroleum odors in near surface soils but not at depth in the borings. The RI WP also proposed collection of four grab groundwater samples if a tank was located. Because no tank was located, only two grab groundwater samples were collected.

Additionally, after the May 2016 field activities, USACE and AECOM-Tidewater JV discussed collection of a grab groundwater sample from the existing well in the parking lot behind Building 22. During the June 2016 field activities, the USACE and AECOM-Tidewater JV team agreed that samples will not be collected from monitoring wells during Phase I; rather, the well will be sampled via low-flow methodology during Phase II when other newly-installed monitoring wells are sampled, pending results of the Phase I investigation.

4.14 Suspected Tank C

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at former Building 2 was designated Suspected Tank C.

Phase I Field Operations: A geophysical survey was conducted around former Building 2 to confirm the absence or presence of Suspected Tank C. The geophysical survey identified multiple underground anomalies in the area of former Building 2, one of which was consistent with the location of the suspected tank identified in historical records, as identified on the geophysical survey map in Appendix E. Five additional anomalies were identified which were believed to be historic underground utilities.

In June 2016, small "test holes" were conducted at the Suspected Tank C location identified by the geophysical survey using shovels. Miscellaneous building debris was uncovered, and no evidence of a tank or petroleum-contaminated soil was identified. Therefore, no borings were conducted and no environmental samples were collected.

Deviations from the RI WP: None.

4.15 Suspected Tank D

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at former Building 104R was designated Suspected Tank D.

Phase I Field Operations: A geophysical survey was conducted around Building 104R to confirm the absence or presence of Suspected Tank D. The geophysical survey results indicated an abundance of utility connections along with former building and concrete pad infrastructure, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations.

Because no tank-sized features were identified in the geophysical survey, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.16 Suspected Tank E (Building 3001)

Building 3001 has also historically been referred to as Building 47 (Cashin Report), State Park Police Lilco Building, and AT&T Building. UST 26 was previously removed from Building 3001, and another tank (AST 49) remains in use at the building. Archive drawings suggested a third UST in the vicinity of the former UST 26 location (Suspected Tank E). Additionally, one existing well is located on the South side of Building 3001, which was previously used as a water source in the building prior to

connection to Suffolk County Water in 2011. The RI WP recommended collection of one grab groundwater sample from the existing well for analysis of VOCs and SVOCs.

Phase I Field Operations: A geophysical survey was conducted around Building 3001 to confirm the absence or presence of Suspected Tank E. The geophysical survey results indicated building and fence-line interference, along with verified manholes and telephone pole surface features, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations. Because tank-sized features were not identified in the geophysical survey, borings were not completed at this AOC.

Additionally, the existing well, which is no longer used at Building 3001, could not be sampled as the well is disconnected and access to groundwater through the well head seal was not available.

Deviations from the RI WP: None.

4.17 Suspected Tank F

Archive figures indicated that Suspected Tank F could be located at the pump house near Battery 216 (also known as Bunker-4). This groundwater pump house was suspected to have a UST in proximity to the building, because similar pump house on Camp Hero had a 100 gallon gasoline UST removed.

Phase I Field Operations: A geophysical survey was conducted in the vicinity of the pump house near Battery 216 to confirm the absence or presence of Suspected Tank F. Due to dense vegetation and terrain, the area was assessed using AGM. Interferences (e.g., buildings, fences) or metallic items large enough to represent a UST were not identified, as shown on the geophysical survey map in Appendix E. Because tank-sized features were not identified, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.18 Suspected Tank G

An additional pump house was noted at Well 4 during the January 2016 site walk. This groundwater pump house was suspected to have a UST (Suspected Tank G) in proximity to the building, because similar pump house on Camp Hero had a 100 gallon gasoline UST removed.

Phase I Field Operations: A geophysical survey was conducted around the pump house to confirm the absence or presence of Suspected Tank G. Due to dense vegetation and terrain, the

area was assessed using AGM. No interferences (e.g., buildings, fences) or metallic items large enough to represent a UST were identified, as shown on the geophysical survey map in Appendix E. Because no tank-sized features were identified, borings were not completed at this AOC.

4.19 Suspected Tank H

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G). Geophysical surveys were conducted in May 2016 to confirm the presence or absence of the suspected tanks. During the geophysical survey around Building 22, an additional tank-sized anomaly was identified just north of Building 109. This anomaly was designated as Suspected Tank H and was investigated as a separate AOC.

Phase I Field Operations: In June 2016, small "test holes" were conducted at the Suspected Tank H location using shovels. Miscellaneous building debris was uncovered, but there was not any evidence of a tank or petroleum impacts. Therefore, borings were not completed at this AOC.

Deviations from the RI WP: The Suspected Tank H AOC was not included in the RI WP but was added to the investigation after the geophysical surveys in May 2016.

4.20 Abandoned Waste Disposal System (Site-Wide)

The site-wide Abandoned Waste Disposal System is a suspected former area of hazardous waste dumping. The abandoned site-wide sanitary sewer was identified during the 2016 historical records search from archive drawings of Camp Hero provided by the NY State Parks; the system was abandoned and has not been used by the NY State Parks. The drawings indicate that septic fields and cesspools were also utilized at Camp Hero prior to construction of the site-wide sanitary sewer system. The system was connected to a chlorine chamber for treatment prior to discharge to the Atlantic Ocean at a headwall outfall. The location of the site-wide sanitary sewer line and former septic fields and cesspools are shown on the Site Map (**Figure 1-2**).

Phase I Field Operations: Twenty-seven Geoprobe® borings (WDS-SB01 through -SB27) were advanced throughout the abandoned waste disposal system, at locations targeting former leach fields and cesspools downgradient from buildings which may have utilized hazardous materials. Boring locations were biased to potential weak sites or collection areas along the sewer line, such as locations of 90-degree turns, where the sanitary line was joined by a secondary sanitary line from former operations buildings, collection tanks, and at the chlorine contact chamber. The locations of former sanitary leach fields, septic tanks, and cesspools utilized prior to construction of the site-wide sanitary sewer system were also included in the soil and groundwater sampling.

Borings were advanced to the depth of the targeted abandoned waste disposal system features (bottom of the leach field, septic tank, cesspool, etc.). The soil cores were screened with a PID;

readings above 0.0 ppm were not observed. One soil sample was collected from each boring at depth. Temporary wells were set in each boring and grab groundwater samples were collected. Soil and groundwater samples were sent to the laboratory for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sample locations for the site-wide abandoned waste disposal system are shown on **Figures 4-12** through **4-16**.

Deviations from the RI WP: At some locations, groundwater recharge was insufficient to fill all required sample bottleware, even after multiple attempts; in those instances, the volume obtained was submitted for analysis of shortened list of analytes.

4.21 Motor Pool

The Motor Pool building contained a hydraulic lift for vehicle maintenance. According to the State Park Superintendent (Mr. Tom Dess) in a phone interview, the concrete floor over the hydraulic lift was capped at the time the State Park began utilizing the Facility. Since that time, the Motor Pool building has been beneficially reused by the NY State Park. A 1940 Camp Hero archive site map identifies the Motor Pool building was once utilized as an Ordnance Repair Shop. A floor drain was likely present in the building during DoD use of the building.

Additionally, a cesspool on the east side of the motor pool, downgradient from the building, has also been identified through the historical records search. There is potential that petroleum, munitions constituents, and/or hazardous materials may have drained through the floor drain, which may have led to the cesspool. There was no evidence of a discharge pipe from the Motor Pool Building to the ground surface outside of the Motor Pool Building observed during a site walk over in this area conducted on 3 November 2015 during the project kick-off meeting.

One existing groundwater supply well currently utilized for non-potable purposes at the Motor Pool (untreated tap) is located on the west side of the building.

Phase I Field Operations: At the location of the former hydraulic lift, one Geoprobe® boring (MP-SB01) was advanced through the concrete slab adjacent at the former hydraulic lift to 10 ft bgs, just past the depth of the bottom of the former lift, which is assumed to be 8 to 10 ft bgs. Concrete coring was conducted prior to boring. Additionally, concrete and debris were encountered in the boring around 9 ft bgs. The soil core was screened with a PID; elevated PID readings from 5 to 10 ft bgs were observed (maximum of 21.0 ppm). One soil sample was collected 4 to 5 ft bgs from the non-native and native soil interface, which was also just above the soil-water interface, for analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs and SVOCs. Petroleum odor was observed in the purge water during groundwater sample collection. The temporary well was abandoned and the concrete was patched at grade once sample collection was complete.

Adjacent to the location of the former floor drain to the cesspool just outside the building (approximately 6 ft from the edge of the building), one Geoprobe® boring (MP-SB02) was advanced to 15 ft bgs, just past the depth of the perched water table. The soil core was screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were collected from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 11 to 12 ft bgs, just above the soil-water interface. Soil samples were submitted for laboratory analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs and for energetics. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs, SVOCs, and energetics.

Along the sewer line from the building to the cesspool, one Geoprobe® boring (MP-SB03) was advanced to 15 ft bgs, just past the depth of the perched water table. Two soil samples were obtained from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 8 to 9 ft bgs, just above soil-water interface, for laboratory analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs, PCBs, and energetics. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs, SVOCs, PCBs, and energetics.

Additionally, one grab groundwater sample was collected from the existing well located on the west side of the Motor Pool from an available untreated tap for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, energetics, and metals. The Phase I sampling locations at the Motor Pool are shown on **Figure 4-17**.

Note that an additional soil boring (WDS-SB11) was conducted immediately adjacent to the cesspool as part of the site-wide abandoned waste disposal system AOC.

Deviations from the RI WP: None.

4.22 Engineering Field Office

A former engineering field office building was identified on a 1940 site map located adjacent to the Motor Pool building. The 1940 site map identifies the motor pool building as once utilized as an Ordnance Repair Shop. Archive pictures of the engineering field office indicate it was a two-story high wooden building with double doors. Work related to ordnance repair may have also occurred in the engineering field office located adjacent to the Motor Pool building.

Phase I Field Operations: One soil boring was advanced downgradient of the former engineering field office, on the south side of the building within the drainage area adjacent to the building foundation, to 14 ft bgs. Two soil samples were collected from the boring, one surface soil sample (0 to 1 ft bgs) and one subsurface soil sample just above perched groundwater-soil

interface (7 to 8 ft bgs), for laboratory analysis of energetics. One grab groundwater sample was also collected from a temporary well for analysis of energetics. The Phase I sampling location for the Engineering Field Office is shown on **Figure 4-18**.

Deviations from the RI WP: None.

4.23 Former Building 34

During the May 2016 Phase I RI activities, the USACE and AECOM-Tidewater JV team discovered a building foundation, old furnace, and building debris in the H-16 area east of the Motor Pool Building at former Building 34. USACE requested that AECOM review locations of proposed borings and surface and near-surface soil samples at nearby H-5 and H-16 in relation to this debris and shift sample locations to cover this debris area. This area was identified as a new AOC, former Building 34.

Phase I Field Operations: One Geoprobe® boring (034-SB01) was advanced to 10 ft bgs on the north side of former Building 34. Water was encountered at 2 ft bgs. The soil core was screened with a PID; no readings over 0.0 ppm were observed. Two soil samples were collected from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 1 to 2 ft bgs, just above the soil-water interface. Soil samples were submitted for laboratory analysis of PAHs, PCBs, and metals. A temporary well was placed in the boring and a groundwater sample was collected for laboratory analysis of PAHs, PCBs, and metals.

Additionally, four co-located surface soil and near-surface soil samples (locations 034-SS02 through -SS05) were collected downgradient of the debris toward the embankment of revetments southeast of former Building 34. The revetments are narrow, wooden stream channelization structures found in stream beds throughout Camp Hero State Park, which appear to have been installed to control surface water flow across the facility. Surface soil and near-surface soil samples were submitted for laboratory analysis of PAHs, PCBs, and metals. Phase I sample locations at former Building 34 are shown in **Figure 4-19**.

Deviations from the RI WP: This is a new AOC that was not included in the WP.

4.24 Drum Location (H-1)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-1. One drum was present with no labeling or identification. No liquid was present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were

collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-1 are shown on **Figure 4-20**.

Deviations from the RI WP: None.

4.25 Drum Location (H-2)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-2. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-2 are shown on **Figure 4-21**.

Deviations from the RI WP: None.

4.26 Drum Location (H-3)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-3. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-3 are shown on **Figure 4-22**.

Deviations from the RI WP: None.

4.27 Construction Debris Area (H-4)

The Cashin Report noted areas H-4 and H-6 contained construction debris.

Phase I Field Activities: A walk-over survey was conducted to identify the amount and location of construction debris at H-4.

Three Geoprobe® borings (H4-SB01 through -SB03) were advanced to 10 ft bgs (just past the depth of the perched aquifer) under the debris or on the downgradient edge of the debris. The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample just above the perched groundwater-soil interface.

Temporary wells were installed in each boring. One grab groundwater sample was collected from each boring. Soil and groundwater samples were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations at H-4 are shown on **Figure 4-23**.

Deviations from the RI WP: None.

4.28 Drum Location with Construction Debris (H-5)

Five drums and construction debris were noted at area H-5 in the Cashin Report, located in a topographic swale southeast of the Motor Pool Building (Cashin 1998). Three of the drums were identified as contents unknown. However, there was no evidence of these drums present during a Site Walk Over in this area conducted on November 3, 2015 during the RI/FS Project kick-off meeting. Tom Dess (NYS Camp Hero Superintendent) indicated the parks had removed the debris and a motorcycle frame from the area previously.

Phase I Field Operations: Four surface soil samples (0 to 1 ft bgs) and four co-located near-surface soil samples (1 to 2 ft bgs) were collected in the vicinity of the former drums and construction debris. The two soil sample locations near the former drums (H5-SS01 and -SS02) were sampled for VOCs, SVOCs, PCBs, and metals. The two soil samples at the construction debris area (H5-SS03 and -SS04) were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations for H-5 are shown on **Figure 4-24**.

Deviations from the RI WP: Eight surface soil and eight near-surface soil samples were proposed for H-5 in the RI WP. During the May 2016 site walk, USACE and AECOM-Tidewater JV agreed that four sample locations instead of eight were sufficient.

4.29 Construction Debris Area (H-6)

The Cashin Report noted areas H-4 and H-6 contained construction debris.

Phase I Field Activities: A walk-over survey was conducted to identify the amount and location of construction debris at H-6.

Three Geoprobe® borings (H6-SB01 through -SB03) were advanced to 8 ft bgs (just past the depth of the perched aquifer) under the debris or on the downgradient edge of the debris. The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were obtained from each boring, one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample just above the perched groundwater-soil interface.

Temporary wells were installed in each boring. One grab groundwater sample was collected from each boring. Soil and groundwater samples were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations at H-6 are shown on **Figure 4-25**.

Deviations from the RI WP: None.

4.30 Possible Boilers (H-7 and H-8)

The Cashin Report noted three locations at Camp Hero which contained what appeared to be old boilers (1998): H-7, H-8, and H-9. The RI WP proposed a visual survey to determine whether boilers still exist. If the boilers were present, one surface soil sample (0–1 ft bgs) was to be collected. If stained soils were noted or if field screening of the surface soil samples with the PID (in the plastic, re-sealable bag) indicated the presence of petroleum during the survey, one Geoprobe® boring was to be advanced for the collection of two subsurface soil samples and one grab groundwater sample.

Phase I Field Operations: An extensive visual and magnetometer survey was conducted by the project team; however, the team was unable to locate debris noted by previous Cashin Report at AOC H-7 and H-8 after multiple attempts. As such, sampling activities were not completed at these AOCs.

Deviations from the RI WP: None.

4.31 Possible Boiler (H-9)

The third boiler noted in the Cashin Report, H-9, was confirmed present during visual survey during the initial project site walk (Cashin, 1998).

Phase I Field Operations: A visual survey was conducted and confirmed that the boiler at location H-9 still existed in June 2016. One surface soil sample (H9-SS01) was collected from 0 to 1 ft bgs for laboratory analysis of PAHs and metals. Field screening of the surface soil sample with the PID (in the plastic, re-sealable bag) was conducted; no readings above 0.0 ppm were observed. Because stained soils were not observed and field screening did not indicate elevated PID readings, borings were not completed in accordance with the RI WP. The Phase I sampling location at H-9 is shown on **Figure 4-26**.

Deviations from the RI WP: None.

4.32 Former Power Plant (H-11)

The Cashin Report recommended investigation potential petroleum, metals, and PCBs in soil and groundwater associated with the former power plant. In an August 2000 environmental assessment, five groundwater, two surficial soil, two subsurface soil, and two sediment samples were collected and analyzed for PCBs, SVOCs, and metals (Weston 2000).

At that time, the former Power Plant location contained three to five feet of fill material, consisting mostly of charcoal. PCBs were not detected in soils or groundwater from the area. Beryllium was

detected above the regulatory criteria in one subsurface soil (SS-1) and chromium and lead were detected at concentrations that slightly exceeded screening criteria in one of five groundwater sample locations (GW-2). The levels of chromium and lead were somewhat elevated in relation to the reference well located up-gradient of the former Power Plant location. Results from surface water and sediment samples indicated no evidence of contaminant transport pathways from the buildings to adjacent sensitive environmental areas, such as forested wetlands and streams (Weston 2000).

Additional investigation of the power plant was included in the Phase I investigation to confirm the Weston results (Weston 2000).

Phase I Field Operations: Two Geoprobe® borings (H11-SB01 and -SB02) were advanced to 10 ft bgs (just past the depth of water) within the footprint of the former Power Plant Building. The soil cores were screened with a PID; there were not any readings detected at location H11-SB01, but elevated PID readings (21.7 ppm maximum) were observed 3 to 5 ft bgs at location H11-SB02. Two soil samples were obtained from each boring, one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 3 to 4 ft bgs, just above the perched groundwater-soil interface or in the interval with elevated PID readings.

A temporary well was installed in each boring and a grab groundwater samples were collected. Soil and groundwater samples were submitted for laboratory analysis of PAHs, PCBs, and metals. Phase I sampling locations for the former power plant are shown on **Figure 4-27**.

Note that two Geoprobe® borings were also conducted in the tile drain field associated with the former Power Plant Building as part of the site-wide abandoned sanitary sewer investigation and are discussed under that AOC. Those results will be incorporated into approach for this AOC.

Deviations from the RI WP: None.

4.33 Sewage Ejector Station (H-12)

The sewage ejector station, located near the former heating plant, was noted in the Cashin Report as a potential concern due to waste handling.

Phase I Field Operations: One Geoprobe® boring (H12-SB01) was advanced to 10 ft bgs within the footprint of the former ejector station. The soil core was screened with a PID and there were not any readings above 0.1 ppm recorded. Two soil samples were collected: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 4 to 5 ft bgs, just above the soil-water interface. A temporary well was placed in the boring and a grab groundwater sample was collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs,

PCBs, and metals. Phase I sampling locations for the Sewage Ejector Station are shown on **Figure 4-28**.

Deviations from the RI WP: None.

4.34 Former Coal Storage (H-14)

Two former coal storage areas were identified in the Cashin Report and on archive drawings obtained during the 2016 historical records search (H-14 and H-15).

Phase I Field Operations: Three Geoprobe® borings (H14-SB01 through -SB03) were advanced within the suspected area of the H-14 coal storage area. The soil cores were screened with a PID and there were not any readings above 0.0 ppm recorded. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample just above the soil-water interface or at the depth of the boring, if not water was encountered.

Temporary wells were placed in all three boring locations; grab groundwater samples were collected from H14-SB01 and -SB03. H14-SB02 was dry upon gauging and a groundwater sample could not be collected. Soil and groundwater samples were submitted for laboratory analysis of PAHs and metals. Phase I sampling locations for H-14 are shown on **Figure 4-29**.

Deviations from the RI WP: None.

4.35 Former Coal Storage (H-15)

Two former coal storage areas were identified in the Cashin Report and on archive drawings obtained during the 2016 historical records search (H-14 and H-15).

Phase I Field Operations: Three Geoprobe® borings (H15-SB01 through -SB03) were advanced within the suspected area of the H-15 coal storage area. The soil cores were screened with a PID and there were not any readings above 0.0 ppm recorded. Groundwater was not encountered in the borings. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample just above where moisture was encountered or at the depth of the boring. Soil samples were submitted for laboratory analysis of PAHs and metals. Phase I sampling locations for H-15 are shown on **Figure 4-30**.

Deviations from the RI WP: Temporary wells were placed in all three boring locations; however, all three wells were dry upon gauging and groundwater samples could not be collected despite multiple attempts.

4.36 Former Sewage Treatment Area (H-16)

The Cashin Report reported a sewage treatment area just east of the Motor Pool. Historic site drawings indicated a proposed sewage treatment plant in this area; however, the available documentation was incomplete and the RI WP recommended additional investigation.

Phase I Field Operations: A walk-over survey was conducted to attempt to identify the status and size of former sewage treatment area at this location; however, no indicators were present other than some mounding. One Geoprobe® boring was advanced to the perched groundwater table in the former sewage treatment area. The soil core was screened with a PID and there were not any readings above 0.0 ppm that were recorded. Two soil samples were obtained the boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 4 to 5 ft bgs, just above the groundwater-soil interface.

A temporary well was placed in the boring and a grab groundwater sample was collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. The Phase I sampling location for H-16 is shown on **Figure 4-31**. Additionally, one boring location associated with the abandoned site-wide waste disposal system (WDS-SB11) was located within the H-16 area.

Deviations from the RI WP: Two borings were planned for H-16 in the RI WP; however, because one boring associated with the abandoned site-wide waste disposal system (WDS-SB11) was located within the H-16 area, one of the two H-16 borings was reallocated to former Building 34, a new AOC established during the Phase I field activities (see Section 4.23 for more details).

4.37 Open Pits (H-17)

The Cashin Report noted two open pit locations which may have been dumping areas (H-17 and H-21). Geospatial analysis of these areas by the USACE AGC were inconclusive (USACE 2016). Based on visual inspection of the areas, there have been ground disturbances; therefore, the goal of the Phase I investigation was to confirm or deny suspected waste related to DoD utilization of this area.

Phase I Field Operations: Three Geoprobe® borings (H17-SB01 through -SB03) were advanced in the vicinity of the ground disturbances at H-17, two topographically downgradient and one upgradient of the disturbance. During the initial attempt on each boring, groundwater was not encountered and the sandy lithology caused boreholes to collapse around 20 ft bgs. The team returned at a later date with steel casing and advanced borings to 35 ft bgs (greater than the 25 ft bgs established in the RI WP), in attempt to reach groundwater. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 4 to 5 ft bgs. Groundwater was encountered in two of the three borings; temporary wells were installed in those two borings (H17-SB02 and -SB03) and grab groundwater samples

were collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-17 are shown on **Figure 4-32**.

Deviations from the RI WP: As detailed above, one of the three planned groundwater samples was not obtained.

4.38 Drum Location (H-18)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-18. Minimal drum remnants were present with no labeling or identification; liquid was not present in the drum remnants. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected in the vicinity of the drum remnants for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-18 are shown on **Figure 4-33**.

Deviations from the RI WP: None.

4.39 AST 550-Gallon (H-19)

The Cashin Report noted one discarded 550-gallon above ground storage tank was located in the area of Camp Hero between Hill 72 and 83, in the northern section of the site (see **Figure 1-2**).

Phase I Field Operations: A walk-over survey was conducted and confirmed that the 550-gallon AST still exists at Camp Hero. Liquid was not present in the tank. Two surface soil samples (H19-SS01 and -SS02) were collected from 0 to 1 ft bgs adjacent to the tank for analysis of VOCs, PAHs, and metals. The soils were screened with a PID and there were not any readings above 0.0 ppm that were recorded. Because there were not any elevated PID readings or petroleum-stained soils observed, Geoprobe® borings were not conducted. Phase I sampling locations at H-19 are shown on **Figure 4-34**.

Deviations from the RI WP: None.

4.40 Drum Location (H-20)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-20. One drum was present, with no labeling or identification, located inside the wooden revetment (as described above in Section 4.23). Liquid was not present in the drum. Two co-

located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum within the revetment for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-20 are shown on **Figure 4-35**. Photographs of the sampling at H-20 are located in the Photograph Log (H-20).

Deviations from the RI WP: None.

4.41 Open Pits (H-21)

The Cashin Report noted two open pit locations which may have been dumping areas (H-17 and H-21). Geospatial analysis of these areas by the USACE AGC were inconclusive (USACE 2016). Based on visual inspection of the areas, there have been ground disturbances; therefore, the goal of the Phase I investigation was to confirm or deny suspected waste related to DoD utilization of this area.

Phase I Field Operations: Three Geoprobe® borings (H21-SB01 through -SB03) were advanced to 15 ft bgs in the vicinity of the ground disturbances. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample at varying depths. Temporary wells were installed in the borings and grab groundwater samples were collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-21 are shown on **Figure 4-36**.

Deviations from the RI WP: None.

4.42 Drum Location (H-22)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-22. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-22 are shown on **Figure 4-37**.

Deviations from the RI WP: None.

4.43 AGC Sites 1, 2, and 4

As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for features associated with dumps within the former Camp Hero boundary. Their report concluded that there was no photographic evidence of debris accumulation suggestive of a dump in the years collected within the timeframe of this project.

However, four areas were identified where dumping could have taken place, described as access points to cleared areas near or along the bluff (USACE 2016). The four areas were designated "AGC Sites 1, 2, 3, and 4" for this RI. AGC Site 3 corresponds to the "Camp Hero State Park Bluffs" AOC, which was already established as a part of this investigation (see below).

Phase I Field Operations: To investigate potential buried debris, a visual inspection and screening-level geophysical survey using a metal detector were conducted during Phase I field activities. Visual and magnetometer results did not identify any subsurface anomalies indicative of waste dumping. As such, borings were not advanced at this AOC.

Deviations from the RI WP: None.

4.44 Camp Hero State Park Bluffs/AGC Site 3

A boiler or small tank and metal debris was observed at the bottom of the steep slope along the southern bluffs of Camp Hero during the Site Walk conducted in October 2015. Additionally, the USACE AGC identified this location as an area where dumping could have taken place. Based on a previous walk-over survey, it was concluded that the miscellaneous metal debris was inert and did not previously contain liquid contents.

Phase I Field Operations: The boiler was removed from the bluffs and disposed of as solid waste.

Deviations from the RI WP: None.

Vinyl chloride	SW 8260B	200	µg/L	120	U	120	U

Notes

G: ICB/CCB result is greater than the MDL.
J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.
Q: % REC exceeded control limits. When applied to sample analytes, denotes an associated LCS recovery that exceeded control limits.
U: The analyte concentration is less than the DL. The result is reported as less than the LOD.
X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.
Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

EXECUTIVE SUMMARY

AECOM-Tidewater JV is conducting a Comprehensive Environmental Restoration, Compensation, and Liability Act (CERCLA) Remedial Investigation (RI), Feasibility Study, Proposed Plan, and Decision Document, at Camp Hero, a formerly used defense site (FUDS). This work is being completed under contract number W912DR-13-D-0016 for the United States Army Corps of Engineers (USACE). The RI for this site is being completed in two phases, with Phase I having been completed in June 2016. This Phase I Investigation Field Report provides: (1) a documentation of the field activities, (2) details on any significant deviations from the work plan that may have occurred, and (3) all the raw data collected.

Camp Hero State Park is located on the eastern tip of the south fork of Long Island, New York (NY), approximately 5 miles east of the Village of Montauk. The former Camp Hero was established in early 1942 as a Coastal Defense Installation and the facility changed ownership within the military multiple times over the course of the following decades. Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies, and the facility was permanently closed in 1982. The area is now used as Camp Hero State Park and is owned by the New York State Parks Commission.

Former Department of Defense (DoD) activities at Camp Hero may have resulted in contaminated material or an environmental release from these materials at certain Areas of Concern (AOCs). The RI technical approach consists of two phases of field sampling investigation (Phase I and Phase II). The primary objective of the Phase I investigation was to determine the presence or absence of contamination at the Camp Hero AOCs. The primary objectives of the Phase II investigation is to determine the nature and extent of target constituents in soil, groundwater, surface water, and sediment at the Camp Hero AOCs where the presence of contamination above applicable screening criteria is established following the Phase I investigation and to determine if there are unacceptable risks to human health and ecological health associated with exposure to related constituents.

Forty-five AOCs were identified in the RI Work Plan (WP), including former waste disposal and coal storage areas, abandoned drum locations, and former storage tanks (AECOM-Tidewater JV, 2016). Two additional AOCs were established by the USACE and the AECOM-Tidewater JV team during the Phase I investigation, for a total of forty-seven AOCs investigated during the Phase I activities. The locations are shown on site wide **Figure 1-2** and individual AOC Figures are presented as **Figures 4-2 to 4-37** (Appendix A).

Phase I investigation activities included a geospatial survey utilizing archived aerial photography, digital geophysical mapping of select AOCs, a botanical survey for the protection of rare and threatened species, field sampling, and surveying. The geospatial survey (aerial photography archival research) of the former Camp Hero, performed by the U.S. Army Geospatial Center, evaluated Camp Hero for the potential presence of waste disposal areas which may have been

utilized during DoD activities at Camp Hero. The geospatial survey was conducted as part of the June 2016 Final RI WP and results are presented in that document; however, the results are also included as Appendix E to this Phase I Investigation Field Report for reference.

The Phase I investigation was generally completed to the scope that was provided in the WP. Any deviations to the RI WP are provided in detail within this report. The most significant deviation consisted of the inability to collect groundwater samples at some of the AOCs due to a lack of groundwater from the perched aquifer. Temporary wells were installed and visited multiple times in an attempt to obtain sufficient quantities of groundwater for sample collection. This lack of available groundwater in some locations required a prioritization of analytical parameters due to the large number of sample containers required as a result of the long list of constituents that were being analyzed. Another significant deviation from the WP was at the Battery 112 AOC, which could not be investigated due to the lack of safe access. Lastly, tables which compare the analytical data to project screening levels and determinations of whether each AOC requires further investigation during Phase II are not included in the Phase I Field Investigation Report. To provide a more thorough analysis, tables and recommendations will instead be provided as part of an addendum to the RI WP that will describe the activities to be completed during the Phase II RI (referred to as the RI WP Addendum).

This Phase I Investigation Field Report describes the investigation activities and provides analytical results of the Phase I investigation. The Phase II RI sampling activities will be detailed in the WP Addendum, which will describe specific activities and sampling protocols for the Phase II RI. The RI WP Addendum will be provided to the project team for review, comments, and concurrence with recommendations.

The information and data collected during the Phase II RI will serve as the basis for a baseline Human Health Risk Assessment (HHRA) and Screening-Level Ecological Risk Assessment (SLERA). The objectives of the baseline HHRA and the SLERA are to evaluate whether concentrations of constituents from the AOCs pose unacceptable risks to human health and the environment, and to develop site-specific preliminary remediation goals, if necessary.

1.0 INTRODUCTION

Under contract to the United States Army Corps of Engineers (USACE), AECOM-Tidewater JV is conducting a Comprehensive Environmental Restoration, Compensation, and Liability Act (CERCLA) Remedial Investigation (RI), Feasibility Study, Proposed Plan, and Decision Document, at Camp Hero, a formerly used defense site (FUDS) under Contract Number W912DR-13-D-0016, Order Number DB01. A Camp Hero general location map is provided as **Figure 1-1** in Appendix A. The areas of concern (AOCs) at Camp Hero established in the June 2016 RI Work Plan (WP) are based on 1) the Camp Hero Feasibility Study/Hazardous Materials Survey prepared by NY State Parks contractor Cashin Associates in 1998 (hereinafter, "Cashin Report") and 2) a historical records search conducted in 2016 in preparation of this RI (AECOM, 2016). AOCs include former waste disposal areas, coal storage areas, abandoned drum locations, and former storage tanks. A site map with AOC locations is provided as **Figure 1-2** in Appendix A. The RI scope of work for this project is limited to the investigation and characterization of these sites (i.e., no remediation).

The RI technical approach consists primarily of two phases of investigation, Phase I and Phase II. The Phase I investigation was intended to confirm either the presence or the absence of suspected DoD waste at an AOC. A Phase II investigation will be conducted to define the nature and extent of the waste constituents at the AOCs where the presence of contamination above applicable screening criteria is established during the Phase I investigation. AECOM-Tidewater JV prepared this Phase I Investigation Field Report under Contract Number W912DR-13-D-0016, Order Number DB01, to provide: (1) a documentation of the field activities, (2) details on any significant deviations from the work plan that may have occurred, and (3) all the raw data collected.

1.1 Facility Background

The Camp Hero State Park Site consists of 469 acres located on the eastern tip of the South Fork of Long Island, NY, approximately 5 miles east of the Village of Montauk in Suffolk County, NY (**Figure 1-1** in Appendix A). Camp Hero State Park is split into two large subareas: the former Military Area (the Site) and the "Sanctuary Area." The Site is bounded by Montauk Highway (Route 27) to the north, the Atlantic Ocean to the south, Montauk Point State Park to the east, and Camp Hero State Park's undeveloped sanctuary area to the west.

The former military facility Camp Hero was established in early 1942 as a Coastal Defense Installation to defend the approaches to New York and was named in honor of Major General Andrew Hero. Three self-sufficient batteries (Battery 112, 113, and 216) and supporting facilities were constructed which included barracks, mess halls, hospital facilities, a motor repair shop, a recreation facility, sentry boxes, and water supply and sewage facilities. A total of 600 enlisted men and 37 officers were stationed at Camp Hero.

Camp Hero was a sub-installation of the 11th Coast Artillery Regiment (Harbor Defense) located at Fort H.G. Wright, Fischers Island, Block Island Sound, New York. Fort H.G. Wright was under the control of the Eastern Defense Command. Elements from the 11th Coast Artillery Regiment, along with elements from the 242nd Connecticut National Guard Coast Artillery Regiment (Harbor Defense), which augmented the 11th Coast Artillery Regiment at Fort H .G . Wright.

Battery 216 (identified as Bunker 216 on Figure 1-2) contained two 6-inch shielded guns, a mechanical power room, and powder room for storage of ammunition and powder charges. Battery 113 (identified as Bunker 113 on maps) consisted of two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. A requirement for war reserve allowances of ammunition for the batteries also existed. However this ammunition was stored outside of Camp Hero installation boundaries at an unknown central depot location under the control of the Chief of Ordnance. Batteries 112 and 113 had a battle allowance of 200 16-inch 2,240-lb projectiles and a war reserve allowance of 300 16-inch 2,240-lb projectiles. Battery 216 had a battle allowance of 200 6-inch 90-lb HE (high explosive) rounds and 300 6-inch 105-lb AP (armor piercing) rounds and a war reserve allowance of 300 6-inch 90-lb HE rounds and 400 6-inch 105-lb AP rounds (USACE 2000).

Additionally, 37-millimeter (mm) weapons and .50-caliber antiaircraft weapon platoons were assigned to protect the Camp from air attack. The Camp's weaponry was periodically fired to practice over water but was never fired as a result of an act of hostility. It is presumed that the antiaircraft weapon ammunition for Camp Hero and nearby facilities was also stored within the battery ammunition storage facilities of Camp Hero, as no other historical or physical evidence is present to display a separate storage facility for these items. This was conceivably possible due to the storage capacity of 400 rounds of ammunition in Batteries 112 and 113, and a battle allowance requirement of only 200 rounds of ammunition (USACE 2000).

The Camp was placed on inactive status on July 31, 1947 and ultimately declared surplus by the Department of the Army on December 31, 1949. In 1949, approximately 97 acres of Former Camp Hero was transferred to the Department of the Air Force for an aircraft control and warning station. On January 24, 1951, the former Camp Hero was withdrawn from surplus and designated for use as a firing range and field exercise area for antiaircraft artillery from Fort Totten, NY. Arrangements were made for an Army cadre at the Camp and 90 mm and quad .50-caliber antiaircraft artillery began firing exercises from firing positions established in the southern bluff overlooking the Atlantic Ocean near Bunker 216. Tow target planes and radio controlled aircraft were utilized to gauge firing accuracy (later towed barges were also used). Due to limited facilities for the training units,

the units bivouacked at the Camp. Ammunition for training exercises, when required, was stored in the internal bunkers of the now unused Battery 216 (USACE 2000).

In 1952, the Air Force property was renamed the Montauk Air Force Station and was occupied by the Aircraft Control and Warning Squadron (ACWS). The Former Montauk Air Force Station portion of Former Camp Hero has been shown on Figure 1-1. Army unit training continued using 90 mm and 120 mm guns, 3.5-inch rockets, and .50 caliber guns until 1957. The facility was active until October 1958 when the ACWS was re-designated as the Radar Squadron with a new mission to provide surveillance data of air traffic in the area. In order to accomplish this mission, an advanced Specific Frequency Diversity Search Radar was built in late 1960 (Army-Navy/Fixed-Pulse Radar-Surveillance [FPS]-35 Radar Tower and Antenna).

Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies and the ACWS facility was permanently closed in 1982. The area is currently operated by the NY State Office of Parks, Recreation, and Historic Preservation and is operating as Camp Hero State Park. The park landscape includes wooded areas, freshwater wetlands, and sea-side bluffs, complete with hiking trails and roadways leading to former military buildings, picnic areas, and recreational areas.

In 2002, the AN/FPS-35 Radar Tower and Antenna was listed under the National Register of Historic Places (NRHP). Camp Hero State Park as a whole is potentially eligible for listing on the NRHP, according to the NY State Historic Preservation Office.

1.2 Scope and Objectives

The RI technical approach consists of two phases of investigation, Phase I and Phase II. The Phase I investigation is intended to confirm either the presence or the absence of suspected CERCLA DoD waste at an AOC. A Phase II investigation will be conducted to define the nature and extent of the waste constituents at the AOCs where the presence of contamination above applicable screening criteria is established during the Phase I investigation.

This Phase I Field Report documents the Phase I RI activities at Camp Hero during May and June 2016. The objectives of this Field Report are to provide the following information:

- A summary of the Phase I RI activities at each AOC.
- Details on any significant deviations from the work plan that may have occurred.
- Raw data that was collected both in the field and from the off-site analytical laboratory.

1.3 Phase I Investigation Field Report Organization

This Field Report is organized into the following sections:

- Section 1.0: Introduction – provides an introduction to the project including the scope and objectives, installation background, and organization of this Field Report.
- Section 2.0: Technical Approach – provides the regulatory framework, description of the phased RI approach, descriptions of general field investigation operations, and information on data analysis and validation.
- Section 3.0: Background Sampling – provides the approach and results for the Camp Hero background soil sampling.
- Section 4.0: AOC Investigations – presents brief historical information, reason for concern, and the Phase I RI activities for each AOC at Camp Hero.
- Section 5.0: References – lists the references utilized in this Field Report.

The following appendices are included in this Field Report:

- Appendix A contains the figures referred to in this Field Report.
- Appendix B contains the tables referred to in this Field Report.
- Appendix C contains key correspondence with stakeholders prior to the field effort.
- Appendix D contains the Camp Hero Army Geospatial Center (AGC) Report. As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for features associated with possible solid waste disposal areas within the former Camp Hero boundary.
- Appendix E contains the Camp Hero Geophysical Survey Report. Digital Geophysical Mapping (DGM) surveys were conducted at select AOCs in attempt to locate and identify subsurface historic infrastructure to streamline subsequent sampling activities. The Geophysical Survey Report presents the geophysical survey results and provides metal detection summary figures for each AOC investigated.
- Appendix F contains the Community Air Monitoring results. Continuous air monitoring was completed during Phase I RI activities downwind of the Geoprobe® rig during intrusive activities, in accordance with the modified generic NY State Department of Health (NYSDOH) Generic Community Air Monitoring Plan (CAMP), Attachment 1A of the NYSDEC Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation.

- Appendix G contains the laboratory analytical data results, laboratory investigation-derived waste report, and the data validation reports.
- Appendix H includes contains the Daily Reports completed during Phase I RI Field work.
- Appendix I contains a Photograph Log of the Phase I RI activities and AOCs at Camp Hero.

This page intentionally left blank.

2.0 TECHNICAL APPROACH

2.1 Regulatory Framework

The RI work was conducted in accordance with CERCLA and the FUDS ER-200-3-1 (USACE 2004). New York State Department of Environmental Conservation (NYSDEC) is the lead regulator for this RI and will provide review and concurrence pursuant to CERCLA. The criteria established for constituents of concern in New York Codes, Rules, and Regulations (NYCRR) Subpart 375-6, "Remedial Program Soil Cleanup Objectives" will be utilized for screening criteria (NYCRR 2015a). For those areas of this project strictly addressing releases of fuels from formerly removed or used storage tanks, the following NYCRR will be applied: 6 NYCRR 613.9 (b), Closure of Tanks Permanently Out of Service (NYCRR 2015b) and NYSDEC DER-10, Technical Guidance for Site Investigation and Remediation.

In accordance with NYSDEC policy CP-51, soil samples at suspected petroleum storage tank AOCs were analyzed for petroleum compounds by the NYSDEC Spills, Technology, and Remediation Services (STARS) list for either fuel oil or gasoline, which include volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and lead analyses (based on the suspected fuel type). Groundwater samples at suspected petroleum tank AOCs were analyzed for VOCs, SVOCs, and lead (based on the suspected fuel type). Soil and groundwater analyses at non-petroleum AOCs include a more comprehensive analytical list, depending on the concern at each AOC, which are detailed by AOC in Section 4.0.

- **Human Health Screening Criteria:** The project screening levels (PSLs) for soil are obtained from the following criteria: United States Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for Residential Soil (USEPA 2016a), 6 NYCRR Part 375-1 Soil Cleanup Objectives (NYCRR 2015a), and NYSDEC CP-51/Soil Cleanup Guidance (NYSDEC 2010a). The PSLs for soil are the lowest of each of the criteria listed.

  The PSLs for groundwater are obtained from the following criteria: USEPA Regional Screening Level for Tap Water (USEPA 2016a), USEPA MCL criteria (USEPA 2016b), NYSDEC Technical & Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values (NYSDEC 2004), and New York State Department of Health Maximum Contaminant Level (MCL) criteria (NYCRR 2011).

  In order to meet PSL data quality objectives, SVOCs in soil and groundwater were analyzed by Method 8270D with Selected Ion Mass Spectrometry (SIM).

- **Ecological Screening Levels:** Ecological screening level guidance and references are detailed in the RI WP. Data from the surface soil samples, as well as information from the

Phase 1 RI to assess surface water flow directions, wetlands, and ecological receptors, will be used to identify ecological data gaps to be addressed in the Phase 2 RI sampling. A summary of chemicals of potential environmental concern and the areas of concern where surface soil contamination was detected above the ecological screening criteria will be identified in the WP Addendum.

2.2 Phased Approach

The RI technical approach consists of two phases of investigation, Phase I and Phase II. The Phase I investigation was intended to confirm either the presence or the absence of suspected DoD waste constituents at an AOC. Based on Phase I findings confirming waste constituents at an AOC, a Phase II investigation will be conducted to define the nature and extent of the contamination.

- **Phase I RI:** The primary objective of the Phase I RI is to determine the presence or absence of contamination at the Camp Hero AOCs. Phase I RI activities included aerial photography archival research, digital geophysical mapping of subsurface anomalies, a botanical survey, Geoprobe® soil borings, piezometer and temporary well installations, and field sample collection. Sample collection for the Phase I investigation included surface soil [defined as soil between 0 to 1 foot (ft) bgs], subsurface soil (greater than 1 ft bgs), wipe samples of concrete and building materials, concrete chip samples, and groundwater sampling.

  The purpose of this Field Report is to summarize the Phase I field activities and provide the analytical data. The original Project Work Statement scoped the Field Report to provide all the raw data collected and details on any deviations from the work plan. The RI WP mistakenly added scope to the Field Report by indicating tables would be produced and recommendations would be made regarding which AOCs will be included in the Phase II investigation. A WP Addendum will be prepared to detail the Phase II investigation approach. The RI WP Addendum will be provided to the project team for review, comments, and concurrence. A technical review meeting will be conducted with the project stakeholders to obtain consensus with the proposed Phase II investigation activities.

- **Phase II RI:** For AOCs requiring further investigation, the primary objective of the Phase II RI is to determine the nature and extent of target constituents in soil and groundwater at the Camp Hero AOCs and to determine if there are unacceptable risks to human health and ecological receptors associated with exposure to AOC-related constituents.

  The Phase I RI sampling results will be used as a basis for determining the locations of Phase II samples and analyses in order to: 1) determine the nature and extent of contamination at the Camp Hero AOCs and 2) determine the concentration of a contaminant that may be contacted by a receptor at a site to conduct risk assessment. The Phase II data may include:

concrete chip samples, liquid samples from containers, surface soil (0 to 1 ft bgs), subsurface soil (greater than 1 ft bgs), surface water, sediment, and groundwater samples from temporary or permanent monitoring wells.

2.3 Coordination with Stakeholders

Project kick-off meetings were held to initiate coordination with stakeholders. Activities were coordinated with the Camp Hero State Park Superintendent, Mr. Tom Dess, to ensure activities did not impact park visitors or conflict with seasonal work restrictions. Additionally, activities were coordinated with the State Historic Preservation Officer and other interested parties and stakeholders, in accordance with Section 106 of the National Historic Preservation Act of 1996, as amended and 36 Code of Federal Regulations (CFR) 800. Appendix C of this Field Report contains key correspondence related to coordination with stakeholders.

The NYSDEC Natural Heritage and NYS Office of Parks, Recreation, and Historic Preservation (OPRHC) were consulted regarding Camp Hero RI activities, with particular focus on the botanical survey of rare and endangered species (see Section 2.4.3. below).

Coordination letters were submitted to the NYDEC Region 1 Office, the United States Fisheries and Wildlife Service (USFWS) New York Field Office, and the Shinnecock Nation regarding planned Camp Hero activities. The coordination letters indicated the USACE's intent to conduct a RI at the former Camp Hero, with the purpose of assessing if the former DoD activities may have results in adverse environmental conditions. The letters additionally explained the scope of the project and stated that care will be taken to minimize impacts to vegetation and local threatened and endangered species (see Appendix C). The NYDEC and the USFWS both indicated that they did not have any threatened or endangered species concerns for this project.

2.4 General Phase I Investigation Operations

The Phase I Investigation at Camp Hero included aerial photography archival research, digital geophysical mapping of subsurface anomalies, a botanical survey, Geoprobe® soil borings, piezometer and temporary well installations, and field sample collection. Details of each activity are provided in the sections below.

2.4.1 Aerial Photography Archival Research

As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for site features which could be associated with solid waste disposal within the former Camp Hero boundary. Their report is included in this Field Report as Appendix D and contains a summary of potential disposal locations, along with a list of spatial data collected from 1940 to 1982 (USACE 2016). The report concluded that there was no

photographic evidence of debris accumulation suggestive of a solid waste disposal areas in the spatial data collected for this project. However, four areas were identified where solid waste disposal could have taken place, described as access points to cleared areas near or along the bluff. The four areas were designated "AGC Sites 1, 2, 3, and 4" for this RI. AGC Site 3 corresponds to the "Camp Hero State Park Bluffs" AOC, which was already established as an AOC as part of the RI investigation.

2.4.2 Digital Geophysical Mapping

Prior to the Phase I sampling activities, Digital Geophysical Mapping (DGM) surveys were conducted at select AOCs to locate and verify suspected underground storage tanks (USTs) and subsurface historic infrastructure to optimize sampling activities. DGM was conducted at the following AOCs:

- Suspected Tank A – Building 0020 – Fire Department, suspected former UST location(s)
- Suspected Tank B – Building 0022 – Kitchen/Office, suspected former UST location(s)
- Suspected Tank C – Building 0002 – Barracks, suspected former UST location(s)
- Suspected Tank D – Building 104R – Commissary, suspected former UST location(s)
- Suspected Tank E – Building 3001 – AT&T/Lilco, suspected former UST location(s)
- Suspected Tank F – Well Pump House, suspected former UST location(s), hazardous materials
- Suspected Tank G – Well Pump House, suspected former UST location(s)
- Fuel Pump House Distribution Line – distribution line from the Fuel Pump House (connected to AST-35) identified on historic drawings connecting to former Building 203
- Battery 216 – potential underground vaults, unknown use, potential storage
- Plotting Room 113 – waste area, potential storage or waste dump site

The intent of the geophysical surveys at each of the above sites was to: (a) verify the outline of a tank (if still exists), (b) identify the extent of residual subsurface features, and (c) examine the general vicinity to support safe subsurface sampling within close proximity to the structures.

The DGM field survey methods consisted of a combination of electromagnetic (EM) and magnetic (MAG) Analog Geophysical Mapping (AGM) metal detection surveys, at 5-ft increments, within the bounds of accessible areas of each pre-marked survey area. The DGM was completed using the Geonics EM61-MK2 instruments in relatively open areas, while AGM, using a Schonstedt® GA-72cd, was reserved for vegetated areas not accessible using DGM methods. After each sweep of the AOC

area, significant DGM instrument readings were relocated, marked, and annotated as to whether a surface feature coincides with the instrument reading.

Additional information is available in the Camp Hero Geophysics Report (Appendix E), which presents results and provides metal detection summary figures for each AOC investigated. Results are discussed by AOC in Section 4 of this Field Report.

2.4.3 Botanical Survey

A botanical survey for rare and threatened species at Camp Hero State Park was completed in May 2016, in conjunction with the Geophysical Surveys, prior to any vegetation removal activities. The NYSDEC Natural Heritage Program identified four rare plant species which have been historically reported within the Camp Hero RI project area, including: Little-leaf Tick-trefoil, Fringed boneset, Blunt mountain-mint, and Southern arrowwood.

Prior to the botanical survey field activities, the AECOM botanist researched the habitat requirements, phenology, critical diagnostic characteristics, and morphologically-similar congeners for the target plant species identified as potentially occurring in the vicinity of the Project survey area by the NYSDEC Natural Heritage Program. Botanical references and regional field manuals were consulted for the northeastern United States as well as Flora of North America.

During field preparation for the remedial investigation, each AOC and background soil sampling location was surveyed for the four rare plant species. If any rare plant species were identified, they were marked with red and white checkerboard flagging. The USACE and AECOM-Tidewater JV team was consulted to determine the best method to avoid destruction of any protected plants by subsequent investigative procedures, including brush clearing and use of heavy equipment.

The Camp Hero sites were surveyed by the AECOM botanist and USACE project ecologist in May 2016. Findings indicated that the upland forests consisted of a mixed hardwood canopy dominated by *Quercus* species. Also present in the canopy to a lesser degree were *Fagus grandifolia*, *Tilia americana*, *Nyssa sylvatica*, *Prunus serotina*, and *Acer rubrum*. The upland forest understory was dominated by *Hamamelis virginiana*, *Ilex opaca*, *Vaccinium corymbosum*, *Smilax rodundifolia*, and in some areas, *Viburnum dentatum* var. *venosum*. Forested wetlands were dominated by an *Acer rubrum* canopy with a *Lindera benzoin* and *Vaccinium corymbosum* understory.

Upland successional shrub lands were often dominated by *Morella pensylvanica*, *Amelanchier canadensis*, *Prunus serotina*, *Toxicodendron radicans*, *Vaccinium corymbosum*, and in some areas- *Viburnum dentatum* var. *venosum*. Many upland successional shrub land sites were also heavily infested with *Lonicera morrowii* and *Elaeagnus umbellata*.

Additionally, a few AOCs were located on anthropogenically-altered or regularly disturbed sites, including turf areas and hardscape which contained herbaceous weeds.

Regarding the four target rare plant species, the three herbaceous species, *Desmodium ciliare, Eupatorium torreyanum*, and *Pycnanthemum muticum*, were not encountered. It is likely that it was too early in the season for these three species to have emerged.

The fourth target rare plant species, *Viburnum dentatum* var. *venosum (*Southern arrowwood*),* was encountered with great frequency throughout Camp Hero; in some areas, it was co-dominate in the forested understory or upland successional shrub lands and it appears the population is stable and thriving. While all larger specimens were flagged, a small number of sites also had numerous seedlings that are almost impossible to avoid without employing extraordinary measures. In consultation with the NYSDEC Natural Heritage and NYS OPRHC, it was concluded that the destruction of a few seedlings during the course of further remedial investigation at Camp Hero would be acceptable in light of the large and stable population of *Viburnum dentatum* var. *venosum*. Copies of key correspondence with the OPRHC regarding the Southern arrowwood are included in Appendix C.

2.4.4 Field Sampling

Sample collection for the Phase I investigation included surface soil (defined as soil between 0 to 1 ft bgs), subsurface soil (greater than 1 ft bgs), concrete chip, and groundwater sampling. After sample collection and/or field screening, samples were transferred to the appropriate sample container for laboratory analysis and placed in a cooler on ice. The required sample containers, preservatives, and holding times were specified in the Uniform Federal Policy (UFP) Sampling and Analysis Plan (SAP), Attachment B to the RI WP (AECOM 2016). Sample locations were marked with a pin flag with sample identification number, photo-documented, and recorded with a hand-held global positioning system unit. The collected coordinates were utilized to produce sample location maps for this RI Field Report and are available for use in sample location mapping for future documents. The non-disposable sampling equipment (i.e., hand auger) was decontaminated between sample locations.

Surface and Near-Surface Soil: A clean (decontaminated) hand auger or disposable scoop was used to collect surface and near-surface soil samples. In some locations, the Direct Push Geoprobe® rig was used to collect a small, 5–foot core, from which the 0 to 1 foot surface soil sample was collected. As defined in the WP, surface soil samples were considered to be 0 – 1 ft bgs, where near-surface samples were considered to be 1 – 2 ft bgs. VOC samples were collected directly from the recently-exposed soil using a sampling corer (Terra Core kits). For the other analyses, the soil was removed and transferred to a disposable, re-sealable plastic bag and was

then homogenized, which consisted of mixing the soil until the sample is a uniform color, texture, and particle size. Any non-homogenous particles, organic matter, and debris were removed from the soil samples. Soil samples at pre-selected locations were field-screened with the PID while in the plastic bag prior to the homogenization of the soil. After sample collection and/or field screening, the sample was transferred to the appropriate sample container for laboratory analysis and placed in a cooler on ice.

Subsurface Soil: Subsurface soil samples were collected using a Direct Push Geoprobe® drill rig. A Geoprobe® dual-tube sampling system was used to collect continuous soil cores by advancing a 5-ft (60-inch) coring barrel fitted with the dedicated, disposable polyvinyl chloride (PVC) liners to the target depth, as established in the RI WP. Borings were either advanced to the depth of the perched water table or to 25 ft bgs, with the exception of the borings at AOC H-17, which were advanced to 35 ft bgs in an attempt to reach groundwater. Specific depths of the borings at each AOC are provided in Section 4.0.

Soil cores were screened for VOCs immediately upon opening the sleeve with a PID utilizing an 11.7 electron-Volt bulb. Screening results, lithologic descriptions, and other observations and measurements were recorded on a soil boring log by the field geologist. At a minimum, depth interval, recovery thickness, PID concentrations, moisture, relative density, color (using a Munsell soil color chart), and texture using the Unified Soil Classification System were recorded. Additional observations recorded may have included detectable odors, groundwater or perched water depth, organic material, cultural debris, or color changes indicating staining. Photographs were also taken of significant boring cores.

Two subsurface soil samples were generally be collected from each Geoprobe® location unless otherwise specified in the RI SAP. Samples were collected from depth intervals where field screening or observations (i.e., highest VOC concentration measured with the photo-ionization detector, odor, staining) indicated the potential presence of contaminants, the depth of the structure being evaluated, or at the depth of groundwater, as established in the RI WP. VOC samples were collected directly from the recently-exposed soil using a sampling corer (Terra Core kits). For the other analyses, the soil was removed and transferred to a disposable, re-sealable plastic bag and was then homogenized, which consisted of mixing the soil until the sample is a uniform color, texture, and particle size. Any non-homogenous particles, organic matter, and debris were removed from the soil samples.

Concrete Coring: Concrete coring was necessary prior to boring at locations with asphalt or cement. A 4-inch diameter core barrel was advanced through the concrete using a stand mounted core drill to

access soils for direct push sampling. Once drilling and sampling activities were finished, the core and lag holes were patched with concrete.

Groundwater Sample Collection from Temporary Wells (Grab Sample): Groundwater samples were collected from temporary wells installed during the DPT drilling activities at locations where groundwater was encountered in the borings. If groundwater was encountered at the location, a Peristaltic Geopump with disposable tubing was used to collect a grab groundwater sample. A YSI 6920® water quality meter with a multi-parameter cell was used to obtain one set of groundwater parameter readings after the grab sample was collected, if sufficient groundwater was left in the well. Water quality parameters included temperature, pH, specific conductivity, dissolved oxygen, reduction-oxidation potential, and turbidity.

Recharge in some wells was insufficient to collect the required volume for all planned analyses. Multiple attempts were made to sample these wells and the collected volume was submitted for laboratory analysis of a shortened analyte suite, if all bottleware could not be filled. If within 24 hours, groundwater recharge had not produced any water in the temporary well, no groundwater sample was collected during Phase I.

Concrete Chip Samples: The surface of the sample location was broken up using a rotary hammer drill with a decontaminated 1-inch bit. Multiple holes up to 2 centimeters (cm) in depth were created within the sampling area, in order to fill the full 8-ounce (oz) required volume. An effort was made to avoid scattering pieces out of the general sampling area. The chipped/pulverized concrete pieces and powder were collected using dedicated gloves and transferred directly into the laboratory-provided sample container.

Wipe Sampling for polychlorinated biphenyls (PCBs): Prior to sampling, the gauze pad was saturated with hexane. A 10 cm × 10 cm sample area was prepared at the sample location. The sample area was thoroughly wiped from left to right and again from top to bottom. Once the area had been wiped, the gauze pad was placed back into the sample jar and allowed to air-dry prior to sealing the jar.

Sample Identification. The sample identification numbers consisted of an alphanumeric designation related to the AOC, event, media type, and consecutive number, according to the following conventions:

AOC Identification (ID): **203** = Building **203** *(see Table 2-1 for AOC IDs)*
Location ID, which consists of:
Media Type: **SB** = **S**urface **B**oring *(see Table 2-1 for Media Type Codes)*
Consecutive Number: 01, 02, 03, etc.

For groundwater samples, "-GW" at the end of the location ID
For soil samples, depth of sample (in ft): 01, 02, 03 etc.

For example, the sample identification number for the first soil boring sample collected at Building 203 from 2 to 3 ft bgs was 203-SB01-03. The sample identification number for the groundwater sample collected from the same boring was 203-SB01-GW. Duplicate sample identification numbers were followed with a "DUP". MS sample identification numbers were followed with a "MS" and MSD sample identification numbers were followed with a "MSD."

Sample Handling, Storage, and Shipment: Samples were collected into laboratory-supplied bottleware and placed in a cooler on ice. Sample times, dates, and analyses were recorded on boring logs, field sample forms, and field team logbooks. Samples were then quality-control checked by the site Sample Manager and recorded on chain-of-custody (COC) records prior to being packed in coolers on fresh ice and transported daily via overnight commercial carrier to the laboratory. Original COCs were included in the coolers with their respective samples; carbon-copies of the COCs were kept on-site by the Sampler Manager and emailed to the laboratory and project chemist each night, along with tracking numbers for the shipped coolers.

Water Level Measurement: Water level measurements were collected from temporary wells prior to the collection of samples using an electric measuring tape. Additionally, three piezometers were installed in the vicinity of former Building 203 to obtain information on the direction of groundwater flow. The piezometers were constructed as standard PVC wells with filter-pack and a bentonite seal, as necessary, but were not grouted in place. No analytical samples were collected from the piezometers.

Borehole and Temporary Well Abandonment: DPT borings and temporary wells were abandoned at completion of sampling activities. The PVC pipe was removed and backfilled with sand at the locations with temporary wells, whereas borings in grass or sand were abandoned by backfilling with bentonite chips. Borings in asphalt or concrete were abandoned by backfilling with bentonite chips to approximately 6 inches bgs, and the remainder of the borehole was patched with asphalt cold patch or hydraulic concrete. The surface at each location was restored to match the surrounding area.

Temporary wells at AOCs AST-35, FPH, and former Building 203 (including the piezometers) were left in place with the permission of the USACE and NYS Parks Service. These temporary wells are located in gated areas off-limits to the public and may need to be utilized due to the discovery of free product at former Building 203.

2.4.5 Anomaly Avoidance

An Unexploded Ordnance (UXO) Probability Assessment for Intrusive Investigation at Former Camp Hero completed by USACE Baltimore District determined that the Camp Hero RI activities had a low probability of encountering munitions and explosives of concern (MEC), except for areas H and K, which would not be entered at any point during RI field activities. However, as a precautionary measure, anomaly avoidance was conducted in accordance with EM 385-1-97 by a UXO Technician II during intrusive Phase I RI activities with a hand-held magnetometer. "Anomaly avoidance" is defined as the avoidance of surface MEC and any subsurface anomalies where the specific activity can be moved to another location.

Additionally, all field personnel, including AECOM-Tidewater JV employees and subcontractors, completed Ordnance Recognition Training prior to the start of field activities.

2.4.6 Community Air Monitoring

Continuous air monitoring was completed downwind of the Geoprobe® rig during intrusive activities, in accordance with the modified generic NYSDOH Generic CAMP, Attachment 1A of the NYSDEC Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation. The CAMP establishes air monitoring activities that were to be implemented to protect the community from any potential airborne releases that could result from field activities associated with the RI or interim remedial action efforts, as necessary (NYSDEC 2010b). No exceedances were observed during Phase I RI activities. Data from Phase I RI air monitoring are included as Appendix F to this Field Report.

2.4.7 Surveying

The horizontal and vertical position of temporary well locations were surveyed to a horizontal accuracy of 0.1 ft and a vertical accuracy of 0.01 ft. However, no permanent benchmark was available near RI activities in Camp Hero State park; therefore, the vertical positions were based on an arbitrary benchmark of 80 feet at the 1st well surveyed (H17-SB01), near the Commissary Building). Surveyed locations were collected relative to an initial arbitrary benchmark with the following exceptions: Building F100C (UST 34) locations F100C-SB01 and F100C-SB02 and Waste Disposal System locations WDS-SB01, WDS-SB02, and WDS-SB03. The vertical position of temporary wells at these AOCs were surveyed relative to the other temporary wells within the AOC. The temporary wells at these two AOCs were not surveyed relative to the Phase I arbitrary benchmark (H17-SB01) due to their "remote" location relative to the other AOCs. The vertical positions of the temporary well locations and depth to groundwater data were utilized to estimate the direction of groundwater flow at each AOC. A surveyed benchmark with known elevation will be acquired by licensed surveyors during permanent monitoring well installation as part of the Phase II investigation.

2.4.8 Investigation-Derived Waste (IDW) Management:

AECOM-Tidewater JV managed IDW generated during the Phase I field activities pursuant to applicable Federal, State, and local regulations and guidance, including the USEPA Management of Investigation-Derived Wastes during Site Inspections (USEPA 1992), USACE guidance (2013), and NYSDEC Technical Guidance for Site Investigation and Remediation (2010b).

In accordance with NYSDEC Technical Guidance for Site Investigation and Remediation (2010b), soil cuttings and purged groundwater were disposed at the site within the corresponding borehole to within 24 inches of the ground surface with the remainder of the borehole filled with bentonite. An exception to this was when volatile organic field screening instruments detected measurements from soil or groundwater that were above background or visual discoloration of soil or olfactory evidence of contamination were noted. In general, minimal groundwater IDW was generated as most of the purged groundwater was utilized for analytical samples.

IDW was stored in 55-gal drums, which were properly labeled indicating the generator, contact information, contents, and date of generation. The drums were stored at the Camp Hero State Park Motor Pool building, with the permission of State Park Superintendent Mr. Tom Dess. Analytical samples of both the soil and liquid IDW were collected on 20 September 2016 and submitted to RTI Laboratories for hazardous waste determination, including Toxicity Characteristic Leaching Procedure (TCLP). Both soil and liquid IDW were determined to be non-hazardous. Table 2-1 (Appendix B) presents the IDW analytical results compared to TCLP regulatory levels (40 CFR § 261, 1993). The analytical laboratory package of results from the liquid and solid IDW samples are included in Appendix G.

2.5 Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples were collected to ensure field and laboratory protocols resulted in consistent and valid data. The following types of QA/QC samples were collected:

Field Duplicates: One additional set of sample containers were collected along with the normal sample. The duplicate was analyzed as a normal sample at the laboratory. Duplicates were collected at a frequency of one duplicate per ten samples.

Matrix Spike/Matrix Spike Duplicates (MS/MSD): Two additional sets of sample containers were collected along with the normal sample. A Matrix Spike and Spike Duplicate (MS/MSD) are representative but randomly chosen samples with known concentrations of analytes of interest added to the samples prior to sample preparation and analysis. They are processed along with the same un-spiked sample.

Equipment Blanks: One equipment blank was collected from the hammer drill used to collect the concrete chip samples. The equipment blank was collected by pouring Type II deionized water over the decontaminated drill bit and collecting the water in the appropriate sample containers.

Trip Blanks: Trip blanks for VOC analysis were provided by the laboratory. One trip blank was included in each cooler with VOC samples for VOC analysis.

2.6 Data Validation

Data validation was conducted on the Automated Data Review (ADR) output for the Phase I analytical data. All analytical data packages were validated to ensure compliance with specified analytical, QA/QC requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria. This includes, but is not limited to, the following:

- Sample preservation and holding times;
- Blanks (method and rinse);
- Matrix spikes and spike duplicates;
- Laboratory and field sample duplicates;
- Surrogates; and
- Laboratory control samples.

Analytical results were assessed for accuracy and precision of laboratory analysis to determine the limitations and quantity of data. The quality of the data collected in support of the sampling activity was considered acceptable.

The data validation process assigned data qualifiers to results that did not meet specified laboratory protocols but were still considered acceptable via the data validation process. Some data that required qualifiers included samples which were subject to cooler delivery issues resulting in samples arriving out of temperature, samples exceeding specified hold times, and samples requiring multiple dilutions for the SIM PAH method. Samples falling within these qualification scenarios are detailed below.

Sampling and Cooler Delivery Issues. The cooler containing sample H17-SB02-GW was received outside temperature (at 22°C) due to delayed delivery via Federal Express package delivery company. For the VOC analyte group, non-detect results were qualified “R” (rejected value) and the detects were qualified “J” (estimated value). All other analytes in the sample (SVOCs and PCBs) were qualified “J” (estimated value) for detected values and “UJ” (value under detection limit; estimated value) for non-detected values. Samples H14-SB01-GW, H14-SB03-GW, and MP-SB03-

GW were also received outside temperature due to a cooler delivery delay; however, the samples were recollected at a later date and the recollected samples were delivered to the laboratory without temperature or hold time concerns and no results required qualification.

Hold Time Issues. Several Camp Hero samples were qualified due not meeting the recommended method hold times, as detailed in Table 2-2 (Appendix B). Analyte detects were qualified "J" (estimated value) and non-detected values were qualified "UJ" (value under detection limit; estimated value) in the samples.

Multiple Dilutions for PAH SIM method. Multiple dilutions were required for some samples utilizing the SIM PAH analysis. These samples had compounds that were being reported over calibration. The laboratory had to run several dilutions to capture concentrations within the calibration range. Some of the samples had to be analyzed three times. Data from all dilutions were evaluated and compound results were reported from the lowest dilution that exhibits lack of interference.

For example, samples FPH-SB02-GW, FPH-SB03-GW, FPH-SB04-GW, and FPH-SB04-GW DUP were run for several SIM PAH dilutions, as well as regular PAH Method 8270. Due to the very high dilutions in SIM PAH, results were reported from the regular PAH Method 8270.

This page intentionally left blank.

3.0 BACKGROUND SAMPLING

Background soil samples were collected in Phase I to establish park-wide background levels for naturally occurring constituents and anthropogenic impacts. A total of 62 background soil samples (30 surface and 32 subsurface) were collected from four different locations (BG-01 through BG-04) representing two different soil types, Whitman Sandy loam (outwash deposits of stratified sand and gravel) and Montauk loam (glaciofluvial deposits of stratified sand and gravel in forms of kames). These two soil types represent the soil types where most of the Camp Hero RI AOCs are located, excluding urban soil complexes, which are not representative of background conditions. A soil survey map of Camp Hero is included as **Figure 3-1** (Appendix A).

Background samples were analyzed for metals and polycyclic aromatic hydrocarbons (PAHs) by method 8270D in SIM mode. PAHs were included in the background analysis because they may be ubiquitous to the environment and may be derived from non-anthropogenic and anthropogenic influences not directly related to former military activities at Camp Hero.

Phase I Background Field Operations. A total of 16 soil borings were advanced for background sampling. Eight borings were located in the Whitman Sandy Loam (4 borings at 2 locations) and eight borings were located in the located in the Montauk Loam (4 borings at 2 locations). Sample locations were spaced a minimum of 25 ft apart. Borings were advanced to 10 ft bgs or the depth of the perched aquifer, whichever was encountered first. Two subsurface soil samples were collected per boring: 4 to 5 ft bgs and 9 to 10 ft bgs or 1 to 2 ft above the depth to ground water, whichever was encountered first. One surface soil sample was collected from 0 to 1 ft from each boring. Fourteen additional surface soil samples were collected between the four background locations. All four background soil sampling locations are shown on the site map (**Figure 1-2**) and individual background location maps are provided as **Figures 3-2**, **3-3**, **3-4**, and **3-5**, respectively (Appendix A).

Per this methodology, the sample sizes for the background soil samples are as follows:

- n = 15 for surface soil in Montauk Loam (at locations BG-02, BG-04)
- n = 15 for surface soil in Whitman Sandy Loam (at locations BG-01, BG-03)
- n = 16 for subsurface soil in Montauk Loam (at locations BG-02, BG-04)
- n = 16 for subsurface soil in Whitman Sandy Loam (at locations BG-01, BG-03)

The location and need for groundwater, sediment and surface water background data, and the methods that will be used to determine whether site concentrations are within background levels for these media, will be defined in the RI WP Addendum prior to Phase II sampling.

This page intentionally left blank.

4.0 AOC INVESTIGATIONS AND RESULTS

The AOCs investigated as part of the Phase I RI were a combination of sites previously identified in the 1998 Camp Hero FS (Cashin 1998) and others identified during the 2016 records review conducted in preparation of the RI, as described in the Phase I RI WP (AECOM-Tidewater JV, 2016). The locations of the AOCs are shown on the Site Map in **Figure 1-2**. Groundwater elevations across the facility are presented in **Figure 4-1**.

Analytical results from the Phase I sampling are provided in Appendix G (Laboratory Analytical Reports). Tables with analytical results compared to PSLs will be provided as part of the WP Addendum for those AOCs included in the Phase II sampling, and in the final RI Report for all AOCs. The field operations and results for the Phase I Investigation are provided for AOC in the subsections below and also documented in the Daily Reports (Appendix H). **Table 3-1** (Appendix B) provides a summary of the Phase I investigation activities and the analytical samples collected at each AOC. Photographs of the AOCs are included in the Photograph Log (Appendix I).

4.1 Battery 113

Battery 113 has historically been referred to as Bunker-1 and Battery Dunn. Battery 113 historically contained two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. The Camp Hero FS (Cashin 1998) noted a cluster of tanks of various sizes and shapes inside Battery 113, the prior purpose of which is unknown. These included two cylindrical red-painted tanks suspended from the wall; three vertical tanks standing on the floor, which have heavily rusted exteriors; and what was suspected to be one or more tanks in a wooden enclosure on the floor. These tanks were thought to be part of a single system, or multiple systems, possibly including fire suppression, hydraulic fluids, emergency water supply, or emergency fuel supply. Waste drums were also noted. During the records review of archived NY State Park Service drawings of Battery 113, the two cylindrical red-painted tanks suspended from the wall are identified as 150 gallon diesel fuel tanks.

Additionally, the Cashin Report notes Battery 113 to have had oil staining under electrical equipment in the old electrical room. This location was sampled for PCBs, and results showed a PCB level of 24,200 ppb (Cashin 1998).

Phase I Field Operations: A site survey of Battery 113 was conducted during Phase I field activities to identify the presence of tanks and waste drums, assess if standing water was present in pits, and identify visual evidence of potentially PCB-contaminated stained concrete. Prior to entering the building, the team conducted demolition of the sealed entryway to Battery 113 to create an entrance for the team, using a hammer drill and sledge hammer. Four team members

entered the battery to complete the survey. Team members wore tyvek suits, rubber booties, nitrile gloves, full or half-face respirators with P100/OV cartridges, hardhats, and head lamps. The buddy system was utilized while inside the Battery and at least one team member was stationed outside the entrance of the Battery at all times.

Two sub-slab pits with standing water were observed in Battery 113. Additional pits, open manholes, and trenches were observed throughout the Battery, but no others contained standing water. One liquid characterization sample was collected from one of the open pits (B113-LC02-01) for laboratory analysis of VOCs, SVOCs, PCBs, and metals. A second sample was not collected from the other pit with water because it appeared to contain human waste.

The Power Room was identified during the site survey and two diesel storage tanks (identified as 150-galllon Tanks 3 and 4 in site records) were still present on the wall in good condition. No labels were present on the tanks. The field team was able to determine that fluid was still present in the Tanks and one liquid characterization sample (B113-LC01-01) was collected for fuel analysis, ignitability, and toxicity for purposes of disposal characterization. Approximately 16 L of volume was collected for fuel characterization and volume was still present in the tanks; however, the field team could not determine the remaining volume in the tanks. A level meter was present on the wall adjacent to the tanks, which indicated the tanks volume was 3/4 full; however, the field team could not verify the meter's purpose or whether it was still working.

Three extremely rusted, unlabeled cylinders were present below Tanks 3 and 4; however, the cylinders appeared to be empty. Additionally, trenches with piping were present in the Power Room; some of the trenches were covered with metal plate covers and others were covered with wooden planks. The wooden planks were rotting and falling apart in most places. No tanks or storage units were observed in the trenches. Additionally, the Cashin report had mentioned drums present in the power room near Tanks 3 and 4 (Cashin 1998), however, no drums were present in the Power Room at the time of the field survey.

An electric room on the North side of the Power Room was identified, containing portions of a former transformer labeled as Marcus Transformer Company, Inc., and four severed single conductor electric breakout cables mounted on the wall. Dried oil was observed on parts of the transformer carriage and oil staining was noted on the concrete floor in this area. One wipe sample (B113-WP01-01) was collected from the oil-stained surface and one concrete chip sample (B113-CC01-01) was collected at the location of the stained concrete, using the hammer drill with a decontaminated drill bit. Additionally, an equipment blank was collected from the decontaminated drill bit after sampling. The wipe sample, concrete chip sample, and equipment blank were submitted for laboratory analysis of PCBs.

Phase I sampling locations at Battery 113 are shown on **Figure 4-2**.

Deviations from the RI WP: Per the RI WP, if liquid was present in the tanks or drums in Battery 113 during the site survey, a liquid characterization sample was to be collected for VOCs, SVOCs, PCBs, and metals at RTI Laboratories. Because the liquid present in the Battery 113 tanks appeared to be weathered fuel, samples were instead collected for fuel analysis (ignitability and toxicity) for purposes of disposal. Samples were submitted to AB Environmental (Bohemia, NY) via subcontract with CGE.

4.2 Battery 112

Battery 112, also known as Bunker-3, is also associated with UST 36 and UST 37, which were located outside the battery. Battery 112 consisted of two 16-inch casemated guns and battle allowances of ammunition and powder charges were stored within the battery. Battle allowances of ammunition and powder charges for the Camp Hero battery guns were stored within the individual batteries of the camp. Battery 112 had a battle allowance of 200 16-inch 2,240-lb projectiles.

The Cashin Report noted that the "as-built" plans for Battery 112 show that the floor plan for Battery 113 and Battery 112 (Bunker 3) are identical; however, no tanks or waste drums were observed in Battery 112 in the Cashin Report.

Phase I Field Operations: A site survey was recommended in the RI WP to confirm that ASTs are not present in Battery 112 and to complete a visual inspection for evidence of PCB-contaminated stained concrete.

Deviations from the RI WP: It was noted in the Project Kick-Off Meeting in October 2015 that Battery 112 is sealed and access inside the building was not feasible. Access to Battery 112 was assessed during the Phase I field operations; however, Mr. Tom Dess, NY State Park Superintendent, indicated that the building was completely sealed and that safe access was not available, and therefore the site survey was not completed.

4.3 Building 107

Building 107 is also known as Building 5 (Cashin Report) or the Electrical Substation. The Cashin Report noted that transformers were in the basement of the building and may have contained or contain PCBs. Archive pictures of Building 107 show multiple electrical conduits in a concrete trench with metal covering that extended to the power generating building 203.

In an August 2000 environmental assessment, a stained area was noted in the northeast comer of the basement of Building 5, which was three feet by five feet in area. At that time, there was an opening to the outside approximately three to four feet above the floor. No floor drains were

observed in the basement where the four transformers are still mounted on the wall. A concrete chip sample was collected from the stained area (Weston 2000).

Analytical results indicated that PCBs were present within the observed oil stain at a level above the Toxic Substances Control Act (TSCA) unrestricted use limit of 1 milligram per kilogram (mg/kg). Based on the depth of the PCBs in the concrete, it appeared that the oil had not migrated outside the building at that time. The findings indicated that no significant ecological or human health threats existed via migration.

Phase I Field Operations: Access to the basement of Building 107 was available for the field team upon arriving on-site; a hole was present in the Northeast corner of the building. The field team performed a visual survey Building 107. Parts of the wall-mounted transformer were still present in the basement. The field team attempted to verify if fluids are present in the transformers but was not able to open the pieces of the transformer which were still present. However, dried oil was running down the side of the wall-mounted portions of the transformer and minimal staining was noticed on the concrete. Three samples were collected for analysis of PCBs: one sample of the dried fluid (107-LC01), one wipe sample on the surface of the stained transformer (107-WP01), and one concrete chip sample within the stained area (107-CC01). The Phase I sampling locations at Building 107 are shown on **Figure 4-3**. The integrity of the original building was not be impacted during the sampling effort.

Deviations from the RI WP: None.

4.4 Building 201

Building 201 is also known as Building 1 (Cashin Report), Building #P-201, the Radar Tower, and AN/FPS-35. Building 201 is a 5-story radar tower with 2-foot thick concrete walls and was sealed off by USACE and NYS Parks to prohibit entrance. The building has a large steel radar dish, which was a prime component of the DoD early detection radar systems. Building 201 was associated with UST 20, which was removed and included in NYSDEC Spill Report #93-12038.

The Cashin Report recommended further investigation for possible oil leaks and PCB releases. In an August 2000 Data Collection Report (Weston 2000), the first floor of the Radar Tower contained a stained area, which was approximately four feet by six feet in area. The stained area was present below several pipes extending from the ceiling labeled "refrigerated water return." The stained area was reported as not darkly stained and adjacent to a six-inch diameter floor drain. The concrete was not stained below 0.5 inches. One chip sample (from the stained area), four surficial soil, and one subsurface soil sample was obtained at the Radar Tower for PCB analysis (Weston 2000).

PCBs were detected in the surface soil only at sample location (SS-14) at the Radar Tower. Aroclor 1254 was detected at 1.4 mg/kg, which is just above the TSCA unrestricted use limit of 1 mg/kg. Based on the data provided in the 2000 report, the area of contamination appears to be minimal, as no PCBs were detected above the regulatory criteria in adjacent samples collected within 50 ft of that location (Weston 2000).

Additionally, analytical results indicated that PCBs were present within the observed concrete oil stain at a level above the TSCA unrestricted use limit of 1 mg/kg in the Radar tower. Based on the depth of the PCBs in the concrete, it appeared that the oil had not migrated outside the building. The findings indicated that no significant ecological or human health threats existed via migration. Weston recommended that the stains addressed by concrete removal, painting, or controlling building access (Weston 2000).

A structure adjacent to the Radar Tower was also noted in the Data Collection Report, which appeared to be a cesspool. A cesspool was also identified on sanitary drawings obtained during the records research for this RI WP.

In 2002, the Radar Tower was listed on the National Register of Historic Places through the Department of the Interior. The NY State Office of Parks, Recreation, and Historic Preservation and the Department of Interior were contacted prior to beginning the Phase I investigation at this AOC. Sampling at this located was minimally-invasive during Phase I to ensure the preservation and conservation of the Radar Tower and Antenna.

Phase I Field Operations: One Geoprobe® boring was conducted adjacent to the former Radar Tower cesspool to 25 ft bgs. Water was not encountered in the boring. The soil core was screened with a PID; no readings above 0.0 parts per million (ppm) were observed and there were no visual indicators of staining. Two soil samples were obtained from the boring, from 9 to 10 ft bgs and from 24 to 25 ft bgs, and submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals, which may have been released to the cesspool from historic activities at the Radar Tower.

A temporary well was placed in the boring with a 10-foot screen; however, the well was dry upon gauging four days later and a groundwater sample could not be collected. The Phase I sampling location at Building 201 is shown on **Figure 4-4**.

Deviations from the RI WP: A site survey of the bottom floor of the Radar Tower where transformers and staining was observed during previous assessment (Weston 2000) was proposed in the RI WP. However, safe access inside the Radar Tower was not available during Phase I RI activities. Mr. Tom Dess, NY State Park Superintendent, indicated that the building was completely sealed, the structures and stairwells inside are not stable, and he did not believe it is safe for

anyone to enter. As such, a site survey inside the Radar Tower was not completed and the proposed PCB wipe sample was not collected.

4.5 Battery 216

The Records review revealed concern for potential buried metal debris, unknown USTs, or underground vaults around Battery 216. The RI WP recommended a geophysical survey around the building and Geoprobe® borings if underground anomalies were identified.

Phase I Field Operations: A geophysical survey was conducted around the Battery to confirm the absence or presence of underground anomalies. The geophysical survey results indicated mostly debris or infrastructure, as identified on the geophysical survey map in Appendix E. No responses of significant size to be considered vaults or storage facilities or unique features which would require new sampling locations were identified. No borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.6 Plotting Room 113

Records review revealed concern for potential buried metal debris or unknown USTs around Plotting Room 113. The RI WP recommended a geophysical survey around the building and Geoprobe® borings if underground anomalies were identified.

Phase I Field Operations: A geophysical survey was conducted around Plotting Room 113 in May 2016 to confirm the absence or presence of underground anomalies. The geophysical survey results indicated a potential waste area on the north side of the building, with concentrated subsurface metal debris, as identified on the geophysical survey map in Appendix E.

In June 2016, three borings were conducted to the depth of the perched aquifer within the subsurface anomaly area (P113-SB01 through -SB03). The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were collected per boring from P113-SB01 and -SB02: one from the upper portion and one just above the soil-groundwater interface. Only one sample was collected from P113-SB03 because the groundwater was encountered at 1 ft bgs. Soil samples were submitted for laboratory analysis of the NYSDEC STARS lists for fuel oil and gasoline VOCs, SVOCs, and lead.

A temporary well was installed in each boring. One grab groundwater sample was collected from each boring and submitted for laboratory analysis of VOCs, SVOCs, and lead. Phase I sampling locations at Plotting Room 113 are shown on **Figure 4-5**.

Deviations from the RI WP: None.

4.7 Building 2010 (UST 30)

Building 2010 was formerly operated as a groundwater supply well pump house. The well house contained a power generator for groundwater pump operation which was connected to UST 30. A 100-gallon gasoline UST was removed from the southeast corner of Building 2010 in October 1993. The excavation was 4.5 ft by 7 ft by 4.5 ft deep. The NYSDEC Tank Removal Form indicated that no release had occurred from the UST. Low levels of petroleum were detected in soil samples from the excavation; however, lead was reported to be as high as 600 ppm (NYSDEC Tank Removal Form, December 1994).

Phase I Field Operations: To determine the presence or absence of lead in soil and groundwater, two Geoprobe® borings (2010-SB01 and -SB02) were advanced adjacent to the former 100-gallon UST excavation at the southeast corner of Building 2010 to a depth of 7 ft bgs. Four soil samples were collected from each boring, from the 0 – 4 ft bgs, 4 – 5 ft bgs, 5 – 6 ft bgs, and 6 – 7 ft bgs intervals, for laboratory analysis of lead.

A temporary well was set in 2010-SB02 and a grab groundwater sample was collected for laboratory analysis of lead. Phase I sampling locations at Building 2010 are shown on **Figure 4-6**.

Deviations from the RI WP: A temporary well was not placed at 2010-SB01 and thus a groundwater sample was not obtained from this boring; the on-site USACE and AECOM geologists agreed that the formation was too tight to produce sufficient water for sample collection.

4.8 Building F100C (UST 34)

Building F100C has previously been referred to in the Cashin Report as Building 40 and formerly operated as a groundwater well supply pump house. UST 34 was a 275 gallon gasoline tank removed from the south side of Building F100C in October 1993. Ten yards of petroleum-impacted soil was removed from around the UST at that time. Low levels of petroleum were detected in soil samples from the excavation and lead was reported to be as high as 549 ppm (NYSDEC Tank Removal Report, December, 1994).

Phase I Field Operations: To confirm the presence or absence of lead above regulatory concentrations in soil and groundwater, two Geoprobe® borings were advanced immediately adjacent to the former 100-gallon UST excavation at the south of Building F100C to a depth of 7 ft bgs. Four soil samples were collected from each boring, from the 0 – 4 ft bgs, 4 – 5 ft bgs, 5 – 6 ft bgs, and 6 – 7 ft bgs intervals, for laboratory analysis of lead.

Temporary wells were set in the borings and one grab groundwater grab sample was collected from each boring for laboratory analysis of lead. Phase I sampling locations at Building F100C are shown on **Figure 4-7**.

Deviations from the RI WP: None.

4.9 AST-35 (H-13)

One aboveground storage tank (AST) at Camp Hero (AST-35, also identified as H-13 in the Cashin Report) did not have complete closure documentation at the time of records review. The H-13 location was identified in the Cashin Report as a sewage holding tank; however, the Cashin Report and archive drawings indicated that a 200,000-gallon diesel fuel AST was located at this site (Cashin 1998). The archive research indicated that there was a 1,000-gallon release from this tank; however, the available documentation is incomplete.

Phase I Field Operations: Four Geoprobe® borings (AST35-SB01 through -SB04) were advanced to 10 ft bgs (just past the depth of the perched water table) around the concrete containment unit for the former AST, in compliance with 6 NYCRR 613.9(b). The soil cores were screened with a PID; no readings above 0.0 ppm were observed. However, elevated PID readings were observed at the adjacent Fuel Pump House (FPH) AOC (see below). Two soil samples were collected from each boring above the groundwater-soil interface. Soil samples were submitted for laboratory analysis of petroleum compounds by the NYSDEC STARS list for fuel oil VOCs and SVOCs.

A temporary well was installed in each boring and one groundwater sample was collected from each boring for analysis of VOCs and SVOCs. Phase I sampling locations at AST-35/H-13 are shown on **Figure 4-8.**

Deviations from the RI WP: The RI WP recommended that one of the four Geoprobe® borings were to be located within the containment unit of the former AST. However, access inside the containment wall was not available for the Geoprobe® rig, and the four borings were conducted around the accessible portions of the containment wall.

Additionally, the RI WP proposed two piezometers upgradient and downgradient of AST-35 to determine groundwater flow direction around AST-35, the FPH, and Building 203. However, piezometers were not needed within in the AST-35 AOC because the temporary wells installed at AST-35 and the FPH provided sufficient coverage of the area. However, three piezometers were installed at the Building 203 AOC to assist in determining groundwater flow direction.

4.10 Fuel Pump House and Distribution Line for AST-35

Archive drawings indicated that a fuel pump house is located on the northwest side of the former AST-35 pad and that a fuel line may have extended from the former AST-35 location to the former generators at Building 203. No additional information about the fuel line is available. During the January 2016 site walk, fuel odor was noticed inside the Fuel Pump House.

Phase I Field Operations: A geophysical survey was conducted around the fuel pump house in May 2016 to confirm the absence or presence of the fuel pipeline. The geophysical survey results identified the fuel pipeline extending southwest from the fuel pump house, as shown on the geophysical survey map in Appendix E. In June 2016, the fuel pump house distribution line was further traced with a hand-held magnetometer. Hand digging along the distribution line confirmed that the distribution line had been cut and removed after approximately 6-feet from the fuel house. Soil excavated from around the existing fuel line did not indicate noticeable staining or petroleum odor.

Four Geoprobe® borings (FPH-SB01 through -SB04) were conducted to 10 ft bgs around the FPH building and remaining portion of the distribution line, in compliance with 6 NYCRR 613.9(b) (NYCRR 2015b). The soil cores were screened with a PID; elevated PID readings were observed at locations FPH-SB02 (maximum of 13.0 PPM) and FPH-SB04 (maximum of 203 PPM). Water was encountered between 1 ft bgs and 5 ft bgs in the borings; two soil samples were obtained from each boring above the soil-water interface. Sample intervals were biased to depths where there were elevated PID readings or visual indicators of staining were observed. Soil samples were submitted for laboratory analysis of petroleum compounds by the NYSDEC STARS list for fuel oil VOCs and SVOCs.

A temporary well was installed in each boring and one groundwater sample was collected from each boring for analysis of VOCs and SVOCs. Petroleum odor was observed in the purge water from all four temporary wells. Phase I sampling locations at the FPH and Distribution Line for AST-35/ H-13 are shown on **Figure 4-9**.

Deviations from the RI WP: The RI WP proposed nine soil borings at the FPH (three at the building, six along the distribution line to Building 203), at locations based on the results of the geophysical survey. However, because the fuel pipe was cut approximately 6 ft from the FPH, only four borings were conducted around the FPH and the remaining portion of the fuel line.

Additionally, the RI WP proposed that one of the borings would be conducted inside the FPH. However, access inside the FPH was not available and the Geoprobe® rig would not have been able to clear the ceiling of the FPH if access had been available. Therefore, borings were not completed inside the building but relocated immediately adjacent to the building.

4.11 Building 203

Former Building 203, the former power building, housed four large generators which supplied electrical power to Camp Hero. USTs outside of Building 203 were utilized to supply fuel and lubricants to the generators.

Previous Actions and Investigations: In 1994, UST 16 (25,000 gallon #2 fuel oil), UST 18 (25,000 gallon #2 fuel oil), and UST 17 (1000 gallon lube oil) were removed from the perimeter of former Building 203. USTs 16 and 18 were located on the south side of the building and UST 17 was located on the southeast side of the building. Upon removal of USTs 16 and 18, a green liquid that appeared to be ethylene glycol was observed on the sidewalls of the excavation and on water standing in the bottom of the excavation at 17 ft bgs. A solvent odor was present and it was suspected that solvents had been dumped around the building based on visual evidence of surface soil staining and elevated volatile and semivolatile laboratory results of soil. The area behind former Building 203 and adjacent to the USTs was described as a dumping ground for waste oil and spent solvents. A French drain was also observed during excavation activities to surround the Building 203 foundation. The French drain was suspected of acting as a conduit to allow hazardous liquids to migrate around the foundation of the building and into the subsurface soil (NYSDEC Spill Report 93-09575 1993).

Additionally, several drums of glycol were identified at the site during the 1993 UST removal action and several hundred feet of piping containing 150 gallons of ethylene glycol were noted in the former power generator building, presumably used for cooling the generators (NYSDEC Spill Report 93-09575 1993). However, ethylene glycol is a clear, colorless, and viscous liquid that is miscible in water and rapidly biodegrades in soils. It is very likely that ethylene glycol in soils would not be detected at this time decades after it was released. In addition, the soils and foundation around former Building 203, which likely contained ethylene glycol, were excavated during decommission of the building.

In 1995, the single excavation pit for USTs 16 and 18 was over-excavated and 2,500 yards of soil were removed. A Site Assessment Report was submitted for the site to NYSDEC in June 1995 (USACE, 1995). Nine Geoprobe® borings were conducted surrounding the USTs excavation and two Geoprobe® locations were conducted near the center of the excavation. The Geoprobe® location near the center of the excavation was advanced to 53 ft bgs in an attempt to reach groundwater; however, no groundwater was intercepted to this depth. Dense clay was found at depth and surrounding the UST excavation. A soil sample was taken at 53 ft bgs with analysis results below screening criteria. A temporary well was installed to 21 ft below grade, which slowly recharged with groundwater overnight. The results of the soil samples and the groundwater sample taken from the Geoprobe® boreholes were below screening criteria. However, the laboratory method detection limits utilized in the assessment at that time are roughly 10 orders of magnitude higher than what is currently required to evaluate human health risk. The Spill Report Case was closed by the NYSDEC in July 1995.

In 2000, during additional site-wide environmental assessment at Camp Hero by the USACE, a surface water sample was obtained from a drainage area below Building 203 near where a small ditch leading from Building 203 was observed to outfall (Weston 2000). The sample was analyzed for PCBs, SVOCs, and metals. No PCBs or SVOCs were detected in the surface water sample. Two metals, zinc and arsenic, were detected in the sample but were below screening criteria.

Phase I Field Operations: Five Geoprobe® borings (203-SB01 through -SB05) were advanced within the area of the former Building 203 and UST excavation to the depth of the perched aquifer or to 25 ft bgs, whichever was encountered first. Building 203 and USTs have been excavated and replaced with clean fill; the borings were located just beyond the excavation and fill zones to the extent possible. The soil cores were screened with a PID; no readings above 0.0 ppm were observed in borings 203-SB01 through -SB03, but elevated readings of up to 11.3 ppm and 402.8 ppm were observed in borings 203-SB04 and -SB05, respectively. A dense clay layer was encountered between 2 and 20 ft bgs across the AOC; the Phase I RI soil sampling was focused on the layer just above the clay as a potential contaminant transport zone from former Building 203 and the USTs.

Two subsurface soil samples were collected from each boring above the sand-clay interface, with the exception of 203-SB02, because the clay layer was encountered at 2 ft bgs. Sample intervals focused on those with the largest PID readings, if elevated PID readings were observed. Soil samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals.

Temporary wells were installed in the borings and grab groundwater samples were collected for laboratory analysis of VOCs, SVOCs, PCBs, and metals. However, recharge in some of the wells was insufficient to collect the required volume for all planned analyses. The wells were visited multiple times by the sampling team and the collected volume was submitted for laboratory analysis of a shortened analyte suite: VOCs, metals, and one liter for SVOCs were submitted.

Additionally, three piezometers were installed upgradient and downgradient of the Building 203 UST 16 and 18 excavations (PZ-1 through PZ-3) to help determine radial groundwater flow and direction information in the vicinity; analytical samples were not collected from these piezometers. Phase I sampling locations and piezometer locations at Building 203 are shown on **Figure 4-10**.

Upon gauging the piezometers, approximately 5 ft of light non aqueous phase liquid (LNAPL) was observed in piezometer PZ-3. The LNAPL appeared to be weathered petroleum product. Thickness was physically measured to be 8.00 ft to 13.30 ft with 5 ft measured using an interface probe. A petroleum release at AOC Building 203 was made to the NYSDEC hotline by USACE (Ms. Megan Cullen). Pollution Complaint Number PC-1602757 was assigned to the reported release. Mr. Dess

(NYS Camp Hero Park Superintendent) was also notified that a release at former Building 203 had been reported to NYSDEC.

Deviations from the RI WP: As detailed above, an abbreviated analytical suite was submitted due to recharge of groundwater in the temporary wells. Additional piezometers were installed to help determine groundwater flow direction, which were not in the RI WP.

4.12 Suspected Tank A

Seven suspected tanks were identified during the records review (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. The suspected UST located behind former Building 20 (former Fire Department) was designated Suspected Tank A.

Phase I Field Operations: A geophysical survey was conducted around former Building 20 to confirm the absence or presence of Suspected Tank A. The geophysical survey results indicated subsurface anomalies, including inferred utility junctions, documented culvert end-points, and confirmed fence-line and building infrastructures, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations.

Because no tank-sized features were identified in the geophysical survey, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.13 Suspected Tank B

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at Building 22 was designated Suspected Tank B.

Phase I Field Operations: A geophysical survey was conducted around Building 22 to confirm the absence or presence of Suspected Tank B. The geophysical survey results identified two possible tanks on the east side of Building 22, as identified on the geophysical survey map in Appendix E. The location the first of the two anomalies was consistent with location of the suspected tank identified in historical records (Suspected Tank B). The second tank-like anomaly was just north of Building 109. This anomaly was designated as Suspected Tank H and was

investigated as a separate AOC (see below). Signals received to the west side of Building 22 were considered to be likely associated with subsurface utilities.

In June 2016, small "test holes" were conducted at the Suspected Tank B location using shovels. Miscellaneous building debris was uncovered, but no evidence of a tank was identified. However, a petroleum odor was noted in the uncovered soil; therefore, four borings (STB-SB01 through -SB04) were advanced to 10 ft bgs (just below the depth of the water table) in the vicinity of the petroleum odor. The soil cores were screened with a PID; no readings above 0.1 ppm were observed. One sample was collected from each boring just above the soil-water interface. An additional three surface soil samples were collected (STB-SS05 through -SS07) from 0 to 1 ft bgs in the vicinity of the borings. Soil samples were submitted for analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs.

Temporary wells were placed in the borings. Because a tank was not present in the subsurface, grab groundwater samples were only collected from two of the borings: one up-gradient and one down-gradient of the soil with petroleum odor (STB-SB01 and -SB03, respectively). Groundwater samples were submitted for analysis of VOCs and SVOCs. Phase I sampling locations at Suspected Tank B are shown on **Figure 4-11**.

Deviations from the RI WP: The RI WP proposed collection of two samples per boring and no separate surface soil samples; because no tank was located, only one sample was collected per boring and an additional three surface soil samples were collected. Surface soil samples were added based on the observation of petroleum odors in near surface soils but not at depth in the borings. The RI WP also proposed collection of four grab groundwater samples if a tank was located. Because no tank was located, only two grab groundwater samples were collected.

Additionally, after the May 2016 field activities, USACE and AECOM-Tidewater JV discussed collection of a grab groundwater sample from the existing well in the parking lot behind Building 22. During the June 2016 field activities, the USACE and AECOM-Tidewater JV team agreed that samples will not be collected from monitoring wells during Phase I; rather, the well will be sampled via low-flow methodology during Phase II when other newly-installed monitoring wells are sampled, pending results of the Phase I investigation.

4.14 Suspected Tank C

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at former Building 2 was designated Suspected Tank C.

Phase I Field Operations: A geophysical survey was conducted around former Building 2 to confirm the absence or presence of Suspected Tank C. The geophysical survey identified multiple underground anomalies in the area of former Building 2, one of which was consistent with the location of the suspected tank identified in historical records, as identified on the geophysical survey map in Appendix E. Five additional anomalies were identified which were believed to be historic underground utilities.

In June 2016, small "test holes" were conducted at the Suspected Tank C location identified by the geophysical survey using shovels. Miscellaneous building debris was uncovered, and no evidence of a tank or petroleum-contaminated soil was identified. Therefore, no borings were conducted and no environmental samples were collected.

Deviations from the RI WP: None.

4.15 Suspected Tank D

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G); no closure documentation was available for these tanks, but archive drawings indicated possible locations of the tanks. A suspected UST located at former Building 104R was designated Suspected Tank D.

Phase I Field Operations: A geophysical survey was conducted around Building 104R to confirm the absence or presence of Suspected Tank D. The geophysical survey results indicated an abundance of utility connections along with former building and concrete pad infrastructure, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations.

Because no tank-sized features were identified in the geophysical survey, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.16 Suspected Tank E (Building 3001)

Building 3001 has also historically been referred to as Building 47 (Cashin Report), State Park Police Lilco Building, and AT&T Building. UST 26 was previously removed from Building 3001, and another tank (AST 49) remains in use at the building. Archive drawings suggested a third UST in the vicinity of the former UST 26 location (Suspected Tank E). Additionally, one existing well is located on the South side of Building 3001, which was previously used as a water source in the building prior to

connection to Suffolk County Water in 2011. The RI WP recommended collection of one grab groundwater sample from the existing well for analysis of VOCs and SVOCs.

Phase I Field Operations: A geophysical survey was conducted around Building 3001 to confirm the absence or presence of Suspected Tank E. The geophysical survey results indicated building and fence-line interference, along with verified manholes and telephone pole surface features, as identified on the geophysical survey map in Appendix E. However, a tank-sized object was not identified at the location indicated in the archive drawings, nor elsewhere in the survey data, implying that the tank had been removed. Additionally, no unique features were identified which should present new concerns of potential environmental release or require new sampling locations. Because tank-sized features were not identified in the geophysical survey, borings were not completed at this AOC.

Additionally, the existing well, which is no longer used at Building 3001, could not be sampled as the well is disconnected and access to groundwater through the well head seal was not available.

Deviations from the RI WP: None.

4.17 Suspected Tank F

Archive figures indicated that Suspected Tank F could be located at the pump house near Battery 216 (also known as Bunker-4). This groundwater pump house was suspected to have a UST in proximity to the building, because similar pump house on Camp Hero had a 100 gallon gasoline UST removed.

Phase I Field Operations: A geophysical survey was conducted in the vicinity of the pump house near Battery 216 to confirm the absence or presence of Suspected Tank F. Due to dense vegetation and terrain, the area was assessed using AGM. Interferences (e.g., buildings, fences) or metallic items large enough to represent a UST were not identified, as shown on the geophysical survey map in Appendix E. Because tank-sized features were not identified, no borings were advanced and no environmental samples were collected.

Deviations from the RI WP: None.

4.18 Suspected Tank G

An additional pump house was noted at Well 4 during the January 2016 site walk. This groundwater pump house was suspected to have a UST (Suspected Tank G) in proximity to the building, because similar pump house on Camp Hero had a 100 gallon gasoline UST removed.

Phase I Field Operations: A geophysical survey was conducted around the pump house to confirm the absence or presence of Suspected Tank G. Due to dense vegetation and terrain, the

area was assessed using AGM. No interferences (e.g., buildings, fences) or metallic items large enough to represent a UST were identified, as shown on the geophysical survey map in Appendix E. Because no tank-sized features were identified, borings were not completed at this AOC.

4.19 Suspected Tank H

Seven suspected tanks were identified during the records review summary (Suspected Tanks A through G). Geophysical surveys were conducted in May 2016 to confirm the presence or absence of the suspected tanks. During the geophysical survey around Building 22, an additional tank-sized anomaly was identified just north of Building 109. This anomaly was designated as Suspected Tank H and was investigated as a separate AOC.

Phase I Field Operations: In June 2016, small "test holes" were conducted at the Suspected Tank H location using shovels. Miscellaneous building debris was uncovered, but there was not any evidence of a tank or petroleum impacts. Therefore, borings were not completed at this AOC.

Deviations from the RI WP: The Suspected Tank H AOC was not included in the RI WP but was added to the investigation after the geophysical surveys in May 2016.

4.20 Abandoned Waste Disposal System (Site-Wide)

The site-wide Abandoned Waste Disposal System is a suspected former area of hazardous waste dumping. The abandoned site-wide sanitary sewer was identified during the 2016 historical records search from archive drawings of Camp Hero provided by the NY State Parks; the system was abandoned and has not been used by the NY State Parks. The drawings indicate that septic fields and cesspools were also utilized at Camp Hero prior to construction of the site-wide sanitary sewer system. The system was connected to a chlorine chamber for treatment prior to discharge to the Atlantic Ocean at a headwall outfall. The location of the site-wide sanitary sewer line and former septic fields and cesspools are shown on the Site Map (**Figure 1-2**).

Phase I Field Operations: Twenty-seven Geoprobe® borings (WDS-SB01 through -SB27) were advanced throughout the abandoned waste disposal system, at locations targeting former leach fields and cesspools downgradient from buildings which may have utilized hazardous materials. Boring locations were biased to potential weak sites or collection areas along the sewer line, such as locations of 90-degree turns, where the sanitary line was joined by a secondary sanitary line from former operations buildings, collection tanks, and at the chlorine contact chamber. The locations of former sanitary leach fields, septic tanks, and cesspools utilized prior to construction of the site-wide sanitary sewer system were also included in the soil and groundwater sampling.

Borings were advanced to the depth of the targeted abandoned waste disposal system features (bottom of the leach field, septic tank, cesspool, etc.). The soil cores were screened with a PID;

readings above 0.0 ppm were not observed. One soil sample was collected from each boring at depth. Temporary wells were set in each boring and grab groundwater samples were collected. Soil and groundwater samples were sent to the laboratory for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sample locations for the site-wide abandoned waste disposal system are shown on **Figures 4-12** through **4-16**.

Deviations from the RI WP: At some locations, groundwater recharge was insufficient to fill all required sample bottleware, even after multiple attempts; in those instances, the volume obtained was submitted for analysis of shortened list of analytes.

4.21 Motor Pool

The Motor Pool building contained a hydraulic lift for vehicle maintenance. According to the State Park Superintendent (Mr. Tom Dess) in a phone interview, the concrete floor over the hydraulic lift was capped at the time the State Park began utilizing the Facility. Since that time, the Motor Pool building has been beneficially reused by the NY State Park. A 1940 Camp Hero archive site map identifies the Motor Pool building was once utilized as an Ordnance Repair Shop. A floor drain was likely present in the building during DoD use of the building.

Additionally, a cesspool on the east side of the motor pool, downgradient from the building, has also been identified through the historical records search. There is potential that petroleum, munitions constituents, and/or hazardous materials may have drained through the floor drain, which may have led to the cesspool. There was no evidence of a discharge pipe from the Motor Pool Building to the ground surface outside of the Motor Pool Building observed during a site walk over in this area conducted on 3 November 2015 during the project kick-off meeting.

One existing groundwater supply well currently utilized for non-potable purposes at the Motor Pool (untreated tap) is located on the west side of the building.

Phase I Field Operations: At the location of the former hydraulic lift, one Geoprobe® boring (MP-SB01) was advanced through the concrete slab adjacent at the former hydraulic lift to 10 ft bgs, just past the depth of the bottom of the former lift, which is assumed to be 8 to 10 ft bgs. Concrete coring was conducted prior to boring. Additionally, concrete and debris were encountered in the boring around 9 ft bgs. The soil core was screened with a PID; elevated PID readings from 5 to 10 ft bgs were observed (maximum of 21.0 ppm). One soil sample was collected 4 to 5 ft bgs from the non-native and native soil interface, which was also just above the soil-water interface, for analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs and SVOCs. Petroleum odor was observed in the purge water during groundwater sample collection. The temporary well was abandoned and the concrete was patched at grade once sample collection was complete.

Adjacent to the location of the former floor drain to the cesspool just outside the building (approximately 6 ft from the edge of the building), one Geoprobe® boring (MP-SB02) was advanced to 15 ft bgs, just past the depth of the perched water table. The soil core was screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were collected from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 11 to 12 ft bgs, just above the soil-water interface. Soil samples were submitted for laboratory analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs and for energetics. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs, SVOCs, and energetics.

Along the sewer line from the building to the cesspool, one Geoprobe® boring (MP-SB03) was advanced to 15 ft bgs, just past the depth of the perched water table. Two soil samples were obtained from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 8 to 9 ft bgs, just above soil-water interface, for laboratory analysis of the NYSDEC STARS list for fuel oil VOCs and SVOCs, PCBs, and energetics. A temporary well was placed in the boring and a grab groundwater sample was collected for analysis of VOCs, SVOCs, PCBs, and energetics.

Additionally, one grab groundwater sample was collected from the existing well located on the west side of the Motor Pool from an available untreated tap for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, energetics, and metals. The Phase I sampling locations at the Motor Pool are shown on **Figure 4-17**.

Note that an additional soil boring (WDS-SB11) was conducted immediately adjacent to the cesspool as part of the site-wide abandoned waste disposal system AOC.

Deviations from the RI WP: None.

4.22 Engineering Field Office

A former engineering field office building was identified on a 1940 site map located adjacent to the Motor Pool building. The 1940 site map identifies the motor pool building as once utilized as an Ordnance Repair Shop. Archive pictures of the engineering field office indicate it was a two-story high wooden building with double doors. Work related to ordnance repair may have also occurred in the engineering field office located adjacent to the Motor Pool building.

Phase I Field Operations: One soil boring was advanced downgradient of the former engineering field office, on the south side of the building within the drainage area adjacent to the building foundation, to 14 ft bgs. Two soil samples were collected from the boring, one surface soil sample (0 to 1 ft bgs) and one subsurface soil sample just above perched groundwater-soil

interface (7 to 8 ft bgs), for laboratory analysis of energetics. One grab groundwater sample was also collected from a temporary well for analysis of energetics. The Phase I sampling location for the Engineering Field Office is shown on **Figure 4-18**.

Deviations from the RI WP: None.

4.23 Former Building 34

During the May 2016 Phase I RI activities, the USACE and AECOM-Tidewater JV team discovered a building foundation, old furnace, and building debris in the H-16 area east of the Motor Pool Building at former Building 34. USACE requested that AECOM review locations of proposed borings and surface and near-surface soil samples at nearby H-5 and H-16 in relation to this debris and shift sample locations to cover this debris area. This area was identified as a new AOC, former Building 34.

Phase I Field Operations: One Geoprobe® boring (034-SB01) was advanced to 10 ft bgs on the north side of former Building 34. Water was encountered at 2 ft bgs. The soil core was screened with a PID; no readings over 0.0 ppm were observed. Two soil samples were collected from the boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 1 to 2 ft bgs, just above the soil-water interface. Soil samples were submitted for laboratory analysis of PAHs, PCBs, and metals. A temporary well was placed in the boring and a groundwater sample was collected for laboratory analysis of PAHs, PCBs, and metals.

Additionally, four co-located surface soil and near-surface soil samples (locations 034-SS02 through -SS05) were collected downgradient of the debris toward the embankment of revetments southeast of former Building 34. The revetments are narrow, wooden stream channelization structures found in stream beds throughout Camp Hero State Park, which appear to have been installed to control surface water flow across the facility. Surface soil and near-surface soil samples were submitted for laboratory analysis of PAHs, PCBs, and metals. Phase I sample locations at former Building 34 are shown in **Figure 4-19**.

Deviations from the RI WP: This is a new AOC that was not included in the WP.

4.24 Drum Location (H-1)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-1. One drum was present with no labeling or identification. No liquid was present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were

collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-1 are shown on **Figure 4-20**.

Deviations from the RI WP: None.

4.25 Drum Location (H-2)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-2. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-2 are shown on **Figure 4-21**.

Deviations from the RI WP: None.

4.26 Drum Location (H-3)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-3. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-3 are shown on **Figure 4-22**.

Deviations from the RI WP: None.

4.27 Construction Debris Area (H-4)

The Cashin Report noted areas H-4 and H-6 contained construction debris.

Phase I Field Activities: A walk-over survey was conducted to identify the amount and location of construction debris at H-4.

Three Geoprobe® borings (H4-SB01 through -SB03) were advanced to 10 ft bgs (just past the depth of the perched aquifer) under the debris or on the downgradient edge of the debris. The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample just above the perched groundwater-soil interface.

Temporary wells were installed in each boring. One grab groundwater sample was collected from each boring. Soil and groundwater samples were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations at H-4 are shown on **Figure 4-23**.

Deviations from the RI WP: None.

4.28 Drum Location with Construction Debris (H-5)

Five drums and construction debris were noted at area H-5 in the Cashin Report, located in a topographic swale southeast of the Motor Pool Building (Cashin 1998). Three of the drums were identified as contents unknown. However, there was no evidence of these drums present during a Site Walk Over in this area conducted on November 3, 2015 during the RI/FS Project kick-off meeting. Tom Dess (NYS Camp Hero Superintendent) indicated the parks had removed the debris and a motorcycle frame from the area previously.

Phase I Field Operations: Four surface soil samples (0 to 1 ft bgs) and four co-located near-surface soil samples (1 to 2 ft bgs) were collected in the vicinity of the former drums and construction debris. The two soil sample locations near the former drums (H5-SS01 and -SS02) were sampled for VOCs, SVOCs, PCBs, and metals. The two soil samples at the construction debris area (H5-SS03 and -SS04) were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations for H-5 are shown on **Figure 4-24**.

Deviations from the RI WP: Eight surface soil and eight near-surface soil samples were proposed for H-5 in the RI WP. During the May 2016 site walk, USACE and AECOM-Tidewater JV agreed that four sample locations instead of eight were sufficient.

4.29 Construction Debris Area (H-6)

The Cashin Report noted areas H-4 and H-6 contained construction debris.

Phase I Field Activities: A walk-over survey was conducted to identify the amount and location of construction debris at H-6.

Three Geoprobe® borings (H6-SB01 through -SB03) were advanced to 8 ft bgs (just past the depth of the perched aquifer) under the debris or on the downgradient edge of the debris. The soil cores were screened with a PID; no readings above 0.0 ppm were observed. Two soil samples were obtained from each boring, one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample just above the perched groundwater-soil interface.

Temporary wells were installed in each boring. One grab groundwater sample was collected from each boring. Soil and groundwater samples were analyzed for lead from lead-based paint and PCBs. Phase I sampling locations at H-6 are shown on **Figure 4-25**.

Deviations from the RI WP: None.

4.30 Possible Boilers (H-7 and H-8)

The Cashin Report noted three locations at Camp Hero which contained what appeared to be old boilers (1998): H-7, H-8, and H-9. The RI WP proposed a visual survey to determine whether boilers still exist. If the boilers were present, one surface soil sample (0–1 ft bgs) was to be collected. If stained soils were noted or if field screening of the surface soil samples with the PID (in the plastic, re-sealable bag) indicated the presence of petroleum during the survey, one Geoprobe® boring was to be advanced for the collection of two subsurface soil samples and one grab groundwater sample.

Phase I Field Operations: An extensive visual and magnetometer survey was conducted by the project team; however, the team was unable to locate debris noted by previous Cashin Report at AOC H-7 and H-8 after multiple attempts. As such, sampling activities were not completed at these AOCs.

Deviations from the RI WP: None.

4.31 Possible Boiler (H-9)

The third boiler noted in the Cashin Report, H-9, was confirmed present during visual survey during the initial project site walk (Cashin, 1998).

Phase I Field Operations: A visual survey was conducted and confirmed that the boiler at location H-9 still existed in June 2016. One surface soil sample (H9-SS01) was collected from 0 to 1 ft bgs for laboratory analysis of PAHs and metals. Field screening of the surface soil sample with the PID (in the plastic, re-sealable bag) was conducted; no readings above 0.0 ppm were observed. Because stained soils were not observed and field screening did not indicate elevated PID readings, borings were not completed in accordance with the RI WP. The Phase I sampling location at H-9 is shown on **Figure 4-26**.

Deviations from the RI WP: None.

4.32 Former Power Plant (H-11)

The Cashin Report recommended investigation potential petroleum, metals, and PCBs in soil and groundwater associated with the former power plant. In an August 2000 environmental assessment, five groundwater, two surficial soil, two subsurface soil, and two sediment samples were collected and analyzed for PCBs, SVOCs, and metals (Weston 2000).

At that time, the former Power Plant location contained three to five feet of fill material, consisting mostly of charcoal. PCBs were not detected in soils or groundwater from the area. Beryllium was

detected above the regulatory criteria in one subsurface soil (SS-1) and chromium and lead were detected at concentrations that slightly exceeded screening criteria in one of five groundwater sample locations (GW-2). The levels of chromium and lead were somewhat elevated in relation to the reference well located up-gradient of the former Power Plant location. Results from surface water and sediment samples indicated no evidence of contaminant transport pathways from the buildings to adjacent sensitive environmental areas, such as forested wetlands and streams (Weston 2000).

Additional investigation of the power plant was included in the Phase I investigation to confirm the Weston results (Weston 2000).

Phase I Field Operations: Two Geoprobe® borings (H11-SB01 and -SB02) were advanced to 10 ft bgs (just past the depth of water) within the footprint of the former Power Plant Building. The soil cores were screened with a PID; there were not any readings detected at location H11-SB01, but elevated PID readings (21.7 ppm maximum) were observed 3 to 5 ft bgs at location H11-SB02. Two soil samples were obtained from each boring, one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 3 to 4 ft bgs, just above the perched groundwater-soil interface or in the interval with elevated PID readings.

A temporary well was installed in each boring and a grab groundwater samples were collected. Soil and groundwater samples were submitted for laboratory analysis of PAHs, PCBs, and metals. Phase I sampling locations for the former power plant are shown on **Figure 4-27**.

Note that two Geoprobe® borings were also conducted in the tile drain field associated with the former Power Plant Building as part of the site-wide abandoned sanitary sewer investigation and are discussed under that AOC. Those results will be incorporated into approach for this AOC.

Deviations from the RI WP: None.

4.33 Sewage Ejector Station (H-12)

The sewage ejector station, located near the former heating plant, was noted in the Cashin Report as a potential concern due to waste handling.

Phase I Field Operations: One Geoprobe® boring (H12-SB01) was advanced to 10 ft bgs within the footprint of the former ejector station. The soil core was screened with a PID and there were not any readings above 0.1 ppm recorded. Two soil samples were collected: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample from 4 to 5 ft bgs, just above the soil-water interface. A temporary well was placed in the boring and a grab groundwater sample was collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs,

PCBs, and metals. Phase I sampling locations for the Sewage Ejector Station are shown on **Figure 4-28**.

Deviations from the RI WP: None.

4.34 Former Coal Storage (H-14)

Two former coal storage areas were identified in the Cashin Report and on archive drawings obtained during the 2016 historical records search (H-14 and H-15).

Phase I Field Operations: Three Geoprobe® borings (H14-SB01 through -SB03) were advanced within the suspected area of the H-14 coal storage area. The soil cores were screened with a PID and there were not any readings above 0.0 ppm recorded. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample just above the soil-water interface or at the depth of the boring, if not water was encountered.

Temporary wells were placed in all three boring locations; grab groundwater samples were collected from H14-SB01 and -SB03. H14-SB02 was dry upon gauging and a groundwater sample could not be collected. Soil and groundwater samples were submitted for laboratory analysis of PAHs and metals. Phase I sampling locations for H-14 are shown on **Figure 4-29**.

Deviations from the RI WP: None.

4.35 Former Coal Storage (H-15)

Two former coal storage areas were identified in the Cashin Report and on archive drawings obtained during the 2016 historical records search (H-14 and H-15).

Phase I Field Operations: Three Geoprobe® borings (H15-SB01 through -SB03) were advanced within the suspected area of the H-15 coal storage area. The soil cores were screened with a PID and there were not any readings above 0.0 ppm recorded. Groundwater was not encountered in the borings. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs and one subsurface soil sample just above where moisture was encountered or at the depth of the boring. Soil samples were submitted for laboratory analysis of PAHs and metals. Phase I sampling locations for H-15 are shown on **Figure 4-30**.

Deviations from the RI WP: Temporary wells were placed in all three boring locations; however, all three wells were dry upon gauging and groundwater samples could not be collected despite multiple attempts.

4.36 Former Sewage Treatment Area (H-16)

The Cashin Report reported a sewage treatment area just east of the Motor Pool. Historic site drawings indicated a proposed sewage treatment plant in this area; however, the available documentation was incomplete and the RI WP recommended additional investigation.

Phase I Field Operations: A walk-over survey was conducted to attempt to identify the status and size of former sewage treatment area at this location; however, no indicators were present other than some mounding. One Geoprobe® boring was advanced to the perched groundwater table in the former sewage treatment area. The soil core was screened with a PID and there were not any readings above 0.0 ppm that were recorded. Two soil samples were obtained the boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 4 to 5 ft bgs, just above the groundwater-soil interface.

A temporary well was placed in the boring and a grab groundwater sample was collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. The Phase I sampling location for H-16 is shown on **Figure 4-31**. Additionally, one boring location associated with the abandoned site-wide waste disposal system (WDS-SB11) was located within the H-16 area.

Deviations from the RI WP: Two borings were planned for H-16 in the RI WP; however, because one boring associated with the abandoned site-wide waste disposal system (WDS-SB11) was located within the H-16 area, one of the two H-16 borings was reallocated to former Building 34, a new AOC established during the Phase I field activities (see Section 4.23 for more details).

4.37 Open Pits (H-17)

The Cashin Report noted two open pit locations which may have been dumping areas (H-17 and H-21). Geospatial analysis of these areas by the USACE AGC were inconclusive (USACE 2016). Based on visual inspection of the areas, there have been ground disturbances; therefore, the goal of the Phase I investigation was to confirm or deny suspected waste related to DoD utilization of this area.

Phase I Field Operations: Three Geoprobe® borings (H17-SB01 through -SB03) were advanced in the vicinity of the ground disturbances at H-17, two topographically downgradient and one upgradient of the disturbance. During the initial attempt on each boring, groundwater was not encountered and the sandy lithology caused boreholes to collapse around 20 ft bgs. The team returned at a later date with steel casing and advanced borings to 35 ft bgs (greater than the 25 ft bgs established in the RI WP), in attempt to reach groundwater. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample from 4 to 5 ft bgs. Groundwater was encountered in two of the three borings; temporary wells were installed in those two borings (H17-SB02 and -SB03) and grab groundwater samples

were collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-17 are shown on **Figure 4-32**.

Deviations from the RI WP: As detailed above, one of the three planned groundwater samples was not obtained.

4.38 Drum Location (H-18)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-18. Minimal drum remnants were present with no labeling or identification; liquid was not present in the drum remnants. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected in the vicinity of the drum remnants for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-18 are shown on **Figure 4-33**.

Deviations from the RI WP: None.

4.39 AST 550-Gallon (H-19)

The Cashin Report noted one discarded 550-gallon above ground storage tank was located in the area of Camp Hero between Hill 72 and 83, in the northern section of the site (see **Figure 1-2**).

Phase I Field Operations: A walk-over survey was conducted and confirmed that the 550-gallon AST still exists at Camp Hero. Liquid was not present in the tank. Two surface soil samples (H19-SS01 and -SS02) were collected from 0 to 1 ft bgs adjacent to the tank for analysis of VOCs, PAHs, and metals. The soils were screened with a PID and there were not any readings above 0.0 ppm that were recorded. Because there were not any elevated PID readings or petroleum-stained soils observed, Geoprobe® borings were not conducted. Phase I sampling locations at H-19 are shown on **Figure 4-34**.

Deviations from the RI WP: None.

4.40 Drum Location (H-20)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-20. One drum was present, with no labeling or identification, located inside the wooden revetment (as described above in Section 4.23). Liquid was not present in the drum. Two co-

located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum within the revetment for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-20 are shown on **Figure 4-35**. Photographs of the sampling at H-20 are located in the Photograph Log (H-20).

Deviations from the RI WP: None.

4.41 Open Pits (H-21)

The Cashin Report noted two open pit locations which may have been dumping areas (H-17 and H-21). Geospatial analysis of these areas by the USACE AGC were inconclusive (USACE 2016). Based on visual inspection of the areas, there have been ground disturbances; therefore, the goal of the Phase I investigation was to confirm or deny suspected waste related to DoD utilization of this area.

Phase I Field Operations: Three Geoprobe® borings (H21-SB01 through -SB03) were advanced to 15 ft bgs in the vicinity of the ground disturbances. Two soil samples were obtained from each boring: one surface soil sample from 0 to 1 ft bgs interval and one subsurface soil sample at varying depths. Temporary wells were installed in the borings and grab groundwater samples were collected. Soil and groundwater samples were submitted for laboratory analysis of VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-21 are shown on **Figure 4-36**.

Deviations from the RI WP: None.

4.42 Drum Location (H-22)

During the Camp Hero FS (Cashin 1998), six locations were observed with one or two 55-gallon drums or drum remnants (H-1, H-2, H-3, H-18, H-20, and H-22).

Phase I Field Operations: A site survey was conducted to verify the number of drums present at H-22. One drum was present with no labeling or identification. Liquid was not present in the drum. Two co-located surface soil (0 to 1 ft bgs) and near-surface soil samples (1 to 2 ft bgs) were collected from underneath the drum for analysis of the SW-846 list of analytes for VOCs, SVOCs, PCBs, and metals. Phase I sampling locations for H-22 are shown on **Figure 4-37**.

Deviations from the RI WP: None.

4.43 AGC Sites 1, 2, and 4

As part of this investigation, the Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate of the USACE ACG was tasked to search, collect, and review historical aerial photography from 1940 to 1982 searching for features associated with dumps within the former Camp Hero boundary. Their report concluded that there was no photographic evidence of debris accumulation suggestive of a dump in the years collected within the timeframe of this project.

However, four areas were identified where dumping could have taken place, described as access points to cleared areas near or along the bluff (USACE 2016). The four areas were designated "AGC Sites 1, 2, 3, and 4" for this RI. AGC Site 3 corresponds to the "Camp Hero State Park Bluffs" AOC, which was already established as a part of this investigation (see below).

Phase I Field Operations: To investigate potential buried debris, a visual inspection and screening-level geophysical survey using a metal detector were conducted during Phase I field activities. Visual and magnetometer results did not identify any subsurface anomalies indicative of waste dumping. As such, borings were not advanced at this AOC.

Deviations from the RI WP: None.

4.44 Camp Hero State Park Bluffs/AGC Site 3

A boiler or small tank and metal debris was observed at the bottom of the steep slope along the southern bluffs of Camp Hero during the Site Walk conducted in October 2015. Additionally, the USACE AGC identified this location as an area where dumping could have taken place. Based on a previous walk-over survey, it was concluded that the miscellaneous metal debris was inert and did not previously contain liquid contents.

Phase I Field Operations: The boiler was removed from the bluffs and disposed of as solid waste.

Deviations from the RI WP: None.

Notes

AOC	Area of Concern
AST	Aboveground Storage Tank
ID	Identification
N/A	Not Applicable
PCB	Polychlorinated Biphenyls
STARS	[NYSDEC] Spills, Technology, and Remediation Services
SVOC	Semi-Volatile Organic Compound
UST	Underground Storage Tank
VOC	Volatile Organic Compound

Media Type Codes

GW	Groundwater Sample
SB	Subsurface Soil Sample
SS	Surface Soil
WP	Wipe Sample
CC	Concrete Chip Sample
LC	Liquid Characterization Sample

Boring/Sample Depth Classifications

A	Boring to perched aquifer or max 25 ft bgs. Two SB per boring – one from upper portion at staining/elevated PID, one at depth
B	Boring to depth of former UST (7 ft bgs) or the perched water table. Up to 4 SB per boring: first 0 - 4 ft bgs (homogenize), then additional sample every 1 ft interval from 4 ft bgs to depth (4 - 5, 5 - 6, 6 - 7 ft bgs)
C	Boring to perched aquifer. Two SB per boring – one from the upper portion and one at the depth of the suspected UST
D	Boring to specific depth - see Table 2-2 of the SAP. One SB per boring at depth
E	Boring to depth of former lift, approx. 8 - 10 ft bgs (at the interface of the fill and native soil). Two SB per boring – one from upper portion, one at depth
F	One SS sample (0 - 1 ft bgs) and one near-surface soil sample (1 - 2 ft bgs) at 2 locations
G	One SS sample (0 - 1 ft bgs). Per RI WP, one geoprobe may have been needed, but was not necessary based on site survey.
H	Boring to 35 ft bgs in attempt to reach groundwater. One SS and one SB per boring.
I	Boring to perched aquifer. Two samples per boring – one SS from 0 - 1 ft bgs, one SB at depth. Third sample would have been collected if staining/elevated PID readings were noted.
J	Borings to 10 ft bgs or perched aquifer (whichever encountered first). Two SB per boring: 4-5 ft bgs, 9-10 ft bgs or1-2 ft above GW, if GW is above 10 ft bgs One SS from 0 - 1 ft from each boring.

RE: Former Camp Hero, Formerly Used Defense Site (FUDS) Property # C02NY0024, Montauk, New York

Dear Ms. Pierpont:

We are planning to conduct a remedial investigation (RI) at the former Camp Hero, now known as Camp Hero State Park, which is about 5 miles east of the village of Montauk (see enclosed site map). Please note that this initial field sampling is the first phase of a two-phase study, both of which will be coordinated with your office. We expect that Phase 1 of the investigation at Camp Hero State Park will have no effect upon significant historic properties in accordance with Section 106 of the National Historic Preservation Act (NHPA) and implementing regulations at 36 CFR 800. We would appreciate your concurrence with this determination.

The former Camp Hero, consisting of 469 acres, was established in early 1942 as a coastal defense installation with three batteries (Battery 112, 113, and 216) and supporting facilities that included barracks, mess halls, hospital facilities, a motor repair shop, a recreation facility, sentry boxes, and water supply and sewage facilities. In 1952, the Air Force acquired a portion of Camp Hero that became known as the Montauk Air Force Station. Camp Hero site lands were transferred to State, local and Federal agencies between 1974 and 1984 and the Air Force station was closed in 1982. Currently, Camp Hero State Park (415.35 acres) is owned by the NY State Office of Parks, Recreation, and Historic Preservation.

The purpose of our two-phased investigation is to assess if former Department of Defense (DoD) activities at Camp Hero may have resulted in adverse environmental conditions. The purpose of Phase 1 is to determine the presence or absence of contamination at various areas of Camp Hero, while Phase 2 is to determine the nature and extent of contamination and whether unacceptable risks to human and ecological

health are present. This correspondence pertains to Phase 1 activities only; Phase 2 activities will be coordinated with your office at a later date.

Forty-four areas, identified in Table 6-1 (Enclosure 1) will be investigated; the investigation will consist primarily of soil and groundwater borings; sampling of liquid (from storage tanks identified); concrete chip sampling; as well as geophysical surveys for the locating underground tanks. In some cases, wipe samples will be tested for polychlorinated biphenyls (PCBs), and site/visual surveys will be conducted to locate boilers, drums, debris, and pits. Additionally, four areas have been selected along the bluffs (see attached figure) for visual inspection and use of a hand-held magnetometer to determine if these locations have been used as landfill or dumping areas. These areas were selected based upon an examination of historic aerial photography and earlier removal actions conducted in 2000 and 2002. Anomalies will be positively identified and avoided during Phase 1.

The Camp Hero State Park study area as a whole is potentially eligible for listing on the National Register of Historic Places (NRHP). In late 1960, an advanced Specific Frequency Diversity Search Radar was built to provide surveillance data of air traffic in the area for the Montauk Air Force Station's Aircraft Control and Warning Squadron. This radar, known as the Army-Navy/Fixed Pulse Radar Surveillance-35 Radar Tower and Antenna (AN/FPS Radar Tower and Antenna) was listed on the NRHP in 2002. Additionally, there are undisturbed areas of archaeological sensitivity within the State Park in addition to significant individual historic properties according to the NY State Historic Preservation Office database.

This is a limited sampling investigation consisting of visual, geophysical, surface, subsurface and groundwater and concrete chip samples in previously disturbed contexts. Impacts to historic properties are not expected during this phase. Access to Batteries 112 and 113 and Buildings 107 and 201 will be assessed; however, no structural impacts to the integrity of these structures will be permitted. At Building 201, the AN/FPS Radar Tower and Antenna, site assessment will consist of a survey to determine access, identify any staining, three PCB wipe samples, and one boring at any adjacent cesspool. Again, we expect Phase 1 of the investigation at Camp Hero State Park will have no effect upon significant historic properties in accordance with Section 106 of the NHPA and implementing regulations at 36 CFR 800. We would appreciate your concurrence with this determination.

If you have any questions regarding this matter, please contact me at 917-790-8235 or Mr. Marc Paiva, the Project Archaeologist and Tribal Liaison at 978-318-8796.

Sincerely,

Gregory J. Goepfert
Project Manager

REPLY TO
ATTENTION OF

Programs and Project Management Division

David Stilwell, Field Supervisor
U.S. Fish and Wildlife Service
New York Field Office
3817 Luker Road
Cortland, New York 13045

Dear Mr. Stilwell:

We are planning to conduct a remedial investigation (RI) at the former Camp Hero, a formerly used defense site (FUDS), which is located on the eastern tip of the south fork of Long Island, New York (NY), approximately 5 miles east of the Village of Montauk. The former Camp Hero, now known as Camp Hero State Park, was established in early 1942 as a Coastal Defense Installation; the facility changed ownership within the military multiple times over the course of the following decades. Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies, and the facility was permanently closed in 1982. Camp Hero State Park is operated by the New York State Office of Parks, Recreation and Historic Preservation.

The purpose of our two-phased investigation is to assess if former Department of Defense (DoD) activities at Camp Hero may have resulted in adverse environmental conditions. Forty-four Areas of Concern (AOCs) have been identified. These sites included former waste disposal and coal storage areas, abandoned drum locations, and former storage tanks. The AOCs are shown on Figure 1.

The RI technical approach will consist of two phases of field sampling investigation (Phase 1 and Phase 2). The primary objective of the Phase 1 investigation is to determine the presence or absence of contamination at the Camp Hero AOCs. The primary objective of the Phase 2 investigation is to determine the nature and extent of target constituents in soil, groundwater, surface water, and sediment at the Camp Hero AOCs and determine if there are unacceptable risks to human health and ecological health associated with exposure to related constituents. Proposed sampling activities at each AOC during Phase 1 are summarized in the attached table.

At most sites GeoProbe borings will be conducted to collect soils and groundwater samples. Care will be taken to minimize disturbance of vegetation to access the AOCs. Cutting of large trees (> 3" dbh) and snags will be avoided. Some sampling will occur inside abandoned buildings. Sampling activities will be suspended and the Long Island Field Office and New York Department of Environmental Conservation contacted if any bats are

encountered in the buildings. Phase I field work is expected to begin in April and be completed by June, 2016.

Please submit a letter with any concerns you have regarding the potential impacts of field sampling activities on threatened or endangered species pursuant to the Federal Endangered Species Act.

If any additional information is required please contact me at (917) 790-8235 or Mr. Michael Penko of the New England District Environmental Resources Section at (978) 318-8139.

Sincerely,

Gregory J. Goepfert
Project Manager

Re: USACE
Former Camp Hero Remedial Investigation, Camp Hero State Park
Camp Hero Road, Easthampton, Suffolk County
16PR02102

Dear Mr. Paiva:

Thank you for requesting the comments of the New York State Historic Preservation Office (SHPO). We have reviewed the provided documentation in accordance with Section 106 of the National Historic Preservation Act of 1966. These comments are those of the SHPO and relate only to Historic/Cultural resources. They do not include other environmental impacts to New York State Parkland that may be involved in or near your project. Such impacts must be considered as part of the environmental review of the project pursuant to the National Environmental Policy Act and/or the State Environmental Quality Review Act (New York Environmental Conservation Law Article 8).

As noted, the radar installation on the former base has been listed in the National Register of Historic Places and we believe the remainder of the camp may be eligible for the register. However, additional research will be required before a final determination on eligibility can be made. That stated it is the opinion of the NYSHPO that the scope of work proposed in this undertaking will have *No Effect* on those resources listed in or potentially eligible for the registers.

If I can be of any further assistance I can be reached at john.bonafide@parks.ny.gov or (518) 268-2166.

Sincerely,

John A. Bonafide
Director,
Technical Preservation Services Bureau

REPLY TO
ATTENTION OF

Programs and Project Management Division

Carrie Meek Gallagher, Regional Director
New York Department of Environmental Conservation
Region 1 Office
SUNY @ Stony Brook
50 Circle Road
Stony Brook, New York 11790-3409

Dear Ms. Gallagher:

We are planning to conduct a remedial investigation (RI) at the former Camp Hero, a formerly used defense site (FUDS), which is located on the eastern tip of the south fork of Long Island, New York (NY), approximately 5 miles east of the Village of Montauk. The former Camp Hero, now known as Camp Hero State Park, was established in early 1942 as a Coastal Defense Installation; the facility changed ownership within the military multiple times over the course of the following decades. Between 1974 and 1984, site lands were transferred to State, Local, and other Federal agencies, and the facility was permanently closed in 1982. Camp Hero State Park is operated by the New York State Office of Parks, Recreation and Historic Preservation.

The purpose of our two-phased investigation is to assess if former Department of Defense (DoD) activities at Camp Hero may have resulted in adverse environmental conditions. Forty-four Areas of Concern (AOCs) have been identified. These sites included former waste disposal and coal storage areas, abandoned drum locations, and former storage tanks. The AOCs are shown on Figure 1.

The RI technical approach will consist of two phases of field sampling investigation (Phase 1 and Phase 2). The primary objective of the Phase 1 investigation is to determine the presence or absence of contamination at the Camp Hero AOCs. The primary objective of the Phase 2 investigation is to determine the nature and extent of target constituents in soil, groundwater, surface water, and sediment at the Camp Hero AOCs and determine if there are unacceptable risks to human health and ecological health associated with exposure to related constituents. Proposed sampling activities at each AOC during Phase 1 are summarized in the attached table.

At most sites GeoProbe borings will be conducted to collect soil and groundwater samples. Care will be taken to minimize disturbance of vegetation to access the AOCs. Cutting of large trees (> 3" dbh) and snags will be avoided. We are coordinating the work with the New York Natural Heritage Program and will avoid impacts to any known rare plant populations. Impacts

to Eastern box turtle will be avoided by sweeping areas in advance of the track mounted GeoProbe for turtles. Some sampling will occur inside abandoned buildings. Sampling activities will be suspended and the Long Island Field Office and New York Department of Environmental Conservation contacted if any bats are encountered in the buildings. Phase I field work is expected to begin in April and be completed by June, 2016.

Please submit a letter with any concerns you have regarding the potential impacts of field sampling activities on listed species pursuant to the New York State Endangered Species Act.

If any additional information is required please contact me at (917) 790-8235 or Mr. Michael Penko of the New England District Environmental Resources Section at (978) 318-8139.

Sincerely,

Gregory J. Goepfert
Project Manager

Mike,

We have no threatened or endangered species concerns for this project. The tree cutting limits would cover any concerns regarding northern long-eared bats if they were present and the turtle sweeps are always a good recommendation.
If they happen to find any bat guano in any of those bunkers it would be nice know about that.
Thanks

~Kevin

Brendan, yes, sounds like you are good to go pending confirmation from Nicole from NY Parks.

Yes, the seedlings also have stellate hairs and are easy to identify. I didn't encounter any Viburnum dentatum var. lucidum (the stellate hair free variety- syn. Viburnum recognitum).

Regarding V. d. venosum distribution- it's everywhere at Camp Hero- extremely common- we even encountered several shrubs overhanging the parking lot where we meet then first day.

In a couple of locations it was so prevalent that we were hard pressed to find any route through.

Julie, sorry, but I didn't take any photos of the seedlings.

If any more assistance or questions are required regarding Camp Hero, don't hesitate to contact me.

Cheers,

Steve

Hi Julie and Steve,

I would expect that the seedlings would have the stellate hairs on the petioles like the larger shrubs but it would be nice to confirm.

Steve

Subject: Re: Viburnum dentatum var. venosum at Camp Hero State Park

Hi Steve

I have been kept in the loop with this project, so I can help you out. Nicole, the environmental analyst from OPRHP can send any additional thoughts or needs and confirm my recommendations.

This rare species has no federal status or regulations, and the DEC regs give OPRHP authority over the rare plants on its land; see page vi in the Rare Plant Status List
Blockedhttp://www.dec.ny.gov/docs/fish_marine_pdf/2010rareplantstatus.pdf

It is great you are taking the time to identify the rare Viburnum dentatum var. venosum (arrowwood) and avoid disturbing that plant as much as possible. I am not sure we could key out seedlings for certain either, but since the rare one is the dominant at this location, chances are these seedlings are the rare species. However, given the abundance of mature Viburnum d-v over a large area and the small scope of the disturbance you are creating (and mostly near structures as I recall), the loss of some seedlings for your project would have minimal impact on this population of Viburnum and would be acceptable. We appreciate the effort to date in taking measures to avoid impacts to the rare species and communities in the park.

If you have a chance to send me some geo-referenced photos of the Viburnum seedlings, I would be interested in having photos to add to our image database.

Subject: Viburnum dentatum var. venosum at Camp Hero State Park

Hi Steve, AECOM has been working with the US Army Corp of Engineers at Camp Hero State Park this week, conducting preliminary surveys on potential remediation sites. One of the target species provided by the New York Heritage Program at Camp Hero is Viburnum dentatum var. venosum (NY-S2). We have found this species quite abundant on numerous sites in Camp Hero and it appears the population is stable and thriving.

Some of the survey sites require vegetation clearance and the insertion of heavy equipment. At those sites I have been flagging specimens of V .d. var. venosum for preservation and have been consulting with the USACE to provide the best method of egress for equipment that avoids these specimens. The problem is that a few sites also have numerous seedlings of V. d. var. venosum that are almost impossible to avoid without employing extraordinary measures.

I write to you asking for guidance as to the NYDEC's tolerance for the possible destruction of a few seedlings in order to complete the surveys.

Please feel free to email or phone me at your convenience, or provide me with a contact if another NYDEC authority is required.

Cheers,

Steve

Julie,

Photograph of a seedling is attached (not my best work...). It was taken at the coal storage area. Brendan should be able to provide approx. lat/long.

Thanks for assisting with coordination.

Hi Steve – Good work. I have included Megan Cullen and Mike Penko and our team on this most recent email chain. It appears we may be good to go without extra measures for protection of seedlings for drilling at Camp Hero?

PUBLIC NOTICE

FORMER CAMP HERO
FORMERLY USED DEFENSE SITE
RESTORATION ADVISORY BOARD ASSESSMENT

The U.S. Army Corps of Engineers (USACE) is required to assess community interest in forming a Restoration Advisory Board (RAB) at Formerly Used Defense Sites (FUDS). USACE is issuing this notice to assess public interest at this site and determine whether the formation of a RAB is appropriate.

USACE is initiating a remedial investigation of the former Camp Hero, under the Defense Environmental Restoration Program for FUDS. The investigation will focus on previous USACE actions taken at the site (such as underground storage tank removals) and determine if further response actions are necessary.

The former Camp Hero, located in Montauk, Suffolk County, was utilized for training activities during the Revolutionary War, the War of 1812, the Spanish-American War, World War I and World War II. During and after WWII, it was a coastal defense installation. In 1951, an anti-aircraft artillery (AAA) unit used a firing range and conducted field exercises; in 1952, a portion of the site was used as the Montauk Air Force Station.

Today, the majority of the former Camp Hero is under the jurisdiction of the New York State Office of Parks, Recreation and Historic Preservation (as Montauk State Park); the Town of East Hampton controls a portion of the former Camp Hero used for housing.

A RAB is one of many methods USACE may use to facilitate public participation. Regardless of whether a RAB is formed, USACE will continue to involve the community in accordance with FUDS regulations. The RAB provides a collaborative forum for the community, government agencies, Indian nations, and property owners to discuss and identify the most efficient and productive means to clean up a site. A RAB should be established when there is sufficient and sustained community interest, and any of the following criteria are met:

1) The closure of an installation involves the transfer of a property to the community;
2) At least 50 citizens petition the installation for the creation of a RAB;
3) Indian nations, Federal, State or Local government representatives request the formation of a RAB: or,
4) The USACE determines the need for a RAB based on community responses to a solicitation for input, correspondence, media coverage, and other relevant information that show that there is sufficient and sustained community interest in the establishment and operation of a RAB.

The USACE-New York District welcomes public feedback regarding community interest in establishing a RAB for the Camp Hero FUDS. Inquiries or questions should be submitted within 30 days of this notice via mail to the U. S. Army Corps of Engineers, New York District, Mr. Gregory J. Goepfert, Project Manager, CENAN-PP-E, 26 Federal Plaza, Rm. 1811, New York, New York 10278. Within 60 days from publication of this notice, USACE will make a determination on whether a RAB will be formed. Individuals that express interest in forming a RAB will be notified via return U.S. mail of the USACE determination.

An Information Repository will be established at the Montauk Library, 871 Montauk Highway, Montauk, New York 11954, which will include the investigation work plan, and document the rationale for all remedial action decisions.

A project fact sheet has been placed at:

U.S. ARMY CORPS OF ENGINEERS – NEW YORK DISTRICT

"Sheila, Lou, and Kafka"
Fiction by Joan Colen

About 10 years ago, Sheila convinced Lou to take her on a sentimental journey to Prague and Budapest, a trip he never would have taken without her.

Lou loved France, especially Paris and its wonderful restaurants. As a bachelor he reveled in trips to Paris and the Loire. He was and still is a talented photographer. His pictures of France rival those of Cartier-Bresson, in his opinion. And in Sheila's too. Shy about showing his work in public, Sheila once sold his photos on a street corner near the Metropolitan Museum of Art just to show Lou they could sell. She placed them on a large blanket and hoped she didn't see anyone she knew on the Upper East Side where they lived. In a mere hour, his photographs of Paris were sold! Sheila was ecstatic, Lou was furious. It was before the days of digital and Lou had taken hours to print them. He didn't care that Sheila came home with a fistful of cash.

"You know how long it's going to take for me to do all those again?"

Lou also has spectacular photos of Venice and Tuscany, and the food is marvelous; but Prague and Budapest, stews and goulash, not to his taste. But Lou was a man who was resigned to pleasing his wife. The couple had been together for years and could finish each others' sentences, thoughts, and jokes. No one knew Sheila better than Lou. He had tolerated her PMS, sometimes foul mouth and was a comfort and support in her depression after a tragic miscarriage when the baby she carried would have been severely retarded if it had lived. But in general, they had experienced a lucky life so far. When Sheila suggested the trip, Lou acquiesced.

"I'll go even though I hear the food's bad."

"Lou, it's always about food. There are other things, Lou."

"Sheila, I notice you eat more than I do."

"Let's not get into this again. My grandfather was born near Prague, or was it his father. You know, the one who sold Beck's Bohemian Liniment, Good for Man and Beast."

"I know, Sheila, to the farmers up near Hudson, New York."

"Yes, well, they were lucky to come here, Lou. Some didn't. So I want to see it for myself. Mom always talked about it. I'm sure she wishes she had gone. And what about Kafka?"

"What about him? He was depressed. All of Eastern Europe is probably depressed."

"Not any more, Lou, times have changed. I want to see Prague, trace my roots; and I always liked Kafka."

"I know, like, the depressing movies you drag me to."

"Lou, we can't avoid sad things."

"Well, I'm not visiting a concentration camp, I have my limits."

Lou was like that. He avoided anything he knew would make him sad. There was a tendency in his family toward depression. And no wonder; his mother had lost her mother to a trolley car that hit her on Fifth Avenue. Lou's mother never talked about anything much, let alone tragedy. In her later years she went into a depression that even electric shock could not dissuade. Lou hates to talk about his mother.

The couple had spent some of their youth in the optimistic '50s, where first-generation and second-generation families tried to put the war behind them and all of America believed in an Oz-like happiness. There would be no more great wars; Ike would see to that. The family had prospered in real estate and textiles. There is no way that Lou wanted any reminder of bad times and the hatred that had blinded Europe.

There was good news and bad news on their trip. In Budapest on the Buda side, Lou found a really great restaurant. It was in a beautiful yellow townhouse surrounded by trees. The ceilings were high; a piano played bohemian rhapsodies. Lou held Sheila's hand and said it was romantic. When Sheila looked closely, as she always did, she saw the pianist was old, hunchbacked, and lecherous; he kept winking at her. But Lou with his cup always half full is happy. He doesn't notice who's playing; he just enjoys the music.

At the next table was a family celebrating the birthday of their daughter; perhaps she is nine or 10. A cake was brought to the table and "Happy Birthday" played. Lou loves watching children. Sheila, with her cup half empty, feels sad. She misses the childhoods of her own daughters now that they are grown up and far away. Lou leans over and kisses her on the cheek, and winks. Why does he love me so much? she is thinking.

They saw the sights and the large imposing synagogue, spared by the bombings somehow. It was impressive and filled with tourists; few congregants were left in this city with a once-thriving Jewish population. Sheila thinks again of her mother, how she would have loved being here.

"How come when we're away, we see every synagogue, Sheila, but when we're home you never set foot in one?"

"I don't know; just to feel connected. I'm going to bring Mother a booklet from the gift shop."

"Your mother doesn't go to temple either. What's with you, Sheila?"

"Look, Lou, if we had lived here then, we'd be dead. It just makes me think, and Lou, I'm warning you, in Prague, I need a tour of the Jewish Quarter. It's a must!"

So here they are in Prague, in the confines of the Jewish Quarter, on a hot summer's day, their first in Prague, trekking around with a group and a guide. They have meandered through the tiny cobblestone streets, Sheila thinking that her great-grandfather might have stepped on these same stones. They talk occasionally with their fellow travelers, all around their age, from places like Roslyn, Great Neck, or Forest Hills. The once-thriving Jewish ghetto is now a museum, a kind of Jewish Disneyland as if created for the eyes of tourists. There is even a museum built by the Nazis to show "the culture that did not survive." We fooled them, thinks Sheila. The group visited the famous Jewish cemetery where the headstones of the graves were piled on top of one another for generations; the Jews were allotted only a small piece of land to bury their dead. This was their inventive solution, the stones of their ancestors jammed together like tenements on the Lower East Side, no room to move or expand. Jewish graves piled one on top of the other in a segregated space.

"There's no room for the dead to breathe," joked Lou.

"That's not funny," said Sheila.

"Look, Sheila, you dragged me here. I told you it would be depressing."

"Shh, Lou, it's reality."

The Pincus synagogue was next. It was empty except for the thousands of names on its white walls, painted with block letters in red and black. The names were alphabetical, listing the dates of birth and death and the names of the camps where they had been murdered. And there Sheila found the names Meyer and Anna Bek, Treblinka, 1944.

"Lou, come here quick with the camera. I found Grandpa Moe's sister Anna. Take a picture for Mom."

Lou took the picture and was approached by a guard who told him no photos were allowed; but he had gotten the shot. On the way back to their hotel, Sheila wanted to see the picture.

"Will this really mean anything to your mother? You know she's been kind of vague lately."

"It means something to me. I saw the family tree. I know Moe had a sister Anna who stayed in Prague and was killed. It's got to be her, although the spelling is without a C. It's them, I know it. As a child, mother told me, relatives were begging for money and passage, but it must have been too late."

Sheila was crying; Lou was distressed.

"I found a restaurant in the Four Seasons; it gets a 28 in Zagat's. Get dressed up, I'll take you there tonight."

All through dinner Sheila thought of the lost family. She didn't enjoy the meal. Lou was disappointed. The fish was bland, the meal overpriced.

"I just knew we couldn't find a decent restaurant here," said Lou.

"Lou, there's more to life than food."

The next day Sheila convinced Lou to visit the Kafka museum. It was the second to last day of the trip.

Outside the museum was the last laugh Lou would get. There was a water fountain — two men peeing. The water flowed from each penis.

"Sheila, put your hand around a penis; let me get a shot!"

"No thank you, Lou."

Once inside the dark and strange museum, no one was laughing. Sheila had read a little Kafka in college. She knew that he was one of the great 20th-century writers, a Jew who wrote in German. A Jew who had made Prague the background of his stories. She loved "Metamorphosis," not sure she understood it. She thought maybe Gregor Samsa was crazy or maybe funny. She knew he was trapped. It was all about being trapped with Kafka; she knew that much.

The museum conveyed that same feeling. There were exhibits of his work and pictures of Prague in his day. There was this ominous feeling that came over Sheila that day. Something bad was going to happen. She thought she heard the sound of insects, roaches clicking like Samsa, who was a man who turned into a cockroach. That's how Kafka must have felt with a mind such as his, trapped working in an insurance office, trapped in the bureaucracy of a society that must have shunned him. On the second level of the odd museum was a replica of the torture machine pictured in his story "The Penal Colony." Kafka's relatives, too, had died in the camps. How he had foreshadowed the coming of Fascism and even Communism in his stories. What a genius!

After they left the museum, the couple held hands as they walked across the King Charles Bridge.

"I need a drink, " said Lou. "Next time I pick the country. Somewhere happy like Spain."

"Bad stuff happens everywhere, Lou."

On their last day, they decided to take the number 25 tram, which made a loop around the entire city. A couple on their tour had recommended it. They bought tickets and took their seats.

Then they were approached by five burly young men wearing black shirts.

"Tickets plees?" said one of the black shirts.

"Who are you?" said Sheila.

"Tickets plees?" another black shirt in a louder voice.

Lou fumbled in his pockets for the bus tickets.

"Not validated," they said in unison. "Off the bus." The other passengers looked on in silence as if they were afraid to interfere.

"What?" asked Sheila. "No one told us about validated. We paid for the tickets!"

One black shirt pointed to a machine near the entrance to the tram, "Walidated there. Get off bus!"

"Stand up, Sheila, don't argue," said Lou.

Sheila thought of Kafka as one burly black shirt gave her a push as she attempted to leave the tram.

"Passport plees," one said as they were on the street.

"They're in our hotel. We don't carry them. We're senior citizens. What do we know, this is unfair. I may call the embassy. I want a policeman."

"Sheila, don't make it worse!"

"You pay fine. Two thousand kroners."

"Shit," said Lou, "that's like two hundred bucks."

"ATM there."

How convenient, thinks Sheila as she withdraws the money from her account. She feels violated, and guilty for some reason. Lou could have had a terrific meal somewhere for the cost of this fine. She handed the money over and felt rather stunned by the whole day.

As the couple crossed the Charles for the last time in a despondent daze, Sheila felt the ghost of Kafka, laughing.

Lou had the last word: "I knew I didn't want to come to Prague."

—

INTRODUCTION

The Hydrologic and Environmental Analysis Branch of the Warfighter Support Directorate was tasked to search, collect and quickly review historical aerial photography from 1940-1982 searching for features associated with dumps within the former Camp Hero boundary in Montauk Point, New York.

This report contains a summary of potential locations, along with a list of spatial data collected from 1940-1982.

This study was completed for the U.S. Army Corps of Engineers (USACE), New York District, New York, New York.

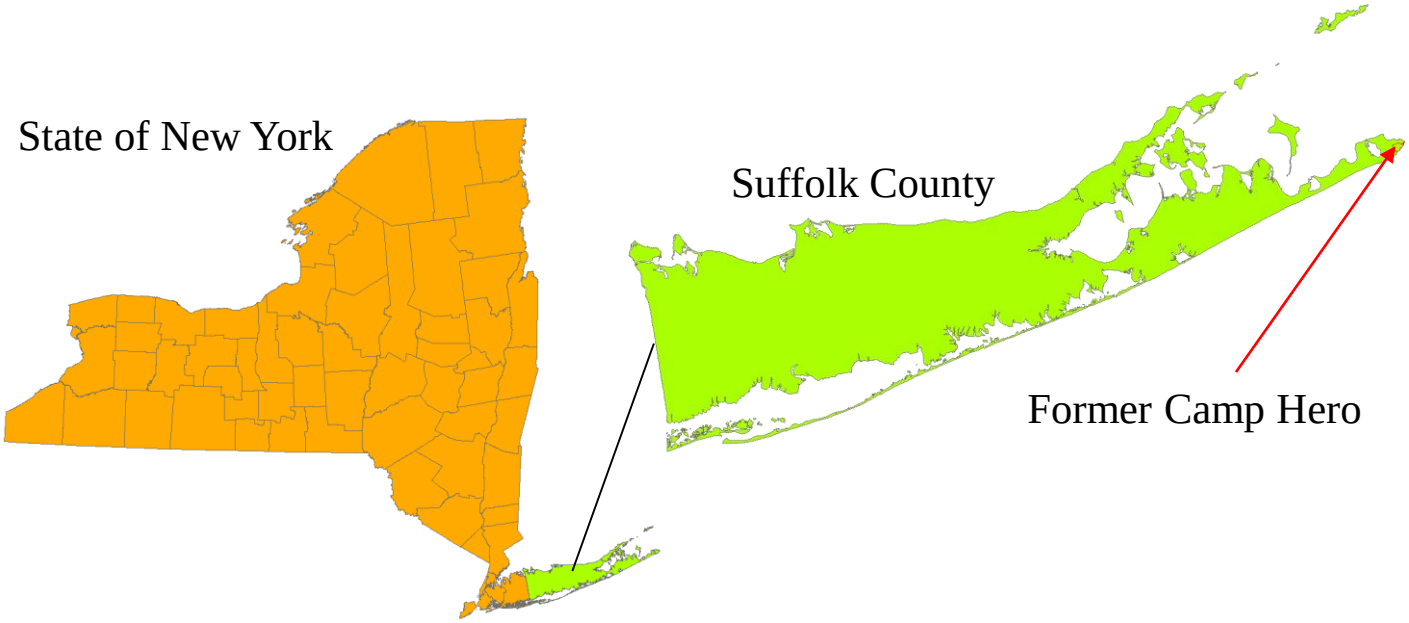
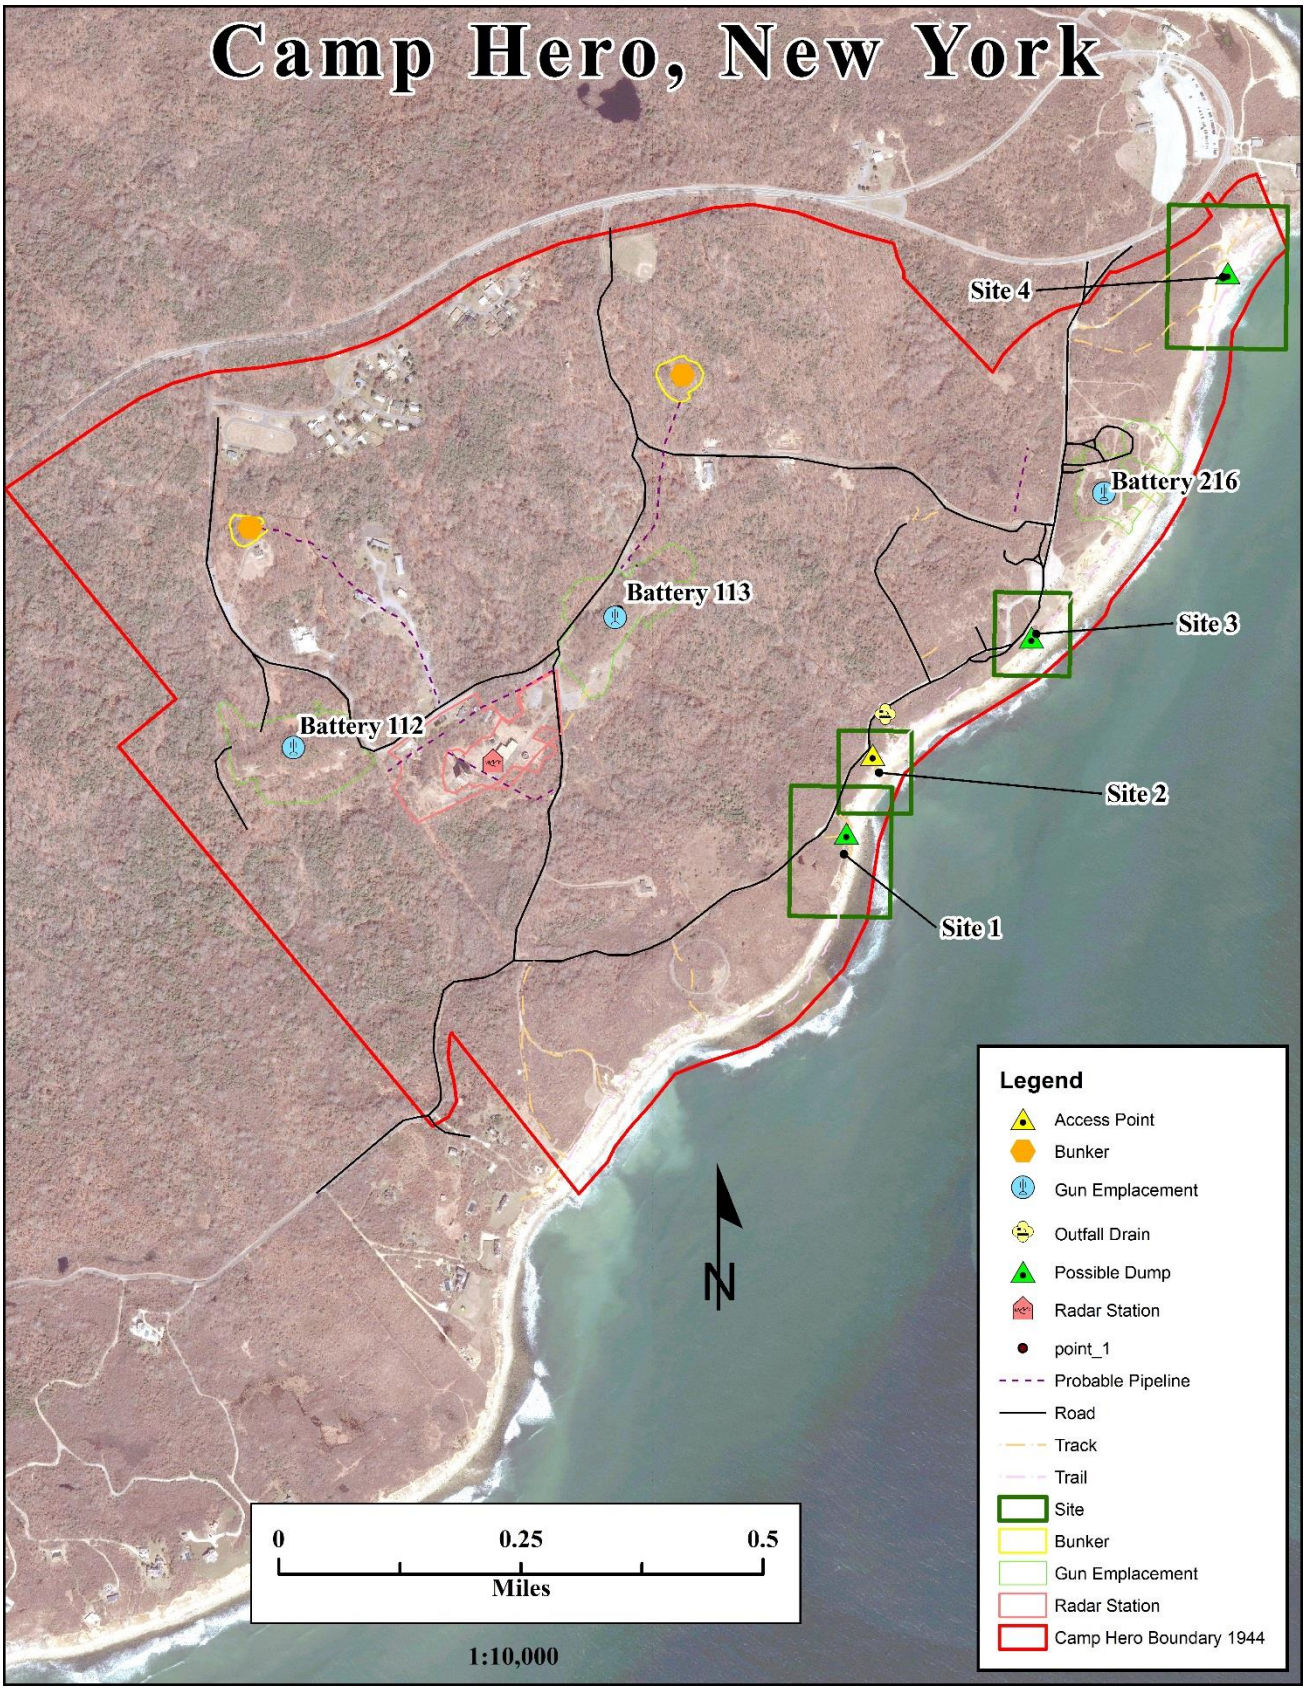
PROJECT AREA LOCATION
FORMER CAMP HERO, NEW YORK

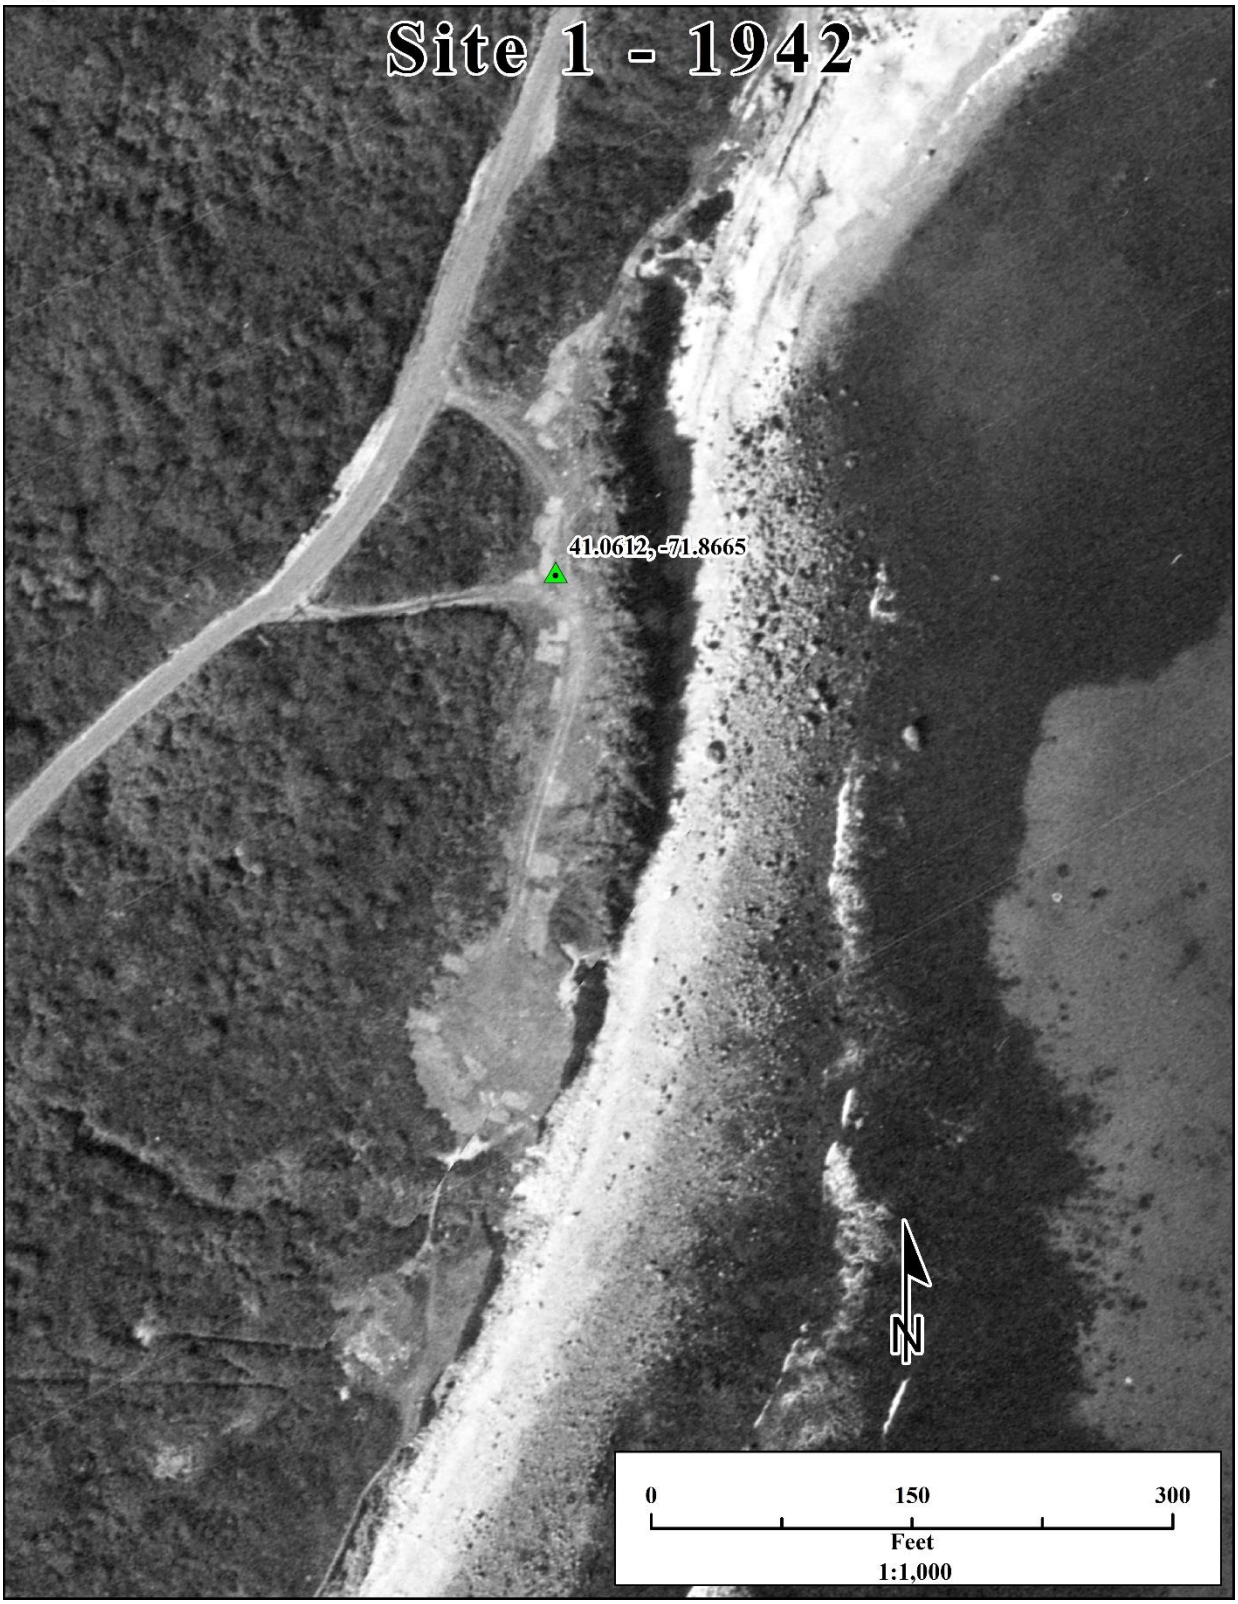


Area of Interest

= Former Camp Hero boundary lines

Site Locations
1940-1982





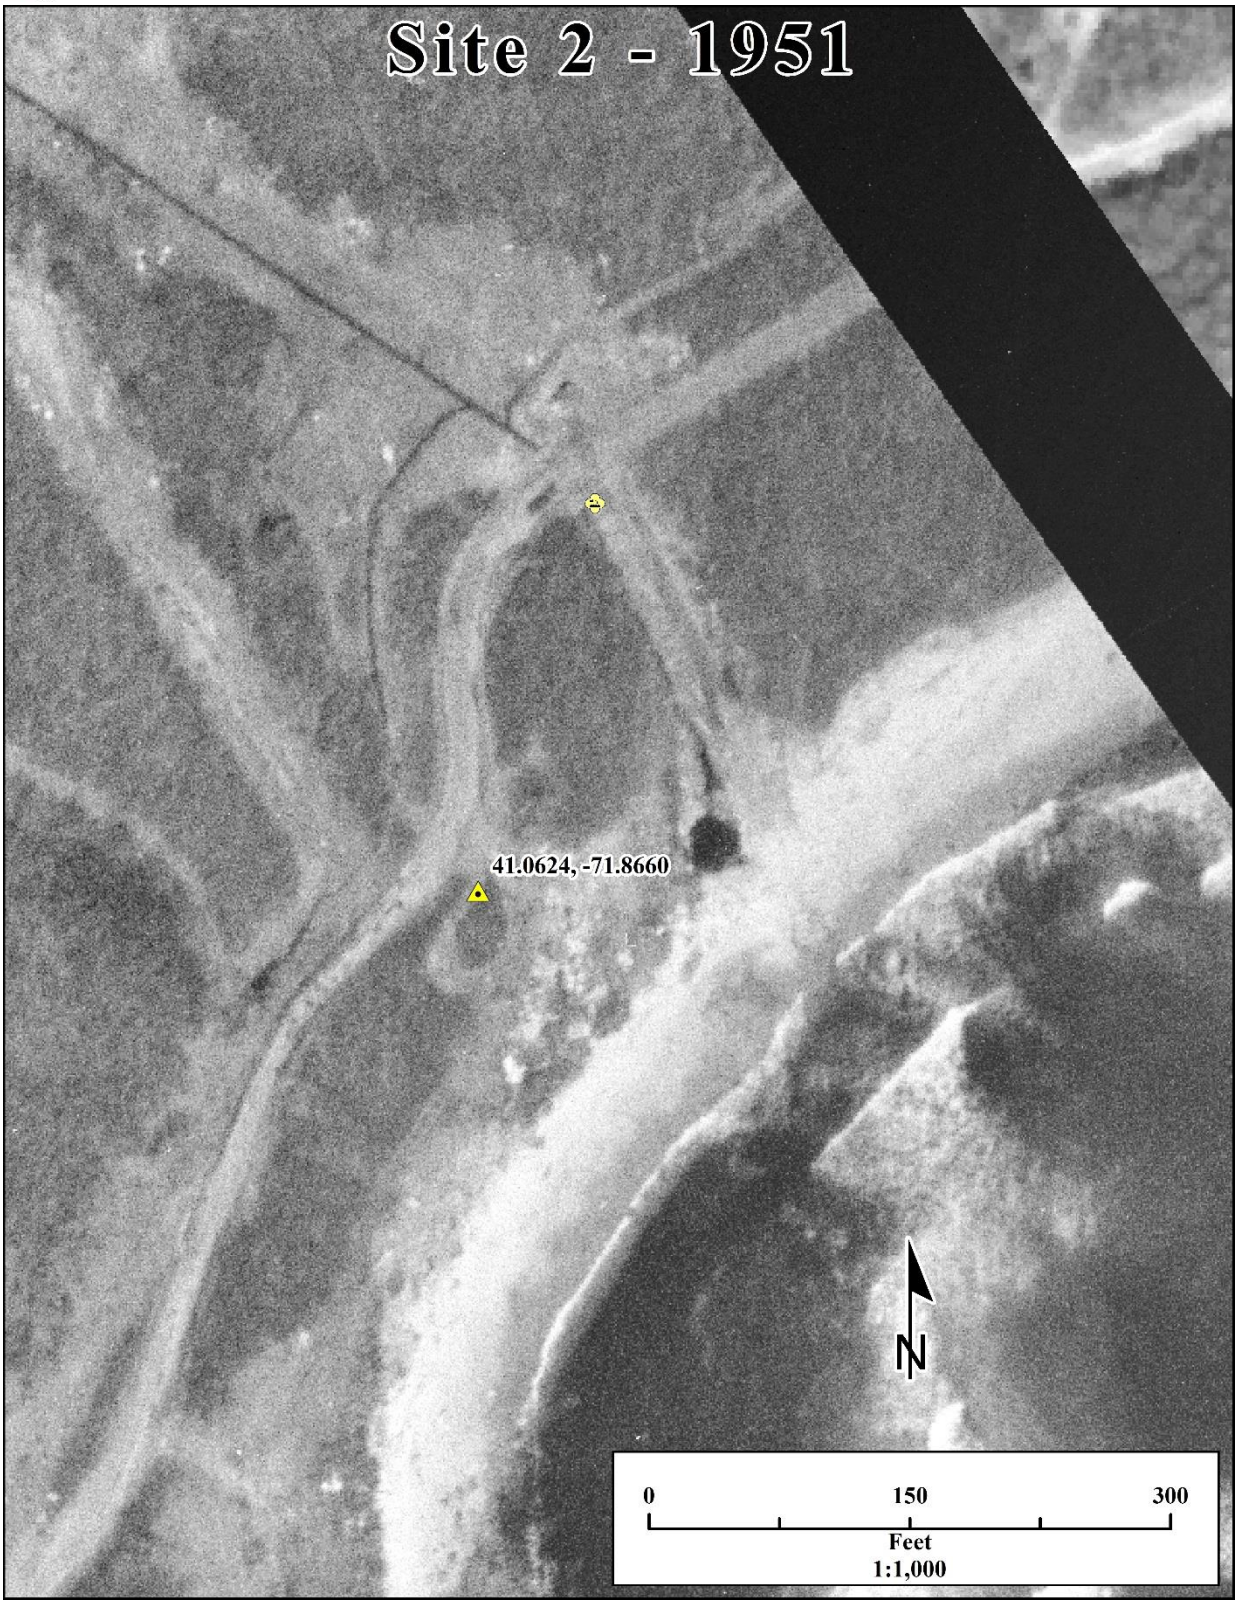
Access to a cleared area from main roadways indicates that this could be a possible dump location. Vehicle tracks are clearly visible and there is access to the bluff.

No aerial photographic evidence of waste piles or dumping is observed in 1951.

Possible erosion or slope failure is observed in 1962 in the area of possible dumping (noted by arrow). Vehicle tracks are observed in the beach area.

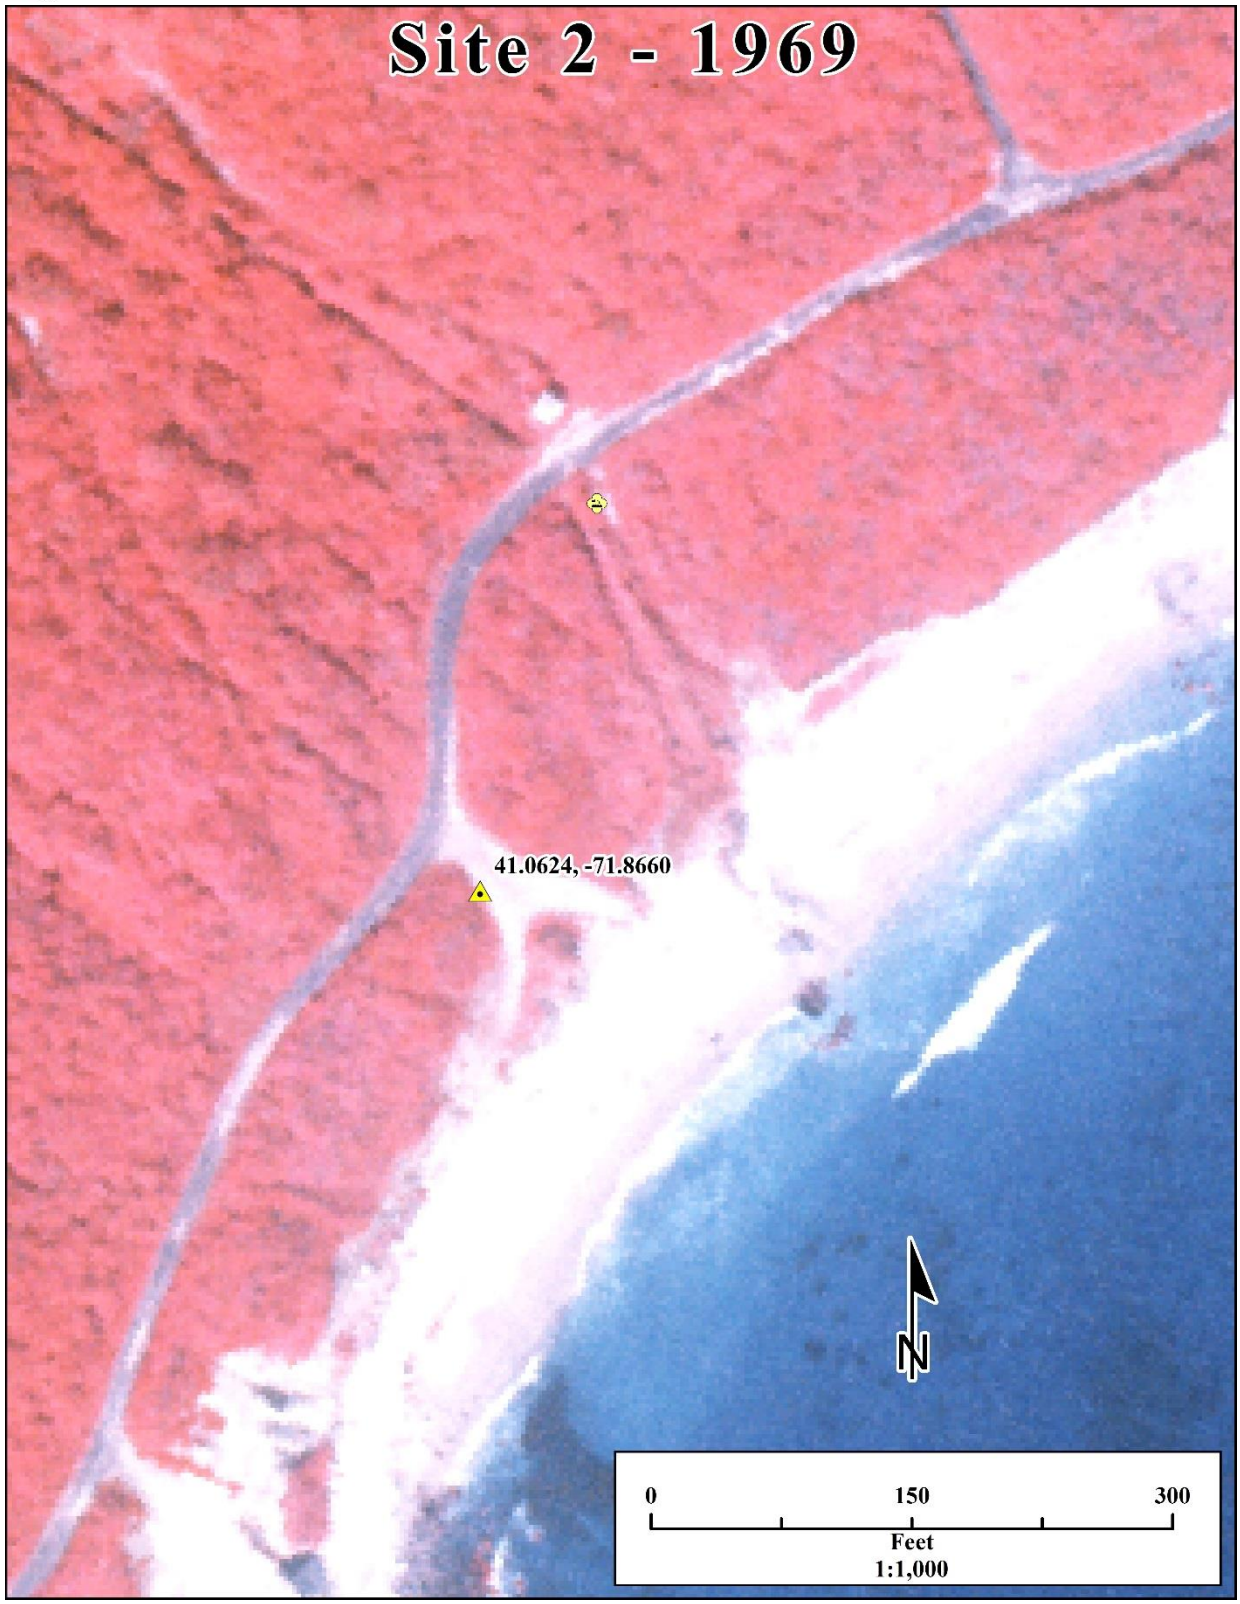
No evidence of waste piles or dumping is observed in the 2013 satellite image.

Access from the main roadway to a cleared area on the beach indicates that this could be a possible dump location. Vehicle tracks are clearly visible in this area.



Possible erosion and/or slope failure near the access point from the roadway is observed in the 1951 aerial photograph. It's possible that dumping could have occurred at this point, as there are vehicular tracks leading to and from this area. No clear, obvious evidence of waste piles or dumping is observed in 1951. Note: Low spatial resolution of this photograph does now allow for the identification of waste piles or dumping.

No aerial photographic evidence of waste piles or dumping is observed at Site 2 in 1962.



No significant activity is observed at the site in 1969. Note: In this color-infrared photograph, vegetation appears red in color. Also, low spatial resolution of this image does now allow for the identification of waste piles or dumping.

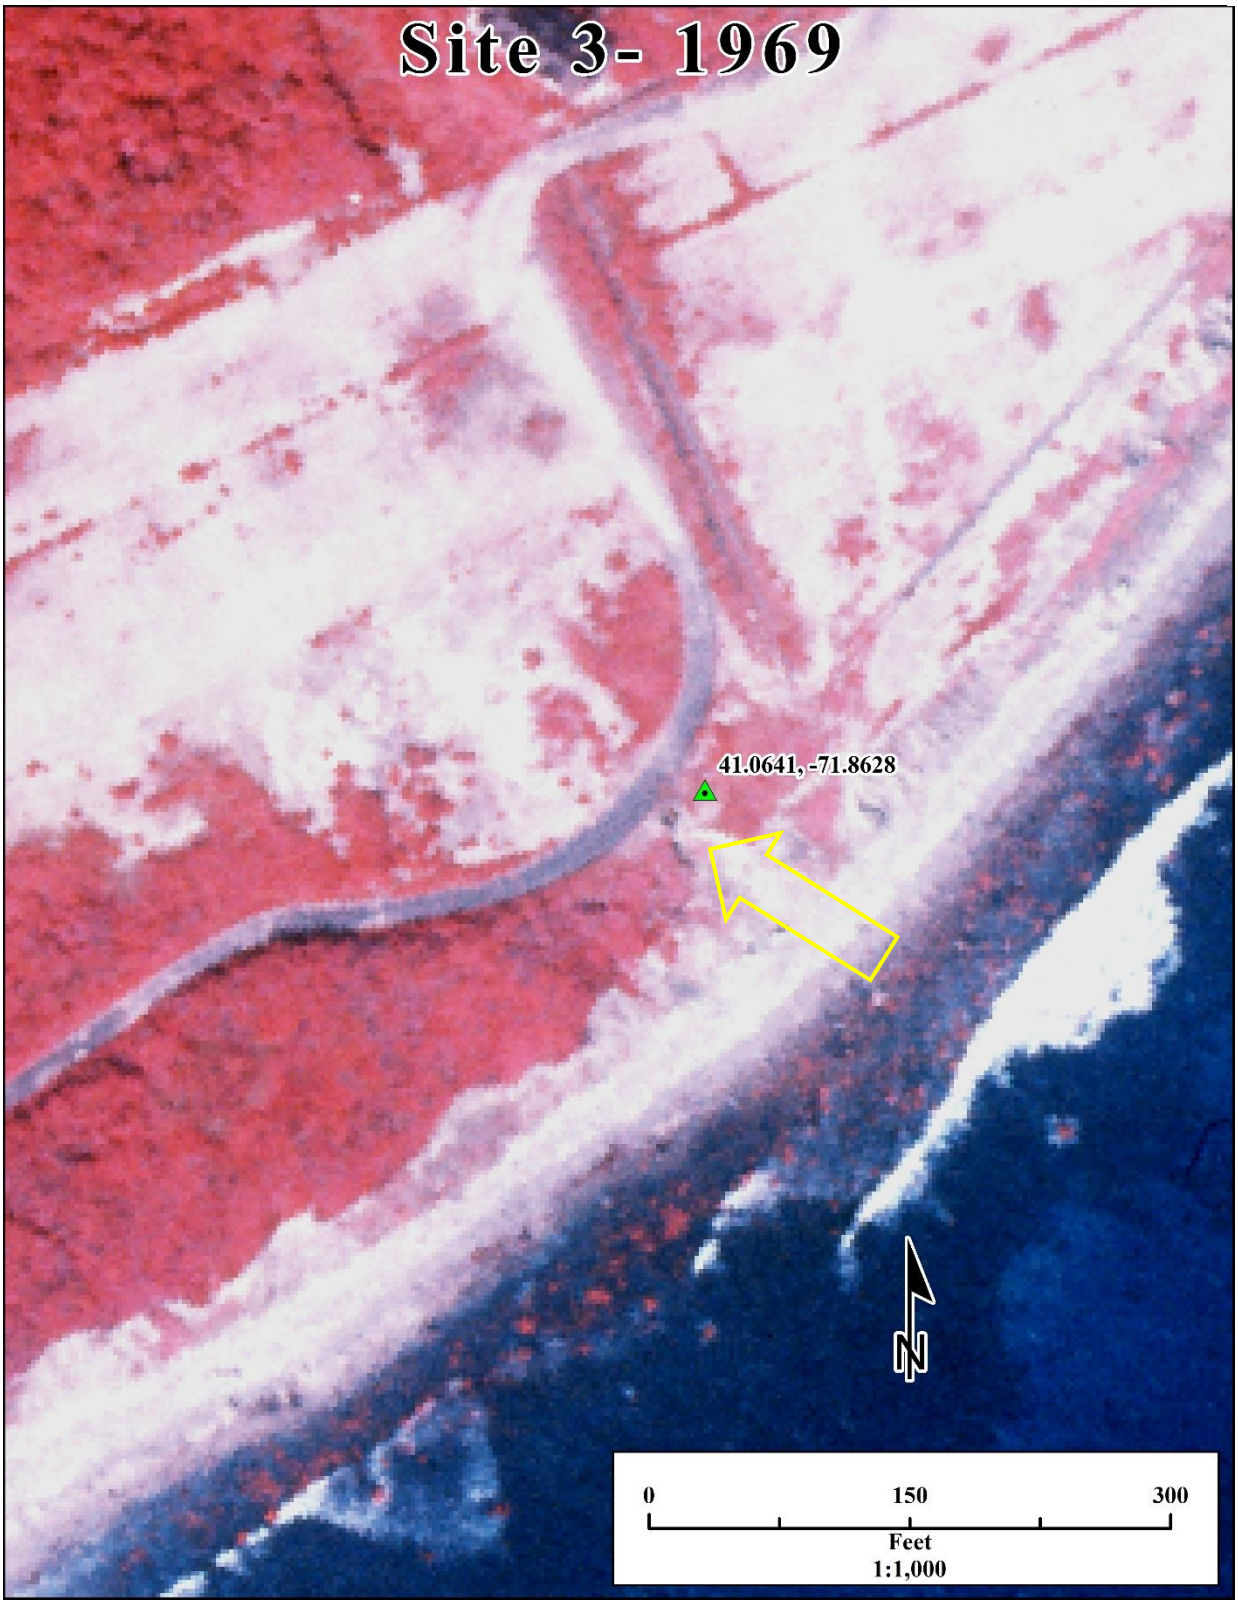
No aerial photographic evidence of waste piles or dumping is observed at Site 2 in 2013.

Site 3 is an area where possible dumping could have occurred; however, no dumping-related activity is observed in 1942. Note residential houses are observed in 1942, as well as open storage of drums at the top of the image.

Major clearing of the property north of the possible dump site is observed. Heavy vehicle tracks are also observed in 1954 aerial photograph. Access to the bluff and beach are evident at this locations and dumping could have occurred during this clearing. The activity in this photograph is the same activity seen in the 1961 photograph on the next page. Material can be observed; however, coupled with the evidence seen from the finer resolution of the 1961 image, there is no direct evidence of dumping or waste piles observed in 1954. Note that houses from 1942 have been removed.

Continued activity, evidenced by vehicle tracks, is observed north of possible dump site. Possible debris, excess grading material, and/or accumulation of rock material due to slope failure is observed at the site.

Continued activity, evidenced by vehicle tracks, is observed north of possible dump site. Possible debris, excess grading material, and/or accumulation of rock material due to slope failure is observed at the site.

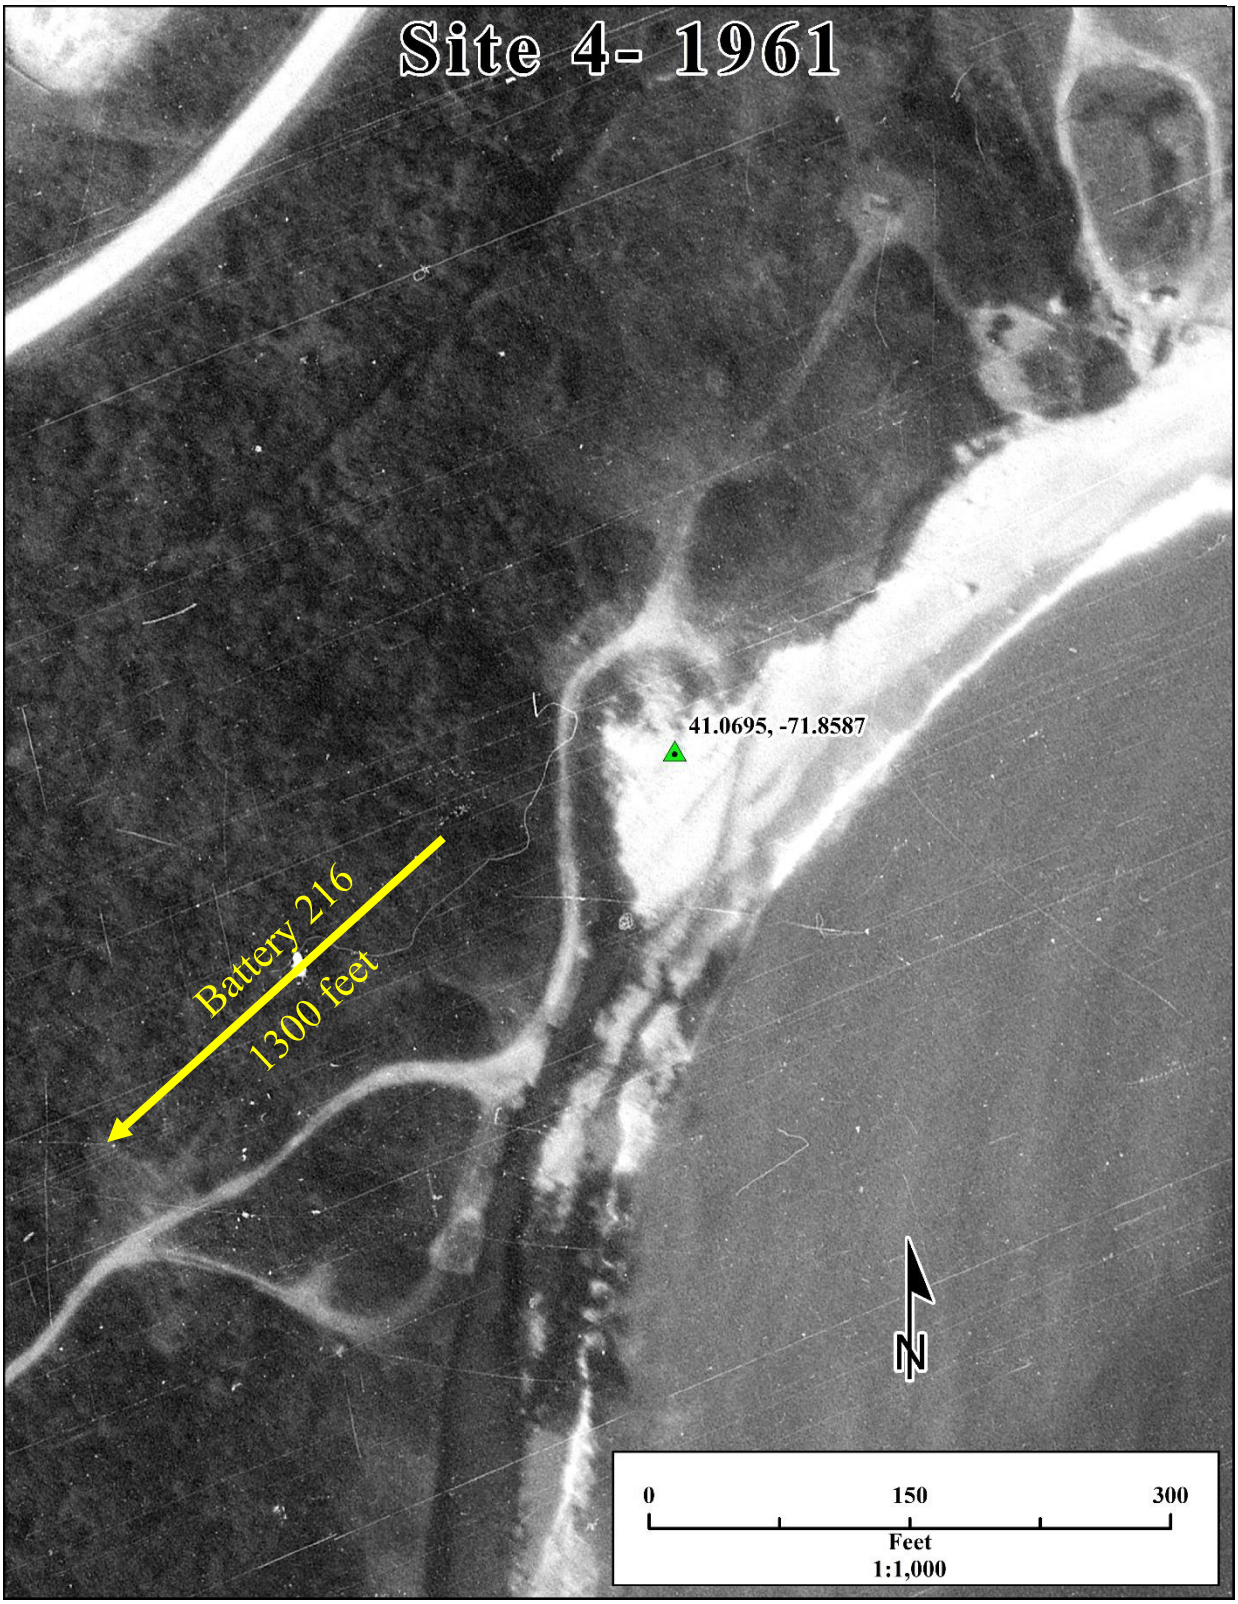


The lack of vegetation observed at the site could be indicative of continued erosion and possible slope failure identified by arrow. Note: In this color-infrared photograph, vegetation appears red in color.

The formerly cleared areas north of Site 3 have been revegetated. No aerial photographic evidence of waste piles or dumping is observed at Site 3 in 2013.

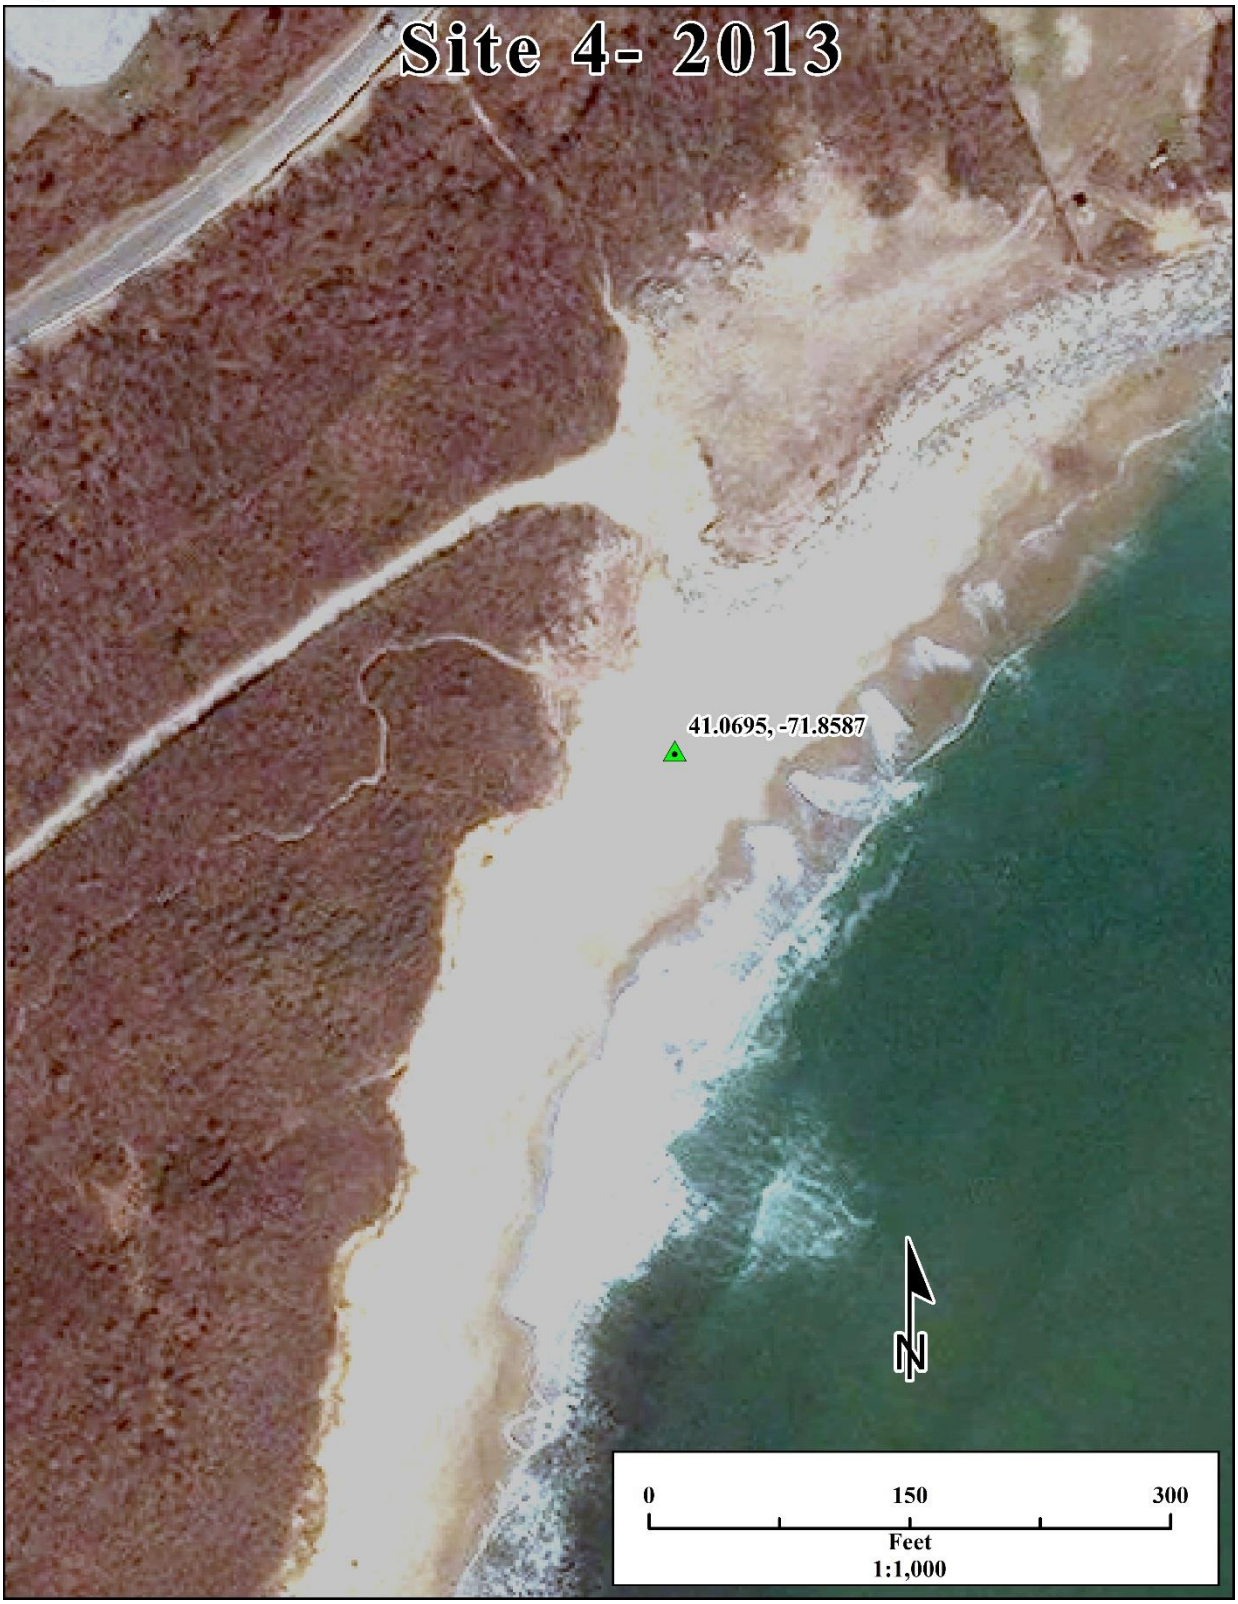
Although no significant dumping or activity is observed at Site 4 in 1942, subsequent years indicate the site could have been an area used for dumping.

Tracks leading to and from the main roadway indicate the area was accessed in 1954.



In improved track leading from Battery 216 appears in the 1961 aerial photography. This area could have been a possible dump area north of Battery 216.

A small building appears 125 feet north of the possible dump site in the 1969 aerial photograph. There does not appear to be any direct evidence of dumping at the site (accumulated debris or piles of material). Note: In this color-infrared photograph, vegetation appears red in color.



Structures at Site 4 have been removed. No evidence of waste piles or dumping is observed at Site 4 in 2013.

CONCLUSIONS, LIMITATIONS & RECOMMENDATIONS

CONCLUSIONS

There was no photographic evidence of debris accumulation suggestive of a dump in the years collected within the timeframe of this project. There are four areas where dumping could have taken place (access points to cleared areas near or along the bluff during different years within the timeframe) and are identified within this report. Area 3 is the only site where significant material can be seen. This area could have been a potential landslide or contain piles of debris or material, given the activity adjacent to this area when the material can be seen, indicates possible dumping activity and should be further reviewed. There is significant activity observed around the location of Battery 216 (Site 4) during construction, but no features signifying long term dumping activity were identified per Conversation Record 1-2: James Schneidmuller, 1969-1993, "he knows of no landfill on the former camp, however there is evidence of an Army dumping station trash off the bluff by battery 216 into the ocean". The proximity of the other areas (Areas 2-3 south and Area 4 north) around Battery 216 could be associated with James' comments, but do not directly support the site association.

LIMITATIONS

The quality of photography collected during this project's limited timeframe contains a mix of spatial resolutions; only one or two years possess a resolution quality high enough to visually identify smaller dumping activities. Additional years of photography are available and should be analyzed to rule out potential dumping activities. Analysis should also include finding and incorporating historical cartographic material and textual documents in order to verify or rule out any evidence of landfills or dumping. For example, the area identified are part of the AAA Firing Point area delineated on the Facility Layout Map (Archive Search Report, Plate 3). More research into the details of the activities of AAA Firing Point area could provide more insight into possible dumping, burial, or landfills along the southeastern coast of Former Camp Hero.

RECOMMENDATIONS

A full Historical Photographic Analysis, including a report and GIS package, is recommended. This process would include additional years of photography as well as a thorough analysis of the entire area. Irregularities within the existing photos reviewed indicate additional areas that should be reviewed further. In addition, the long history of the site area (to include the larger Camp Wikoff) limits some feature confirmation due to prior activity in the area, so including investigating activity at the site through research in the form of maps, available photography, and textual records is highly recommended.

June 01st, 2016

Mark MacEwan, P.E.
Senior Program Director, AECOM
3101 Wilson Boulevard, Suite 900
Arlington, VA 22201
D 703.682.9092; mark.macewan@aecom.com.

Mr. MacEwan:

According to the Scope of Work (SOW) pertaining to supporting the overarching former Camp Hero Remedial Investigation (RI) Work Plan (WP) and other planning documents, AECOM intends to check the sites for indicators of residual utilities or unique subsurface features still in place. As part of the contract, subsurface soil samples and/or groundwater samples are required to be acquired near subsurface pollution source features (e.g., underground storage tanks [USTs], above ground storage tanks [ASTs], fuel pump houses [FPHs], waste dumps) without damaging or puncturing military installation infrastructure. Therefore, prior to the sampling activities, Digital Geophysical Mapping (DGM) surveys were planned as a proactive supplement to narrow down the search areas for specific installation infrastructure of interest for subsequent sampling activities. This process will supplement the local public utilities 1-call services as part of utility mark-outs as those only cover active utilities emplaced by the local government. As part of the DGM survey, the following areas were required for assessment of residual installation infrastructure features within the confines of pre-defined search areas at the Camp Hero facility:

- Tank A – Building 0020 – Fire Department, suspected former UST location(s)
- Tank B – Building 0022 – Kitchen/Office, suspected former UST location(s)
- Tank C – Building 0002 – Barracks, suspected former UST location(s)
- Tank D – Building 104R – Commissary, suspected former UST location(s)
- Tank E – Building 3001 – AT&T/Lilco, suspected former UST location(s)
- Tank F – Building FPH – suspected former UST location(s), hazardous materials
- Tank G – Building FPH – suspected former UST location(s),
- Tank 35 - Building FPH – large AST as part of the pump house(s)
- Vaults – Batteries 0216 – unknown use, potential storage or vaults
- Waste Area – Building 0113 – Plotting Room, potential storage or waste dump site

The intent of the geophysical surveys at each of the above sites is to: (a) verify the outline of a tank (if still exists), (b) identify the extent of residual subsurface features, and (c) examine the general vicinity to support the safe subsurface sampling within close proximity to key features.

1.0 FIELD SURVEY NOTES

The field survey methods consisted of a combination of electromagnetic (EM) Digital Geophysical Mapping (DGM) and magnetic (MAG) Analog Geophysical Mapping (AGM) metal detection surveys, at 5-ft increments, within the bounds of passable areas within the bounds of

each pre-marked survey area. The DGM was completed using the Geonics EM61-MK2 in relatively open areas while AGM, using a Schonstedt GA-72cd, was reserved for vegetated areas not maneuverable using DGM methods. After each set of sweeps and/or analyses, interpreted locations were relocated, marked, and annotated as to whether a surface feature coincides. As a footnote, the survey techniques will only verify the rough dimensions of a subsurface metal object, not necessarily verify the object is the tank unless inferences can be made because the expected location of the tank matches the outlined location of the tank. Regardless, the objects identified are large enough and should be avoided during sampling or any subsurface investigation activities. The field survey logbook notes in **Attachment A** catalogues file names, field procedures, and surface features pertinent to the process of interpretation of subsurface metal detection data. The expected locations of the tank(s) along with proposed sampling locations, as excerpted from the WP, are provided in **Attachment B** for reference. Lastly, a summary of field surveys with preliminary interpretations specific to each area are as follows. For reference to the text below, the final interpretation maps are provided in **Attachment C**.

1.1 *Tank A – Building 0020*

The findings are shown in **Figure 1** (i.e. a side-by-side representation of the full-sized map Figures B-1, C-1) and summarized by the following:

- Inferred utility junctions, documented culvert end-points, and confirmed fence-line / building infrastructures are identified on the geophysics map
- UST identified in the Figure B-1 could not be identified in C-1 due to the interference from the fence-line observed on surface, which implies the tank was removed as a tank-sized object was not detected elsewhere on survey data
- No unique features were identified which should require new sampling locations
- Utilities should be avoided during subsurface sampling activities

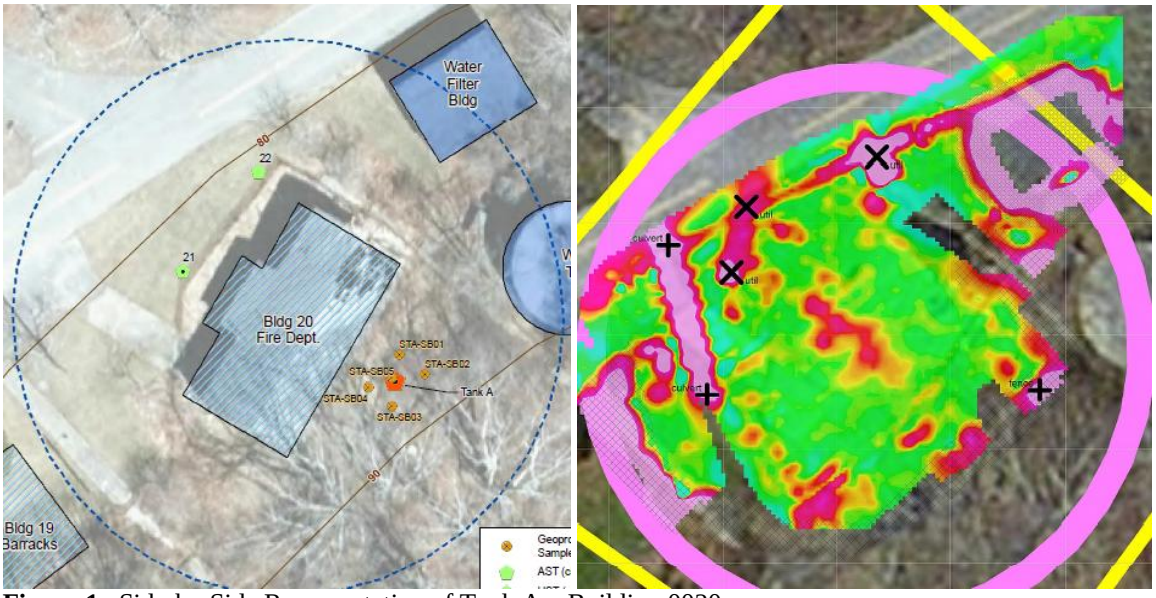

Figure 1. Side-by-Side Representation of Tank A – Building 0020

1.2 *Tank B – Building 0022*

The findings are shown in **Figure 2** (i.e. a side-by-side representation of the full-sized map Figures B-2, C-2) and summarized by the following:

- Inferred utility connections, documented manhole, speed-bump, and well, along with confirmed building infrastructure are identified on the geophysics map
- UST identified in the Figure B-2 appears to be identified in C-2, either in the form of a full-sized tank or the remnant infrastructure associated with the tank
- No unique features were identified which should require new sampling locations
- Utilities should be avoided during subsurface sampling activities

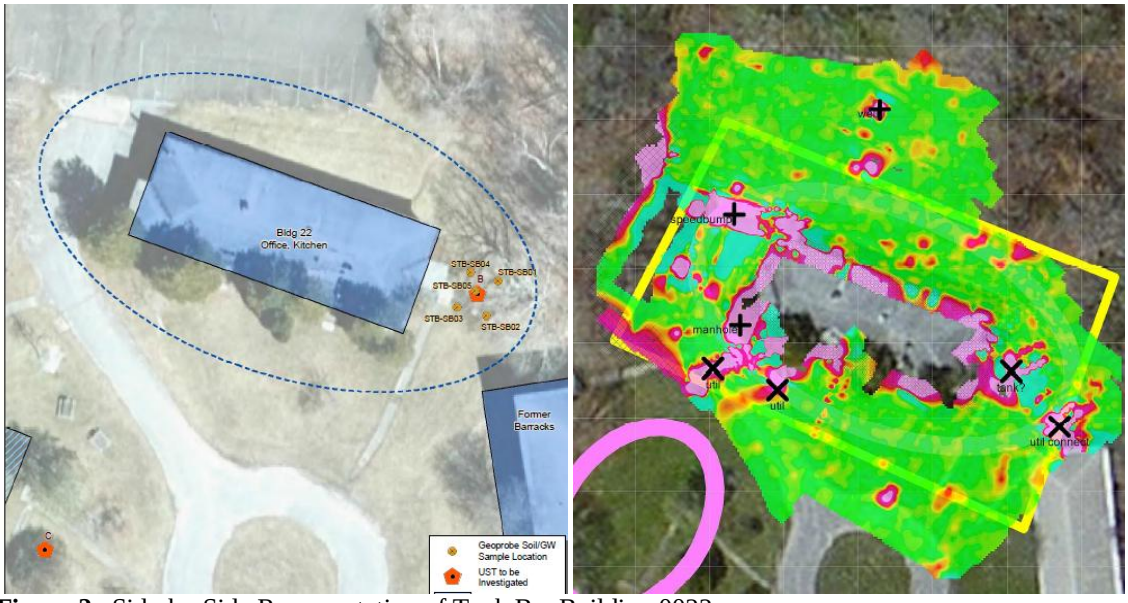

Figure 2. Side-by-Side Representation of Tank B – Building 0022

1.3 *Tank C – Building 0002*

The findings are shown in **Figure 3** (i.e. a side-by-side representation of the full-sized map Figures B-3, C-3) and summarized by the following:

- Inferred utility connections along with debris from former building infrastructure are identified on the geophysics map
- UST identified in the Figure B-3 appears to be identified in C-3, either in the form of a full-sized tank or the remnant infrastructure associated with the tank
- No unique features were identified which should require new sampling locations
- Former building infrastructure and utilities should be avoided during subsurface sampling activities as investigating theses area could damage equipment, along with potentially destroying infrastructure or harming personnel

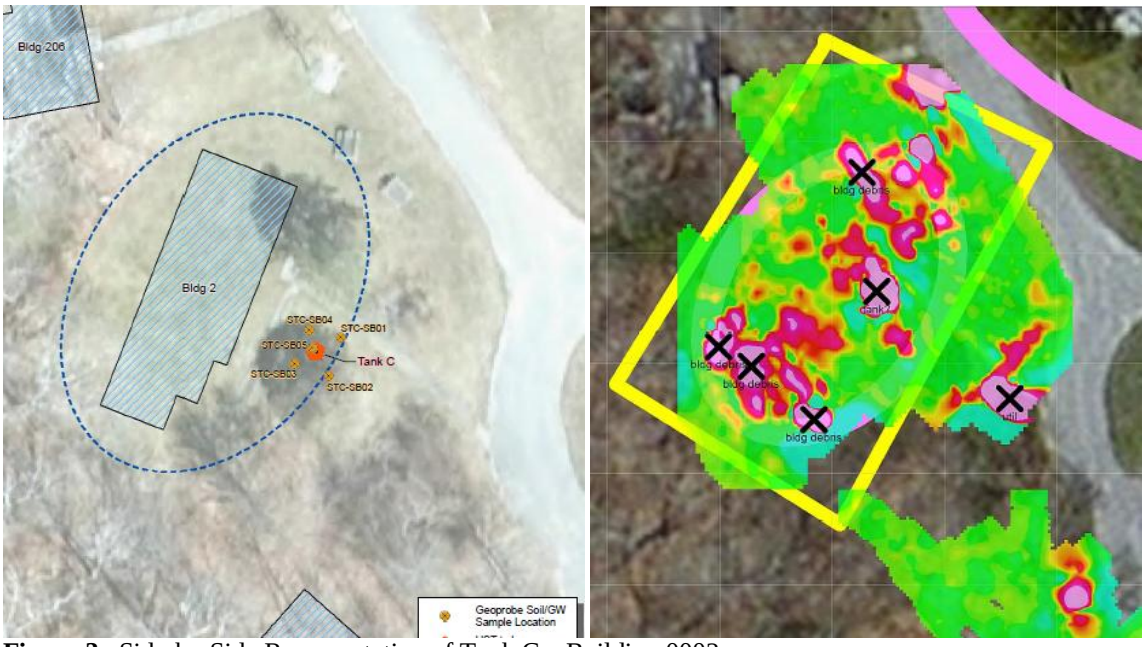

Figure 3. Side-by-Side Representation of Tank C – Building 0002

1.4 *Tank D – Building 104R*

The findings are shown in **Figure 4** (i.e. a side-by-side representation of the full-sized map Figures B-4, C-4) and summarized by the following:

- Inferred abundance of utility connections along with former building and concrete pad infrastructure are identified on the geophysics map
- UST identified in the Figure B-4 could not be identified in C-4, which implies the tank was removed and the tank was not detected elsewhere on survey data
- No unique features were identified which should require new sampling locations
- Former building infrastructure and utilities should be avoided during subsurface sampling activities as investigating theses area could damage equipment, along with potentially destroying infrastructure or harming personnel

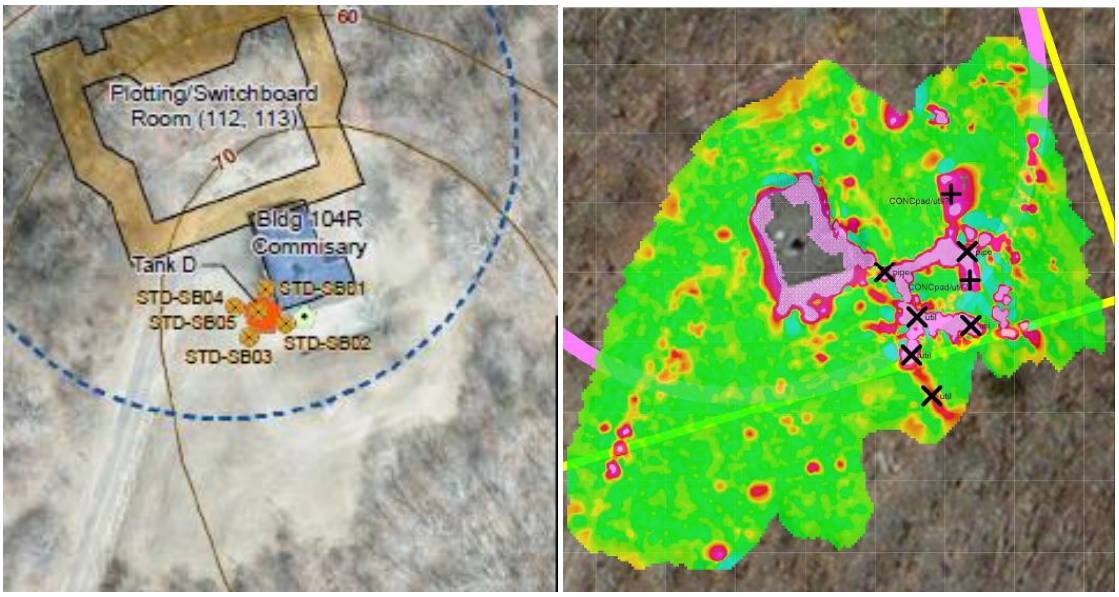

Figure 4. Side-by-Side Representation of Tank D – Building 104R

1.5 *Tank E – Building 3001*

The findings are shown in **Figure 5** (i.e. a side-by-side representation of the full-sized map Figures B-5, C-5) and summarized by the following:

- Confirmed building and fence-line interference, along with verified manholes and telephone pole surface features are identified on the geophysics map
- UST identified in the Figure B-5 could not be identified in C-5 due to the interference from the building, cars, and other metal debris observed on surface
- No unique features were identified which should require new sampling locations
- Current utilities should be avoided if subsurface sampling activities are conducted

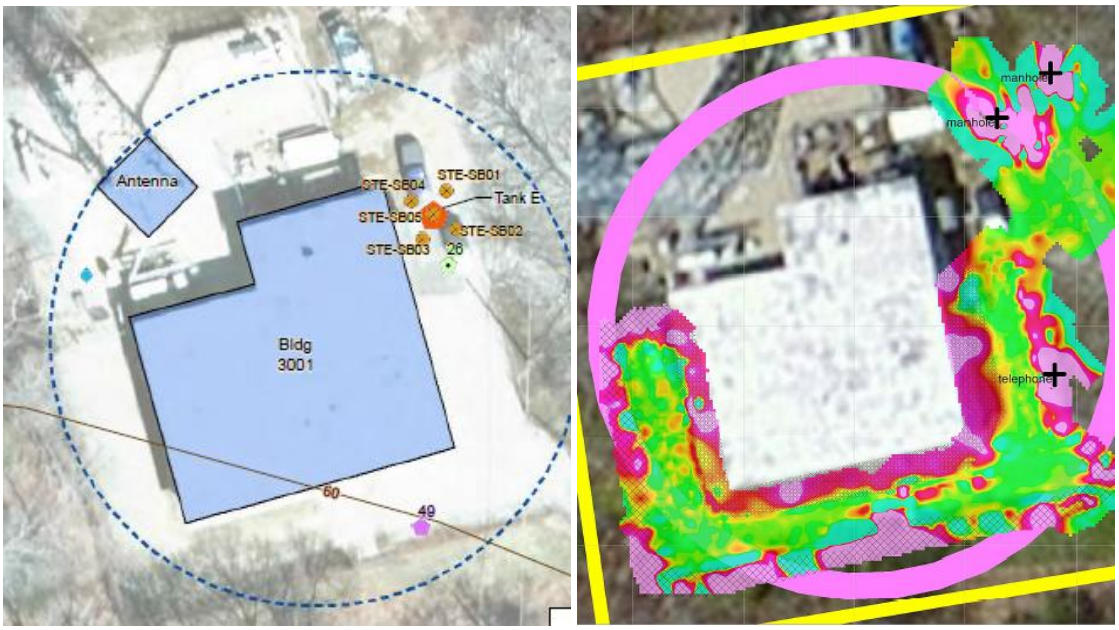

Figure 5. Side-by-Side Representation of Tank E – Building 3001

1.6 *Tank F and Tank G – Pump Houses*

The findings are shown in **Figure 6** (i.e. a side-by-side representation of the full-sized map Figures B-6, B-7, C-6) and summarized by the following:

- Due to dense vegetation and terrain, these area were assessed using AGM and no interferences (e.g., buildings, fences) are identified on the geophysics map
- USTs identified in the Figure B-6/B-7 could not be identified in C-6 due to the fact that a metallic item large enough to represent a UST could not be found and, as such, the USTs are implied to not reside within the bounded areas
- No unique features were identified which should require new sampling locations
- Current features should be avoided if subsurface sampling activities are conducted

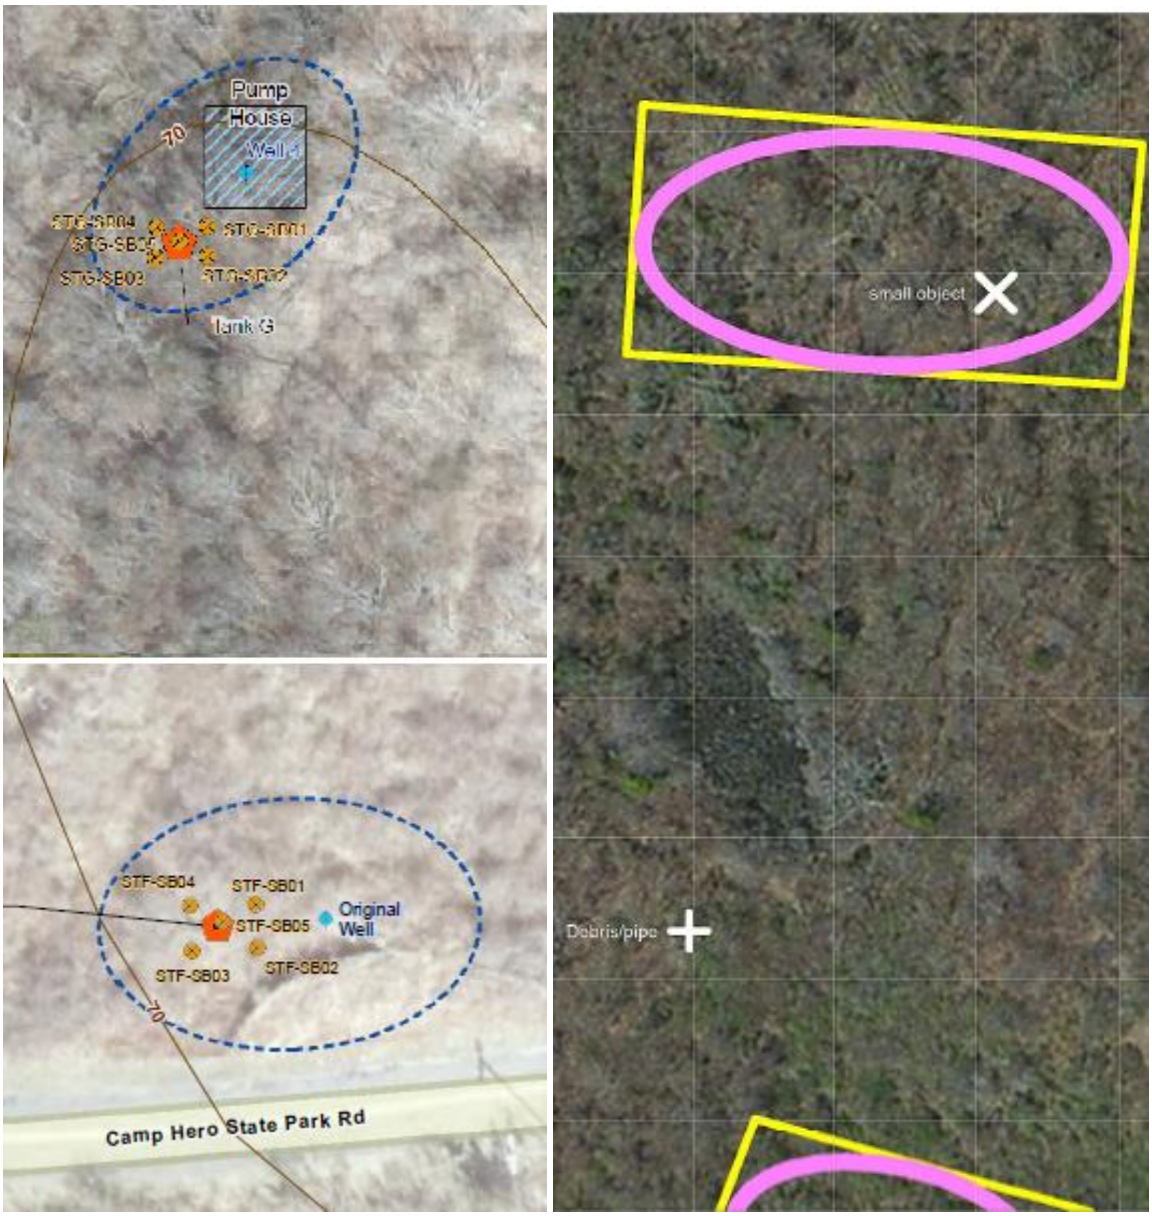

Figure 6. Side-by-Side Representation of Tank F and Tank G – Pump Houses

1.7 *Tank 35 – Fuel Pump House*

The findings are shown in **Figure 7** (i.e. a side-by-side representation of the full-sized map Figures B-8 and C-7) and summarized by the following:

- Confirmed building and fence-line interference, along with fuel piping and fuel pipeline surface features are identified on the geophysics map
- ASTs identified in the Figure B-8 could not be identified in C-7 due to the fact that a structure was an above ground tank and formerly located in a reinforced (with metal rebar) building
- Area west of the building with lots of subsurface anomalies, likely associated with the former fuel pump house infrastructure, should be avoided
- No unique features were identified which should require new sampling locations
- Current features should be avoided if subsurface sampling activities are conducted

Figure 7. Side-by-Side Representation of Tank 35 – Fuel Pump House

1.8 *Storage or Vaults – Battery 216*

The findings are shown in **Figure 8** (i.e. a side-by-side representation of the full-sized map Figures B-9 and C-8) and summarized by the following:

- Confirmed infrastructure interference, as identified on the geophysics map
- USTs identified in the Figure B-9 could not be identified in C-8, likely due to the fact the structures are closed and no longer residing as indicated in DGM data
- Not very many responses of significant size to be considered vaults or storage facilities, mostly debris or infrastructure identified
- No unique features were identified which should require new sampling locations
- Current features should be avoided if subsurface sampling activities are conducted

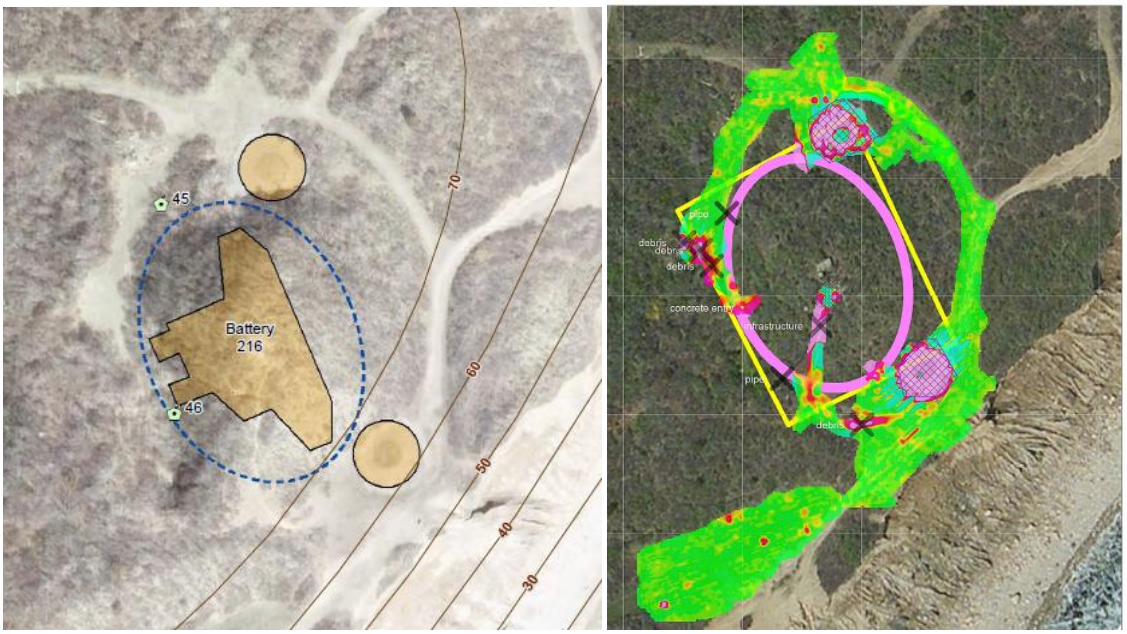

Figure 8. Side-by-Side Representation of Storage or Vaults – Battery 216

1.9 *Waste Area – Building 0113*

The findings are shown in **Figure 9** (i.e. a side-by-side representation of the full-sized map Figures B-10 and C-9) and summarized by the following:

- Two objects and corners of waste area, as identified on the geophysics map
- UST identified in the Figure B-10 could not be identified in C-9, likely due to the fact the structures are closed and no longer residing as indicated in DGM data
- Only one area identified as waste area, remainder of site anomalies too isolated
- No unique features were identified which should require new sampling locations
- Current features should be avoided if subsurface sampling activities are conducted

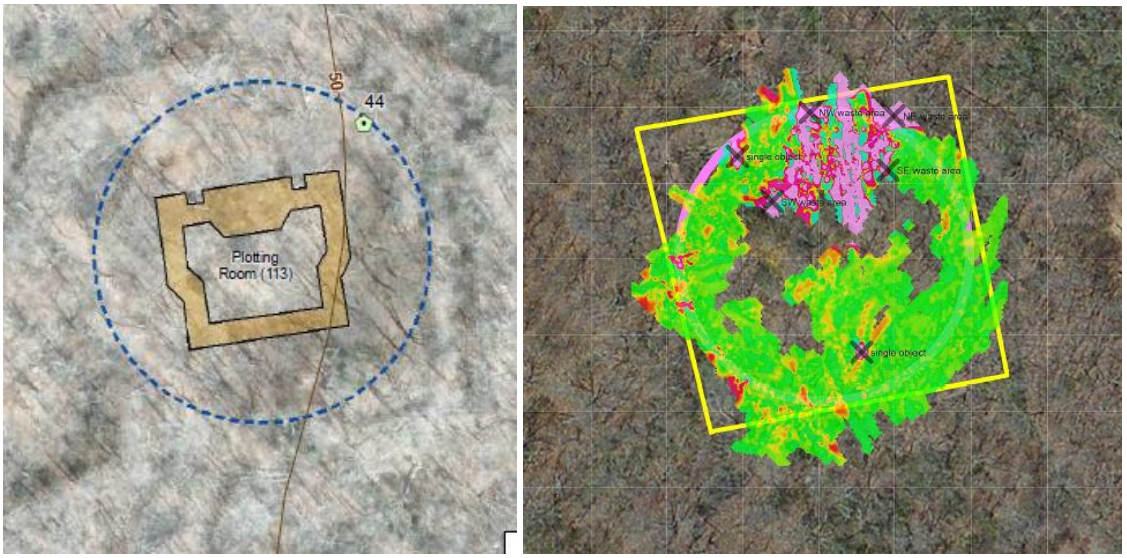

Figure 9. Side-by-Side Representation of Waste Area – Building 113

2.0 APPLICATION SUMMARY OF SURVEY RESULTS

After introducing the side-by-side maps in the previous section, the following is an over-arching summary for the application of the geophysical survey results during sampling activities:

1. Avoid investigating over top of any areas marked-out as infrastructure related (e.g., utilities, buildings, debris) or fuel related (e.g., pipelines, USTs, ASTs);
2. Tank A (Building 0020), Tank D (Building 104R), Tank E (Building 3001), Tank F, Tank G, and Storage Vault (Battery 216) areas *may consider avoiding sampling* as no indications of USTs or other fuel storage within the areas assessed by geophysics;
3. Tank 35 (Building FPH) areas *should consider modifying sampling* as no direct indications of USTs or other significant fuel storage facilities were clearly outlined, but currently standing infrastructure (e.g., building, fencing) and debris were identified to avoid, within the areas assessed by geophysics which overlapped areas expected to contain storage thus requiring careful avoidance;
4. Tank B (Building 0022), Tank C (Building 0002), and Waste Area (Building 113) *should consider maintaining similar sampling patterns* as indications of USTs, UST framework, waste area, and debris were indentified within the areas assessed by geophysics which overlapped areas expected to contain these remnant features; and
5. As a footnote, portions of the Storage Vault (Battery 216) were avoided due to the special plant and vegetation species identified by the AECOM specialist.

The data review results are predicated on sampling in areas deemed necessary while circumventing drilling activities around objects identified within the geophysical survey maps. Anomaly avoidance procedures should be strictly adhered to during sampling activities.

3.0 CONCLUSIONS

In conclusion, areas have been recommended to be separated into three simple categories:

1. Discontinue further sampling due to lack of indications;
2. Modify sampling strategy due to desired sampling locations deemed areas to avoid; and
3. Maintain sampling strategy due to indications of expected remnant features.

If you have any questions or require additional information, please contact the undersigned at your convenience.

ATTACHMENT A:

LOGBOOK ENTRIES FROM FIELD GEOPHYSICS TEAM

May 17, 2016 Camp Hero

Weather: Partly Cloudy with a chance of rain in the late afternoon. High 65°F Low 48°

Crew: Eric Celebrezze (AECOM)
Matt Emmert (URS)

07:00 - Site Safety Brief / Meet with COR & Veg Crew.

07:30 - Set up base station and assemble EM-61.

08:00 - Starting to warm up EM-61 coils. Equipment shake-out.

08:50 - Setup latency test strip.

08:52 - Conducting a latency ~~test~~.
File: 0517lat
Battery: 12.30V

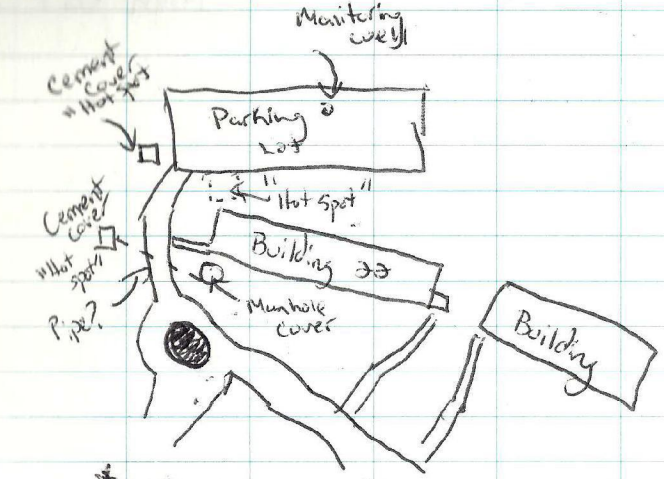
09:08 - Arrive at Bldg 22 for DGM survey.

09:15 - Starting survey
File: 0517BLD22
Battery: 12.30V

17:30 - Finished DGM survey. Three to four hotspots existed that we could audibly hear and at least 1 pipe run was heard while conducting the survey. See Map/Sketch

Rite in the Rain

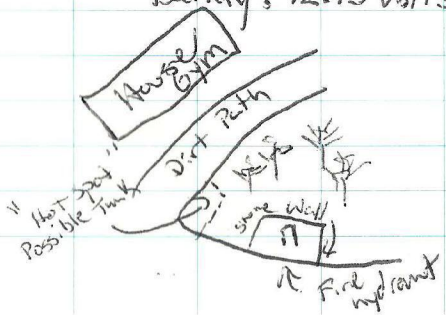
May 17, 2016 Camp Here



10:55 - Starting DGM survey of the area were building 2 on the map was located. Trees are in the areas, survey will be a bit choppy in coverage to avoid obsticles

File: 0517 B162

Battery: 12.15 Volts



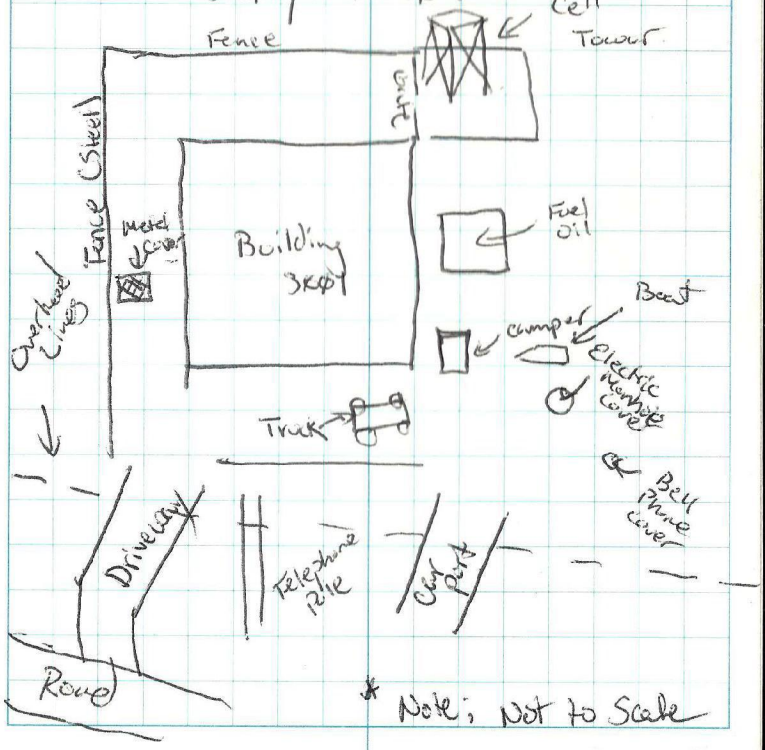
May 17, 2016 Camp Here

17:50 - Arrive at Bldg 30001 were there is a radio tower in the back corner. Switching the batteries in the EM-61. There is also pockets of cultural debris on the property. A steel fence surrounds the compound.

1955 - Starting DGM survey.

File: 0517 cop

Battery: 13.30 V



Rite in the Rain

May 17, 2016 Camp Hero

14:30 - At the fuel pump house to check out veg clearance. Talked to Nicole and suggested a few more clearance locations for optium DGM survey results.

14:55 - At the base station conducting a pm latency test.

File: 0517latp

Battery: 13.30 volts

15:00 - Breaking down GPS base station and EM-61 equipment.

15:30 - Left site to process data

END OF REPORT

5/17/16

5/17/16

May 18, 2016 Camp Hero

Weather: Partly Cloudy with a 10% chance of rain. High of 61°F and a low of 47°F. Low UV index.

Crew: Eric Celebrezze (AECOM)
Matt Emmert (URS)

07:15 - Site Safety Meeting

08:00 - Started to setup GPS base station

08:25 - Warming up EM-61 for AM latency tests.

08:40 - Starting AM latency test

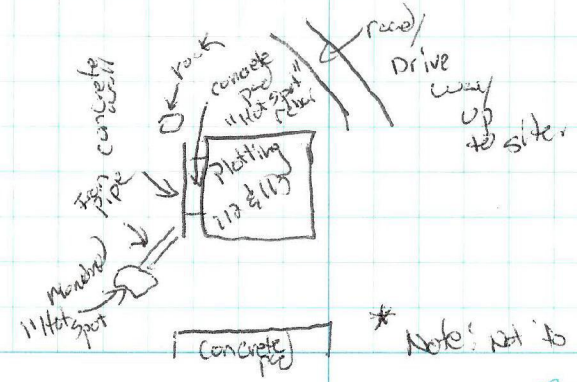
File: 0518latam

Battery: 12.45V

08:52 - At Plotter 112 & 113 for DGM survey.

File: 0518.Plot 112

Battery: 12.45 Volts



* Note: Not to Scale.

Rite in the Rain

May 18, 2016 Camp Hero

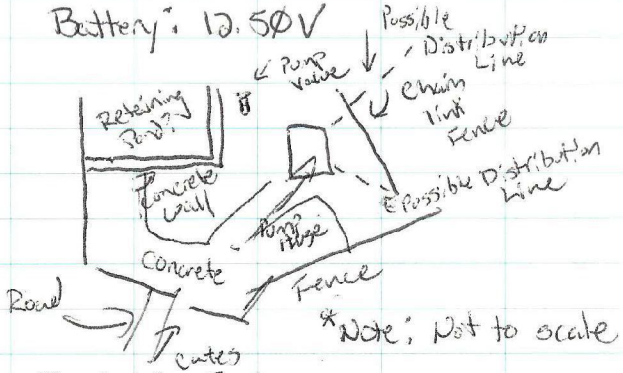
11:50 - Walked Plotting Room 113 to check for veg removal of site. Marked off areas that need to be removed more.

12:10 - Meet with Nicole to explain what veg removal team needs to do in order to conduct DGM survey.

13:15 - At the fuel pump house to begin DGM survey.

File: 0518Fuel

Battery: 12.50V



*Note: Not to scale

File: 0518Fuela

Battery: 12.50V

This file was created due to GPS turning off sometime during the DGM survey.

14:50 - At building 3 site to fill in more DGM survey.

File: 0518Bld2

Battery: 12.30V

May 18, 2016 Camp Hero

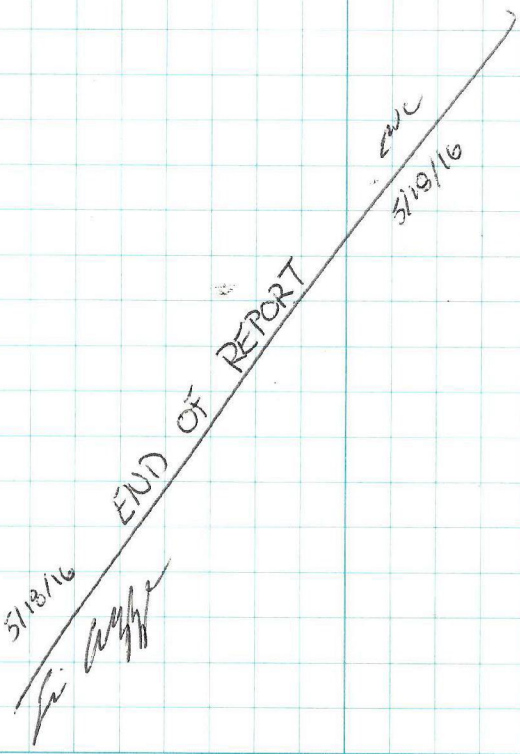
16:04 - Starting closing (pm) latency test.

File: 0518latpm

Battery: 12.15V

16:06 - Starting breakdown of equipment.

16:30 - Leaving site to process/download data.



Rite in the Rain

May 19, 2016 Camp Hero

Weather: Cloudy with early AM rain. High of 61°F. Low of 47°F. Low UV index.

Crew: Eric Celebrezze (AECOM)
Matt Emmert (URS)

07:00 - On site for site safety meeting.

07:30 - Setup the GPS base station and start EM-61 startup.

08:00 - Warming up coils for about 15 minutes for AM latency test.

08:15 - Morning latency test
File: 0519 latam
Battery: 13.60V

08:25 - At Plotting 113 doing site walk before starting survey.

08:35 - Starting DGM survey
File: 0519 Plot 113a
Battery: 13.60V

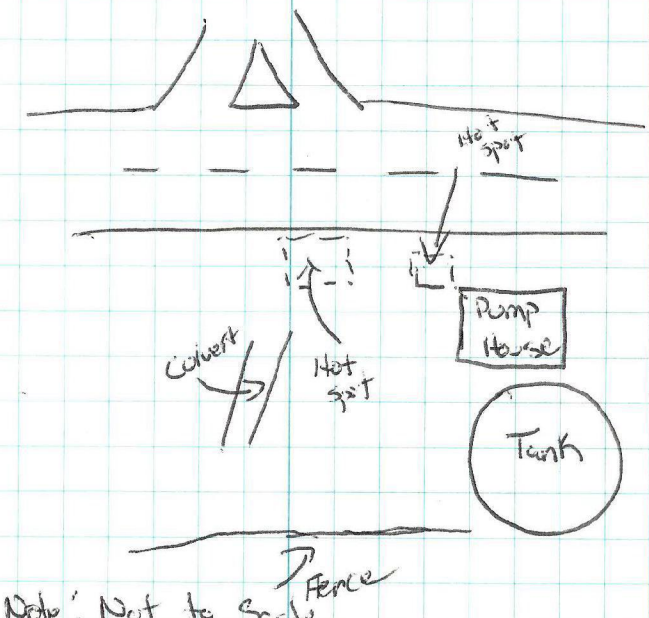
10:10 - Finished First Section of Plotting 113 Called Brian about previous days data. Only Bldg 2 additional has been processed.

10:30 - Used GPS to determine the area provided to be DGM Plotting 113 is not correct. Plot 113 is now located using the centroid point.

May 19, 2016 Camp Hero

10:30 - Veg removal crew was called to come to area and remove veg around the Bunker of 113. Top of Bunker will be mag/flag. for anomalies.

11:40 - At Fire house to conduct DGM survey to locate tanks.
File: 0519Fire
Battery: 13.30V



* Note: Not to Scale.

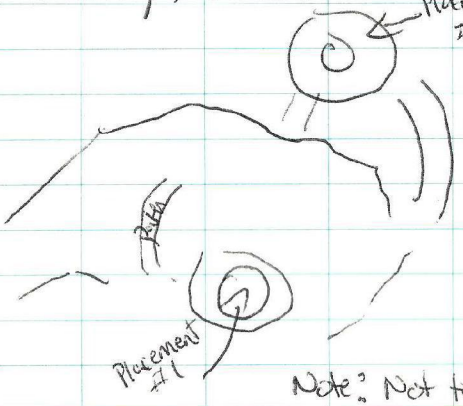
Rite in the Rain

May 19, 2016 Camp Hero

13:00 At Battery 216 for DGM survey.

File: 0519 216

Battery: 12.15V



Note: Not to Scale

14:40 - Stopping DGM survey at Battery 216 to meet Nicole at Plotting 213 AOC to check on veg clearance.

15:15 - Going to conduct a DGM survey on an outer and inner boundry of where the EM-61 can collect data at Plotting Room 113.

File: 0519 Plot 113 ~~Room~~

Battery: 12.00V

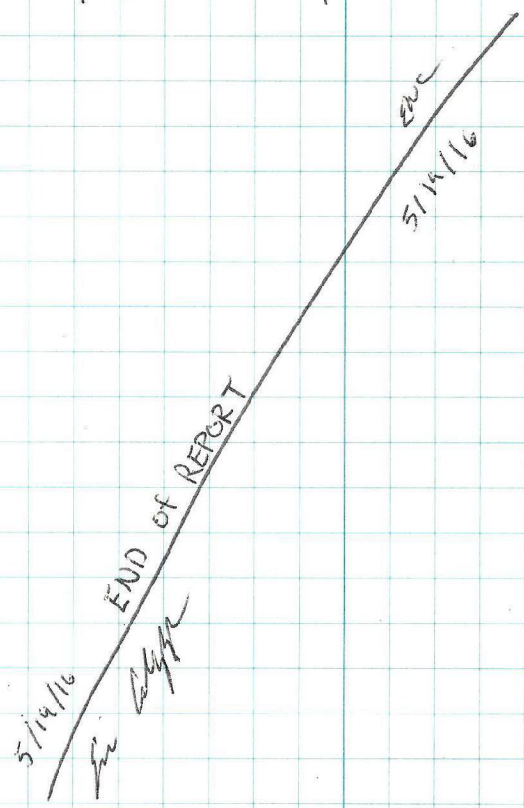
15:45 - Conducting PM latency test

File: 0519 latpm

Battery: 12.00V

16:00 - Breaking down GPS base station and packaging up all equipment.

16:30 - Heading out / off-site to download and preprocess todays data.



Rite in the Rain

May 20, 2016 Camp Hero

Weather; Cloudy with a High of 60°F and a low of 47°F. Low UV Index today Turning to Mostly Sunny.

Crew; Eric Celebrezze (AECOM)
Matt Emmert (URS)

07:00 - Site Safety Meeting

07:30 - Setting up GPS base station and assemble EM-61 MK2.

07:45 - Started warming up EM-61 coils for morning latency test.

07:55 - Starting morning latency.
File: 0520 latam
Battery; 12.60 V

08:00 - Heading to Plotting Room 113 to finish DGM survey in that area. Tree cover will be a concern for data collection and we will increase overlap and break into small pieces to achieve maximum coverage.

08:05 - Starting Plotting Room 113
File; 0500 Plot 113
Battery; 12.60V

11:15 - At Battery 216 to finish up DGM survey started yesterday
File; 0520 Bat 216
Battery; 12.60V

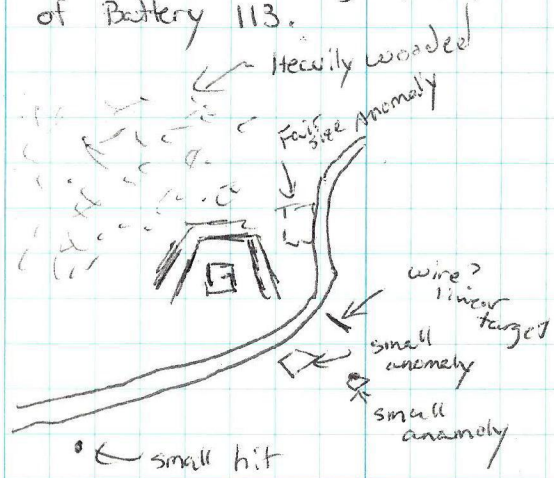
May 20, 2016 Camp Hero

12:02 - Finishing another front section of Battery 216.
File; 0520 Bat 216a
Battery; 12.45 V

12:35 - All areas open to DGM survey have been collected at Battery 216.

12:45 - At the base station / latency test strip to close out DGM survey.
File; 0520 latpm
Battery; 12.45 V

13:00 Started Analog geophysical survey of Battery 113.

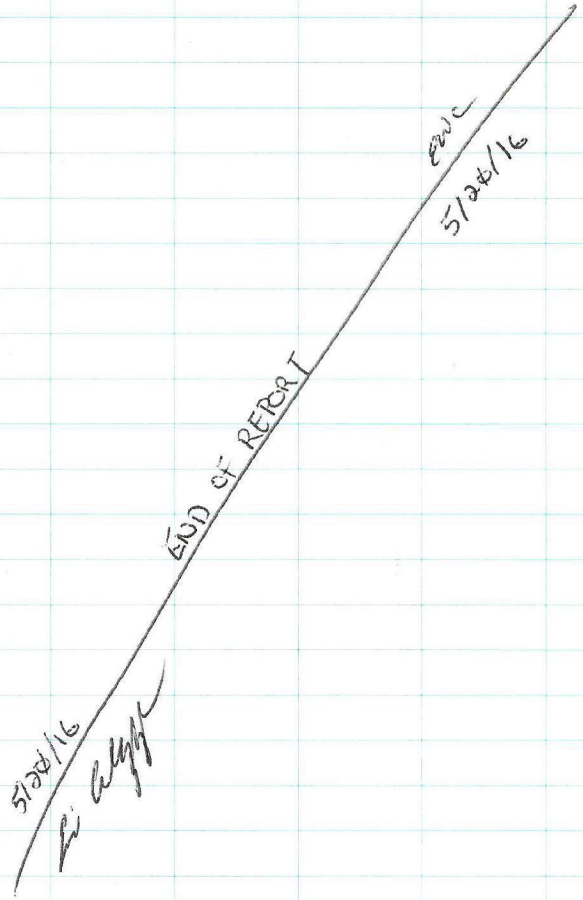


16:00 - Started to break down gps base station.

Rite in the Rain

May 20, 2016 Camp Hero

16:30 - Off-site to downtown and pre process data.



Weather: High of 67°F and low of 51°F. Partly Sunny with a low UV index. 17% Chance of Rain in the afternoon.

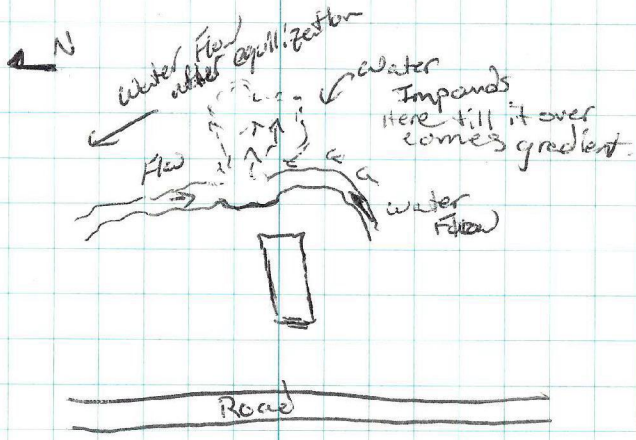
Crew: Eric Celebrezze (AECOM)
Matt Emmert (URS)
Nicole Schulman (URS)

07:00 - Morning Site Safety Meeting.

07:15 - setup GPS base station

07:30 - GPS is initialized and ready for relocates.

07:40 - went to GPS culvert/stream sediment however could not get a GPS lock in the stream to take an accurate measurement.

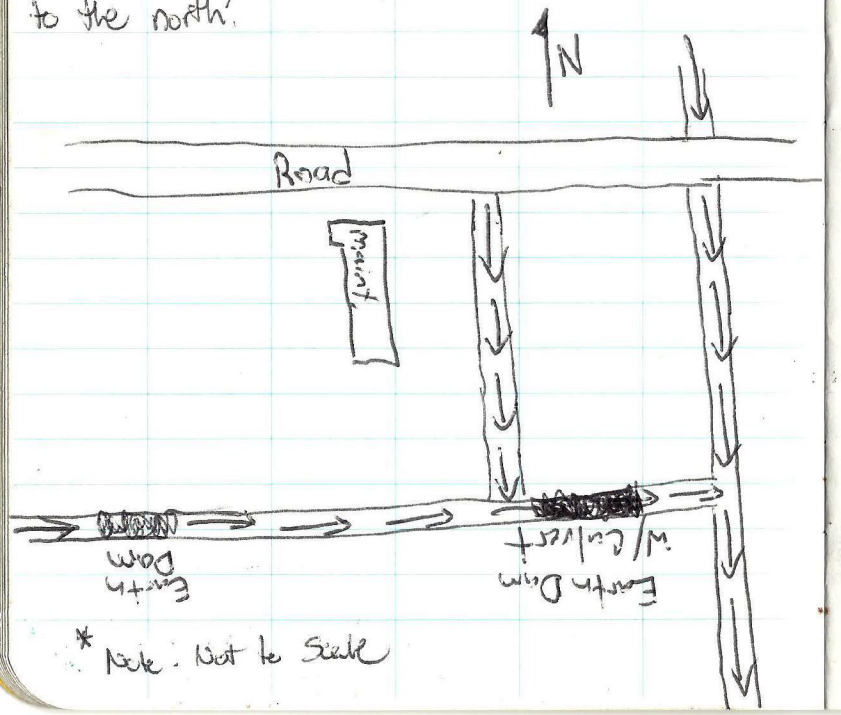


* Note: Not to scale.

Rite in the Rain.

May 23, 2016 Camp Hero

08:50 - The general flow of the stream is to the north/~~west~~ behind the maintence building. However, directly behind the building is a slight elevation that heads to the south. Under storm conditions it is safe to assume the water impounds inbetween these two areas. A lack of plant life supports this assumption of water impoundment. It is also probable that once the gradient has been overcome by the impounded water flow resumes to the north.

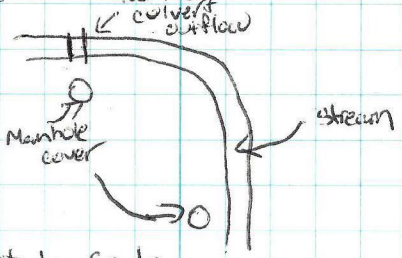


* Note: Not to Scale

May 23, 2016 Camp Hero

09:50 - GPS well near Battery 113. Found pipe coming out of the ground well concrete debris around it.

10:30 - GPS Two (2) wells near the chlorinae contact tanks.



*Note: Not to Scale.

12:00 - Start Analog Survey of Battery 216. Marked out 3 additional locations of possible tanks.

13:00 - Conducting survey of AGP4. Found a pipe and what used to be a manhole that has eroded away.

14:00 - Nicole Schulman offsite.

15:00 - Removing V4 off list as it is concrete/rebar.

15:29 - B3 is Manhole cover Removing from list.

15:39 - E3 is Manhole cover Removing from list. E1 is telephone pole with wires. Removed.

Rite in the Rain

May 23, 2016 — Camp Itro.

16:37 - A10 was fence and removed from list

16:45 - Breaking down GPS base station and packing away equipment.

GPS Points from survey

ID	Northing	Easting

==========
16/06/08 09:06
****
Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-905808
Unit Firmware Ver	V1.10A

Running Mode	Search Mode
Measure Type	Min; Avg; Max; Real
Datalog Mode	Continuous
Datalog Type	Manual
Diagnostic Mode	No
Stop Reason	Power Down

Site ID	3
User ID	1

Begin	6/8/2016 9:06
End	6/8/2016 12:15
Sample Period(s)	60
Number of Records	189

Sensor	VOC(ppm)
Span	100
Span 2	N/A
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutene
Calibration Time	6/8/2016 7:38
Peak	0.094
Min	0
Average	0.012

==========
16/06/13 09:01
****
Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-905808
Unit Firmware Ver	V1.10A

Running Mode	Search Mode
Measure Type	Min; Avg; Max; Real
Datalog Mode	Continuous
Datalog Type	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	17
User ID	1

Begin	6/13/2016 9:01
End	6/13/2016 13:07
Sample Period(s)	60
Number of Records	246

Sensor	VOC(ppm)
Span	100
Span 2	N/A
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25

TWA Alarm	10
Measurement Gas	Isobutene
Calibration Time	6/13/2016 7:19
Peak	0.102
Min	0
Average	0.004

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-905808
Unit Firmware Ver	V1.10A

Running Mode	Search Mode
Measure Type	Min; Avg; Max; Real
Datalog Mode	Continuous
Datalog Type	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	15
User ID	1

Begin	6/14/2016 7:27
End	6/14/2016 7:27
Sample Period(s)	60
Number of Records	0

Sensor	VOC(ppm)
Span	100
Span 2	N/A
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutene

****
Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-905808
Unit Firmware Ver	V1.10A

Running Mode	Search Mode
Measure Type	Min; Avg; Max; Real
Datalog Mode	Continuous
Datalog Type	Manual
Diagnostic Mode	No
Stop Reason	Battery Low

Site ID	18
User ID	1

Begin	6/14/2016 14:14
End	6/14/2016 14:23
Sample Period(s)	60
Number of Records	9

Sensor	VOC(ppm)
Span	100
Span 2	N/A
Low Alarm	50
High Alarm	100

Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutene
Calibration Time	6/14/2016 7:26
Peak	0
Min	0
Average	0

****
Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-908497
Unit Firmware Ver	V1.10C
Running Mode	Search Mode
Measure Type	Min; Avg; Max; Real
Datalog Mode	Continuous
Datalog Type	Auto
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00003
User ID	1
Begin	6/16/2016 8:19
End	6/16/2016 9:01
Sample Period(s)	60
Number of Records	41
Sensor	VOC(ppm)
Span	100
Span 2	N/A
Low Alarm	21.738
High Alarm	43.476
Over Alarm	15000
STEL Alarm	43.476
TWA Alarm	21.738
Measurement Gas	Isobutylene
Calibration Time	6/16/2016 7:31
Peak	0.301
Min	0.153
Average	0.201

RE: Camp Hero

Work Order #: 1606286

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Case Narrative

WO#: 1606286

Date Reported: 8/29/2016
Revision v2

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
- Percent Moisture - ASTM-D2216
- Metals, ICP/OES - 6010C
- Metals, ICP/MS - 6020A
- Polychlorinated Biphenyls - 8082A
- Semi-Volatile Organic Compounds - 8270D SIM

Analytical Comments for Test SW_6010S, Analytical Run ID 86750, Batch ID 40137:
Samples 1606293-005D MS/MSD: Several analytes were outside the control limits. RPD for Selenium was outside the control limits.

Analytical Comments for Test SW_6010S, Analytical Run ID 86852, Batch ID 40137:
Samples 1606293-005F MS/MSD: Cr and Mn were outside the control limits.

Analytical Comments for Test SW_6010S, Analytical Run ID 87363, Batch ID 40157:
Samples 1606389-005B MS/MSD: Several Analytes were outside the control limits

Analytical Comments for Test SW_8082S, Analytical Run No 86731, Batch ID 40143:
Sample 1606286-011B: Surrogate Decachlorobiphenyl exceeded recovery control limit.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87554, Batch ID R87554:
Sample CCV SIM 072016S7: Benzo(b)fluoranthene and Benzo(k)fluoranthene slightly exceeded QC limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 86796, Batch ID R40155:
Sample 1606293-005D MS: Fluoranthene was outside the control limits.
Sample 1606293-005D MSD: Several analytes outside the control limits. RPD for Chrysene, Fluoranthene and Pyrene were outside the control limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87530, Batch ID R40155:
Sample 1606286-004A: Surrogate recoveries for Nitrobenzene-d5 and Terphenyl-d14 were outside the control limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87458, Batch ID R40155:
Sample 1606286-005A: Surrogate recoveries for Nitrobenzene-d5 and Terphenyl-d14 were outside the control limits.

Percent Moisture	10	1.0						11.49	13.6	20	

RTI Laboratories - Definitions and Acronyms

WO#: 1606286

Date Reported: 8/29/2016
Revision v2

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

RE: Camp Hero

Work Order #: 1606293

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

Project: Camp Hero

Analytical report revision: 9/16/16: Update LOQ for Benzene for samples 1606293-001A, 003A, -005A, -008A, -010A, -011A, -012A, -013A, -017A, -018A, -019A, and -021A.

Analytical Report revised 8/11/2016: Compound 3,3´-Dichlorobenzidine was missing in the SVOC analysis. Also Benzoic Acid was missing in the QC Summary report for the LCS, MS and MSD. Benzoic Acid is properly populated in the QC Summary. Removed two compounds, 1,2,4-Trichlorobenzene and 1,2-Dichlorobenzene from the VOC 8260 list.

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
- Percent Moisture - ASTM-D2216
- Metals, ICP/OES - 6010C
- Metals, ICP/MS - 6020A
- Polychlorinated Biphenyls - 8082A
- Volatile Organic Compounds - 8260C
- Volatile Organic Compounds - 8260C-ME
- Volatile Organic Compounds - 8260C
- Semi-Volatile Organic Compounds - 8270D-MOD
- Semi-Volatile Organic Compounds - 8270D SIM

Analytical Comments for Test SW_6010S, Analytical Run No 86750, Batch ID 40137:
Sample 1606293-005FMS: Recoveries for several analytes exceeded control limits. Suspected matrix interference for Nickel and Selenium.
Sample 1606293-005FMSD: Recoveries for several analytes exceeded control limits. RPD results for Selenium exceeded control limits. Suspected matrix interference for Nickel and Selenium.

Analytical Comments for Test SW_6010S, Analytical Run No 86852, Batch ID 40137:
Sample 1606293-005FMS: Recoveries for Chromium and Manganese exceeded control limits. Suspected matrix interference for Manganese.
Sample 1606293-005FMSD: Recoveries for Chromium and Manganese exceeded control limits. Suspected matrix interference for Manganese.

Analytical Comments for Test SW_8082S, Analytical Run No 86760, Batch ID 40144:
Sample 1606293-005E: Surrogate Decachlorobiphenyl exceeded recovery control limit.
Sample 1606293-005EMS: Surrogate Tetrachloro-m-xylene exceeded recovery control limit.

Analytical Comments for Test SW_8260S, Analytical Run No 86770, Batch ID R86770:
Sample VOA11B ICV 061616: ICV results for Chloroethane exceed the 20% criteria.
Sample VOA11B CCV2 061716: CCV results for Bromoform and Chloroethane exceed the 20% criteria.
Sample VOA11B LCS2 0617: 1,1,1,2-Tetrachloroethane, bromodichloromethane, Bromoform, Chlorodibromomethane, cis-1,3-dichloropropene, styrene and trans-1,3-dichloropropene were outside the control limits.
Samples 1606130-009C MS/MSD: Several spike recoveries were outside the control limits.
Samples 1606467-004B MS/MSD: Several spike recoveries were outside the control limits.

Analytical Comments for Test SW_8260S, Analytical Run No 86786, Batch ID R86786:
Sample VOA11B ICV 061616: ICV results for Chloroethane exceeded the 20% criteria.
Sample VOA11B CCV 062016: CCV results for Carbon tetrachloride and Chloroethane exceeded the 20% criteria.
Sample VOA11B LCS 06201: Recovery for Bromoform exceeded the control limits.
Sample VOA11B CCVE 062016: Ending CCV results for Chloroethane exceeded the 50% criteria.
Sample 1606522-007A MS: Spike recoveries for Chlorodibromomethane, Chloroethane, cis-1,3-Dichloropropene and Styrene were outside the control limits.
Sample 1606522-007A MSD: Spike recoveries for Chloroethane, cis-1,3-Dichloropropene and Styrene were outside the control limits.

Analytical Comments for Test SW_8260S-LL, Analytical Run No 86674, Batch ID R86674:
Sample VOA11B CCV 061416: Acetone, Trichlorofluoromethane and vinyl acetate exceed 20% criteria.
Sample VOA11B MBLK 0614: Acetone and Methylene Chloride detected in MB at or above 1/2 the LOQ. Common lab contaminate.
Sample VOA11B LCS 06141: Acetone and toluene exceed limits.
Sample VOA11B LCSD 0614: Acetone, Toluene and Bromoform exceed limits.
Sample VOA11B CCVE 061416: Toluene exceeds QC limit.

Analytical Comments for Test SW_8260S-LL, Analytical Run No 86694, Batch ID R86694:

Sample VOA11B CCV 061516: CCV results for acetone and vinyl acetate exceed the 20% criteria.
Sample VOA11B MBLK 0615: Acetone and Methylene Chloride detected in MBLK at or above 1/2 the LOQ.
Sample VOA11B LCS 06151: Acetone and Methylene chloride exceed limits.
Sample VOA11B LCSD 0615: Acetone and Methylene chloride exceed limits.

Analytical Comments for Test SW_8270S-LL, Analytical Run No 86688, Batch ID 40135:
Sample LCS-40135: LCS results for 2,4-Dinitrophenol exceeded control limit.
Sample 1606293-004D: Surrogates recovery for Terphenyl-d14 and 2-Fluorobiphenyl exceeded control limit.
Sample 1606293-005DMS: MS results for N-nitrosodipropylamine, 3,3´-Dichlorobenzidine exceeded control limit.
Sample 1606293-005DMSD: MSD results for N-nitrosodipropylamine, 3,3´-Dichlorobenzidine and Benzoic Acid exceeded control limit.

Analytical Comments for Test SW_8270S-LL, Analytical Run No 86688, Batch ID R86688:
Sample ICV S8 050216: ICV results for Bis(2-chloroisopropyl) ether and Benzoic acid exceeded control limit.
Sample CCV S8 061416: CCV results for Pentachlorophenol, 2,4-Dimethylphenol, 2-Nitrophenol, 2,4-Dinitrophenol and 4,6-Dinitro-2-methylphenol exceeded control limit.

Analytical Comments for Test SW_8270S-LL, Analytical Run No 86714, Batch ID R86714:
Sample ICV S8 050216: ICV results for Bis(2-chloroisopropyl) ether and Benzoic acid exceeded control limit.
Sample CCV S8 061516: CCV results for 2,4-Dinitrophenol, 2-Nitrophenol, and 4,6-Dinitro-2-methylphenol exceeded control limit.

Analytical Comments for Test SW_8270S-LL, Analytical Run No 86814, Batch ID R86814:
Sample ICV S8 050216: ICV results for Bis(2-chloroisopropyl) ether and Benzoic acid exceeded control limit.
Sample CCV S8 062016: CCV results for 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol,Benzoic acid, Bis(2-chloroisopropyl) ether, N-Nitrosodimethylamine, and Pentachlorophenol exceeded control limit.
Sample CCVE S8 062016: Ending CCV results for Benzoic acid exceeded control limit.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 86796, Batch ID 40155:
Sample 1606293-005D MS: Spike recovery for Fluoranthene was outside the control limits.
Sample 1606293-005DMSD: Recovery for several compounds exceeded control limits due to elevated concentrations of target analytes in the sample. Several RPD were outside the control limits.
Sample 1606293-002D: Surrogate recoveries for 2-Fluorobiphenyl, Nitrobenzene-d5 and Terphenyl-d14 were outside the control Limits.
Sample 1606293-003D: Surrogate recovery for Nitrobenzene-d5 was outside the control limits.
Sample 1606293-006D: Surrogate recoveries for 2-Fluorobiphenyl, and Nitrobenzene-d5 were outside the control Limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87554, Batch ID R87554:
Sample CCV SIM 072016S7: Benzo(b)fluoranthene and Benzo (k) Fluoranthene slightly exceeded QC limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 876154, Batch ID 40172:
Sample 1606293-013D: Surrogate recovery for Terphenyl-d14 was outside the control limits.

Analytical Comments for Test SW_6010S, Analytical Run No 87363, Batch ID 401574:
Samples 1606389-005B MS/MSD: Several spike recoveries were outside the control limits.

RTI Laboratories - Definitions and Acronyms

WO#: 1606293

Date Reported: 8/25/2016
Revision v3

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

Hi Kathy,

The analyses for H3-SS001 and H3-SS02 are VOCs, SVOCS-PNA, PBCs,and metals.

Regarding the Terra core kits, I told the field team to NOT put any tape or labels on the vials at the beginning of the event. I just sent a message reminding all of them of the issue. I tried to QC all the samples but must have missed those two in the rush to get to FedEx on time.

Thanks
Amanda

RE: Camp Hero

Work Order #: 1606306

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Workorder Sample Summary

WO#: 1606306

Date Reported: 8/25/2016
Revision v3

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

RTI Laboratories - Case Narrative

WO#: 1606306

Date Reported: 8/25/2016
Revision v3

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
Metals, ICP/MS - 6020
Silver and/or Antimony, ICP/MS - 6020A-SA
Polychlorinated Biphenyls - 8082A
Semi-Volatile Organic Compounds - 8270D SIM

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 86795, Batch ID 40121:
Sample 1606306-001A: Surrogate recovery for Nitrobenzene-d5 was outside the control limits.
Sample MB-40121: Surrogate recoveries for 2-Fluorobiphenyl and Nitrobenzene-d5 were outside the control limits.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87530, Batch ID 40121:
Sample LCSD-40121: RPD for Benzo(k)fluoranthene was outside the control limits.

Analytical Comments for Test SW_6020A, Analytical Run No 87545, Batch ID 40174:
Samples 1606387-005D MS/MSD: Spike recoveries for several analytes were outside the control limits.

Analytical Comments for Test SW_8082A, Analytical Run No 87006, Batch ID 40212:
Samples 1606387-005C MS/MSD: Surrogate recovery for Decachlorobiphenyl was outside the control limits.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87615, Batch ID87615:
Sample CCVE SIM 062716S7, Batch ID R87615 : Ending CCV results for Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz (a,h)anthracene and Indeno(1,2,3-cd)pyrene exceeded the 50% criteria.

RTI Laboratories - Definitions and Acronyms

WO#: 1606306

Date Reported: 8/25/2016
Revision v3

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

RE: Camp Hero

Work Order #: 1606337

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Case Narrative

WO#: 1606337

Date Reported: 8/25/2016
Revision v1

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
Metals, ICP/MS - 6020
Silver and/or Antimony, ICP/MS - 6020A-SA
Polychlorinated Biphenyls - 8082A
Volatile Organic Compounds - 8260C
Semi-Volatile Organic Compounds - 8270D-MOD
Semi-Volatile Organic Compounds - 8270D SIM

Analytical Comments for Test SW_8260A, Analytical Run No 86698, Batch ID R86698:
Sample VOA10 CCV 061516: Chlorodibromomethane, vinyl acetate and 2-hexanone exceed the 20% criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40156:
Sample LCS-40156: LCS results for4-Nitrophenol, N-Nitrosodimethylamine exceeded recovery control limits
Sample 1606337-003B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606337-004B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606337-006B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606337-007B: Surrogate Phenol-d5 exceeded recovery control limit.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40170:
Sample LCS-40170: LCS results for N-Nitrosodimethylamine exceeded recovery control limits.
Sample MB-40170: Surrogate Phenol-d5 was outside the control limits.
Samples 1606422-002B MS/MSD: Several Spike recoveries and RPDs were outside the control limits.
Sample 1606422-008B MS/MSD: Several spike recoveries were outside the control limits. RPD for Pentachlorophenol was outside the control limits.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40156:
Sample 1606387-005B MS/MSD: Spike recoveries for 3'3-Dichlorobenzidine, N-Nitrosodimethylamine, Pentachlorophenol, Phenol and Phenol-d5 were outside the control limits.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID R86748:
Sample ICV S8 050216: ICV results for Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCV S8 061616: CCV results for 2,4-Dinitrophenol, 2-Nitrophenol, 4,6-Dinitro-2-methylphenol, and 2-Nitroaniline exceeded the 20% criteria.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87458, Batch ID 40160:
Sample 1606337-002B: Surrogates 2-Fluorobiphenyl and Nitrobenzene-d5 were outside the control limits.
Sample 1606337-003B: Surrogates 2-Fluorobiphenyl, Nitrobenzene-d5 and Terphenyl-d14 were outside the control limits.
Sample 1606337-004B: Surrogates 2-Fluorobiphenyl and Nitrobenzene-d5 were outside the control limits.
Sample 1606337-006B: Surrogates 2-Fluorobiphenyl and Nitrobenzene-d5 were outside the control limits.
Sample 1606337-007B: Surrogates 2-Fluorobiphenyl and Nitrobenzene-d5 were outside the control limits.
Samples 1606387-005B MS/MSD: Several Spike and surrogate recoveries were outside the control limits. Several RPDs were outside the control limits.

Analytical Comments for Test SW_6020A, Analytical Run No 87545, Batch ID 40174:
Samples 1606387-005D MS: Spike recoveries for several analytes were outside the control limits.

Analytical Comments for Test SW_8082A, Analytical Run No 87006, Batch ID 40212:
Sample 1606387-005C MS/MSD: Surrogate recovery for Decachlorobiphenyl was outside the control limits.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87825, Batch ID 87825:
Sample CCVE SIMS8 072116, Batch ID R87825 : Ending CCV results for Benzo(k)fluoranthene, Benzo(g,h,i)perylene exceeded the 50% criteria.

RTI Laboratories - Definitions and Acronyms

WO#: 1606337

Date Reported: 8/25/2016
Revision v1

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

RE: Camp Hero

Work Order #: 1606387

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Case Narrative

WO#: 1606387

Date Reported: 8/25/2016
Revision v1

Client:	AECOM Design and Consulting Services (DCS)
Project:	Camp Hero

Analytical report revised: Compounds 1,2,4-Trichlorobenzene and 1,2-Dichlorobenzene have been removed from the 8260C analysis.

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
Metals, ICP/MS - 6020
Silver and/or Antimony, ICP/MS - 6020A-SA
Polychlorinated Biphenyls - 8082A
Volatile Organic Compounds - 8260C
Semi-Volatile Organic Compounds - 8270D-MOD
Semi-Volatile Organic Compounds - 8270D SIM

Prep Batch (SW_3510BNA) / 40262:
Sample 1606387-004B: Sample was re-extracted and reanalyzed due to poor surrogate recoveries in the original analysis. Prep Method hold time was exceeded by 10.724 days for re-extraction. Both original analysis and re-analysis are reported as requested.

Analytical Comments for Test EPA_8082, Analytical Run No 87006, Batch ID 40212:
Sample 1606387-005C: Surrogate DCB exceeded control limits.
Sample 1606387-005CMS: Surrogate DCB exceeded control limits.
Sample 1606387-005CMSD: Surrogate DCB exceeded control limits.

Analytical Comments for Test SW_6020A, Analytical Run No 87545, Batch ID 40174:
Sample 1606387-005DMS: Recoveries for Calcium, Iron, Manganese, Potassium, Sodium and Aluminum exceeded control limits due to elevated concentration of analytes in the sample.
Sample 1606387-005DMSD: Recoveries for Calcium, Iron, Manganese, Potassium, Sodium and Aluminum exceeded control limits due to elevated concentration of analytes in the sample.

Analytical Comments for Test SW_8082A, Analytical Run No 87006, Batch ID 40212:
Sample 1606387-005C: Decachlorobiphenyl surrogate exceeded control limit.
Sample 1606387-005CMS: Decachlorobiphenyl surrogate exceeded control limit.
Sample 1606387-005CMSD: Decachlorobiphenyl surrogate exceeded control limit.

Analytical Comments for Test SW_8260A, Analytical Run No 86781, Batch ID R86781:
Sample VOA10 CCV 062016: CCV results for 2-hexanone, and Chlorodibromomethane exceed the 20% criteria.
Sample 1606387-005AMS: 1,2,4-Trichlorobenzene, 1,2-Dibromo-3-chloropropane and acetone exceed limits.
Sample 1606387-005AMSD: Acetone and Methylene chloride exceed limits.
Sample VOA10 CCVE 062016: Dichlorodifluoromethane and 1,2,4-Trichlorobenzene exceed the 50%

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40156:
Sample LCS-40156: LCS results for4-Nitrophenol, N-Nitrosodimethylamine exceeded recovery control limits
Sample 1606387-002B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606387-003B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606387-004B: Surrogates Phenol-d5,Terphenyl-d14, Nitrobenzene-d5 and 2-Fluorobiphenyl exceeded recovery control limit.
Sample 1606387-005BMS: MS results for 3,3´-Dichlorobenzidine, N-Nitrosodimethylamine, Pentachlorophenol and Phenol exceeded recovery control limit. Surrogate Phenol-d5 exceeded control limits.
Sample 1606387-005BMSD: MSD results 3,3´-Dichlorobenzidine, N-Nitrosodimethylamine, Pentachlorophenol and Phenol exceeded recovery control limit. Surrogate Phenol-d5 exceeded control limits.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40170:
Sample LCS-40170: LCS results for N-Nitrosodimethylamine exceeded recovery control limits.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID R86748:
Sample ICV S8 050216: ICV results for Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCV S8 061616: CCV results for 2,4-Dinitrophenol, 2-Nitrophenol, 4,6-Dinitro-2-methylphenol, and 2-Nitroaniline exceeded the 20% criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 87381, Batch ID 40262:
Sample LCS-40262: Bis(2-chloroisopropyl) ether, N-Nitrosodimethylamine, Phenol exceeded the control limit.
Samples 1606422-008B MS/MSD: Several recoveries and RPDs were outside the control limits.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 87381, Batch ID R87381:
Sample ICV S7 031416: Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCV S7 063016: Benzoic acid, Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCVE S7 063016: Pentachlorophenol, Benzoic acid exceeded the 50% criteria.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87458, Batch ID 40160:
Sample 1606387-004B: Surrogate recoveries for 2-Fluorobiphenyl, Nitrobenzene-d5 and Terphenyl-d14 were outside the control limits.
Sample 1606387-005B: Surrogate recoveries for 2-Fluorobiphenyl, and Nitrobenzene-d5 were outside the control limits.
Samples 1606387-005B MS/MSD: Spike recoveries for several compounds were outside the control limits. RPD for several compounds were outside the control limits.
Sample MB-40160: Surrogate recoveries for 2-Fluorobiphenyl, and Nitrobenzene-d5 were outside the control limits.

RTI Laboratories - Definitions and Acronyms

WO#: 1606387

Date Reported: 8/25/2016
Revision v1

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

RE: Camp Hero

Work Order #: 1606389

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Case Narrative

WO#: 1606389

Date Reported: 8/29/2016
Revision v1

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
Percent Moisture - ASTM-D2216
Metals, ICP/OES - 6010C
Metals, ICP/MS - 6020A
Semi-Volatile Organic Compounds - 8270D SIM

Analytical Comments for Test SW_6010S, Analytical Run No 87363, Batch ID 40157:
Sample 1606389-005BMS: Recoveries for several analytes exceeded control limits.
Sample 1606389-005BMSD: Recoveries for several analytes exceeded control limits.

Analytical Comments for Test SW_6010S, Analytical Run No 87363, Batch ID 40157:
Sample 1606392-005B MS: Spike recoveries for Al, Fe and Mn were outside the control limits.
Sample 1606392-005B MSD: Spike recoveries for Al, Ca, Fe, Mg and Mn were outside the control limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87679, Batch ID 40172:
Sample 1606389-014A: Sample required multiple dilutions. The fourth dilution was performed past the recommended hold time.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87615, Batch ID 40178:
Sample 1606392-005A MS: Spike recovery for Benz(a)anthracene was outside the control limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87615, Batch ID 87615:
Sample CCVE SIM 062716S7, Batch ID R87615 : Ending CCV results for Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz (a,h)anthracene and Indeno(1,2,3-cd)pyrene exceeded the 50% criteria.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87532, Batch ID 87532:
Sample CCV SIM 062616S7, Batch ID R87532 : CCV results for Benzo(g,h,i)perylene exceeded the 20% criteria.
Sample CCVE SIM 062616S7, Batch ID R87532 : Ending CCV results for Benzo(g,h,i)perylene, Benzo(k)fluoranthene, Dibenz(a,h) anthracene, Indeno(1,2,3-cd)pyrene exceeded the 50% criteria.

RTI Laboratories - Definitions and Acronyms

WO#: 1606389

Date Reported: 8/29/2016
Revision v1

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

RE: Camp Hero

Work Order #: 1606392

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

RTI Laboratories - Case Narrative

WO#: 1606392

Date Reported: 8/30/2016
Revision v3

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Analytical report revised 9/16/16: Benzene LOQ reporting limits updated for 1606392-018A, 019B, -020B, and -021B.

Analytical report revised 8/30/2016: Surrogate recovery for sample 16063920-020 for SIM PNA analysis was recalculated for 2-Fluorobiphenyl.

Analytical Report revised 8/11/2016: Compound 3,3´-Dichlorobenzidine was missing in the SVOC analysis. Also Benzoic Acid was missing in the QC Summary report for the LCS, MS and MSD.

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
- Percent Moisture - ASTM-D2216
- Metals, ICP/OES - 6010C
- Metals, ICP/MS - 6020A
- Polychlorinated Biphenyls - 8082A
- Volatile Organic Compounds - 8260C-ME
- Volatile Organic Compounds - 8260C
- Semi-Volatile Organic Compounds - 8270D-MOD
- Semi-Volatile Organic Compounds - 8270D SIM

Samples 1606392-019A, -020A, and -021A were initially analyzed twice for Low-Level Volatile Organic Compounds. Responses for internal standards exceeded method specified criteria. Sample re-analyses were performed using the methanol preserved vials. The results for these samples were reported from the methanol vials with associated elevated reporting limits.

Analytical Comments for Test SW_6010S, Analytical Run No 87156, Batch ID 40215:
- Sample 1606392-005BMS: Recoveries for Aluminum, Iron and Manganese exceeded control limits.
- Sample 1606392-005BMSD: Recoveries for Aluminum, Calcium, Iron, Magnesium and Manganese exceeded control limits.

Analytical Comments for Test SW_8260S, Analytical Run No 86786, Batch ID R86786:
- Sample VOA11B ICV 061616: ICV results for Chloroethane exceeded the 20% criteria.
- Sample VOA11B CCV 062016: CCV results for Carbon tetrachloride and Chloroethane exceeded the 20% criteria.
- Sample VOA11B LCS 06201: Recovery for Bromoform exceeded the control limits.
- Sample VOA11B CCVE 062016: Ending CCV results for Chloroethane exceeded the 50% criteria.
- Sample 1606522-007A MS: Spike recoveries for Chlorodibromomethane, Chloroethane, cis-1,3-Dichloropropene and Styrene were outside the control limits.
- Sample 1606522-007A MSD: Spike recoveries for Chloroethane, cis-1,3-Dichloropropene and Styrene were outside the control limits.

Analytical Comments for Test SW_8260S-LL, Analytical Run No 86694, Batch ID R86694:
- Sample VOA11B CCV 061516: CCV results for acetone and vinyl acetate exceed the 20% criteria.
- Sample VOA11B MBLK 0615: Acetone and Methylene Chloride detected in MBLK at or above 1/2 the LOQ.
- Sample VOA11B LCS 06151: Acetone and Methylene chloride exceed limits.
- Sample VOA11B LCSD 0615: Acetone and Methylene chloride exceed limits.

Analytical Comments for Test SW_8270S-LL, Analytical Run No 86814, Batch ID R86814:
- Sample ICV S8 050216: ICV results for Bis(2-chloroisopropyl) ether and Benzoic acid exceeded control limit.
- Sample CCV S8 062016: CCV results for 2,4-Dinitrophenol, 4,6-Dinitro-2-methylphenol, Benzoic acid, Bis(2-chloroisopropyl) ether, N-Nitrosodimethylamine, and Pentachlorophenol exceeded control limit.
- Sample CCVE S8 062016: Ending CCV results for Benzoic acid exceeded control limit.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87637, Batch ID 40193:
- Sample LCS-40193: LCS results for Benz(a)anthracene, Fluorene Phenanthrene and Pyrene exceeded QC limits.
- Sample 1606392-005A MS: Spike recoveries for Benz(a)anthracene and Phenanthrene were slightly above the control limits.
- Sample 1606425-005A MS: Spike recoveries for 1-Methylnapthalene, 2-Methylnaphthalene and Naphthalene were outside the control limits. Surrogate Nitrobenzene-d5 was outside the control limits.
- Sample 1606425-005A MSD: Spike recovery for Phenanthrene was outside the control limits. RPD for 1-Methylnapthalene, 2-Methylnaphthalene and Naphthalene were outside the control limits.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87589, Batch ID 40178:
Sample MB-40178CCB: 2-Methylnaphthalene, Naphthalene and Phenanthrene detected in method blank at or above 1/2 the LOQ.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87749, Batch ID 40233:
Sample MB-40233, Batch ID 40233 : 2-Fluorobiphenyl exceeded QC limits
Sample LCS-40233, Batch ID 40233 : 2-Fluorobiphenyl exceeded QC limits

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87749, Batch ID R87749:
Sample CCV SIM 070516S7: CCV result for Benzo(b)fluoranthene exceeded QC limit.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87749, Batch ID 40193:
Sample 1606392-020D, Batch ID 40193 : 2-Fluorobiphenyl exceeded QC limits

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87615, Batch ID 87615:
Sample CCVE SIM 062716S7, Batch ID R87615 : Ending CCV results for Benzo(b)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h) anthracene and Indeno(1,2,3-cd)pyrene exceeded the 50% criteria.

Analytical Comments for Test SW_8270S-SIM, Analytical Run No 87749, Batch ID 87749:
Sample CCV SIM 070516S7, Batch ID R87749 : CCV result for Benzo(b)fluoranthene exceeded QC limit. 2-Fluorobiphenyl exceeded QC limits..
Analytical Comments for 8270D SIM, Sample 1606392-020D, Batch ID 40193 : 2-Fluorobiphenyl exceeded QC limits

RTI Laboratories - Definitions and Acronyms

WO#: 1606392

Date Reported: 8/30/2016
Revision v3

DEFINITIONS:

DF: Dilution factor; the dilution factor applied to the prepared sample.

DL: Detection Limit; The lowest concentration of analyte that can be detected by the method in the applicable matrix.

DUP: Duplicate; aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently, used to calculate Precision (%RPD).

LCS: Laboratory Control Sample; prepared by adding a known amount of target analytes to a specified amount of clean matrix and prepared with the batch of samples, used to calculate Accuracy (%REC).

LCSD: A duplicate LCS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

LOD: Limit of Detection; a laboratory verified concentration that can be detected at three times greater than the noise level. This concentration is equal to or greater than the DL.

LOQ: Limit of Quantitation; The lowest verified limit to which data is quantified without qualifications. Analyte concentrations below the LOQ are reported with a "J" qualifier.

MBLK: Method Blank; a sample of similar matrix that does not contain target analytes or interference that may impact the analytical results and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedure, used to assess and verify that the analytical process is free of contamination.

Mg/Kg or mg/L: Units of part per million (PPM) – milligram per Kilogram (W/W) or milligram per Liter (W/V).

MS: Matrix Spike; prepared by adding a known amount of target analytes to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available, used to calculate Accuracy (%REC)

MSD: A duplicate MS sample, used to calculate both Accuracy (%REC) and Precision (%RPD)

% REC: Percent Recovery of a known spike (SPK); a measure of accuracy expressed as a percentage of a measured (recovered) concentration compared to the known concentration (SPK) added to the sample. This is compared to the Low Limit and High Limit.

% RPD: Relative Percent Difference; a measure of precision expressed as a percentage of the difference between two duplicates relative to the average concentration. This is compared to the RPD Limit.

Qual: Qualifier that applies to the analyte reported

SPK: Spike; used in the QC section for both SPK Value and SPK Ref Val

Ug/Kg or ug/L: Units of part per billion (PPB) – microgram per Kilogram (W/W) or microgram per Liter (W/V).

QUALIFIERS:

*: Reported value exceeds the maximum allowed concentration by regulation or permit.

B: Analyte detected in the associated Method Blank at a concentration greater than 1/2 the LOQ

G: ICB/CCB result is greater than the MDL

H: Holding time for preparation or analysis has been exceeded

J: Estimated result. Greater uncertainty is associated with this result and data reported is estimated.

M: Manual Integration used to determine area response

P: Second column RPD exceeds 40%

Q: % REC exceeded control limits. When applied to sample analytes - denotes an associated LCS recovery that exceeded control limits.

R: % RPD exceeds control limits

T: MBLK result is greater than 1/2 of the LOQ

U: The analyte concentration is less than the DL. The result is reported as less than the LOD

X: Matrix spike recovery for the noted analyte exceeded control limits. Applied to the MS/MSD parent sample.

Y: Percent Difference/Drift in the associated CCV exceeded acceptance criteria.

Z: Percent Difference/Drift in the associated ICV exceeded acceptance criteria.

4 Express Package Service * To most locations.

Packages up to 150 lbs.
For packages over 150 lbs., use the FedEx Express Freight US Airbill.

Next Business Day

- [ ] FedEx First Overnight — Earliest next business morning delivery to select locations. Friday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [X] FedEx Priority Overnight — Next business morning.* Friday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [X] FedEx Standard Overnight — Next business afternoon.* Saturday Delivery NOT available.

2 or 3 Business Days

- [ ] FedEx 2Day A.M. — Second business morning.* Saturday Delivery NOT available.
- [ ] FedEx 2Day — Second business afternoon.* Thursday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [ ] FedEx Express Saver — Third business day.* Saturday Delivery NOT available.

5 Packaging * Declared value limit $500.

[ ] FedEx Envelope* [ ] FedEx Pak* [ ] FedEx Box [ ] FedEx Tube [X] Other

6 Special Handling and Delivery Signature Options Fees may apply. See the FedEx Service Guide.

[X] Saturday Delivery
NOT available for FedEx Standard Overnight, FedEx 2Day A.M., or FedEx Express Saver.

- [ ] No Signature Required — Package may be left without obtaining a signature for delivery.
- [ ] Direct Signature — Someone at recipient's address may sign for delivery.
- [ ] Indirect Signature — If no one is available at recipient's address, someone at a neighboring address may sign for delivery. For residential deliveries only.

Does this shipment contain dangerous goods?

One box must be checked.

- [X] No
- [ ] Yes — As per attached Shipper's Declaration.
- [ ] Yes — Shipper's Declaration not required.
- [ ] Dry Ice — Dry Ice, 9, UN 1845 ____ x ____ kg

*Restrictions apply for dangerous goods — see the current FedEx Service Guide.

[ ] Cargo Aircraft Only

7 Payment *Bill to:*

Enter FedEx Acct. No. or Credit Card No. below.

Address

Use this line for the HOLD location address or for continuation of your shipping address.

City LIVONIA State MI ZIP 48150

Hold Weekday FedEx location address REQUIRED. NOT available for FedEx First Overnight.

Hold Saturday FedEx location address REQUIRED. Available ONLY for FedEx Priority Overnight and FedEx 2Day to select locations.

0123459941

8103 0202 5979

4 Express Package Service * To most locations. Packages up to 150 lbs. For packages over 150 lbs., use the FedEx Express Freight US Airbill.

Next Business Day

- [ ] FedEx First Overnight — Earliest next business morning delivery to select locations. Friday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [x] FedEx Priority Overnight — Next business morning.* Friday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [x] FedEx Standard Overnight — Next business afternoon.* Saturday Delivery NOT available.

2 or 3 Business Days

- [ ] FedEx 2Day A.M. — Second business morning.* Saturday Delivery NOT available.
- [ ] FedEx 2Day — Second business afternoon.* Thursday shipments will be delivered on Monday unless Saturday Delivery is selected.
- [ ] FedEx Express Saver — Third business day.* Saturday Delivery NOT available.

5 Packaging * Declared value limit $500.

- [ ] FedEx Envelope*
- [ ] FedEx Pak*
- [ ] FedEx Box
- [ ] FedEx Tube

6 Special Handling and Delivery Signature Options Fees may apply. See the FedEx Service Guide.

- [ ] Saturday Delivery — NOT available for FedEx Standard Overnight, FedEx 2Day A.M., or FedEx Express Saver.
- [ ] No Signature Required — Package may be left without obtaining a signature for delivery.
- [ ] Direct Signature — Someone at recipient's address may sign for delivery.
- [ ] Indirect Signature — If no one is available at recipient's address, someone at a neighboring address may sign for delivery. For residential deliveries only.

Does this shipment contain dangerous goods?

- [ ] No
- [ ] Yes — As per attached Shipper's Declaration.
- [ ] Yes — Shipper's Declaration not required.
- [ ] Dry Ice — Dry Ice, 9, UN 1845 ____ x ____ kg

Restrictions apply for dangerous goods — see the current FedEx Service Guide.

- [ ] Cargo Aircraft Only

7 Payment Bill to:

Enter FedEx Acct. No. or Credit Card No. below.

- [ ] Sender Acct. No. in Section 1 will be billed.
- [ ] Recipient
- [ ] Third Party
- [ ] Credit Card
- [ ] Cash/Check

Total Packages ____ Total Weight ____ lbs. Credit Card Auth.

*Our liability is limited to US$100 unless you declare a higher value. See the current FedEx Service Guide for details.

RE: Camp Hero

Work Order #: 1606422

Dear Devon Chicoine:

There were no problems with the analytical events associated with this report unless noted in the Case Narrative.

This report may only be reproduced in its entirety. Individual pages, reproduced without supporting documentation, do not contain related information and may be misinterpreted by other data reviewers.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Katherine Griffin

Project Manager

RTI Laboratories - Case Narrative

WO#: 1606422

Date Reported: 8/26/2016
Revision v5

Client: AECOM Design and Consulting Services (DCS)

Project: Camp Hero

Analytical Report revised 9/1/2016: Sampple ID 1606422-006 was update to 2010-SB02-GW.
Analytical report revised: removed 1,2,4-Trichlorobenzene and 1,2-Dichlorobenzene from VOC 8260 analytes list.

Concentrations reported with a J flag in the Qual field are values below the reporting limit (RL) but greater than the established method detection limit (MDL). There is greater uncertainty associated with these results and data should be considered as estimated. These analytes are not routinely reviewed nor narrated below as to their potential for being laboratory artifacts.

Concentrations reported with an E flag in the Qual field are values that exceed the upper quantification range. There is greater uncertainty associated with these results and data should be considered as estimated.

Any comments or problems with the analytical events associated with this report are noted below.

Sample Analysis:
Samples were analyzed at the RTI Laboratories
- Metals, ICP/MS - 6020
- Metals, ICP/MS - 6020A-PB-STAR
- Silver and/or Antimony, ICP/MS - 6020A-SA
- Polychlorinated Biphenyls - 8082A
- Volatile Organic Compounds - 8260C
- Semi-Volatile Organic Compounds - 8270D-MOD
- Semi-Volatile Organic Compounds - 8270D SIM
- Semi-Volatile Organic Compounds - 8270D-SIM-STAR

Prep Batch (SW_3510BNA) / 40262:
Samples 1606422-008B, -008B MS and -008B MSD: Samples re-extracted and analyzed due to surrogate failures in initial run. Samples were prepped past the recommended hold time by 7.88 days. Both Re-analysis and original analysis were reported.

Analytical Comments for Test SW_8260A, Analytical Run No 86803, Batch ID R86803:
Sample VOA10 CCV 062116: CCV results for 1,2,4-Trichlorobenzene, 1,2-Dibromo-3-chloropropane and Chlorodibromomethane exceeded the 20% criteria.
Sample 1606422-002AMS: Recoveries for 1,2,4-Trichlorobenzene, 1,2-Dibromo-3-chloropropane, Methylene chloride and Toluene exceeded control limits.
Sample 1606422-002AMSD: Recoveries for 1,2,4-Trichlorobenzene, and 1,2-Dibromo-3-chloropropane exceeded control limits.
Sample 1606422-008AMSD: Recoveries for 1,2,4-Trichlorobenzene, and 1,2-Dibromo-3-chloropropane exceeded control limits. RPD percentage for Acetone exceeded control limits.
Sample VOA10 CCVE 062116: Ending CCV results for 1,2,4-Trichlorobenzene, and Dichlorodifluoromethane exceeded the 50% criteria.

Analytical Comments for Test SW_8270A, Analytical Run No 86884, Batch ID 40190:
Sample ICV S8 050216: Recoveries for Benzoic acid and Bis(2-chloroisopropyl)ether were outside control criteria.
Sample CCV S8 062116: Recoveries for 2,4-Dinitrophenol, Benzoic acid, Bis(2-chloroisopropyl)ether, N-Nitrosodimethylamine and Pentachlorophenol were outside control criteria.
Sample MB-40109: Surrogate recovery for Phenol-d5 was outside control criteria.
Sample LCS-40190: Recoveries for 4-Nitrophenol, N-Nitrosodimethylamine and Phenol exceeded control limits.
Sample LCSD-40190: Recoveries for 4-Nitrophenol, N-Nitrosodimethylamine and Phenol exceeded control limits.

Analytical Comments for Test SW_8270A, Analytical Run No 87440, Batch ID 40262:
Sample ICV S7 031416: Recovery for Bis(2-chloroisopropyl)ether was outside 20% control criteria.
Sample CCV S7 063016: Recovery for Bis(2-chloroisopropyl)ether was outside 20% control criteria.
Sample LCS-40262: Recoveries for N-Nitrosodimethylamine and Phenol exceeded the recovery limits.
Sample 1606422-008BMS: Recovery for several compounds exceeded control limits due to sample matrix. Surrogate recovery for Phenol-d5 was outside control criteria.
Sample 1606422-008BMSD: Recovery for several compounds exceeded control limits due to sample matrix. RPD percentages for 1,4-Dichlorobenzene and N-Nitrosodimethylamine were above control criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40156:
Sample LCS-40156: LCS results for 4-Nitrophenol, and N-Nitrosodimethylamine exceeded recovery control limits

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID 40170:
Sample MB-40170: Surrogate recovery for Phenol-d5 was outside control criteria.
Sample LCS-40170: LCS result for N-Nitrosodimethylamine exceeded recovery control limits.
Sample 1606422-002B: Surrogate Phenol-d5 exceeded recovery control limit.
Sample 1606422-002BMS: Recoveries for several analytes exceeded control limits. Surrogates recoveries for 2-Fluorobiphenyl, Nitrobenzene-d5 and Phenol-d5 were outside control criteria.
Sample 1606422-002BMSD: Results and RPD percentages for several analytes exceeded control limits. Surrogate recovery for Phenol-d5 was outside control criteria.
Sample 1606422-003B: Surrogate Phenol-d5, Nitrobenzene-d5, and 2-Fluorobiphenyl exceeded recovery control limit.
Sample 1606422-008B: Surrogates Nitrobenzene-d5, and 2-Fluorobiphenyl exceeded recovery control limit.

Sample 1606422-008BMS: Results 4-Bromophenyl phenyl ether, 4-Nitrophenol, Hexachlorobenzene, N-Nitrosodimethylamine, and Phenol exceeded control limits. Surrogate recovery for Phenol-d5 was outside control criteria.
Sample 1606422-008BMSD: Results for 4-Nitrophenol, Hexachlorobenzene, N-Nitrosodimethylamine and Phenol exceeded recovery control limit. RPD percentage for Pentachlorophenol exceeded control limits. Surrogate recovery for Phenol-d5 was outside control criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86748, Batch ID R86748:
Sample ICV S8 050216: ICV results for Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCV S8 061616: CCV results for 2,4-Dinitrophenol, 2-Nitrophenol, and 4,6-Dinitro-2-methylphenol exceeded the 20% criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 86836, Batch ID 40190:
Sample ICV S8 050216: ICV results for Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria
Sample CCV S8 062116: CCV results for 2,4-Dinitrophenol, Benzoic acid and Bis(2-chloroisopropyl) ether, N-Nitrosodimethylamine and Pentachlorophenol exceeded the 20% criteria.

Sample MB-40190: Surrogate recovery for Phenol-d5 was outside the control limits.
Sample LCS-40190: Recoveries for 4-Nitrophenol, Benzoic Acid, N-Nitrosodimethylamine and Phenol exceeded control limit. Surrogate recovery for Phenol-d5 was outside control criteria.
Sample LCSD-40190: Recoveries for 4-Nitrophenol and N-Nitrosodimethylamine exceeded control limits. The RPD percentage for Benzoic Acid was above control limit. Surrogate recovery for Phenol-d5 was outside control criteria.

Analytical Comments for Test SW_8270A-LL, Analytical Run No 87381, Batch ID 40262:
Sample ICV S7 031416: ICV result for Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample CCV S7 063016: CCV results for Benzoic acid and Bis(2-chloroisopropyl) ether exceeded the 20% criteria.
Sample MB-40262: Surrogate recovery for Phenol-d5 was outside control criteria.
Sample LCS-40262: Recoveries for Benzoic Acid, N-Nitrosodimethylamine and Phenol exceeded the control limit.
Sample 1606422-009BMS: Spike recoveries for several compounds were outside the control limits. Surrogate recovery for Phenol-d5 was outside control criteria.
Sample 1606422-009BMSD: Spike recoveries for several compounds were outside the control limits. RPD percentage for 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, N-Nitrosodimethyamine were outside the control limits. Surrogate recovery for Phenol-d5 was outside control criteria.

Analytical Comments for Test SW_8270A-SIM, Analytical Run No 87471, Batch ID 40179:
Sample 1606422-002B: Surrogate recovery for 2-Fluorobiphenyl was outside the control limits.
Sample 1606422-002BMS: Surrogate recoveries for 2-Fluorobiphenyl, Nitrobenzene-d5 and Terphenyl-d14 were outside the control limit
