EXECUTIVE SUMMARY

Camp Hero is a formerly used defense site (FUDS) undergoing a Remedial Investigation and Feasibility Study (RI/FS) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The RI field effort was completed in three phases; the Phase I field investigation was completed from May to June 2016, the Phase II field investigation was completed from November to December 2016, and the Phase III field investigation was completed from May to June 2017. A total of 47 areas of concern (AOCs) were identified and evaluated during the Phase I and II RI process; AOCs warranting additional investigation based on the Preliminary Screening Evaluation (PSE) were grouped into 18 geometric Decision Units (DUs) for the Phase III field investigation, as established in the Phase III Sampling and Analysis Plan (SAP; AECOM-Tidewater JV 2017b).

The primary objectives of the Phase III field investigation were to collect an unbiased, representative dataset for potentially impacted surface and subsurface soil associated with each DU; collect a representative background dataset for surface water and sediment at a sitewide scale; collect unbiased, representative surface water and sediment data within stream exposure areas in the vicinity of DUs that could potentially impact downgradient surface water and sediment; establish a representative sitewide groundwater monitoring well network and collect groundwater samples on a sitewide scale, as well as on a local scale in the vicinity of DUs that could potentially have (or have been demonstrated to have in previous RI results) localized groundwater impacts; and collect additional physical and chemical data to support the development of the RI conceptual site model (CSM), risk assessments, and FS.

This Phase III Investigation Field Report provides: (1) documentation of the Phase III field activities, (2) details on any significant deviations from the Phase III RI SAP (AECOM-Tidewater JV 2017b) that occurred, and (3) field data and analytical laboratory reports for samples collected during the Phase III field investigation.

A total of 22 permanent monitoring wells were installed and developed during the Phase III field event, creating a sitewide network of 43 total monitoring wells. Groundwater samples were collected from 27 monitoring wells, including all existing and new monitoring wells with the exception of the 15 background wells and one well with light non-aqueous phase liquid (LNAPL) present. Groundwater samples were analyzed sitewide for semi-volatile organic compounds (SVOCs) and metals (including hexavalent chromium [Cr^{6+}, in 10% of samples] and mercury); groundwater in the vicinity of DU01 and DU11 was also analyzed for volatile organic compounds (VOCs), and groundwater in the vicinity of DU15 was also analyzed for polychlorinated biphenyls (PCBs). Total (unfiltered) and dissolved (filtered) groundwater samples were collected at each well.

A sitewide network of 30 co-located background surface water and sediment samples were collected upstream of the DUs to establish sitewide background levels for naturally-occurring constituents and anthropogenic impacts. Additionally, a sitewide network of co-located surface water and sediment samples were collected from 125 locations within exposure areas in the vicinity of DUs for assessment of potential impacts from DU constituents that could potentially impact downgradient surface water and sediment. Surface water and sediment samples were analyzed site-wide for SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury); surface water and sediment samples in the vicinity of DU15 were also analyzed for PCBs. A total of 155 sediment samples, 148 unfiltered surface water samples, and 30 filtered surface water samples were collected at Camp Hero (including sitewide and background locations). Filtered surface water samples were collected when the turbidity of the surface water was greater than 10 nephelometric turbidity units (NTUs; additional information provided below on deviations to the Phase III SAP). Surface water could not be collected at 7 of the 155 locations because they were dry at the time of sampling.

Soil samples were collected at 17 of the 18 DUs during the Phase III field event. Soil samples could not be collected from DU08 because the DU was inundated with water; instead, surface water and sediment samples were collected at DU08. A total of 400 soil samples were collected, including 256 surface soil samples (0 to 1 feet [ft] below ground surface [bgs]) from 16 DUs and 144 subsurface soil samples (1 to 10 ft bgs or 1 to 2 ft bgs in wetlands) from 9 DUs. Analytical parameters for surface and subsurface soil varied by DU based on the data needs established in the PSE and Phase III SAP, but generally included SVOCs and metals (AECOM-Tidewater JV 2017b). Cr^{6+} was analyzed in 10% of samples analyzed for metals, along with pH and oxidation-reduction potential (ORP). PCBs were also evaluated in soil samples from DU15. Additionally, two undisturbed subsurface soil samples were collected at DU01 by Shelby tube methodology for laboratory analysis of soil permeability.

The Phase III field investigation was generally completed according to the scope provided in the Phase III SAP. Although the overall objectives were met, some deviations to the Phase III RI SAP, field decisions, and avoidance and minimization best management practices (BMPs) occurred during the field effort following discussions between the USACE and AECOM team. Field decisions and deviations from the SAP are documented in Section 5.0 of this Field Report.

One deviation of note was that due to a misinterpretation of the SAP, filtered surface water samples were generally only collected when the turbidity was elevated (>10 NTU). Although the Phase III SAP established that filtered samples for organic parameter groups (SVOCs and PCBs) in surface water would only be collected if the turbidity was elevated (>10 NTU), filtered surface water samples were to be collected for dissolved metals analysis regardless of the turbidity. Unfiltered metals in surface water were collected as planned at all locations. Field-filtered surface water samples were collected from 30 locations during the Phase III field event (inclusive of the sitewide background locations).

To obtain a filtered surface water dataset for metals, additional sample volume on hold at the laboratory was evaluated for metals. A total of 197 surface water samples were filtered in the laboratory and analyzed for the Phase III SAP metals list, minus mercury and hexavalent chromium (197 samples, including samples from all 148 surface water locations, 30 previously analyzed field-filtered locations, and 19 field duplicate locations). Mercury and hexavalent chromium were not evaluated because the samples were approximately 100 days past their respective hold times. The 197 surface water samples (dissolved [field-filtered] and total) from 148 locations were unpreserved and kept in cold storage in amber bottles since the Phase III field event. The field-filtered samples were re-filtered and analyzed for comparability. Details on the validation of the lab-filtered surface water data are provided in Section 2.14 of this Field Report.

The field-filtered and lab-filtered results will be used to assess the comparability of results during data evaluation in the RI Report. Surface water samples were out of hold for both filtration and total metals analysis, and biological activity can occur under cool conditions in an amber bottle. Therefore, the lab-filtered surface water data will only be considered qualitatively in the Ecological Risk Assessment (ERA) portion of the RI Report and any potential data gaps related to this approach will be discussed in the uncertainty section of the ERA. Not having filtered surface water samples for hexavalent chromium and mercury represents a minor data gap for the ERA evaluation of risks to aquatic receptors. However, since total recoverable data are available for these chemicals, as well as for total chromium, the ERA will still be able to assess the potential for risks due to these chemicals. Total recoverable data may slightly over-estimate risks relative to the evaluation of filtered data; therefore, if the total recoverable results identify potential risks, uncertainties associated with a lack of filtered data will be discussed. Additional details regarding the lab-filtered surface water dataset for metals are discussed in Section 5.0 of this Field Report.

A laboratory metals data quality breach was identified that affected a total of approximately 14,000 analytical metals results from 596 samples in 33 sample delivery groups (SDGs). These samples were collected during both the Phase II field investigation event conducted in December 2016 (affecting 4 SDGs) and the Phase III field investigation (affecting 29 SDGs). The four affected data packages from the Phase II field investigation are documented in the revised Final Phase II Investigation Field Report (AECOM-Tidewater JV 2018). Based on the evaluation of this matter conducted by ELLE and the AECOM Camp Hero project chemists, 18 samples collected from DU04 in one Phase III SDG required re-analysis. The reanalyzed metals samples were determined to have acceptable QC parameters and replaced the metals affected by the data breach. Of the remaining potentially affected data, 19 sample results (0.13% of the 15,400 results) required an actual value change, and 226 sample results (1.6%) required qualifier changes. All revised data for both Phase II and Phase III field investigation events were deemed usable. Additional details regarding the laboratory data breach are discussed in Section 2.14 of this Field Report.

1.0 INTRODUCTION

Camp Hero is a formerly used defense site (FUDS) undergoing a Remedial Investigation and Feasibility Study (RI/FS) under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The primary objectives of the Camp Hero RI are to determine the nature and extent of potential releases and impacts in site media from former military operations, and to subsequently quantify whether there are unacceptable risks posed to human health or ecological receptors. This RI/FS program for Camp Hero is being conducted by AECOM on behalf of the AECOM-Tidewater Joint Venture (JV) in coordination with the United States Army Corps of Engineers (USACE), New England and New York Districts, as well as the Environmental and Munitions (EM) Center of Expertise (CX). A Camp Hero general location map is provided as **Figure 1-1** in **Appendix A**.

The RI technical approach consists of three phases of field investigation: Phase I, Phase II, and Phase III. The primary objective of the Phase I field investigation was to determine the presence or absence of contamination at the 47 Camp Hero Areas of Concern (AOCs). Phase I field activities included collection of discrete, biased surface and subsurface soil samples for use in the preliminary screening evaluation (PSE) and grab groundwater samples for use in refining the groundwater conceptual site model (CSM). The Phase I field investigation was conducted between 16 May and 24 June 2016 and is documented in the Phase I Investigation Field Report (AECOM-Tidewater JV 2016b).

The Phase II field investigation evaluated the extent of residual light non-aqueous phase liquid (LNAPL) and related constituents present at the former Building 203 AOC (now DU01). The Phase II field investigation also included the installation and sampling of 15 sitewide background monitoring wells. The Phase II field investigation was conducted between 28 November and 16 December 2016 and is documented in the Phase II Investigation Field Report (AECOM-Tidewater JV 2018).

The PSE was completed using the Phase I and II RI dataset to (1) determine which AOCs require further assessment as part of the Phase III field effort and (2) refine the list of parameters for sample collection during the Phase III field effort with the intent of completing the RI phase of the CERCLA process. The PSE is available as Appendix E to the Phase III Sampling and Analysis Plan (SAP) (AECOM-Tidewater JV 2017b). Based on the PSE, a total of 21 AOCs, plus 6 segments of the former sitewide waste disposal system AOC, warranted further assessment and were grouped into 18 geometric Decision Units (DUs) for the Phase III field investigation.

The primary objectives of the Phase III field investigation were to:

- Collect an unbiased, representative dataset for potentially impacted surface and subsurface soil associated with each of the individual DUs;

- Collect a representative background dataset for surface water and sediment at a sitewide scale, as well as collect unbiased, representative surface water and sediment data in exposure areas in the vicinity of DUs to assess whether DU constituents have potentially impacted downgradient surface water and sediment;

- Establish a representative groundwater monitoring well network and collect groundwater samples on a sitewide scale, as well as on a local scale in the vicinity of DUs that could potentially have (or have been demonstrated in previous RI results to have) localized groundwater impacts; and

- Collect additional physical and chemical data to support the development of the RI CSM, risk assessments, and the FS.

The Phase III field investigation was conducted between 30 May and 28 June 2017 and is documented in this Field Report.

1.1 Facility Background

The Camp Hero State Park Site consists of 469 acres located on the eastern tip of the South Fork of Long Island, NY, approximately 5 miles east of the Village of Montauk in Suffolk County, NY (**Figure 1-1** in **Appendix A**). The Site is bounded by Montauk Highway (Route 27) to the north, the Atlantic Ocean to the south, Montauk Point State Park to the east, and Camp Hero's undeveloped sanctuary area to the west.

Camp Hero was originally established in early 1942 as a Coastal Defense Installation and was utilized by the Department of Defense (DoD) for training and other activities over the course of the following decades. Between 1974 and 1984, site lands were incrementally transferred to state, local, and other federal agencies, and the facility was permanently closed in 1982. Camp Hero is now used as a State Park and is owned by the State of New York and operated under the jurisdiction of the Office of Parks, Recreation, and Historic Preservation. In order to streamline this field report, the full facility history is not provided in this document. A detailed facility history can be referenced in the Camp Hero Final RI Work Plan (AECOM-Tidewater JV 2016a).

1.2 Scope and Objectives

This Phase III Investigation Field Report documents the Phase III field investigation at Camp Hero during May and June 2017. The objectives of this Field Report are to:

- Summarize the Phase III RI field activities, including wetlands delineation and management, Unexploded Ordnance (UXO) anomaly avoidance, rare plant surveys, vegetation clearance, installation and development of new monitoring wells, down-wind community air monitoring

during drilling activities, soil sample collection within the DUs, groundwater sample collection from sitewide monitoring wells, background surface water and sediment sample collection, and sitewide surface water and sediment sample collection from multiple stream exposure areas;

- Present details on any significant deviations from the Phase III SAP that occurred; and
- Provide field data and analytical data from the off-site laboratory, Eurofins Lancaster Laboratories Environmental (ELLE), LLC (Lancaster, PA).

1.3 Report Organization

This Field Report is organized into the following sections:

- **Section 1.0:** Introduction – provides an introduction to the project including the scope and objectives, installation background, and organization of this Field Report.
- **Section 2.0:** Field Investigation Tasks – provides descriptions of general field investigation procedures and information on the data analysis and validation process.
- **Section 3.0:** Background Surface Water and Sediment Sampling – provides the approach and overview for the Camp Hero background surface water and sediment sampling.
- **Section 4.0:** Field Sampling and Data Collection – presents the Phase III field investigation activities for each DU, sitewide groundwater, and sitewide surface water and sediment at Camp Hero.
- **Section 5.0:** Deviations from the Phase III SAP – presents a list of deviations from the Phase III SAP.
- **Section 6.0:** References – lists the references utilized in this Field Report.

The following appendices are included in this Field Report:

- **Appendix A** contains the figures referred to in this Field Report.
- **Appendix B** contains the tables referred to in this Field Report.
- **Appendix C** contains the Community Air Monitoring results. Continuous air monitoring was completed during Phase III field investigation downwind of intrusive activities, in accordance with the modified generic NY State Department of Health (NYSDOH) Generic Community Air Monitoring Plan (CAMP), Attachment 1A of the New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER)-10 Technical Guidance for Site Investigation and Remediation (NYSDEC 2010).

- **Appendix D** contains the land surveying report and data form the Phase III field investigation.
- **Appendix E** contains the Investigation-Derived Waste (IDW) disposal documentation from the Phase III field investigation.
- **Appendix F** contains the laboratory analytical data results from the Phase III field investigation, the laboratory IDW report, the data validation reports, the Eurofins Lancaster Laboratories Environmental LLC (ELLE) Corrective Action Summary Letter, and the Camp Hero Project Laboratory Subcontractor Data Quality Breach Letter.
- **Appendix G** contains the Daily Reports completed during Phase III field investigation.
- **Appendix H** contains a photograph log of significant photos collected during the Phase III field investigation, which are not already included in the Daily Reports.
- **Appendix I** contains field documentation including well boring logs, well construction and development forms, groundwater sampling forms, surface water and sediment sampling forms, stream exposure area characterization sheets, soil boring logs and sampling forms, and raw slug test data.

2.0 FIELD INVESTIGATION TASKS

The Phase III RI field investigation activities at Camp Hero included a botanical survey for rare and threatened plant species, wetland delineation, best management practices (BMPs) for wetland avoidance and minimization, stream exposure area characterization, UXO anomaly avoidance, community air monitoring, permanent monitoring well installation and development, hydraulic conductivity (slug) testing, field sample collection, and land surveying. Details of each activity are provided in the sections below.

2.1 Coordination with Stakeholders

Project kick-off meetings were held to initiate coordination with stakeholders. Activities were coordinated with the Camp Hero State Park Superintendent, Mr. Tom Dess, to ensure activities did not impact park visitors or conflict with seasonal work restrictions. Additionally, activities were coordinated with the State Historic Preservation Officer and other interested parties and stakeholders, in accordance with Section 106 of the National Historic Preservation Act of 1996, as amended and 36 Code of Federal Regulations (CFR) 800.

The New York Natural Heritage Program (NYNHP) and NYS Office of Parks, Recreation, and Historic Preservation (OPRHC) were consulted regarding Camp Hero RI activities, with particular focus on the botanical survey of rare and endangered species (see Section 3.1 below). Coordination letters were submitted to the NYSDEC Region 1 Office, the United States Fisheries and Wildlife Service (USFWS) New York Field Office, and the Shinnecock Nation regarding planned Camp Hero activities. The coordination letters indicated the USACE's intent to conduct an RI at Camp Hero, with the purpose of assessing if the former DoD activities may have resulted in adverse environmental conditions. The letters additionally explained the scope of the RI and stated that care would be taken to minimize impacts to vegetation and local threatened and endangered species. Copies of coordination correspondence are available in the Phase I Investigation Field Report (AECOM-Tidewater JV 2016b).

2.2 Rare Plant Survey

A botanical survey for rare and threatened species at Camp Hero was completed during the Phase III field event, prior to any vegetation removal activities. The NYNHP identified four rare plant species which have been historically reported within Camp Hero State Park, including: Little-leaf Tick-trefoil, Fringed boneset, Blunt mountain-mint, and Southern arrowwood (NYNHP 2010).

Prior to the botanical survey field activities, the AECOM botanist researched the habitat requirements, phenology, critical diagnostic characteristics, and morphologically-similar congeners for the target plant species identified as potentially occurring in the vicinity of the Camp Hero DUs

by the NYNHP. Botanical references and regional field manuals were consulted for the northeastern United States as well as Flora of North America.

During the Phase III field investigation, each DU and monitoring well installation location was surveyed for the four rare plant species. If any rare plant species were identified, they were marked with pink and black striped flagging. The USACE and AECOM team was consulted to determine the best method to avoid destruction of any protected plants by subsequent investigative procedures, including brush clearing and use of heavy equipment.

One of the target rare plant species, *Viburnum dentatum* var. *venosum* (Southern arrowwood), was encountered with great frequency throughout Camp Hero; in some areas, it was co-dominate in the forested understory or upland successional shrub lands and it appears the population is stable and thriving. While all larger specimens were flagged, a small number of sites also had numerous seedlings that are almost impossible to avoid without employing extraordinary measures. In consultation with the NYSDEC, NYNHP, and NYS OPRHC, it was concluded that the destruction of a few seedlings during the course of further remedial investigation at Camp Hero would be acceptable in light of the large and stable population of *Viburnum dentatum* var. *venosum*.

2.3 Wetland Delineation and Best Management Practices

Wetlands evaluation was completed at all DUs and around monitoring well locations during the Phase III field investigation prior to drilling activities or stream sampling. Where wetlands boundaries were observed within the DU, a delineation was performed including flagging and Global Positioning System (GPS) location of flagging within the DU. The wetland delineation was conducted in accordance with the NY State Freshwater Wetlands Delineation Manual (NYSDEC 1995) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region, Version 2.0 (USACE 2012). The methodology producing the more inclusive wetland boundary was used at each area of delineation. The following summary describes the wetland avoidance and minimization procedures established for Camp Hero.

No wetland conditions were observed at 8 DUs (DU01, DU04, DU09, DU10, DU12, DU13, DU14, and DU18). Wetland conditions were observed at the remaining 10 DUs (DU02, DU03, DU05, DU06, DU07, DU08, DU11, DU15, DU16, DU17, and DU18) and the aboveground storage tank (AST) 35/FPH and STB monitoring well areas, roughly ranging from covering 10% to 100% of each respective DU.

Pink wetland flagging tape with "WETLAND DELINEATION" was hung to clearly demark the wetland boundaries prior to the commencement of any disturbance activities. In accordance with article 24 of the NY Freshwater Wetlands Act, Class 1 NY State Freshwater wetlands (wetlands of 12.5 acres or more, except for wetlands of "unusual local importance" as determined by DEC) were afforded a

100 foot (ft) buffer zone from heavy equipment (NYDSEC 1997). Where the 100 ft buffer zone intersected the DU extent, yellow and black striped flagging was hung to clearly demark the heavy equipment exclusion area. Where the entire DU was within a state buffer zone, the field crew team disseminated information to heavy equipment crews to avoid the entire DU if practicable. A buffer zone was not established for wetlands which were not state-mapped. Wetland boundary coordinates were collected in the field using a Trimble Geo X7 handheld GPS. Wetland boundaries are displayed on the DU-specific figures in Section 4.0 of this field report.

Established BMPs for avoidance and minimization are presented on **Table 3-1** (**Appendix B**). "Site standard" BMPs for avoidance and minimization were implemented at all DUs, including but not limited to:

- Minimal vegetation clearance and limiting tree clearing to trees less than 3 inches in width;
- Monitoring wells located within wetland or buffer zone boundaries were relocated outside of the established boundaries; and
- Direct push soil sample locations falling within wetland or buffer zone boundaries were either relocated outside of the established boundaries or collected via hand-auger to a shallower depth (refer to Section 2.10 for additional details).

In addition to the above avoidance and minimization BMPs, at DU07, the entire sampling grid was shifted to the west to allow for more sample locations to be accessed by a drill rig, to avoid the 100 ft buffer zone but still encompass a representative exposure area covering the targeted former AOCs. At DU08, the entire DU (with the exception of the roadway running through the DU) were inundated with water. No soil samples were collected; instead, surface water and sediment samples were collected.

Work within wetland areas occurred in the following two circumstances:

- The monitoring well at AST35/FPH (CH-MW024) was installed in wetland boundary (not state-mapped). It was not possible to relocate the well, because it was placed strategically in a potential petroleum release area, downgradient of a former AST and upgradient of a creek. Wetland impact minimization procedures included using matting and a catch basin to collect liquid and soil cuttings to minimize potential release of sediment to wetlands; utilizing one point of machinery entry and exit to minimize clearing and disturbance, raking ruts to reestablish pre-condition contours and re-seeding denuded areas with wetland seed mix; and verifying successful initial vegetative re-establishment and contours two weeks post-installation.

- Monitoring wells at DU08 (CH-MW036 and CH-MW037), DU15 (CH-MW039 and CH-MW040), and STB (CH-MW026 through CH-MW028) were installed within the 100 ft buffer zone of state-mapped wetlands boundaries (Class 1), but within park-maintained roadways, lawns, or asphalt lots. As these areas were already "disturbed," no impacts to wetlands or the buffer occurred. Lawns within the 100 ft buffer zone that driven over by heavy equipment were monitored after two weeks to ensure no change to turf-grass (such as bald spots or ruts) had occurred.

2.4 Stream Exposure Area Characterization

Stream exposure area characterization information was collected during the Phase III RI field effort in June 2017. The purpose of the characterization was to collect information pertinent to the ecological risk assessment, further understand the surface water flow drainage at Camp Hero, and identify drainage channels which have revetments. The revetments were built within some of the drainage channels during DoD site activities and consist of wooden planking lining each side of the drainage embankment, with wooden cross-ties for support. While the exact date of installation is unknown, the revetments were likely installed in the 1940s or 1950s during active military operation of the facility. Information collected included where the stream was shaded, whether sediment deposition was occurring, if vegetation was growing in the channel, land use, whether trash or discharge pipes were present in the channel, and additional ecological information. Characterization was completed for all stream exposure areas where surface water and sediment samples were collected.

2.5 Anomaly Avoidance

An UXO Probability Assessment for Intrusive Investigation at Camp Hero completed by USACE Baltimore District determined that the Camp Hero RI activities had a low probability of encountering munitions and explosives of concern (MEC), except for areas H and K, which would not be entered at any point during RI field activities (USACE 2016a; 2016b). However, as a precautionary measure, anomaly avoidance was conducted in accordance with EM 385-1-97 by a UXO Technician II during intrusive Phase III field investigation with a hand-held magnetometer. "Anomaly avoidance" is defined as the avoidance of surface MEC and any subsurface anomalies where the specific activity can be moved to another location. The locations examined by the UXO Tech II were all monitoring well and soil boring areas within the DUs. No munitions items were observed during investigation activities.

Additionally, all field personnel, including AECOM employees and subcontractors, completed Ordnance Recognition Training prior to the start of field activities.

2.6 Community Air Monitoring

Continuous air monitoring was completed downwind of the drill rig during intrusive activities, in accordance with the modified generic NYSDOH Generic CAMP, Attachment 1A of the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation. The CAMP establishes air monitoring activities that were to be implemented to protect the community from any potential airborne releases that could result from field activities associated with the RI or interim remedial action efforts, as necessary (NYSDEC 2010). Parameters monitored included VOCs and aerosol concentrations corresponding to PM_1, $PM_{2.5}$, and PM_{10} size fractions. No exceedances of thresholds established in the NYSDOH Generic CAMP were observed during Phase III field investigation. Data from Phase III field investigation air monitoring are included as **Appendix C** to this Field Report.

2.7 Monitoring Well Installation

A total of 22 permanent monitoring wells were installed during the Phase III field activities at Camp Hero, creating a sitewide network of 43 wells total. Sonic drilling methods were utilized for installation of the wells, with the exception of two monitoring wells (CH-MW024 and CH-MW040), as described below. An exclusion zone was established with cones surrounding the drilling operation. During sonic drilling operations, the drilling team put a sheet of plastic under the sonic drill rig and around the tracks to act as a containment barrier in the unlikely event of a release. The sonic drill was advanced through a tub to containerize any water and cuttings generated during drilling. A 4-inch inner diameter (ID) core barrel and a 6-inch ID temporary override casing was utilized advance through the overburden material to the borehole target depth. Soil within each 5-foot long core barrel was extruded from the core barrel into a plastic sleeve. The plastic sleeve was then placed horizontally on clean plastic for logging and sampling purposes.

An unused 2-inch diameter milled slot poly-vinyl chloride (PVC) screen and casing was installed to the bottom of the borehole and sand pack was placed in lifts as the drilling crew pulled the casing back to expose the well screen. The filter pack was poured directly into the borehole annular space from the top of the 6-inch temporary casing and allowed time to settle and avoid bridging. The borehole above the sand pack was sealed with 2 feet (ft) of bentonite chips. The remaining annular space between the well casing and the 6-inch temporary override casing from the top of the sand pack to the ground surface was pressure-grouted with a bentonite/cement grout using a tremie pipe. The remaining 6-inch temporary diameter sonic casing was pulled from the ground. The vibration that is applied to the casing as it is pulled served to densify and degas the grout, as well as to knit the grout into the borehole wall. The vibration is also utilized in the emplacement of the screen sand pack, which promotes a consistent, more compacted filter pack and helps prevent bridging (voids).

Due to rig access issues and the presence of wetlands, two monitoring wells (CH-MW024 and CH-MW040) were installed using Direct Push methods and pre-packed screens. The prepacked well screens were constructed of 2-inch well screens with a 1.25-inch thick sand pack surrounding the screen, with a total outside diameter of the prepacked well screens and sand filter to be 3.25-inch. The borehole above the prepacked well screens sand pack was sealed with 2 ft of bentonite chips. The remaining annular space between the 2-inch well casing riser and the 4-inch core barrel from the top of the bentonite seal to the ground surface was pressure-grouted with a bentonite/cement grout using a tremie pipe.

Additionally, the Phase I piezometer PZ-3 was secured with a well vault and pad. This location was originally intended to be a temporary location for gauging groundwater elevations during the Phase I field investigation, but because LNAPL was present in the piezometer, it was not abandoned. IDW generated during the well installation process was contained and transported to the IDW storage area.

2.8 Monitoring Well Development

Permanent monitoring wells were developed at least 24 hours after completion of well installation. Development was completed by a combination of surging with a surge block and over-pumping with a submersible monsoon pump. Water clarity was visually monitored and water quality parameters, including dissolved oxygen (DO), specific conductivity (SC), oxidation-reduction potential (ORP), pH, temperature, and turbidity, were measured using a YSI 6920 V2 multi-parameter water quality sonde with flow-through cell every 5 minutes during purging to determine progress of development. The multi-parameter water quality meter was calibrated at the beginning of each day and continually throughout the day if needed. A calibration check was performed at the end of each day. Each well was developed until the well produced clear (silt-free) water with a minimum of three stable water quality readings, as outlined below:

- pH – within ± 0.2 units.
- SC – within ± 3 percent (%).
- DO – within ± 10%
- ORP – within ± 10 millivolts.
- Temperature – within ±1 degree Celsius.
- Turbidity – at or below 10 nephelometric turbidity unit (NTU) or within ± 10% if above 10 NTU.

If any water was added to the well's borehole during development or drilling, three times the volume of water added was removed during well development, when possible. If the well had slow

groundwater recharge and was purged dry, the well was considered developed when pumped dry three times in succession.

2.9 Hydraulic Conductivity (Slug) Tests

In-situ hydraulic conductivity test data, via rising or falling head slug tests, was collected at permanent monitoring wells CH-MW016, CH-MW018, CH-MW019, CH-MW020, and CH-MW021 near DU01. Slug testing was not conducted at CH-MW017 because LNAPL was present in the well. Slug tests were performed to assess the hydraulic conductivity of the soil surrounding the tested monitoring well. Hydraulic conductivity values can be used to estimate rates of groundwater flow, estimate responses of aquifers to applied stresses (such as pumping), estimate the rate of movement of various chemicals in subsurface zones, and construct and calibrate groundwater flow models.

The monitoring wells tested were previously developed or sampled and had sufficient time to equilibrate before the testing was conducted. An initial round of static water level measurements was collected prior to initiating the slug tests and recorded in the field logbook. During the variable head test (slug test), a sudden rising or falling of the static water level in the monitoring well was produced by submerging or withdrawing a solid cylinder of known volume. Water levels were monitored and recorded until the water level returned to static conditions or sufficient data was collected to perform the hydraulic conductivity calculations.

The response of the water level to the test was monitored using an In-Situ Level Troll 700 Data Logger. The datalogger was lowered into each monitoring well and hung at a field determined depth below top of casing. The datalogger depth was set low enough to fully submerge the slug. Each datalogger was programed using a Win-Situ program through use of an In-Situ Rugged Reader. Test results were monitored real-time in the field using the Rugged Readers. All equipment that came into contact with the groundwater was decontaminated between each test location.

2.10 Field Sampling

Sample collection for the Phase III field investigation included surface soil (defined as soil from 0 to 1 ft below ground surface [bgs]), subsurface soil (1 to 10 ft bgs or 1 to 2 ft bgs in wetlands), groundwater, surface water, and sediment media. After sample collection, samples were transferred to the appropriate sample container for laboratory analysis and placed in a cooler on ice. The required sample containers, preservatives, and holding times were specified in the Phase III SAP (AECOM-Tidewater JV 2017b). Samples were transported by courier to ELLE (Lancaster, PA) for analysis. Analyses performed included volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs; including polycyclic aromatic hydrocarbons [PAHs]), metals (including hexavalent chromium [Cr^{6+}] in 10% of samples sitewide and mercury), and/or polychlorinated

biphenyls (PCBs). In order to meet project data quality objectives, the PAH subset of some SVOC samples were analyzed by Method 8270D with Selected Ion Mass Spectrometry (SIM).

Sample locations were marked with a pin flag with sample identification number and vertical and horizontal position coordinates were collected by a New York licensed surveyor. All non-disposable sampling equipment (i.e., drill rig core barrel) was decontaminated between sample locations. Decontamination generally consisted of a water rinse to remove gross contamination (if needed), followed by a non-phosphate detergent (e.g., Liquinox) water rinse, and a rinse with de-ionized water. Smaller equipment needing to be stored or transported was wrapped in aluminum foil after air-drying. Details on the sampling methodology are presented below.

Surface and Subsurface Soil: Subsurface soil samples were collected using a Direct Push Geoprobe® drill rig. A Geoprobe® dual-tube sampling system was used to collect continuous soil cores by advancing a 5-ft (60-inch) coring barrel fitted with the dedicated, disposable PVC liners to the target depth. At locations where Direct Push borings were conducted, surface soil samples were collected from the soil core. At locations where only surface soil samples were collected, a hand auger, disposable scoop, or shovel was used for sample collection. As established in the Phase III SAP, subsurface soil samples were collected via hand-auger from 1 to 2 ft bgs in wetland areas (AECOM-Tidewater JV 2017b).

Soil cores were screened for VOCs immediately upon opening the sleeve with a photo-ionization detector (PID) utilizing a 10.6 electron-Volt bulb. Screening results, lithologic descriptions, and other observations and measurements were recorded on a soil boring log by the field geologist. At a minimum, depth interval, recovery thickness, PID concentrations, moisture, relative density, color (using a Munsell soil color chart), and texture using the Unified Soil Classification System were recorded. Additional observations recorded may have included detectable odors, groundwater or perched water depth, organic material, or color changes indicating staining. Photographs were also taken of significant boring cores.

Surface soil samples were collected 0 to 1 ft bgs at all DUs. Subsurface soil samples were collected from a target depth of 1 to 10 ft bgs at DUs warranting additional subsurface soil investigation, as established in the PSE (AECOM-Tidewater JV 2017b). In wetland areas, subsurface samples were collected from 1 to 2 ft bgs.

VOC samples were collected directly from the recently-exposed soil using a sampling corer (Terra Core kits). For the other analyses, the soil was removed and transferred to a disposable, re-sealable plastic bag or large piece of poly sheeting (depending on the volume of soil) and was then homogenized, which consisted of mixing the soil until the sample is a uniform color, texture, and particle size. Any

non-homogenous particles, organic matter, and debris were removed from the soil samples prior to filling the laboratory-supplied sample containers.

Soil Permeability (Shelby Tubes): Shelby tubes samples were collected via sonic drilling methods at two locations, adjacent to monitoring wells CH-MW019 and CH-MW021. Shelby tube samplers are thin-walled, hollow steel tubes, which are driven into the ground to extract a relatively undisturbed soil sample for use in laboratory tests used to determine density, permeability, compressibility, and strength. Data from the Shelby tube samples will be used in conjunction with the hydraulic conductivity data to evaluate potential response actions in the FS.

Each Shelby tube sample was collected from the clay soil unit which underlies the perched groundwater in a 3-inch outer diameter Shelby tube following American Society for Testing and Materials (ASTM) D1587/D1587M. Once the sample was recovered, the total length was recorded to the nearest inch and logged on the side of the tube, the borehole log, and the field book. Prior to sealing, approximately 1-inch of material was removed from the lower end of the tube. The tubes were sealed on both ends using waxed caps and stored in laboratory-provided containers to ensure the tubes were transported in an upright position. Samples were submitted to the geotechnical laboratory for measurement of soil permeability (hydraulic conductivity) following ASTM method D5084 (hydraulic conductivity of saturated porous materials using a flexible wall permeameter).

Groundwater Sample Collection from Permanent Monitoring Wells: Groundwater samples were collected from the newly-installed permanent monitoring wells a minimum of 72 hours after development using low-flow sampling methodology. Groundwater levels were measured in each well prior to sampling using a water level meter (Solonist or equivalent). The monitoring wells were purged using low-flow sampling techniques using peristaltic pump or bladder pump and disposable tubing. Bladder pumps were used only when the hydraulic head was too low for use of a peristaltic pump. Water quality parameters, including DO, SC, ORP, pH, temperature, and turbidity were measured using a YSI 6920 V2 multi-parameter water quality sonde with flow-through cell. Readings were collected every five minutes until the well produced clear (silt-free) water with a minimum of three stable water quality readings, as outlined above in the Well Development procedures (Section2.8), or for a maximum of two hours, or until the well ran out of water. The multi-parameter water quality meter was calibrated initially and continually throughout its usage each day, as needed. A calibration check was performed at the end of each day.

Once the water quality parameters reached stabilization, samples were collected in laboratory-supplied bottleware. Unfiltered and filtered groundwater samples were collected at each location. Filtered samples were collected for dissolved SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and PCBs (if applicable); filtered samples were not appropriate for VOCs. Filtered

samples were field-filtered using a clean, disposable in-line filter. The pH of dissolved and total Cr^{6+} samples was adjusted according to the procedures outlined in the SAP (AECOM-Tidewater JV 2017b). A subset of monitoring wells (approximately 20%) was selected for analysis of an expanded parameter list to assess the potential for Monitored Natural Attenuation (MNA). These additional parameters included biochemical oxygen demand, total oxygen demand, total organic carbon (TOC), chlorides, sulfates and sulfides, nitrates and nitrites, alkalinity, methane, ethane, and ethene.

At wells where MNA parameters were collected, the concentration of ferrous iron (Fe^{2+}) in filtered and unfiltered groundwater samples was analyzed in the field using the HACH® DR890 Colorimeter and HACH® Method 8146, according to the procedures in the Phase III SAP (AECOM-Tidewater JV 2017b). Samples were analyzed immediately after collection because Fe^{2+} readily oxidizes to ferric iron upon exposure to air. Dilutions were conducted for samples with Fe^{2+} concentrations greater than 3.30 milligram per liter (mg/L).

Recharge in one well (CH-MW021) was insufficient to complete sampling via low-flow methodology. Instead, a grab groundwater sample was collected at this well. One set of water quality parameters was collected at the end of grab sampling.

Surface Water and Sediment Sample Collection: Co-located surface water and sediment samples were collected from permanent, intermittent, revetted, and non-revetted stream exposure areas throughout Camp Hero in the vicinity of DUs with potential environmental impacts. Surface water samples were collected first at each location, prior to sediment sampling. Samples were not collected directly following a rain event. Sampling occurred from downstream to upstream locations and agitation of the sediment and water at shallow locations was minimized. Physical characteristics of the sampling locations (e.g., water depth, stream width, etc.) were documented on the field forms.

All surface water samples were analyzed for SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and hardness; select surface water locations were analyzed for additional parameters, depending on the exposure area CSM established in the Phase III SAP (AECOM-Tidewater JV 2017b). Filtered surface water samples were also collected for SVOCs, metals, and PCBs (where applicable) when the turbidity was >10 NTU. Although the Phase III SAP established that filtered samples would only be collected for organic parameter groups (SVOCs, PAHs, PCBs) in surface water if the turbidity was elevated (>10 NTU), filtered surface water samples were to be collected for dissolved metals analysis regardless of the turbidity. Due to a misinterpretation of the SAP, filtered surface water samples were generally only collected when the turbidity was elevated (>10 NTU). Unfiltered metals in surface water were collected as planned at all locations.

In some cases, field-filtered samples were collected when the turbidity was not elevated. These exceptions included some locations where the field team thought the field turbidity meter was not working properly, and thus erred on the side of caution by filtering, and at locations CH-SWSD150 through CH-SWSD155, where samples were collected by wading into the pond and were filtered due to do the potential for stirring up sediment in the pond during collection. Due to these exceptions, field-filtered surface water locations were collected at eight locations where the NTUs were less than 10. (Refer to Section 5.0 for additional details on this deviation from the Phase III SAP).

Surface water was pumped from the source using a peristaltic pump with disposable tubing and placed into the appropriate laboratory-supplied bottleware containing chemical preservatives, if necessary. For filtered surface water samples, individual disposable in-line filters were used to field-filter water samples. Each filter was used once and discarded as non-hazardous waste.

At the end of surface water sampling, field parameters including ORP, pH, SC, temperature, DO, and turbidity were measured with a water quality meter and recorded in the field logbook or sampling form. An YSI 6920 V2 multi-parameter water quality sonde was used to collect field parameters. The water quality meter was calibrated at the beginning of each day and continually throughout the day if needed. A calibration check was performed at the end of each day.

Once surface water sampling was complete, sediment samples were collected from 0 to 0.5 ft bgs using an Eijkelkamp Flap gouge auger or a clean, disposable scoop. Sediment samples targeted the fine grained material from depositional areas. All sediment samples were analyzed for SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and TOC; select locations were analyzed for additional parameters, depending on the exposure area CSM. Material such as twigs, leaves, and stones were removed and samples were then homogenized in disposable bags prior to filling laboratory-supplied sample containers.

Sample Identification: The sample identification (ID) number consisted of a Location ID (an alphanumeric designation related to the DU or facility), plus alphanumeric designations for the event, media type, and/or consecutive number, according to the following conventions. Permanent monitoring wells locations and surface water/sediment sample locations utilized the Facility ID ("CH" for Camp Hero) instead of a DU component, since they were assessed at a site-wide level.

Location IDs for permanent monitoring wells used the Facility ID ("CH") followed by "-MW" and then the consecutive number (01, 02, 03, etc.). Permanent wells were numbered sequentially across the entire facility.

Groundwater samples collected from permanent monitoring wells used the following naming convention:

Facility ID: CH-
Well Location ID: MW001, MW002, MW003, etc., to MW043 *(numbered sequentially)*
Consecutive Sampling Event Number: -01, -02, -03, etc. *(The Phase II field event in Fall 2016 had the sample event number "-01" and the Phase III field event had the sample event number "-02".)*

For example, the sample identification number for the groundwater sample collected from monitoring well CH-MW016 in June 2017 was CH-MW016-02.

Surface water and sediment samples collected sitewide used the following naming convention:

Facility ID: CH-
Surface Water/Sediment Location ID: SWSD001-, SWSD002-, etc., to SWSD155-
Media Type: SW = Surface Water, SE = Sediment
Consecutive Sampling Event Number: 01, 02, 03, etc. *(The Phase III field event had the sample event number "-01" for surface water and sediment, as it was the first time sampling those media during the RI.)*

For example, the sample identification number for the surface water sample collected from location SWSD096 in June 2017 was CH-SWSD096-SW01.

Soil samples collected from temporary soil borings used the following naming convention:

DU Identification (ID): DU01-, DU02-, DU03-, etc., to DU18
Media Type: SO = Soil
Consecutive Location Number within DU: 01, 02, 03, etc., to 16
Beginning depth of sample (in ft): -00, -01, etc.
End depth of sample (in ft): -01, -10, etc.

For example, the sample identification number for the sixth soil location sample collected at DU01 from 1 to 10 ft bgs was DU01-SO06-01-10. This nomenclature also applies to surface soil samples; surface soil sample IDs ended in "-00-01" to represent the 0 to 1 ft bgs depth interval.

Field duplicate sample identification numbers were followed with a "D". Matrix spike (MS) sample identification numbers were followed with a "MS" and matrix spike duplicate (MSD) sample identification numbers were followed with a "MSD." Filtered liquid (groundwater and surface water) samples ended with a -F.

Sample Handling, Storage, and Shipment: Samples were collected into laboratory-supplied bottleware and placed in a cooler on ice. Sample times, dates, and analyses were recorded on boring logs, field sample forms, and field team logbooks. Samples were then quality-control checked by the site Sample Manager and recorded on chain-of-custody (COC) records prior to being packed in coolers on fresh ice and transported via courier to the laboratory. Original COCs were transferred to the courier with their respective samples; carbon-copies of the COCs were kept on-site by the Sample Manager and emailed to the laboratory and project chemist each night.

Borehole Abandonment: Direct Push borings were abandoned at completion of sampling activities. In accordance with NYSDEC Technical Guidance for Site Investigation and Remediation (2010), soil cuttings from soil borings without petroleum impacts were disposed at the site within the corresponding borehole to within 24 inches of the ground surface with the remainder of the borehole filled with bentonite. If impacts were noted, the soil was containerized as solid IDW and the borehole was abandoned by backfilling with bentonite chips.

Additionally, 15 temporary well locations from the Phase I field investigation at the former Building 203 (DU01) and the AST35/FPH areas were abandoned by removing the top five ft. of PVC riser (at a minimum) and backfilling with granular bentonite. These temporary wells were left in place at the conclusion of the Phase I to potentially support the LNAPL investigation at the former Building 203 area. The temporary wells were located in fenced areas of the park off-limits to the public. The surface at each location was restored to match the surrounding area.

2.11 Land Surveying

All monitoring wells and Phase III sample locations were marked with a sample identification number and vertical and horizontal position coordinates were obtained by a New York licensed surveyor during the Phase III field investigation. The Phase III field investigation land surveying report is included as **Appendix D** to this Field Report.

Data were obtained using the NYS Plane Coordinate System, Long Island Zone 3104, with horizontal data using the North American Datum (NAD 83) and vertical data using the North American Vertical Datum (NAVD 88). The horizontal control for the locations was surveyed to at least (+/-) 0.10 foot and the vertical control for the locations was surveyed to at least (+/-) 0.01 foot. Equipment utilized included a Trimble R8 Global Positioning System (GPS) with a tripod data system (TDS) Ranger collector and Nikon NIVO 5M Prismless Total Station.

The Trimble R8 GPS was utilized with the real time kinematic (RTK) satellite navigation GPS system connected in real time to New York Precision's RTK Base Network. This is a spatial reference network of continuously operating Global Navigation Satellite System (GNSS) reference stations encompassing Long Island, New York City, and parts of Westchester, NY, into Connecticut. The

equipment and associated procedures achieve sub-centimeter positioning for surveying applications or sub-meter positioning for GIS mapping applications. The locations of all Base Stations are determined using the National Oceanic and Atmospheric Administration's (NOAA) Online Positioning User Service (OPUS) and raw GPS data is automatically processed using standard National Geodetic Survey (NGS) data and models to compute an accurate position. All base stations are constantly monitored for movement and positional accuracy. The Nikon NIVO 5M Prismless Total Station was utilized in locations of heavy tree and brush cover for a portion of collected points.

2.12 Investigation-Derived Waste Management

IDW generated during the Phase III field activities was managed pursuant to applicable Federal, State, and local regulations and guidance, including the United States Environmental Protection Agency (USEPA) Management of Investigation-Derived Wastes during Site Inspections (USEPA 1992), USACE guidance (2013), and NYSDEC Technical Guidance for Site Investigation and Remediation (2010).

Liquid IDW from well installation, development, and sampling was stored in a 3,000-gallon (gal) poly tank provided by the waste hauler. Liquid IDW with potential petroleum impacts was segregated from IDW in the poly tank and stored in five 55-gal drums. Solid (soil) IDW from well installation and sampling was stored in a lined 20 cubic yard roll-off with a locking lid. Solid IDW with petroleum impacts was segregated and stored in one 55-gal drums. All drums and containers were properly labeled indicating the generator, contact information, contents, and date of generation. The tanks, drums, and roll-off were stored at the Camp Hero State Park Motor Pool building, with the permission of State Park Superintendent Mr. Tom Dess.

In accordance with NYSDEC Technical Guidance for Site Investigation and Remediation (2010), soil cuttings from soil borings without petroleum impacts were disposed at the site within the corresponding borehole to within 24 inches of the ground surface with the remainder of the borehole filled with bentonite.

Analytical samples of the solid IDW were collected on 16 June 2017 and analytical samples of the liquid IDW were collected on 27 June 2017 and submitted to the laboratory for waste classification. **Table 2-2** (**Appendix B**) presents the IDW analytical results compared to regulatory levels. All waste was characterized as non-hazardous.

AWT Environmental Services, Inc. (AWT) (Sayreville, NJ) was contracted to transport and dispose of IDW accumulated on site. AWT transported the liquid IDW (1,450 gallons from the poly tank and drums) to disposal facility Clean Water of New York (Staten Island, NY) on 18 July 2017 under non-hazardous waste manifest (#15295-1). AWT transported a portion of the solid IDW (one drum with soil cuttings and 41 DOT/RCRA empty drums) to Clean Water of New York (Staten Island, NY) for

disposal on 18 July 2017 under non-hazardous waste manifest (#15295-2). AWT transported the remaining solid IDW (approximately 3.36 tons of soil cuttings) to Cycle Chem (Elizabeth, NJ) for disposal on 18 July 2017 under non-hazardous waste manifest (#15295-3). Because the pH levels for the soil in the roll-off (pH 11.6) exceeded the disposal criteria, the disposal facility treated the soil with kiln dust to lower the pH to between 5 and 9 upon acceptance of the waste and prior to final disposal. All final waste documentation, including the analytical laboratory package of results, is included in **Appendix E**.

2.13 Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples were collected to ensure field and laboratory protocols resulted in consistent and valid data. The following types of QA/QC samples were collected:

Field Duplicates: One additional set of sample containers were collected along with the normal sample. The duplicate was analyzed as a normal sample at the laboratory. Duplicates were collected at a frequency of one duplicate per ten samples.

Matrix Spike/Matrix Spike Duplicates (MS/MSDs)*:* Two additional sets of sample containers were collected along with the normal sample. MS/MSD samples are representative but randomly chosen samples with known concentrations of analytes of interest added to the samples prior to sample preparation and analysis. They are processed along with the same un-spiked sample.

Equipment Blanks: One equipment blank was collected from each drill rig used for soil sampling (for a total of three equipment blanks). The equipment blank was collected by pouring Type II deionized water over the decontaminated core barrel shoe and collecting the water in the appropriate sample containers.

Trip Blanks: Trip blanks for VOC analysis were provided by the laboratory. One trip blank was included in each cooler with VOC samples for VOC analysis.

2.14 Data Validation

Data validation was conducted on the Automated Data Review (ADR) output for the Camp Hero analytical data. The ADR.net program performed an automated data review of the project samples and produced validation outlier reports and assigned qualifiers; the reports and qualifiers were reviewed and approved by the AECOM chemists. All analytical data packages were validated at a level 2a to ensure compliance with specified analytical, QA/QC requirements, data reduction procedures, data reporting requirements, and required accuracy, precision, and completeness criteria. This includes, but is not limited to, the following:

- Sample preservation and holding times;
- Blanks (method, rinse, and trip);
- MS and MSD samples;
- Laboratory and field sample duplicate samples;
- Surrogates; and
- Laboratory control samples.

Analytical results were assessed for accuracy and precision of laboratory analysis to determine the limitations and quantity of data. The quality of the data collected in support of the sampling activity was considered acceptable. Data validation memos are provided in **Appendix F**.

The data validation process assigned data qualifiers to results that did not meet specified laboratory protocols (J, J-, J+, U, and UJ flags) but were still considered acceptable via the data validation process as well as the "R" qualifier for data that was not usable. The validation qualifiers assigned are:

- J: The result is positively identified and the associated numerical value is an estimated quantity with an unknown bias.
- J+: The result is an estimated quantity but the result may be biased high.
- J-: The result is an estimated quantity but the result may be biased low.
- UJ: The result is not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- U: The result is not detected above the reported sampled quantitation limit.
- NP: The result is not preferred for this analyte by this method as another result is available.
- R: The result is rejected and not usable due to QC reasons.

Hold Time Issues: Three samples (CH-MW037-02, CH-MW037-02D, and CH-MW026-02) did not meet the recommended method hold times for nitrate/nitrite. Analyte detects were qualified "J-" and non-detected values were qualified "R" in the samples. To address the lack of field-filtered surface water samples for metals, surface water samples were filtered at the laboratory. These surface water samples were analyzed for dissolved metals by 6020A; however, the filtration occurred after receipt in the laboratory. The recommended holding time criterion of 15-minutes was exceeded (40 CFR Part 122, 136 requires filtration within 15 minutes). The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively. If the total metals results (unfiltered) were non-

detected and the lab-filtered results were detected, the result was qualified "R". There were 3.7% rejections in the lab-filtered data.

Nonconformance Issues: The nonconformance concerns addressed during the Phase III field investigation data validation are listed below by analytical method:

- SVOCs via Method SW8270D:

  Issue: The prep technician failed to spike the lab control sample (LCS), MS and MSD with both the LCS mix #1 which contains all project analytes and the SW8270D surrogate mix. The LCS/MS/MSD was only spiked with LCS mix #1 and not with the surrogates; other samples and the blank were correctly spiked with the surrogate mix. **Affected Samples**: DU07-S006-01-03 plus MS/MSD (in SDGnumber APP36); DU07-S013-00-01 (in SDG number APP37); and DU03-S001-00-01, DU03-S001-01-02, DU03-S001-01-02D, DU03-S002-00-01, DU03-S002-01-02, DU03-S003-00-01, DU03-S003-01-02, DU03-S004-00-01, DU03-S004-01-02, DU03-S005-00-01, DU03-S005-01-02, DU03-S006-00-01, DU03-S009-00-01, DU03-S009-01-02, DU03-S013-00-01, DU03-S013-01-02, and DU03-S014-00-01 (in SDG number APP38).

- SVOCs via method SW8270D:

  Issue: The original analyses of several samples had low surrogate recoveries; the lab re-extracted the samples outside of recommended extraction hold times and all samples have acceptable surrogate recoveries.

  Affected Samples: CH-SWSD140-SW01 plus MS/MSD, CH-SWSD134-SW01, CH-SWSD135-SW01D, CH-SWSD135-SW01, CH-SWSD132-SW01, CH-SWSD133-SW01, CH-SWSD130-SW01, CH-SWSD030-SW01, CH-SWSD003-SW01, CH-SWSD017-SW01, CH-SWSD021-SW01, CH-SWSD023-SW01, and CH-SWSD022-SW01 (in SDG number APP26).

- SVOCs/PAHs via Method SW8270D SIM:

  Issue: The PAH SIM blank was prepared with the internal standards (IS) mix that is normally used for the regular SW8270D for one extraction batch; this puts the internal standards at 20 times too high for four of the six IS that are used for SIM. The four IS are: Napthalene-d8, Acenaphthene-d10, Phenanthrene-d10, and Perylene-d12. The PAH compounds not affected by this issue are: pyrene, benzo(a)anthracene, and chrysene.

  Affected Samples: DU07-S006-01-03 plus MS/MSD (in SDG number APP36); DU07-S013-00-01 (in SDG number APP37); and DU03-S001-00-01, DU03-S001-01-02, DU03-S001-01-02D, DU03-S002-00-01, DU03-S002-01-02, DU03-S003-00-01, DU03-S003-01-02, DU03-S004-00-01, DU03-S004-01-02, DU03-S005-00-01, DU03-S005-01-02, DU03-S006-00-01, DU03-S009-

00-01, DU03-S009-01-02, DU03-S013-00-01, DU03-S013-01-02, and DU03-S014-00-01 (in SDG number APP38).

- SVOCs/PAHs via Method SW8270D SIM:

  Issue: The shift ending calibration check (SECC) was out of tune by five minutes due to a computer issue. The SECC passed for everything in the out-of-tune injection and was documented in the case narratives for the affected SDGs.

  Affected Samples: CH-MW021-02, CH-MW031-02, CH-MW032-02, and CH-MW033-02 (in SDG number APP60); CH-MW030-02F, CH-MW020-02F, CH-MW024-02F, CH-MW020-02, and CH-MW024-02 (in SDG number APP61); CH-MW043-02, CH-MW016-02 plus MS/MSD, CH-MW019-02, and CH-MW043-02F (in SDG number APP62).

- SVOCs/PAHs via Method SW8270D SIM:

  Issue: The extraction to analysis holding time was missed for a batch of samples by a day.

  Affected Samples: DU16-S013-01-10, DU16-S001-00-01, DU16-S001-01-10, DU16-S002-00-01, DU16-S002-01-10, DU16-S014-00-01, DU16-S014-01-10, DU16-S011-00-01, DU16-S011-01-10, DU16-S016-00-01, DU16-S016-01-10, DU16-S008-00-01, DU16-S008-01-10, DU16-S004-00-01, and DU16-S004-01-10 (in SDG number APP32).

- PCBs via Method SW8082:

  Issue: During the initial run, the LCS/MS/MSD were not been spiked with the PCB compounds. The surrogates were within specification, and there were no detects for PCBs. The samples were re-extracted nine days out of hold with the proper spikes added to the LCS, MS, and MSD. The LCS and MS/MSD were within specifications on the re-extracted batch.

  Affected Samples: CH-MW039-02 plus MS/MSD and CH-MW040-02 (in SDG number APP54).

- Nitrate/Nitrite via Method SW9056:

  Issue: The initial analysis for nitrate/nitrite consisted of one sample analyzed without the client assigned MS/MSD. This analytical run had misinjected continuing calibration blanks (CCB) that pulled from the wrong vial. The second run (past hold) repeated the samples at the higher dilution, but not with client assigned MS/MSD. All QC checks, continuing calibration verification (CCV) and CCB were within specifications. The third run (also past hold) used the client assigned MS/MSD at both the original and repeated dilutions. The

original analysis of the sample was confirmed by the third run with properly spiked MS/MSD and with CCV and CCB in specifications.

Affected Sample: CH-MW016-02 plus MS/MSD (in SDG number APP62).

For additional details regarding the nonconformance issues, see **Appendix F** (data validation memos).

Laboratory-Filtered Surface Water Samples for Dissolved Metals: During the Phase III field event, filtered surface water samples were collected when the turbidity of the surface water was generally greater than 10 NTUs. Although the Phase III SAP established that filtered samples would only be collected for organic parameter groups (SVOCs, PAHs, PCBs) in surface water if the turbidity was elevated (>10 NTU), filtered surface water samples were to be collected for dissolved metals analysis regardless of the turbidity. Due to a misinterpretation of the SAP, filtered surface water samples were generally only collected when the turbidity was elevated (>10 NTU; refer to Section 5.0 for additional details). Unfiltered metals in surface water were collected as planned at all locations.

After identifying the data gap, a solution was identified that would obtain the filtered surface water dataset for metals, except for mercury and hexavalent chromium. Mercury and hexavalent chromium were not evaluated because the samples were approximately 100 days past their respective hold times. The laboratory had additional sample volume (unpreserved) on hold for all 148 surface water locations (197 samples, including samples from all 148 surface water locations, 30 previously analyzed field-filtered locations, and 19 field duplicate locations). The 197 surface water samples (dissolved and total) were kept in cold storage in amber bottles since the Phase III field event. The laboratory was instructed to filter the 197 surface water samples through a 0.45 micrometer (µm) filter, acidify, and analyze dissolved metals (6020A) on an expedited turn-around-time. All 197 samples were analyzed for the Phase III SAP metals list, minus mercury and hexavalent chromium. Surface water samples were out of hold for both filtration and total metals analysis per guidance in 40 CFR Part 122, 136 which requires filtration within 15 minutes of sample collection. Additional information regarding this issue is discussed under the holding time section of this report.

The lab-filtered metals data was flagged "J" and "UJ" for detected and non-detected results, respectively. If the field-filtered and total results were non-detected and the lab-filtered results were detected, those results were r flagged "R". This flagging scheme was discussed with the USACE Chemist and was based on a comparison assessment between the lab-filtered, the field-filtered, and total metals results. The validated surface water data will be included in the surface water data set for the Ecological Risk Assessment (ERA); however, based on the USACE Chemist's

recommendation, the lab-filtered data will only be considered qualitatively. Any potential data gaps related to this approach will be discussed in the uncertainties section of the ERA.

ELLE Metals Data Breach: On 14 September 2017, an external data validator contacted ELLE in regard to an inductively-coupled plasma mass spectrometry (ICP-MS) result which could not be confirmed during the validation process. The metals department manager reviewed the concern and determined that the reason that the raw result did not match the result presented in the report out of the Laboratory Information Management System (LIMS) was due to a manual change made by an analyst to the data import file between the instrument and the LIMS. The analyst was immediately terminated after admitting to changing numbers. Upon further review, ELLE determined that there were multiple instances where values were changed and launched a full-scale investigation encompassing the terminated employee's tenure. Potential impacts to the Camp Hero project included 13,826 metals data as part of four data packages from the Phase II field event and 29 data packages from the Phase III field event. The four affected data packages from the Phase II field investigation are documented in the revised Final Phase II Investigation Field Report (AECOM-Tidewater JV 2018).

The vast majority of the data changes were made to quality control and/or calibration check samples and not to actual sample results. Where sample results changed, they were due to results exceeding the linear calibration range of the instrument. The results were changed to be slightly lower than the upper limit of the calibration range. Sample analytes that exceeded the calibration range were reanalyzed where within holding time.

AECOM received the final revised level II and level IV lab reports and Staged Electronic Data Deliverable (SEDD) version 5.2 Stage 2a files on 9 November 2017, which consisted of QC data and sample results. Only 14 SEDD files were impacted out of the 33 since laboratory instrument calibration was the main issue for the data breach and raw instrument data files are not included in SEDD 2a deliverables. Due to the data quality breach, AECOM chemists manually reviewed the calibrations for one solid (APP34) and one aqueous (APP61) data package. The two packages were representative of the calibration-related breach items noted by ELLE and exhibited low level calibration check (LLC) compliance issues with multiple analytes.

For APP34, the LLC analyzed on 19 July 2017 exhibited percent recoveries (%Rs) less than 10%. The laboratory indicated that the LLC may have been a blank sample and may not be indicative of the accuracy of the analytical system. The non-compliant LLC appears to be an isolated incident based on the acceptable %Rs of the other LLC samples reported. Upon the calibration review, it was determined that the 18 samples in SDG APP34 required re-digestion and analysis due to the multiple QC failures at the lower end of the calibration range. SW6020A results in APP34 were

rejected, and replaced by the reanalyzed results in APP77. APP34 was the only SDG with LLC values at less than 75 %R (the QC range is 80 to 120 %R).

For APP61, the recoveries were acceptable in the low level calibration check except for a few analytes (aluminum at 132%, calcium at 126%, and barium at 125%). The high LLC recoveries do not affect analytes which were not detected. A single aluminum detection was observed in one instrument blank, which affected two samples (CH-MW020-02 at 36.5 J µg/L and CH-MW024-02 at 130 J µg/L).

Out of 13,836 Phase III metals results in the affected SDGs, only 18 field sample results required value changes (0.13%). There were 226 results which required qualifier changes (1.6%). All 398 rejected metals in SDG APP34 have acceptable results in SDG APP77, and were therefore not included in the numbers of result and qualifier changes. Additional information on the impacts of the metals breach will be discussed in data validation memos for each of the 33 data packages.

The laboratory provided a Corrective Action letter, which is included in this Field Report as **Appendix F4**. Additionally, AECOM prepared the Camp Hero Project Laboratory Subcontractor Data Quality Breach Letter, which is included as **Appendix F5**.

3.0 BACKGROUND SURFACE WATER AND SEDIMENT SAMPLING

A sitewide network of co-located background surface water and sediment samples were collected upstream of the DUs during the Phase III field effort to establish background levels for naturally occurring constituents and anthropogenic impacts. Background surface water and sediment samples were collected from 15 locations within the revetted drainage channels and 15 locations within the non-revetted drainage channels, for a total of 30 surface water and 30 sediment samples. All samples were collected according to the procedures outlined in Section 2.10 of this Field Report. Background surface water and sediment samples were analyzed for SVOCs, TOC, and metals (including mercury). Additionally, samples were collected for Cr^{6+} analysis at 10% of the locations so speciated chromium constituents can be calculated.

As discussed in Section 2.10, although the Phase III SAP established that filtered samples would only be collected for organic parameter groups (SVOCs, PAHs, PCBs) in surface water if the turbidity was elevated (>10 NTU), filtered surface water samples were to be collected for dissolved metals analysis regardless of the turbidity. Due to a misinterpretation of the SAP, filtered surface water samples were generally only collected when the turbidity was elevated (>10 NTU). The turbidity was less than 10 NTUs at all background locations except one, CH-SWSD002, and therefore field-filtered background surface water samples were only collected at that location.

After identifying the data gap, a solution was identified that would obtain the filtered surface water dataset for metals, except for mercury and hexavalent chromium. As described in Section 2.14, the laboratory filtered and analyzed surface water samples that had been maintained in cold storage in amber bottles since the Phase III field investigation. All samples were analyzed for the Phase III SAP metals list, minus mercury and hexavalent chromium. The field-filtered and lab-filtered results will be used to assess the comparability of results during data evaluation in the RI Report (refer to Section 5.0 for additional details on this deviation from the Phase III SAP).

Background surface water and sediment samples will be used to evaluate sitewide background levels in the RI, establish background threshold values (BTVs), and conduct statistical background means comparisons (hypothesis testing) where needed (i.e., when chemical concentrations are above risk-based screening criteria and BTVs) during the human health and ecological risk assessment portions of the RI. A statistical analysis of the variability of constituents in the background surface water and sediment data sets will be assessed prior to establishing BTVs or conducting means comparisons (including between the revetted and non-revetted datasets). The statistical approach for the background soil evaluation that will be used to derive BTVs for surface water and sediment was established in the Phase III SAP (AECOM-Tidewater JV 2017b).

This page intentionally left blank.

4.0 FIELD SAMPLING AND DATA COLLECTION

The field sampling and field data collection at Camp Hero during the Phase III field investigation included installation and development of 22 new sitewide monitoring wells, collection of groundwater samples from 27 monitoring wells, slug testing at 5 monitoring wells near DU01, collection of 30 background surface water and sediment samples, collection of 125 co-located surface water and sediment samples from multiple stream exposure areas, collection of surface soil samples from unbiased grids within 17 DUs, and collection of subsurface soil samples from unbiased grids within 9 DUs.

Analytical results from the Phase III field sampling are provided in **Appendix F** (Laboratory Analytical Reports). Tables with analytical results from the Phase III field investigation will be provided in the final RI Report. The field operations for the Phase III field investigation are detailed in the subsections below and also documented in the Daily Reports (**Appendix G**). Photographs of the Phase III field investigation are included in the Daily Reports and the Photograph Log (**Appendix H**). Field documentation is included in **Appendix I**, including well boring logs, well construction forms, well development forms, groundwater sampling forms, surface water and sediment sampling forms, stream exposure area characterization sheets, and soil boring logs and sampling forms.

4.1 Groundwater Investigation

A total of 22 permanent monitoring wells were installed and developed during the Phase III field activities at Camp Hero, creating a sitewide network of 43 wells total (refer to Sections 2.7 and 2.8 for additional details). Sonic drilling methods were utilized for installation of the wells, with the exception of two monitoring wells (CH-MW024 and CH-MW040), which were installed using Direct Push methods and pre-packed screens (refer to Section 2.7 for additional information). The sitewide monitoring well network is shown on **Figure 4-1**, which also displays the groundwater elevation contours from June 2017 and site topography. The well construction information and well network rationale is presented in **Table 4-1**. Groundwater elevation data from June 2017 is presented in **Table 4-2**.

Filtered and unfiltered groundwater samples were collected at 27 monitoring wells during the Phase III field event, for a total of 54 groundwater samples. All existing and new groundwater monitoring wells were sampled, with the exception of the 15 background wells that were previously sampled to generate groundwater BTVs and one well with LNAPL present. Samples were collected via low-flow methodology according to the procedures outlined in Section 2.10, with the exception of one well (CH-MW021), which had insufficient groundwater present to complete sampling via low-flow methodology. Instead, a grab groundwater sample was collected at this location.

A summary of the Phase III groundwater analytical samples is presented in **Table 4-3**. Groundwater samples were analyzed sitewide for SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury); additional analytical parameters were added for wells in the near vicinity of selected DUs based on the CSM and results of the PSE for each DU, as established in the Phase III SAP (AECOM-Tidewater JV 2017b). Groundwater samples from wells in the vicinity of DU15 were analyzed for PCBs; samples from wells in the vicinity of DU01, AST35/FPH, STB, and the Motor Pool were evaluated for VOCs. Filtered groundwater samples were collected at each location and analyzed for dissolved SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and PCBs (if applicable). Filtering was not appropriate for VOC samples. A subset of monitoring wells (approximately 20%) was selected for analysis of an expanded parameter list to assess the potential for MNA. These additional parameters included biochemical oxygen demand, total oxygen demand, TOC, chlorides, sulfates and sulfides, nitrates and nitrites, alkalinity, methane, ethane, and ethene. At wells where MNA parameters were collected, the concentration of Fe^{2+} in filtered and unfiltered groundwater samples was measured in the field (refer to Section 2.7 for additional details).

Monitoring wells at DU01 and piezometer PZ-3 were gauged for LNAPL thickness in June 2017. Consistent with the previous sampling event in December 2016, LNAPL was present only in monitoring well CH-MW017 and piezometer PZ-3. The measured LNAPL thicknesses in each well were 1.22 ft and 0.41 ft, respectively, compared to 1.98 ft and 8.81 ft in December 2016 (prior to bail-down tests. Well CH-MW017 recovered to 2.81 ft and piezometer PZ-3 recovered to only 0.18 ft of LNAPL thickness at the conclusions of the bail-down tests in December 2016. The groundwater elevations at DU01 were approximately 5 ft higher during LNAPL gauging in June 2017 than during the December 2016 event, which may explain why LNAPL thickness at CH-MW017 was 1.59 ft less than December 2016. Groundwater samples were not collected from these locations due to the presence of LNAPL.

The depth of the perched groundwater encountered across the site varied from approximately 5.10 ft bgs at lower topographic elevations to 28.70 ft bgs at higher topographic elevations. The perched water bearing zone was typically encountered in silty sand and sandy silt above confining clay and silt units in the subsurface. The clay and silt units appeared to dip from east to west across the site and are dissected by local surface water drainage. As discussed in the RI Work Plan (AECOM-Tidewater JV 2016a), the clay and silt unit interface below the perched water table may represent the primary potential contaminant migration zone.

In-situ hydraulic conductivity test data, via rising or falling head slug tests, was collected at permanent monitoring wells CH-MW016, CH-MW018, CH-MW019, CH-MW020, and CH-MW021 near DU01. Slug testing was not conducted at CH-MW017 because LNAPL was present in the well. Slug tests were

performed to assess the hydraulic conductivity of the perched water bearing soil surrounding the tested monitoring well. Results of the slug tests will be included in the RI report.

The physical data that was collected in the field, such as slug tests, will be evaluated during the preparation of the RI Report. Some data may be determined to not be representative of the general formation due to challenges in the development of monitoring wells and would not be used for decision making purposes. Additional development of some monitoring wells using a variety of surging techniques may be warranted if future field events are scheduled.

4.2 Surface Water and Sediment Investigation

The Phase III field investigation included collection of co-located surface water and sediment samples from 125 locations at a sitewide scale, from exposure areas in the vicinity of DUs that could be impacted from potential migration of constituents from the DUs. A minimum of 15 samples were collected within each stream exposure area, spanning the upstream, adjacent, and downstream portions of the channel relative to the nearest DU. Surface water and sediment sampling locations are presented on **Figure 4-2**. A summary of the Phase III field investigation surface water and sediment analytical samples is included in **Table 4-4**.

At the beginning of the Phase III field event, surface water and sediment sample locations were selected by the Field Quality Manager at stream locations with water present within the pre-selected stream exposure areas. Not including background samples (which are discussed above in Section 3.0), a total of 125 sediment samples, 118 unfiltered surface water samples, and 30 filtered surface water samples were collected sitewide. The team was unable to collect surface water samples from all 125 locations because 7 locations were dry at time of sampling.

Surface water and sediment samples were collected according to the procedures outlined in Section 2.10 of this Field Report. All surface water samples were analyzed for SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and hardness; samples in the stream exposure area downgradient of DU15 were also analyzed for PCBs, in accordance with the exposure area CSM established in the Phase III SAP (AECOM-Tidewater JV 2017b). Filtered surface water samples were collected for SVOCs, metals, and PCBs (where applicable) when the turbidity was greater than 10 NTU. Surface water quality parameters were measured and recorded for each location, including ORP, pH, SC, temperature, DO, and turbidity.

Sediment samples were collected from 0 to 0.5 ft bgs, targeting the fine grained material in depositional areas. A total of 125 sitewide sediment samples All sediment samples were analyzed for SVOCs, metals (including Cr^{6+} [in 10% of samples] and mercury), and TOC; samples in the stream exposure area downgradient of DU15 were also analyzed for PCBs, in accordance with the exposure area CSM established in the Phase III SAP (AECOM-Tidewater JV 2017b).

4.3 Soil Investigation

The Phase III field investigation included surface and subsurface soil sample collection within 17 DUs. Each DU was established as uniform 0.5 to 1 acre geometric exposure area encompassing impacted surface soil identified through prior investigations and the PSE. Within each DU boundary, surface soil samples were collected from 0 to 1 ft bgs from an unbiased grid of 16 samples. At DUs warranting additional subsurface soil sampling based on the PSE, subsurface soil samples were collected from 1 to 10 ft bgs (or 1 to 2 ft bgs in wetland boundaries or buffer zones) at the same locations as surface soil. The entire subsurface depth horizon was composited for laboratory analysis.

Soil samples were collected according to the procedures documented in Section 2.10. Direct Push borings were conducted for soil sample collection at locations where both surface and subsurface soil samples were collected. At locations where only surface soil samples were collected, a hand auger, disposable scoop, or shovel was used for sample collection. If inaccessible areas were encountered during the Phase III field effort, sampling locations were adjusted as necessary to ensure collection of the minimum required set of samples.

A total of 400 soil samples were collected, not including QC samples, with a total of 256 surface soil samples collected at 16 DUs and a total of 144 subsurface soil samples collected at 9 DUs. Surface soil samples were not collected at DU01 because an unbiased grid of surface soil samples was collected during the Phase II field event. Analytical parameters for surface and subsurface soil varied by DU based on the data needs established in the PSE and Phase III SAP (AECOM-Tidewater JV 2017b). Cr^{6+} was analyzed in 10% of samples analyzed for metals, along with pH and ORP, to assess what, if any, fraction of total chromium is present in the more toxic Cr^{6+} form.

The following subsections briefly summarize the DU-specific soil sampling activities completed during the Phase III field effort. Soil sampling locations are presented by DU in **Figure 4-3** through **Figure 4-20** and a summary of the Phase III soil analytical samples is presented in **Table 4-5**.

4.3.1 DU01

DU01 is a 1.0-acre DU encompassing the area of petroleum-related impacts at the former Building 203. It is bounded by a fence to the east and steep terrain to the north and west. Previous investigations indicate the residual presence of LNAPL in the subsurface of this area ranging from approximately 8 to 34 ft bgs. A fingerprint analysis conducted during the Phase II field effort identified the LNAPL as primarily composed of weathered Number 2 Diesel Fuel. An unbiased grid of surface soil samples was collected during the Phase II field investigation, which was sufficient for calculating exposure point concentrations (EPCs) during the risk assessment, and no further surface soil characterization was necessary during the Phase III field investigation. Although

characterization of subsurface soil at DU01 also occurred during the Phase II field investigation for data collection to support the FS, an unbiased grid of subsurface soil samples was also collected during the Phase III field investigation to be used for EPC calculation.

A total of 16 subsurface soil samples were collected from 1 to 10 ft bgs at DU01 for analysis of VOCs, SVOCs, and metals (including Cr^{6+} [in 10% of samples] and mercury). VOC samples were collected directly from the soil core, and then the entire subsurface depth horizon was composited before collection of SVOC and metal samples. Elevated PID readings (sustained > 5 parts per million [ppm]) were observed in soil cores at locations DU01-S001 (maximum 735.4 ppm), DU01-S005 (maximum 120.1 ppm), DU01-S006 (355 ppm), DU01-S007 (maximum 82.5 ppm), DU01-S011 (maximum 368 ppm), and DU01-S015 (maximum 1054 ppm). The Phase III DU01 soil sampling locations are presented in **Figure 4-3**.

Additionally, Shelby tube samples were collected at locations DU01-S009 (15 to 17 ft bgs) and DU01-S015 (25 to 27 ft bgs) and submitted to GeoTesting Express, Inc. (Acton, MA) for laboratory analysis of soil permeability. The samples were collected from the clay soil unit underlying the perched groundwater at DU01. One sample was taken from the upper portion of the clay unit and one sample was taken from a lower portion of the clay unit. The geotechnical laboratory reports on permeability analysis are provided in **Appendix F**. The test result of the 15 to 17 foot bgs soil sample (DU01-S005-15-17) identified permeability of the clay sample to be 3.9×10^{-8}. The test result of the 25 to 27 foot bgs soil sample (DU01-S005-25-27) identified permeability of the clay sample to be 2.0×10^{-7}. The orders of magnitude (10^{-7} to 10^{-8}) of the results indicate a clay type grain size with a very low hydraulic conductivity. Geotechnical parameter results do not require data validation and are therefore not included in the data validation reports of this Field Report.

The Phase III SAP indicated that three Shelby tube samples would be collected (two from the silty-sand, perched water bearing soil zone and one from a clay unit); however, only two samples were collected because attempts to collect soil samples of more course-grained subsurface soil in the perched water bearing zone above the clay were unsuccessful. Additionally, the geotechnical laboratory was not able to perform pneumatic (air) permeability analysis by method ASTM D6539 on the soil samples, as planned, because the clay soils contained a high degree of water saturation (91 to 99 percent). ASTM D6539 requires the soil samples be coarse grained soils, silts, or lean cohesive soils that have a low degree of saturation to analyze air permeability.

4.3.2 DU02

DU02 is a 0.5-acre DU established to assess potential impacts from potential drum contents (H-2). The DU02 boundary encompasses the existing drum remnant and is bounded by a fence on the east. An adjacent DU (DU01) will be used to assess the area east of the fence. Based on the results

of the PSE, DU02 warranted further assessment for metals in surface soil. Further assessment of subsurface soil was not warranted based on the PSE.

Wetland conditions were observed within the state-mapped wetland boundary (Class 2) throughout the entire DU during wetland delineation. "Site standard" wetland avoidance and minimization BMPs were implemented during soil sampling activities (refer to Section 2.3) and all samples were collected via hand auger or shovel.

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). An elevated PID reading (sustained > 5 ppm) was observed in the soil sample from location DU02-S004 (11.7 ppm). The Phase III DU02 soil sampling locations are presented in **Figure 4-4**.

4.3.3 DU03

DU03 is a 0.5-acre DU that was established to assess potential impacts from potential drum contents (H-1). The DU03 boundary encompasses the existing drum remnant. Based on the results of the PSE, DU03 warranted further assessment for metals in surface soil and SVOCs in surface and subsurface soil.

Wetland conditions were observed (not state-mapped) throughout the entire DU during wetland delineation. Wetland avoidance and minimization BMPs included collection of all surface and subsurface soil samples with a hand auger instead of a Direct Push drill rig, consistent with the protocols established in the SAP (AECOM-Tidewater JV 2017b).

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury). A total of 16 subsurface soil samples were collected from 1 to 2 ft bgs for analysis of SVOCs only. The entire subsurface depth horizon was composited before collection samples. Elevated PID readings (sustained > 5 ppm) were observed in soil samples from locations DU03-S004 (maximum 13.3 ppm) and DU03-S003 (maximum 7.1 ppm). The Phase III DU03 soil sampling locations are presented in **Figure 4-5**.

4.3.4 DU04

DU04 is a 0.5-acre DU established to assess potential impacts from potential drum contents (H-18). The DU04 boundary encompasses the existing drum remnant and the operational and recreational area along the gravel access road north of Battery 112. Based on the PSE, metals in surface soil warranted further assessment at DU04. Further assessment of subsurface soil was not warranted based on the PSE.

The DU is bounded by steep terrain on the east and west boundaries. No wetland conditions were observed at DU04 during wetland delineation.

A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). The Phase III DU04 soil sampling locations are presented in **Figure 4-6**.

4.3.5 DU05

DU05 is a 0.5-acre DU established to assess potential impacts and exposures in the vicinity of the cesspools associated with the former site-wide waste disposal system (WDS). It is bounded by Camp Hero State Park Road to the west. Based on the results of the PSE, DU05 warranted further assessment for metals in surface and subsurface soil.

The majority of the DU contains portions of steep terrain; sample locations were offset to areas inaccessible to the drill rig. Additionally, wetland conditions were observed (not state-mapped) in the eastern 40% (approximately) of the DU during wetland delineation. Wetland avoidance and minimization BMPs included collection of surface and subsurface soil samples within wetland boundaries with a hand auger instead of a Direct Push drill rig, consistent with the protocols established in the SAP (AECOM-Tidewater JV 2017b).

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). A total of 16 subsurface soil samples were collected for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury): 4 samples (DU05-S003, DU05-S007, DU05-S011, and DU05-S015) were collected from 1 to 2 ft bgs via hand auger due to the presence of wetlands; 1 sample (DU05-S009) was collected from 1 to 5 ft bgs via Direct Push because the drill rig encountered void space from 5 to 10 ft bgs; and the remaining 11 samples were collected from 1 to 10 ft bgs via Direct Push. The entire subsurface depth horizon was composited before collection samples. The Phase III DU05 soil sampling locations are presented in **Figure 4-7**.

4.3.6 DU06

DU06 is a 0.5-acre DU established to assess potential impacts from the Former Power Plant (H-11), former Sewage Ejector Station (H-12), and tile field associated with the WDS. The DU boundary encompasses these former operational areas. Residual weathered fragments of coal are encountered in the shallow subsurface and on the ground surface along the embankments of the drainage areas in the southern portion of the DU. Based on the results of the PSE, DU06 warranted further assessment of metals and SVOCs in surface and subsurface soil.

Wetland conditions (not state-mapped) were observed along the southern border of the DU during wetland delineation; wetland avoidance and minimization BMPs included relocating Direct Push borings outside the observed wetland limits.

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury). A total of 16 subsurface soil samples were collected from 1 to 10 ft bgs for analysis of SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury). The entire subsurface depth horizon was composited before collection samples. The Phase III DU06 soil sampling locations are presented in **Figure 4-8**.

4.3.7 DU07

DU07 is a 1.0-acre DU established to assess potential impacts from a former AST (H-19), drum location (H-20), and former boiler (H-9). The DU boundary encompasses these former items to assess potential impacts and exposures. Based on the results of the PSE, DU07 warranted further assessment of SVOCs and metals in surface and subsurface soil.

Wetland conditions were observed at DU07 within the state-mapped wetland boundary (Class 1) and additional areas outside state-mapped boundary during wetland delineation. Wetlands covered approximately 75% of the original DU boundary. Avoidance and minimization BMPs included:

- establishing a 100 ft buffer zone around Class 1 state-mapped wetlands, in accordance with article 24 of the NY Freshwater Wetlands Act (refer to Section 2.3 for additional information);
- shifting the DU07 boundary (and sampling grid) slightly west to avoid wetlands and the buffer zone to the extent possible, while still encompassing the potential exposure concerns;
- collecting surface and subsurface soil samples remaining within the wetland boundaries with a hand auger instead of the Direct Push rig; and
- relocating monitoring wells in the vicinity of DU07 outside of the 100 ft buffer zone or within a park maintained lawn (refer to Section 4.1).

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of SVOCs and metals (including Cr6+ [in 10% of samples] and mercury). A total of 16 subsurface soil samples were collected for analysis of SVOCs and metals (including Cr6+ [in 10% of samples] and mercury): 8 samples (DU07-S002, DU07-S005, DU07-S006, DU07-S007, DU07-S009, DU07-S010, DU07-S014, and DU07-S015) were collected from 1 to 2 ft bgs via hand auger due to the presence of wetlands, and the remaining 8 samples were collected from 1 to 10 ft bgs via Direct Push. The entire subsurface depth horizon was composited before collection samples. The Phase III DU07 soil sampling locations are presented in **Figure 4-9**.

4.3.8 DU08

DU08 is a 0.5-acre DU established to assess potential impacts in the vicinity of the chlorine contact chamber and north of the chamber along the WDS pipeline. The DU boundary encompasses the chlorine contact chamber and wetland area to the north. Based on the results of the PSE, DU08 warranted further assessment of metals in surface soil and SVOCs in surface and subsurface soil.

Wetland conditions were observed within the state-mapped wetland boundary (Class 1); additional wetland pond conditions were observed throughout the entire DU (with the exception of the roadway running through the DU). Because the DU was inundated with water, no soil samples could be collected; instead, surface water and sediment (0 to 0.5 ft bgs) samples were collected throughout the DU to represent the appropriate exposure conditions. Additionally, monitoring wells in the vicinity of DU08 were relocated along the existing maintained roadway and shoulder to mitigate impacts to wetlands (refer to Section 4.1). The Phase III surface water and sediment sample locations are shown on the Site-Wide Surface Water and Sediment Sampling Locations map presented in **Figure 4-2**.

4.3.9 DU09

DU09 is a 0.5-acre DU established to assess potential impacts from a former coal storage area (H-15). The DU boundary is centered on the former coal storage area. Based on the results of the PSE, DU09 warranted further assessment of metals in surface soil. Further assessment of subsurface soil was not warranted.

No wetland conditions were observed at DU09 during wetland delineation. A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). The Phase III DU09 soil sampling locations are presented in **Figure 4-10**.

4.3.10 DU10

DU10 is a 0.5-acre DU established to assess potential impacts from a former drum and construction debris area (H-5). The DU boundary is centered on the former drum and debris area and is located within the Motor Pool fenced area. Based on the results of the PSE, DU10 warranted further assessment of metals in surface soil. Further assessment of subsurface soil was not warranted.

No wetland conditions were observed at DU10 during wetland delineation. A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). The Phase III DU10 soil sampling locations are presented in **Figure 4-11**.

4.3.11 DU11

DU11 is a 1.0-acre DU established to assess potential impacts from former Building 34, the former Sewage Treatment Area (H-16), and the drain and cesspool east of the Motor Pool associated with

the sitewide WDS. The DU boundary encompasses these former operational areas and is bounded by Coast Artillery Road to the north and the Motor Pool fence to the west. Based on the results of the PSE, DU11 warranted further assessment of SVOCs and metals in surface soil. Further assessment of subsurface soil was not warranted based on the PSE.

Wetland conditions (not state-mapped) were observed within approximately 10% of the DU during wetland delineation. "Site standard" wetland avoidance and minimization BMPs were implemented during soil sampling activities (refer to Section 2.3) and all samples were collected via hand auger or shovel.

A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of SVOCs and metals (including Cr^{6+} [in 10% of samples] and mercury). An elevated PID reading (sustained > 5 ppm) was observed in the soil sample from location DU11-S015 (6.9 ppm). The Phase III DU11 soil sampling locations are presented in **Figure 4-12**.

4.3.12 DU12

DU12 is a 0.5-acre DU established to assess potential impacts from a WDS manhole associated with the sitewide WDS. The DU boundary encompasses these portions of the WDS and both sides of Coast Artillery Road. Based on the results of the PSE, DU12 warranted further assessment of SVOCs in surface and subsurface soil.

No wetland conditions were observed at DU12 during wetland delineation. Sample locations in the vicinity of the roadway were offset to avoid the roadway and overhead power lines.

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of SVOCs. A total of 16 subsurface soil samples were collected from 1 to 10 ft bgs for analysis of SVOCs. The entire subsurface depth horizon was composited before collection samples. The Phase III DU12 soil sampling locations are presented in **Figure 4-13**.

4.3.13 DU13

DU13 is a 0.5-acre DU established to assess potential impacts from a former coal storage area (H-14). The DU is bound by Coast Artillery Road to the north and a creek to the east. Based on the results of the PSE, DU13 warranted further assessment of metals in surface soil. Further assessment of subsurface soil was not warranted based on the PSE.

No wetland conditions were observed at DU13 during wetland delineation. A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). Elevated PID readings (sustained > 5 ppm) were observed in soil samples

at locations DU13-S011 (11.3 ppm) and DU13-S012 (29.8 ppm). The Phase III DU13 soil sampling locations are presented in **Figure 4-14**.

4.3.14 DU14

DU14 is a 0.5-acre DU established to assess potential impacts from a suspected septic tank associated with the sitewide WDS. The DU is bound by Coast Artillery Road to the south and a creek to the east. Based on the results of the PSE, DU14 warranted further assessment of SVOCs in surface and subsurface soil.

No wetland conditions were observed at DU14 during wetland delineation. A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of SVOCs. A total of 16 subsurface soil samples were collected from 1 to 10 ft bgs for analysis of SVOCs. The entire subsurface depth horizon was composited before collection samples. The Phase III DU14 soil sampling locations are presented in **Figure 4-15**.

4.3.15 DU15

DU15 is a 0.5-acre DU established to assess potential impacts from a construction debris area (H-6). The DU boundary encompasses the debris area and is bound by a steep embankment to the north and a revetted creek to the south. Based on the results of the PSE, DU15 warranted further assessment of metals in surface soil and PCBs in surface and subsurface soil.

Wetland conditions were observed within the state-mapped wetland boundary (Class 1) and observed throughout the majority of the DU during wetland delineation. Avoidance and minimization BMPs included establishing a 100 ft buffer zone around Class 1 state-mapped wetlands, in accordance with article 24 of the NY Freshwater Wetlands Act (refer to Section 2.3 for additional information) and collecting all surface and subsurface soil samples with a hand auger instead of the Direct Push rig. Additionally, monitoring wells in the vicinity of DU15 were relocated outside of the 100 ft buffer zone (refer to Section 4.1).

A total of 16 surface soil samples (0 to 1 ft bgs) were collected for analysis of PCBs and metals (including Cr^{6+} [in 10% of samples] and mercury). A total of 16 subsurface soil samples (1 to 2 ft bgs) were collected for analysis of PCBs only. The entire subsurface depth horizon was composited before collection samples. The Phase III DU15 soil sampling locations are presented in **Figure 4-16**.

4.3.16 DU16

DU16 is a 0.5-acre DU established to assess potential impacts from a manhole associated with the sitewide WDS. The DU boundary encompasses the WDS manhole and is bound by roads to the west (Camp Hero State Park Road) and south (Coast Artillery Road). Based on the results of the PSE, DU16 warranted further assessment of SVOCs in surface and subsurface soil.

Wetland conditions (not state-mapped) were observed within approximately 20% of the DU during wetland delineation. Avoidance and minimization BMPs included relocating sample borings outside the wetland limits.

A total of 16 surface soil samples (0 to 1 ft bgs) and 16 subsurface soil samples (1 to 10 ft bgs) were collected for analysis of SVOCs. The entire subsurface depth horizon was composited before collection samples. The Phase III DU16 soil sampling locations are presented in **Figure 4-17**.

4.3.17 DU17

DU17 is a 0.5-acre DU established to assess potential impacts from a construction debris area (H-4). This DU is bounded on the south by an existing fenced concrete foundation used as a waste storage area by the NYS Parks. Based on the results of the PSE, DU17 warranted further assessment for metals in surface soil. Further assessment of subsurface soil was not warranted based on the PSE.

Wetland conditions (not state-mapped) were observed within approximately 30% of the DU during wetland delineation. "Site standard" wetland avoidance and minimization BMPs were implemented during soil sampling activities (refer to Section 2.3) and all samples were collected via hand auger or shovel. Additionally, a well within the DU17 boundary was relocated outside of wetland limits (refer to Section 4.1).

A total of 16 surface soil samples were collected from 0 to 1 ft bgs for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). The Phase III DU17 soil sampling locations are presented in **Figure 4-18**.

4.3.18 DU18

DU18 is a 0.5-acre DU established to assess potential impacts from potential drum contents (H-3). The DU18 boundary is centered on the existing drum remnant in the woods north of Coast Artillery Road. Based on the results of the PSE, DU18 warranted further assessment for metals in surface soil. Further assessment of subsurface soil was not warranted based on the PSE.

Although state-mapped wetlands are shown at this DU, no wetland conditions were observed during wetland delineation. A total of 16 surface soil samples were collected from 0 to 1 ft bgs via hand auger for analysis of metals (including Cr^{6+} [in 10% of samples] and mercury). The Phase III DU18 soil sampling locations are presented in **Figure 4-19**.

5.0 FIELD DECISIONS AND DEVIATIONS FROM THE SAMPLING AND ANALYSIS PLAN

The Phase III field investigation was generally completed to the scope that was provided in the Phase III SAP (AECOM-Tidewater JV 2017b). However, some deviations to the SAP, field decisions, and avoidance and minimization BMPs occurred during the field effort following discussions between the USACE and AECOM team. The list of field decisions below are not deviations from the Phase III SAP because they were within the contingencies established in the SAP but nonetheless warrant explanation.

Deviations from the Phase III SAP included the following:

- The Phase III SAP indicated that three Shelby tube samples would be collected at DU01 (two from the silty-sand, perched water bearing soil zone and one from a clay unit); however, only two samples were collected because attempts to collect soil samples of more course-grained subsurface soil in the perched water bearing zone above the clay were unsuccessful. Additionally, the geotechnical laboratory was not able to perform pneumatic (air) permeability analysis by method ASTM D6539 on the soil samples, as planned, because the clay soils contained a high degree of water saturation (91 to 99 percent). ASTM D6539 requires the soil samples be coarse grained soils, silts, or lean cohesive soils that have a low degree of saturation to analyze air permeability.

- Surface water samples could not be collected from 7 of the 125 sitewide surface water locations because those locations were dry at the time of sampling. All 30 background surface water samples were collected.

- Field-filtered surface water samples were collected from 30 locations during the Phase III field event (inclusive of the sitewide background locations). Field-filtered surface water samples were collected when the turbidity of the surface water was generally greater than 10 NTUs. Although the Phase III SAP established that filtered samples would only be collected for organic parameter groups (SVOCs, PAHs, PCBs) in surface water if the turbidity was elevated (>10 NTU), filtered surface water samples were to be collected for dissolved metals analysis regardless of the turbidity. Due to a misinterpretation of the SAP, filtered surface water samples (in addition to unfiltered samples) were generally only collected when the turbidity was elevated (>10 NTU). Unfiltered metals in surface water were collected as planned at all locations.

  – In some cases, field-filtered samples were collected when the turbidity was not elevated. These exceptions included some locations where the field team thought the field turbidity meter was not working properly. Multiple recalibration attempts were made but error messages were consistently encountered. A replacement probe was ordered from the

equipment company for overnight delivery and filtered samples were collected in the meantime to err on the side of caution. Additionally, at locations CH-SWSD150 through CH-SWSD155, samples were collected by wading into the pond and were filtered due to do the potential for stirring up sediment in the pond during collection. Due to these exceptions, field-filtered surface water locations were collected at eight locations where the NTUs were less than 10.

- This potential data gap was identified during initial Phase III data review, as filtered surface water data for dissolved metals could be beneficial in the evaluation of impacts to aquatic life in the ecological risk assessment (ERA). Dissolved metals more closely approximate the bioavailable fraction of metals in the water column than do total recoverable metals, and regulatory-based freshwater screening criteria for metals are often expressed in terms of the dissolved metals in the water column. Evaluating only total recoverable metals in the water column may result in an overestimate of risks to aquatic life.

- After identifying the data gap, a solution was identified that would obtain the filtered surface water dataset for metals, except for mercury and hexavalent chromium. Mercury and hexavalent chromium were not evaluated because the samples were approximately 100 days past their respective hold times. It was determined that the laboratory had additional sample volume (unpreserved) on hold for all 148 surface water locations (197 samples, including samples from all 148 surface water locations, 30 previously analyzed field-filtered locations, and 19 field duplicate locations). The 197 surface water samples (dissolved and total) were kept in cold storage in amber bottles since the Phase III field event. The laboratory was instructed to filter the 197 surface water samples through a 0.45 micrometer (µm) filter, acidify, and analyze dissolved metals (6020A) on an expedited turn-around-time. All 197 samples were analyzed for the Phase III SAP metals list, minus mercury and hexavalent chromium. The field-filtered and lab-filtered results will be used to assess the comparability of results during data evaluation in the RI Report. Surface water samples were out of hold for both filtration and total metals analysis and biological activity can occur under cool conditions in an amber bottle. Therefore, the lab-filtered surface water data will only be considered qualitatively in the ERA.

- As described in Section 2.14 above, the lab-filtered metals data was flagged "J" and "UJ" for detected and non-detected results, respectively, indicating that these lab-filtered results are estimated values. If the field-filtered and total results were non-detected and the lab-filtered results were detected, those results were rejected ("R" flag). This flagging

scheme was discussed with the USACE Chemist and was based on a comparison assessment between the lab-filtered, the field-filtered, and total metals results. The validated surface water data will be included in the surface water data set for the ERA; however, based on the USACE Chemist's recommendation, the lab-filtered data will only be considered qualitatively. Any potential data gaps related to this approach will be discussed in the uncertainty section of the ERA.

Additional field decisions made within the contingencies established in the SAP, including avoidance and minimization BMPs, included the following:

- Due to rig access issues and the presence of wetlands, two monitoring wells (CH-MW024 and CH-MW040) were installed using Direct Push methods and pre-packed screens, rather than with sonic drilling methods. Refer to Section 2.7 for additional information.
- To mitigate impacts to wetland areas and 100 ft buffer zones of state-mapped wetlands:
  - Monitoring wells located within wetland or buffer zone boundaries were relocated outside of the established boundaries. Monitoring well CH-MW038 was relocated from the originally-planned location to the southwest to avoid wetlands and the 100 ft buffer zone, and placed in park-maintained lawn to the west of DU07. Monitoring well CH-MW039 was relocated from the vicinity of DU07 to the vicinity of DU15 because moving the well outside buffer zone at DU07 would have put it in an area with already sufficient groundwater coverage, close to previously-installed wells CH-MW006 and CH-MW005.
  - Direct Push soil sample locations falling within wetland or buffer zone boundaries were either relocated outside of the established boundaries or collected via hand-auger to a shallower depth (refer to **Table 4-5** for a summary of samples and associated depths). All subsurface soil samples at DU03 and DU15 were collected from the 1 to 2 ft bgs interval; a portion of subsurface soil samples at DU05 and DU07 were collected from the 1 to 2 ft bgs interval.
  - The DU sampling grid for DU07 was shifted to the west to allow for more sample locations to be accessed by a drill rig, while avoiding the 100 ft buffer zone and still encompassing a representative exposure area covering the targeted former areas of concern.
- Recharge in one well (CH-MW021) was insufficient to complete sampling via low-flow methodology. Instead, a grab groundwater sample was collected at this location for the analyses outlined in Section 4.0. One set of water quality parameters were collected at the end of sampling.

Appendix B

Tables

This page intentionally left blank.

Table 2-1. Summary of Observed Wetlands and Best Management Practices
Phase III Remedial Investigation
Camp Hero, Montauk, New York

DU/Area	Wetlands Observed	Potential Impacts to Wetlands	Best Management Practices
DU01	No Wetland Conditions Observed	None	Site Standard (1)
AST35/FPH	Wetland Conditions Observed	Two wells located to delineate downgradient portion of DU01 LNAPL plume; two wells planned in observed wetlands are still required to delineate groundwater impacts; BMPs will be required.	Relocate one well outside wetland limits (CH-MW023); relocating well is consistent with SAP flexibility and 5/9/17 site walk. Where it is not possible to relocate the well (CH-MW024), utilize wetland mats and catch basin to collect liquid and soil cuttings to minimize potential release of sediment to wetlands, utilize one point of entry and exit, rake ruts and re-seed with wetland seed mix, and verify successful BMPs two weeks post-installation.
DU02	Wetland Conditions Observed within State Mapped Wetland Boundary (Class 2) and throughout entire DU	None - no drilling	Site Standard (1)
DU03	Wetland Conditions Observed throughout approx. 90% of DU	Planned drill rig sampling operations located within observed wetlands.	Hand auger samples instead of using direct push drill rig within wetland limits. Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.
DU04	No Wetland Conditions Observed	None - no drilling	Site Standard (1)
DU05	Wetland Conditions Observed throughout approx. 40% of DU	Planned drill rig sampling operations located within observed wetlands.	Hand auger samples within wetland limits. Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.
DU06	Wetland Conditions observed through minimal portion of DU along southern border	Planned drill rig sampling operations located within observed wetlands.	Relocate sample borings outside wetland limits. Wells to be installed in park-maintained lawn outside of wetland limit. Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.
DU07	Wetland Conditions Observed within State Mapped Wetland Boundary (Class 1). Additional wetland conditions outside state-mapped boundary observed. Wetlands cover approx. 75% of DU.	Planned drill rig sampling operations, planned well installations within observed wetlands and buffer zone.	Entire DU07 boundary will be shifted slightly west to avoid wetlands to the extent possible, while still encompassing the exposure area. Hand auger samples instead of using direct push drill rig wells within wetland limits and 100 ft buffer zone of state mapped wetlands. Relocate wells outside of wetland limits and 100 ft buffer zone of state mapped wetlands. Well location CH-MW038 will be adjusted to avoid wetlands and 100 ft buffer zone, placed in park-maintained lawn to west of DU. Well CH-MW039 will be moved to in vicinity of DU15 because moving well outside buffer zone at DU07 would put well close to previously-installed wells CH-MW006 and CH-MW005 (already sufficient groundwater coverage in the area).
DU08	Wetland Conditions Observed within State Mapped Wetland Boundary (Class 1). Additional wetland conditions outside state-mapped boundary observed. Wetlands cover approx. 90% of DU (all except roadway).	Planned drill rig sampling operations, planned well installations within observed wetlands and buffer zone.	Relocate wells along existing, maintained roadway and shoulder. Drill rigs will not leave road. As discussed on 5/9/17 site walk, surface water and sediment samples will be collected instead of soil samples within the DU wetland area.
DU09	No Wetland Conditions Observed	None	Site Standard (1)
DU10	No Wetland Conditions Observed	None - no drilling	Site Standard (1)
DU11	Wetland Conditions Observed throughout approx. 10% observed	Planned well installations within observed wetlands.	Relocate sample borings outside wetland limits. Relocate wells outside of wetland limits, if necessary.

Table 2-1. Summary of Observed Wetlands and Best Management Practices
Phase III Remedial Investigation
Camp Hero, Montauk, New York

DU/Area	Wetlands Observed	Potential Impacts to Wetlands	Best Management Practices
DU12	No Wetland Conditions Observed	None	Site Standard (1)
DU13	No Wetland Conditions Observed	None	Site Standard (1)
DU14	No Wetland Conditions Observed	None	Site Standard (1)
DU15	Wetland Conditions Observed within State Mapped Wetland Boundary (Class 1). Additional wetland conditions extended north of mapped wetlands. Wetland conditions cover 100% of the DU.	Planned drill rig sampling operations, and planned well installation downgradient of debris area with previous PCB detection in grab-groundwater, within observed wetland and buffer zone.	Relocate well CH-MW040 outside of wetland limits and 100 ft buffer zone. For well location CH-MW040, move to northwest outside buffer zone. Move well CH-MW039 to the southeast of the DU, within the buffer zone, but on an existing asphalt which will prevent disturbance to the wetland. For soil samples, consistent with SAP, subsurface soil samples within wetlands will be collected with hand auger.
DU16	Wetland conditions observed within approx. 20% of the DU.	Planned drill rig sampling operations within observed wetlands.	Relocate sample borings outside wetland limits or hand auger samples. Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.
DU17	Wetland conditions observed within approx. 30% of the DU.	Planned well installation within observed wetlands.	Relocate well location outside of wetland limits. Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.
DU18	No Wetland Conditions Observed (although state mapped wetlands are shown)	None	Site Standard (1)
STB	Wetland Conditions Observed within State Mapped Wetland Boundary (Class 1).	Planned well installations within100 ft buffer zone.	Relocate wells outside of wetland limits on park-maintained lawn (within 100 ft buffer). Collecting subsurface soil samples within wetlands with a hand auger is consistent with SAP flexibility.

Notes

(1) Site Standard BMPs include, but are not limited to, minimal vegetation clearance and tree clearing limited to trees under 3".

Yellow highlight indicates drilling activities occurred within wetland boundaries.

Orange highlight indicates drilling activities occurred within the 100 ft buffer zone of state-mapped wetlands boundaries (Class 1), but within park-maintained roadways, lawns, or asphalt lots.

CH-MW041	DU06	Low-Flow	Groundwater	Mid-screen	X			X		CH-MW041-02		X		X					
CH-MW042	DU06	Low-Flow	Groundwater	Mid-screen	X			X		CH-MW042-02		X		X					
CH-MW043	MP	Low-Flow	Groundwater	Mid-screen	X			X	X	CH-MW043-02	X	X		X		X			MNA parameters collected to assess the potential for MNA, specific chemical oxidation states, and fate and transport properties.

Notes:
Total (unfiltered) and dissolved (field-filtered) samples were collected for SVOCs, PCBs, Metals, Cr^{6+}, and Fe^{3+}. Filtered samples are not appropriate for VOCs.
MNA parameters analyzed in 10% of groundwater samples. MNA parameters consisted of biochemical oxygen demand, total oxygen demand, total organic carbon, ferrous iron (field analysis), chlorides, sulfates and sulfides, nitrates and nitrites, alkalinity, methane, ethane, and ethene.
Cr^{6+} was analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.

VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
Metals - Full TAL metals, including mercury
MNA - Monitored natural attenuation parameters to support the FS
LNAPL - Light Non-aqueous Phase Liquid
ORP - Oxidation-Reduction Potential
SpCond - Specific Conductivity
DO - Dissolved Oxygen
Turb - Turbidity

Notes:
All surface water samples evaluated for hardness; all sediment samples evaluated for TOC.
Cr^{6+} will be analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.
Dissolved (field-filtered) surface water samples collected for metals, SVOCs, and PCBs when Turbidity > 10 NTU
SW - Surface Water
SE - Sediment

DO - Dissolved Oxygen
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals and to support the FS
Metals - Full TAL metals, including mercury
ORP - Oxidation-Reduction Potential
PCBs - Polychlorinated biphenyls
spCond - Specific Conductivity
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
TOC - Total Organic Carbon
VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list

Notes:
All surface water samples evaluated for hardness; all sediment samples evaluated for TOC.
Cr^{6+} will be analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.
Dissolved (field-filtered) surface water samples collected for metals, SVOCs, and PCBs when Turbidity > 10 NTU
SW - Surface Water
SE - Sediment

DO - Dissolved Oxygen
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals and to support the FS
Metals - Full TAL metals, including mercury
ORP - Oxidation-Reduction Potential
PCBs - Polychlorinated biphenyls
spCond - Specific Conductivity
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
TOC - Total Organic Carbon
VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list

Table 4-4

Notes:
All surface water samples evaluated for hardness; all sediment samples evaluated for TOC.
Cr^{6+} will be analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.
Dissolved (field-filtered) surface water samples collected for metals, SVOCs, and PCBs when Turbidity > 10 NTU
SW - Surface Water
SE - Sediment

DO - Dissolved Oxygen
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals and to support the FS
Metals - Full TAL metals, including mercury
ORP - Oxidation-Reduction Potential
PCBs - Polychlorinated biphenyls
spCond - Specific Conductivity
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
TOC - Total Organic Carbon
VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list

Notes:
Investigation Method: HA = hand auger, DP = Direct Push Soil Boring, SN = Sonic Soil Boring
Cr^{6+} were analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.

VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
PCBs - Polychlorinated biphenyls
Metals - Full TAL metals
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals (such as hexavalent chromium) and to support the FS
GeoTech - Shelby tube collection for physical characteristic data to evaluate potential LNAPL response actions
ORP - Oxidation-Reduction Potential

Notes:
Investigation Method: HA = hand auger, DP = Direct Push Soil Boring, SN = Sonic Soil Boring
Cr^{6+} were analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.

VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
PCBs - Polychlorinated biphenyls
Metals - Full TAL metals
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals (such as hexavalent chromium) and to support the FS
GeoTech - Shelby tube collection for physical characteristic data to evaluate potential LNAPL response actions
ORP - Oxidation-Reduction Potential

Notes:
Investigation Method: HA = hand auger, DP = Direct Push Soil Boring, SN = Sonic Soil Boring
Cr^{6+} were analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.

VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
PCBs - Polychlorinated biphenyls
Metals - Full TAL metals
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals (such as hexavalent chromium) and to support the FS
GeoTech - Shelby tube collection for physical characteristic data to evaluate potential LNAPL response actions
ORP - Oxidation-Reduction Potential

Notes:
Investigation Method: HA = hand auger, DP = Direct Push Soil Boring, SN = Sonic Soil Boring
Cr^{6+} were analyzed in 10% of samples analyzed for TAL metals, along with pH and ORP to validate the analytical results relative to field conditions.

VOCs - Specific parameters from TCL based on preliminary screening evaluation results, plus NYSDEC STARs list
SVOCs - Selected TCL SVOCs based on preliminary screening evaluation, plus NYSDEC STARs list (includes full TCL PAHs plus NYSDEC STARs list)
PCBs - Polychlorinated biphenyls
Metals - Full TAL metals
GeoChem - Specific geochemical parameters to further evaluate the speciation of metals (such as hexavalent chromium) and to support the FS
GeoTech - Shelby tube collection for physical characteristic data to evaluate potential LNAPL response actions
ORP - Oxidation-Reduction Potential

Table 4-5
Summary of Phase III Soil Analytical Samples
Camp Hero Remedial Investigation
Montauk, New York

Location ID	Investigation Method	Media	Boring Depth	Actual Sample Depth	Planned Sample Depth	Field Sample ID	Parameters Collected						QC Samples Collected		Comment/Deviations from the SAP

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/5/2017 9:09
End	6/5/2017 14:27
Sample Period(s)	10
Number of Records	1906
Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/5/2017 7:37
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Begin	6/6/2017 7:44
End	6/6/2017 8:29
Sample Period(s)	10
Number of Records	265

Sensor	PID(ppm)

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: A. Borden, AECOM
Instrument: MiniRAE 3000

==========

Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:26
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Begin	6/6/2017 9:47
End	6/6/2017 11:29
Sample Period(s)	10
Number of Records	615

Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:26
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/6/2017 13:36
End	6/6/2017 16:00
Sample Period(s)	10
Number of Records	866
Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:26
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Begin	6/12/2017 8:38
End	6/12/2017 8:38
Sample Period(s)	10
Number of Records	1

Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/13/2017 12:58
End	6/13/2017 13:00
Sample Period(s)	10
Number of Records	11
Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/13/2017 7:40

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: A. Borden, AECOM
Instrument: MiniRAE 3000

Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919032
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/14/2017 10:57
End	6/14/2017 11:04
Sample Period(s)	10
Number of Records	42
Sensor	PID(ppm)
Sensor SN	S023030206U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/14/2017 7:31
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/5/2017 9:22
End	6/5/2017 14:37
Sample Period(s)	10
Number of Records	1887
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/5/2017 7:47
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/6/2017 9:21
End	6/6/2017 11:11
Sample Period(s)	10
Number of Records	662
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:16
Peak	N/A
Min	N/A
Average	N/A

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/6/2017 11:19
End	6/6/2017 11:19
Sample Period(s)	10
Number of Records	1
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:16

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Begin	6/6/2017 15:21
End	6/6/2017 16:18
Sample Period(s)	10
Number of Records	342

Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

==========

Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/6/2017 7:16
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

Begin	6/7/2017 9:21
End	6/7/2017 10:36
Sample Period(s)	10
Number of Records	449
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/7/2017 7:14
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/7/2017 12:06
End	6/7/2017 14:15
Sample Period(s)	10
Number of Records	776
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/7/2017 7:14
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

==========

Begin	6/8/2017 8:18
End	6/8/2017 13:39
Sample Period(s)	10
Number of Records	1930
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/8/2017 8:15
Peak	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

Site ID	RAE00000
User ID	USER0000
Begin	6/9/2017 8:26
End	6/9/2017 9:10
Sample Period(s)	10
Number of Records	264
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/8/2017 8:15
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/13/2017 8:10
End	6/13/2017 8:11
Sample Period(s)	10
Number of Records	4
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

Calibration Time	6/13/2017 7:38
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/13/2017 8:13
End	6/13/2017 10:12
Sample Period(s)	10
Number of Records	717
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

==========

STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/13/2017 7:38
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User
Site ID	RAE00000
User ID	USER0000
Begin	6/13/2017 12:34
End	6/13/2017 12:36

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

Sample Period(s)	10
Number of Records	9
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/13/2017 7:38
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14

Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Stop by User

Site ID	RAE00000
User ID	USER0000

Community Air Monitoring Data
Phase III Remedial Investigation
Camp Hero, Montauk, New York

Activity: Down-wind air monitoring during drilling operations
Geologist: M. Glinski, AECOM
Instrument: MiniRAE 3000

==========

Begin	6/14/2017 8:03
End	6/14/2017 9:09
Sample Period(s)	10
Number of Records	398
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/14/2017 7:32
Peak	N/A
Min	N/A
Average	N/A

Summary

Unit Name	MiniRAE 3000(PGM-7320)
Unit SN	592-919025
Unit Firmware Ver	V2.14
Running Mode	Hygiene Mode
Datalog Mode	Manual
Diagnostic Mode	No
Stop Reason	Pause in Menu Mode
Site ID	RAE00000
User ID	USER0000
Begin	6/14/2017 10:14
End	6/14/2017 10:16
Sample Period(s)	10
Number of Records	8
Sensor	PID(ppm)
Sensor SN	S023030183U3
Measure Type	Avg
Span	100
Span 2	1000
Low Alarm	50
High Alarm	100
Over Alarm	15000
STEL Alarm	25
TWA Alarm	10
Measurement Gas	Isobutylene
Calibration Time	6/14/2017 7:32
Peak	N/A
Min	N/A
Average	N/A

Survey Activity Report

Re: **Camp Hero - Remedial Investigation**
at Montauk, T/O Easthampton, New York
Prime Contract #: W913DR-13-D-0016
Project #: 60443903

Dear Ms. Martin,

The following is a summary of survey activities undertaken by us for the above referenced project;

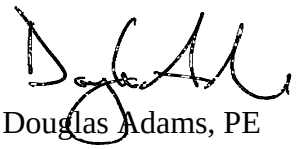
- Survey activities took place on June 19-22, 2017.
- Our Survey crew (Crew Chief Brian Gillis, and Rodperson Jon Darch) met with Amanda Martin for site on-boarding activities and representatives of AECOM (Andrew Borden 6/19 & 6/20, and Mckenzie Miller 6/21 & 6/22) each morning to review the day's agenda.
- Each morning included a safety briefing.
- AECOM representatives accompanied and directed the field crew each day.
- Each day ended with a debriefing with Amanda and the other representatives of AECOM.
- Equipment utilized;
    - GPS - Trimble R8 and TDS Ranger collector - utilized for overall control and a portion of collected points. Our RTK GPS connects, in real time, to New York Precision's RTK Base Network. This is a spatial reference network of continuously

operating Global Navigation Satellite System (GNSS) reference stations encompassing Long Island, the Five Boroughs & Parts of Westchester into Connecticut. This Network is used for RTK (real time) GPS. This equipment, and the procedures we utilize, achieve sub-centimeter positioning for surveying applications or sub-meter positioning for GIS mapping applications. The locations of all Base Stations are determined using NOAA's Online Positioning User Service (OPUS). This automatically processes raw GPS data using standard NGS data and models to compute an accurate position. All base stations are constantly monitored for movement and positional accuracy.

  - Nikon NIVO 5M Prismless Total Station - utilized in locations of heavy tree and brush cover for a portion of collected points.
- NYS Plane Coordinate System, Long Island Zone 3104:
  - Horizontal - North American Datum (NAD 83)
  - Vertical - North American Vertical Datum (NAVD 88)

Please contact our office if you have any questions or wish discuss the project in further detail.

Respectfully Submitted,



Douglas Adams, PE

B. PHYSICAL CHARACTERISTICS OF WASTE

Color/Physical Description: Brown Soil

STRONG INCIDENTAL ODOR PRESENT: Yes X No

PHYSICAL STATE @70°F:
- X SOLID
- LIQUID
- POWDER
- SEMI SOLID

- X SINGLE PHASE
- BI-LAYERED
- MULTI-LAYERED
- SLUDGE

___ WASTEWATER
X NONWASTEWATER

SPECIFIC GRAVITY: N/A

FLASHPOINT:
- ___ <70°F
- ___ >200°F
- ___ 70°F-100°F
- ___ 101°F-141°F
- ___ 142°F-200°F
- ___ >200°F
- X NO FLASH
- ___ EXACT

Ignitable (if solid) ___ Yes ___ No
___ Closed Cup ___ Open Cup

LIQUID/SOLID/SLUDGE:
- % Sludge
- % Suspended Solid
- %Solid/Debris 100
- % Free Liquid

pH:
- ___ <2.0
- ___ 2.01-5
- ___ 5.01-9
- X 9.01-12.4
- ___ >12.50
- 11.6 EXACT

Dumpable	X	Yes		No
Pumpable		Yes	X	No
Pourable		Yes	X	No

C. CHEMICAL COMPOSITION

Is MSDS Attached? ___ Yes X No
Is Analysis Attached? X Yes ___ No

INDICATE IF THE WASTE IS:
- ___ RCRA REACTIVE
- ___ WATER REACTIVE
- ___ RADIOACTIVE
- ___ SUBJECT TO SUBPART FF
- ___ BENZENE REGULATIONS
- ___ ETIOLOGICAL
- ___ TSCA REGULATED
- ___ OXIDIZING MATERIAL
- ___ PYROPHORIC
- ___ EXPLOSIVE/SHOCK SENSITIVE
- X NONE OF THE ABOVE

Indicate If Waste Contains Any Of The Following:

	None	Or Less Than	Or Actual
Pcb's	X	<50PPM	PPM
Cyanides	X	<250PPM	PPM
Phenolics	X	<50PPM	PPM
Sulfides	X	<500PPM	PPM
VOC's	X	<500PPM	PPM

Is this waste characteristically hazardous for metals or organics (EPA Waste Code D004-D043)? ___ Yes X No. If yes please list the constituents and concentrations in Section D

Does this waste contain underlying hazardous constituents as defined in 40 CFR 268 (2)(I) at concentrations exceeding the UTS treatment standards? ___ Yes X No. If yes, please list constituents and concentrations in Section D

GENERATOR CERTIFICATION: I hereby certify that all information submitted in this and all attached documents is complete, contains true and accurate descriptions and it is representative of the waste material, and that all relevant information regarding known or suspected hazards in the possession of the generator has been disclosed. If the TDSF discovers, after having taken delivery of the waste, that any waste does not conform to the identification and description on this MPS then the TSD shall provide notice of such condition to the Generator and coordinate the return of the nonconforming waste to the point of origin as set forth on the manifest or to such other locations designated in writing by the Generator. Generator agrees to reimburse AWT for all handling, packaging, clean-up and transportation costs or charges, damage to equipment, and cost associated with lost time incurred by the TSD during the receipt, handling, temporary storage and return of such nonconforming waste to correction is performed, I will be contacted as such to issue any approval.

General Comments:

All analyses have been performed in accordance with DOD QSM Version 5.0 unless otherwise noted below.

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 9055445, 9055448

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

SW-846 6010C, Metals

Batch #: 171771063602 (Sample number(s): 9055444, 9055447 UNSPK: 9055444 BKG: 9055444)

The recovery(ies) for the following analyte(s) in the LCS exceeded the acceptance window indicating a positive bias: Arsenic

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Arsenic, Silver

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chromium

40 CFR 261.21, Wet Chemistry

Sample #s: 9055443, 9055446

The sample did not spontaneously ignite when exposed to air or water.
The sample did not ignite by friction.
The sample vapors did not ignite when exposed to a flame using a closed cup apparatus.

SW-846 9045D modified, Wet Chemistry

Sample #s: 9055443

The pH was measured in water at 19.2 C.
The reported result was confirmed.

Sample #s: 9055446

The pH was measured in water at 20.3 C.

SM 2540 G-1997, Wet Chemistry

Batch #: 17177820001A (Sample number(s): 9055446 BKG: P44026)

The duplicate RPD for the following analyte(s) exceeded the acceptance window:
Moisture

Quality Control Summary

Client Name: AECOM
Reported: 06/29/2017 15:10

Group Number: 1814762

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

All analyses have been performed in accordance with DOD QSM Version 5.0 unless otherwise noted below.

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 9077890

Reporting limits were raised due to sample foaming.

SW-846 8270D, GC/MS Semivolatiles

Batch #: 17181WAL026 (Sample number(s): 9077889)

The relative percent difference(s) for the following analyte(s) in the LCS/LCSD were outside acceptance windows: Pentachlorophenol. When the individual % recovery is within the acceptance limits, the data is reported.

SW-846 6010C, Metals

Batch #: 171811063603 (Sample number(s): 9077889, 9077892 UNSPK: 9077892 BKG: 9077892)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Silver

SW-846 1010A, Wet Chemistry

Sample #s: 9077891

No flash observed below 184F.
Test flame extinguished at 164F.
Flash point was determined using Pensky Martens closed cup apparatus.

Sample #s: 9077888

No flash observed below 185F.

Test flame extinguished at 165F.
Flash point was determined using Pensky Martens closed cup apparatus.

Quality Control Summary

Client Name: AECOM
Reported: 07/07/2017 14:35

Group Number: 1819546

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

RE: One more question

Masonheimer, Debbie [Debbie.Masonheimer@aecom.com]
Sent: Thursday, June 29, 2017 10:52 AM
To: Stephen Gordon; Chicoine, Devon [Devon.Chicoine@aecom.com]

SVOCs on the TB are not needed, but VOCs are. It looks like the column headers got switched on the COC.

Thanks,
Debbie

To: Masonheimer, Debbie; Chicoine, Devon
Subject: One more question

For the IDW sample, the attached COC indicates SVOCs for the TB. I assume this should have been VOCs but need to confirm.

Thanks!

Stephen Gordon

The laboratory will be closed on Tuesday, July 4, in observance of Independence Day. Lab couriers will not be available for pickup or delivery on July 4.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP17	
Date(s) of Collection:	June 1th, 2017	
Number/Type Samples & Analyses:	12 sediment samples plus 2 duplicate for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	November 21st, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP17. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

CH-SWSD102-SE01, CH-SWSD105-SE01, and CH-SWSD105-SE01D samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Sample CH-SWSD105-SE01D was analyzed for 8270D SIM however the surrogates (benzo(a)pyrene-d12 and fluoranthene-d10) were slightly low. Sample was re-analyzed outside method holding time and three surrogates were very low. Both set of results are comparable. The initial results will be presented.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for vanadium in the low level check standard was not within QC specification. All vanadium results were above LOQ. The percent recovery for calcium in the CCV was above QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP18		
Date(s) of Collection:	June 2nd, 2017		
Number/Type Samples & Analyses:	4 sediment samples for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21st, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP18. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

✓ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Samples CH-SWSD072-SE01, CH-SWSD073-SE01, and CH-SWSD074-SE01 samples were analyzed by regular SW8270D and 8270D SIM. The final results will be presented in SIM.

Sample CH-SWSD074-SE01 was analyzed for 8270D however the shift ending calibration check (SECC) exceeded the +/- 50% of the expected value from the ICAL (indicating matrix effect). Samples were re-analyzed with the SECC marginally exceeding the +/- 50% of the expected value from the ICAL. Both set of results are comparable. The initial results will be presented.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for vanadium in the low level check standard was not within QC specification. All vanadium results were above LOQ. The percent recovery for calcium in the CCV was above QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP19	
Date(s) of Collection:	June 2nd, 2017	
Number/Type Samples & Analyses:	3 surface water samples for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	November 21, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP19. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

x Laboratory control sample (LCS) recoveries

NA Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the silver LCS percent recovery was lower in the corrected data package. Only qualifiers for silver changed.

Qualifier	Explanation
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP20		
Date(s) of Collection:	June 1st, 2017		
Number/Type Samples & Analyses:	24 surface water samples plus 2 MS/MSD and 2 field duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21st, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP20. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

The initial analyses of several samples in method 8270D had low surrogate recoveries; the lab re-extracted the batch outside of recommended extraction hold times and all samples have acceptable surrogate recoveries. (CH-SWSD108-SW01F, CH-SWSD106-SW01F) The results between the first and second runs are comparable. The initial results will be reported as the final results.

Due to method blank contamination in the total chromium result, the calculated chromium III was adjusted to a nondetect in sample CH-SWSD110-SW01-F.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the silver percent recovery for LCS and MS/MSD QC limits were lower in the corrected data package. Only sample qualifiers were changed.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.
