Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP34		
Date(s) of Collection:	June 15th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 2 field duplicates for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 8th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP34. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

For the soil sample (DU04-S011-00-01), both the total chromium and hexavalent chromium results appear to be valid and verified by the lab.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the metals data was rejected due to very low level check standards. The 16 soil samples and 2 field duplicates were re-digested and analyzed; the reanalyzed results are presented in APP77.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable due to QC issues.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports. Attachment B and Table B-1 present summaries of the SW6020A instrument calibration review.

Attachment B and Table B-1 present summaries of the SW6020A instrument calibration review.

Solid Data Review Summary for Method SW-846 6020A

The calibration originally reported in APP34 was re-sloped by the analyst without re-analysis of the associated quality control (QC) samples. The anomaly was identified by the laboratory and the results re-submitted with the investigative and QC samples re-calculated using the original calibration data. The samples reported in APP34 were re-digested and re-analyzed and submitted as APP77. All results reported in APP34 are therefore rejected and are should not be used. However, to evaluate other laboratory data that may have been affected by the calibration modification the data in APP34 was evaluated for usability because the magnitude of QC outliers was most significant in APP34. The attached table presents the quality control parameters evaluated.

The laboratory quantitated with a two point calibration utilizing a zero point and a high concentration standard. The majority of the quality control samples analyzed met the project acceptance criteria. There were a few detections in the instrument blanks and interference check standards, but overall the effects were minor and would result in qualification but do not affect the usability of the results.

Three different concentrations of analytical standards and the laboratory control sample (LCS) were evaluated. The initial calibration verification (ICV), continuing calibration verification (CCV), the low level check standard (LLC) and LCS are analyzed at varying concentrations along the calibrated instrument range. The ICVs, CCVs, and LLC do not go through the digestion process and serve as instrument verification without any contribution from the preparation procedure. The analysis of the LCS evaluates the variability of both the analytical and preparation processes. All of the LCS recoveries were within acceptance limits supporting acceptable accuracy for both preparation and analysis at the LCS spiked concentrations.

The ICVs and CCVs serve to measure the accuracy in the middle and the lower end of the calibrated range. The laboratory selected the ICV to be one half the concentrations of the high calibration standard and the CCV at one quarter of the upper calibration standard. Except for aluminum and silver which had minor high outliers, all of the remaining ICV and CCV percent recoveries (%Rs) were acceptable indicating accuracy at concentrations throughout the calibration range.

The LLC is used to verify the accuracy at the limit of quantitation (LOQ) which is the lowest concentration where precision and accuracy is known. The LLC was analyzed at the LOQ for these soil samples. The laboratory used limits of 80-120%R for the LLC. The majority of the LLC %Rs was acceptable however the LLC analyzed on 7/19/2017 exhibited %Rs less than 10%. The laboratory indicated that the LLC analyzed on 7/19/2017 may have been a blank sample and may not be indicative of the accuracy of the analytical system. The LLC from 7/19/2017 was reviewed and was consistent with a blank sample based on the internal standard intensities and the found concentrations. Because the identity of the standard could not be verified, the reported data quality cannot be fully assessed. However the non-compliant LLC appears to be an isolated incident based on the acceptable %Rs of the other LLC samples reported.

All of the instrument and preparation blanks were less than the LOQ. Furthermore, except for aluminum all blank detections were less than the LOD. Aluminum was detected at a concentration between the LOD and LOQ. Detected aluminum results less than the LOQ were

affected and would be J+ qualified with a high bias indicated.

All of the observed detections in the ICSA interferent check for the un-spiked analytes were also less than the LOQ. Except for cobalt all of the ICSA detections were also less than the LOD. Detected sample results greater than the LOQ would not be affected.

All of the observed calibration blank and interferent check standard detections were less than the LOQ and associated to estimated results. Therefore, any qualifications added because of the calibration and blank review would be associated to data already qualified as estimated. The extremely low LLC %Rs for the analyses performed on 7/19/2017 bring into question any sample results with concentrations less than the LCS spike level, but based on the acceptable LLC %Rs for analyses performed on other days the LLC analyzed on 7/19/2017 appears to be an isolated incident and not indicative of a laboratory wide issue.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP35		
Date(s) of Collection:	June 15th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 2 field duplicates for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 8th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP35. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Attachment A: Data Qualifier Summary and ADR Discrepancy Reports

Data Review Summary

Lab Reporting Batch ID: APP35 **Laboratory: LLL**

EDD Filename: APP35-A_2a_1_rev **eQAPP Name: CAMP_HERO_NP_PIII**

Validation Area	*Note*
Technical Holding Times	A
Temperature	A
Initial Calibration	N
Continuing Calibration/Initial Calibration Verification	N
Method Blanks	A
Surrogate/Tracer Spikes	N
Matrix Spike/Matrix Spike Duplicates	SR
Laboratory Duplicates	SR
Laboratory Replicates	N
Laboratory Control Samples	A
Compound Quantitation	SR
Field Duplicates	SR
Field Triplicates	N
Field Blanks	A

A = Acceptable, N = Not provided/applicable, SR = See report

The contents of this report reflect findings made by ADR during Automated Data Review, manual applied qualifiers are not considered. Please refer to the Overall Qualifier Summary report for manual qualifiers.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP36	
Date(s) of Collection:	June 15th, 2017	
Number/Type Samples & Analyses:	18 soil samples plus 3 MS/MSD and 2 field duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium and metals	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	November 21, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP36. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✗ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

- ✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.
- ✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.
- ✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the soil samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

DU07-S005-00-01 had low surrogate recoveries in method 8270D. The sample was re-extracted outside method holding time and the surrogate recoveries were acceptable. Both initial and re-analysis results are comparable and initial results will be presented as the final results.

DU07-S011-00-01 had low surrogate recoveries in method 8270D SIM. The sample was re-extracted outside method holding time and the surrogate recoveries were acceptable. Both initial and re-analysis results are comparable and initial results will be presented as the final results.

These 8270D SIM samples were re-extracted and re-analyzed because target analytes (chrysene and pyrene) were detected in the method blank: DU07-S011-01-03 and DU07-S005-01-02D. The re-extract was outside the method required holding time. The initial results will be presented.

Samples DU07-S005-01-02D, DU07-S011-01-03, DU07-S010-00-01 were analyzed for 8270D SIM however the SECC exceeded the +/- 50% of the expected value from the ICAL. Sample and the SECC were analyzed and the SECC was once again outside the limits which indicated a matrix effect. Both set of results are comparable. The initial results will be presented.

The prep technician failed to spike the LCS/MS/MSD with both the LCS mix #1 (includes all of the analytes requested for the project) and BNA surrogate mix. The LCS/MS/MSD was only spiked with LCS mix #1 and not with the surrogates; other samples and the blank were correctly spiked with the surrogate mix for sample DU07-S006-01-03 in method 8270D. The re-extract was outside the method holding time and the QC was acceptable. Both initial and re-analysis results are comparable and initial results will be presented as the final results.

The PAH SIM blank was prepared with the internal standard (IS) mix that is normally used for regular 8270 for one extraction batch for sample DU07-S006-01-03; this puts the internal standards at 20x too high for four of the 6 internal standards that used for SIM. The four internal standards are: Napthalene-d8, Acenaphthene-d10, Phenanthrene-d10, and Perylene-d12. The PAH compounds not affected by these IS are: pyrene, benzo(a)anthracene, and chrysene. ADR doesn't review internal standards and there is minimal impact to the results.

Several analytes were over calibration in method 8270D-SIM in sample DU07-S014-00-01 (benzo(k)fluoranthene, fluoranthene, phenanthrene, and pyrene) and DU07-S007-00-01 (fluoranthene). The samples were diluted, and the final results for the over calibration analytes will be presented from the diluted analysis.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result for Manganese in the associated method blank changed from < 0.200 mg/kg to 0.198 J mg/kg. The percent recovery of magnesium, manganese, and selenium in the CCV was not within QC specification. There were no updated qualifiers.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Project Name and Number: Camp Hero - Camp Hero

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP37		
Date(s) of Collection:	June 14th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 2 field duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 24th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP37. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✗ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the soil samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

The prep technician failed to spike the LCS/MS/MSD with both the LCS mix #1 (includes all of the analytes requested for the project) and BNA surrogate mix in method 8270D for sample DU07-S)13-00-01. The LCS/MS/MSD QC samples were only spiked with LCS mix #1 and not with the surrogates; other samples and the blank were correctly spiked with the surrogate mix. Results between the two analyses are comparable and the initial results will be presented.

The 8270D SIM blank was prepared with the internal standard (IS) mix that is normally used for regular 8270 for one extraction batch for sample DU07-S013-00-01; this puts the internal standards at 20x too high for four of the 6 internal standards that used for SIM. The four internal standards are: Napthalene-d8, Acenaphthene-d10, Phenanthrene-d10, and Perylene-d12. The PAH compounds not affected by these IS are: pyrene, benzo(a)anthracene, and chrysene. ADR doesn't automatically review internal standards and there is minimal impact to the results.

Samples DU07-S001-01-10, DU07-S001-01-10D, and DU07-S003-00-01 were analyzed for 8270D SIM, however the internal standards was outside the acceptance limits. Samples were re-analyzed (outside method holding time) and the internal standards were once again outside the limits which indicated a matrix effect. Both set of results are comparable. The initial results will be presented as final.

Sample DU07-S001-00-01 for 8270D SIM had internal standards and a surrogate outside of the acceptance limits. The sample was re-analyzed, and internal standards areas were once again outside the acceptance limits indicating a matrix effect. The sample was re-extracted outside the method required holding time and the QC was acceptable. The initial and re-analysis set of results are comparable. The initial results will be presented as final.

Sample DU07-S004-00-01 for 8270D SIM had low surrogate recovery and the sample was re-injected and the recovery for the surrogate was outside the acceptance limits again. The sample was re-extracted outside the method required holding time and the QC was acceptable. The initial and re-analysis set of results are comparable. The initial results will be presented as final.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP38		
Date(s) of Collection:	June 15th, 2017		
Number/Type Samples & Analyses:	12 soil samples and 1 field duplicate for a project-specific list of SVOCs, PAHs, hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 25th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP38. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✗ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the soil samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Sample DU03-S008-01-02 was analyzed for 8270D SIM however the internal standards were outside QC acceptance criteria. Sample was re-analyzed and was once again outside the limits which indicated a matrix effect. Both set of results are comparable. The initial results will be presented.

The prep technician failed to spike the LCS/MS/MSD with both the LCS mix #1 (includes all of the analytes requested for the project) and BNA surrogate mix in method 8270D. The LCS/MS/MSD samples were only spiked with LCS mix #1 and not with the surrogates; other samples and the blank were correctly spiked with the surrogate mix. Samples in the batch were: DU03-S001-00-01, DU03-S001-01-02, DU03-S001-01-02D, DU03-S002-00-01, DU03-S002-01-02, DU03-S003-00-01, DU03-S003-01-02, DU03-S004-00-01, DU03-S004-01-02, DU03-S005-00-01, DU03-S005-01-02, DU03-S006-00-01, DU03-S009-00-01, DU03-S009-01-02, DU03-S013-00-01, DU03-S013-01-02, amd DU03-S014-00-01. The samples were re-extracted outside method holding time and the surrogate recoveries were acceptable. Both initial and re-analysis results are comparable and initial results will be presented as the final results.

The 8270D SIM blank was prepared with the internal standard (IS) mix that is normally used for regular 8270 for one extraction batch; samples in the batch were DU03-S001-00-01, DU03-S001-01-02, DU03-S001-01-02D, DU03-S002-00-01, DU03-S002-01-02, DU03-S003-00-01, DU03-S003-01-02, DU03-S004-00-01, DU03-S004-01-02, DU03-S005-00-01, DU03-S005-01-02, DU03-S006-00-01, DU03-S009-00-01, DU03-S009-01-02, DU03-S013-00-01, DU03-S013-01-02, and DU03-S014-00-01. This puts the internal standards at 20x too high for four of the 6 internal standards that used for SIM. The four internal standards are: Napthalene-d8, Acenaphthene-d10, Phenanthrene-d10, and Perylene-d12. The PAH compounds not affected by these IS are: pyrene, benzo(a)anthracene, and chrysene. ADR doesn't automatically review internal standards and there is minimal impact to the results.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP39	
Date(s) of Collection:	June 15th, 2017	
Number/Type Samples & Analyses:	32 soil samples plus 2 MS/MSD and 4 field duplicates for a project-specific list of PCBs, hexavalent chromium and metals	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	August 9th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP39. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✓ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Attachment A: Data Qualifier Summary and ADR Discrepancy Reports

Data Review Summary

Lab Reporting Batch ID: APP39 **Laboratory: LLL**

EDD Filename: APP39-A_2a_1_rev **eQAPP Name: CAMP_HERO_NP_PIII**

Validation Area	*Note*
Technical Holding Times	A
Temperature	A
Initial Calibration	N
Continuing Calibration/Initial Calibration Verification	N
Method Blanks	SR
Surrogate/Tracer Spikes	A
Matrix Spike/Matrix Spike Duplicates	SR
Laboratory Duplicates	SR
Laboratory Replicates	N
Laboratory Control Samples	A
Compound Quantitation	SR
Field Duplicates	A
Field Triplicates	N
Field Blanks	A

A = Acceptable, N = Not provided/applicable, SR = See report

The contents of this report reflect findings made by ADR during Automated Data Review, manual applied qualifiers are not considered. Please refer to the Overall Qualifier Summary report for manual qualifiers.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP40		
Date(s) of Collection:	June 14th, 2017		
Number/Type Samples & Analyses:	28 soil samples plus 1 MS/MSD, 3 field duplicates and 2 trip blanks for a project-specific list of VOCs, SVOCs, PAHs, hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP40. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✗ Field rinsate blank data

✓ Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Soil samples (DU01-S001-01-10, DU01-S002-01-10, DU01-S002-01-10D, DU01-S003-01-10, DU01-S003-01-10, DU01-S004-01-10, DU01-S007-01-10, DU01-S008-01-10, DU01-S009-01-10, DU01-S010-01-10, DU01-S012-01-10, DU01-S013-01-10, DU01-S014-01-10, DU01-S015-01-10, and DU01-S016-01-10) were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Several analytes were over calibration in method 8270D in samples DU01-S011-01-10 and DU01-S011-01-10D (1-methylnaphthalene and 2-methylnaphthalene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Sample DU01-S011-01-10 for method 8260C was analyzed twice because of the continuing calibration verification standard exhibited a low response (outside the 20% D criteria). Both initial and re-analysis results were comparable. The initial results will be presented as final results.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the manganese percent recovery for LCS QC limits was lower than the QC range; the CCV percent recovery of vanadium and manganese was within QC specification in the original report as well as in the corrected package; and the percent recoveries in the low level check standard for vanadium and manganese were not within QC specifications. Qualifiers for manganese were added to samples for the low LCS recovery.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Laboratory SDG:	APP43		
Date(s) of Collection:	June 14th, 2017		
Number/Type Samples & Analyses:	24 soil samples and 3 duplicates for a project-specific list of SVOCs and PAHs		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 28th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP43. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the soil samples were run for regular 8270D and 8270D SIM except for DU12-S008-00-01, DU12-S011-00-01, DU12-S012-00-01 and DU12-S008-01-10. The final results will be presented in 8270D SIM.

Pyrene was over calibration in method 8270D SIM in samples DU12-S016-00-01. The sample was diluted and re-analyzed. All results will be presented in the undiluted except for the analyte that was over calibration.

Several analytes were over calibration in method 8270D in samples DU12-S008-00-01 (acenaphthalene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene which was rejected due to analytical issues, carbazole, chrysene, dibenz(a,h)anthracene, dibenzofuran, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene), DU12-S008-01-10 (fluoranthene, phenanthrene, and pyrene), and DU12-S011-00-01 (benzo(a)anthracene, benzo(b)fluoranthene, fluoranthene, phenanthrene, and pyrene) The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Sample DU14-S006-00-01 was analyzed for 8270D SIM three times. The recovery for the internal standard was outside acceptance limits. The sample was re-analyzed and the internal standards were again outside acceptance limits indicating a matrix effect. The sample was re-extracted outside the method required holding time and the QC was acceptable. Final results will be presented in the regular 8270D.

Sample DU14-S004-00-01 had low surrogate recovery in method 8270D SIM. The sample was re-extracted outside the method required holding time. The initial results will be presented as the final results.

Sample DU14-S004-00-01 was analyzed two times because of low surrogate recovery for 8270D. The sample was re-extracted outside the method required holding time. The initial results will be presented as final.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP44		
Date(s) of Collection:	June 16th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 3 duplicates for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 9th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP44. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP45		
Date(s) of Collection:	June 16th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 1 duplicate for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 19th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP45. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the initial calibration verification percent recovery for calcium was slightly below QC specification and the continuing calibration verification percent recovery for calcium was slightly above the QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP46		
Date(s) of Collection:	June 14th – 16th, 2017		
Number/Type Samples & Analyses:	1 trip blank and 6 equipment blanks for a project-specific list of VOCs, SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 17th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for FIELDQC data included in Sample Delivery Group (SDG) APP46. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

✓ Trip blank data

✓ Laboratory control sample (LCS) recoveries

NA Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the equipment samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Equipment blanks EB-SO061517-02 and EB-SO061617-02 were analyzed twice for method 8270D and 8270D SIM because of low surrogate recovery. The initial results will be presented as final.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, analytes antimony, aluminum, and calcium continuing calibration verification percent recoveries were within QC specifications in the original report as well as the corrected package.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP47		
Date(s) of Collection:	June 20th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 3 duplicates for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 17th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP47. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the initial calibration verification percent recovery for calcium was slightly below QC specification and the continuing calibration verification percent recovery for calcium was slightly above the QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP48		
Date(s) of Collection:	June 19th, 2017		
Number/Type Samples & Analyses:	16 soil samples and 1 duplicate for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 19th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP48. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the continuing calibration verification percent recovery for calcium was slightly above the QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

ATTACHMENTS

Attachment A: Data Qualifier Summary and ADR Discrepancy Reports

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP49		
Date(s) of Collection:	June 19th, 2017		
Number/Type Samples & Analyses:	17 soil samples and 1 duplicate for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP49. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the barium and cadmium LCS percent recoveries were lower in the corrected data package. The percent recovery for antimony in the lower calibration check was not within QC specification. The CCV percent recovery for aluminum was within QC specification in the original report as well as in the corrected package. Qualifiers were changed to "J+" in the barium and cadmium detected results.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP50		
Date(s) of Collection:	June 19th, 2017		
Number/Type Samples & Analyses:	1 equipment blank for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 17th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for FIELDQC data included in Sample Delivery Group (SDG) APP50. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

NA Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

NA Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for calcium in the continuing calibration verification was slightly above QC specification and the percent for antimony in the continuing calibration verification was slightly lower than the QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP51		
Date(s) of Collection:	June 20th, 2017		
Number/Type Samples & Analyses:	16 soil samples for a project-specific list of SVOCs, PAHs, hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 26th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP51. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

NA Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the soil samples except for DU11-S001-00-01, DU11-S003-00-01, and DU11-S004-00-01 were run for regular 8270D and 8270D SIM. The final results will be presented in 8270D SIM except where noted below.

Analytes were over calibration in method 8270D in sample DU11-S003-00-01 (anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, fluoranthene, phenanthrene, and pyrene). The sample was diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Samples DU11-S005-00-01 and DU11-S006-00-01 in method 8270D have low surrogate recoveries and the samples were re-extracted outside the method required holding time with acceptable surrogate recoveries. The re-extract reporting limits were raised due to interference from the sample matrix. Both set of results are comparable. The initial results will be presented as the final results.

An analytes was over calibration in method 8270D SIM in sample DU11-S002-00-01 (fluoranthene), The sample was diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Samples DU11-S008-00-01, DU11-S011-00-01, DU11-S012-00-01, DU11-S013-00-01, DU11-S014-00-01, DU11-S015-00-01 were analyzed for 8270D SIM however the SECC exceeded the +/- 50% of the expected value from the ICAL and internal standards was outside acceptable limits. Sample and the internal standards were analyzed and the internal standards were once again outside the limits which indicated a matrix effect. Both set of results are comparable. The initial results will be presented.

Analytes were over calibration in method 8270D SIM in samples DU11-S005-00-01 (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, fluoranthene, phenanthrene, and pyrene). The sample was diluted and analytes were within calibration. All final results will be presented in 8270D in the initial run.

Sample DU11-S010-00-01 was analyzed for 8270D SIM however the internal standards were outside the QC acceptance limits and several analytes were over calibration. (benzo(b)fluoranthene, fluoranthene and pyrene) The sample was re-analyzed and the internal standards were again outside QC acceptance limits. The sample was diluted and the analytes were within calibration. All results for these analytes will be presented in method 8270D.

Sample DU11-S006-00-01 in method 8270D SIM had low surrogate recovery and the sample was reinjected and 3 analytes were over calibration (benzo(b)fluoranthene, fluoranthene, and pyrene). The sample was then diluted and all three analytes were within calibration. Final results will be presented in the method 8270D initial results.

Analytes were over calibration for sample DU11-S007-00-01 (fluoranthene) and the sample was diluted but had low surrogate recovery. The sample was re-analyzed and had low surrogate recovery again but several analytes were over calibration (benzo(b)fluoranthene, fluoranthene, phenanthrene, and pyrene). The sample was diluted and analyzed for a fourth time and the four analytes were with calibration. Final results will be presented in 8270D results.

Sample DU11-S009-00-01 in method 8270D SIM had low surrogate recovery and the sample was reinjected and the surrogate recovery was outside acceptance limits again. The samples re-extracted outside the method required holding time with acceptable surrogate recovery. The re-extract reporting limits were raised due to interference from the sample matrix. Final results will be presented in 8270D results except for 1-methylnaphthalene and 2-methylnaphthalene which will be presented in the 8270D SIM re-analysis.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP53		
Date(s) of Collection:	June 7th, 2017		
Number/Type Samples & Analyses:	2 soil samples for a project-specific list of SVOCs and PAHs		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 21th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP53. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

All the soil samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

ATTACHMENTS

Attachment A: Data Qualifier Summary and ADR Discrepancy Reports

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP54		
Date(s) of Collection:	June 21st, 2017		
Number/Type Samples & Analyses:	6 ground water samples plus 1 MS/MSD and 1 field duplicate for a project-specific list of SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 18th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP54. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

NA Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the ground water samples were run for 8270 SIM and regular 8270. The final results will be presented in SVOC SIM.

During the initial run for method 8082A, the LCS, MS and MSD (for samples CH-MW039-02 plus MS/MSD, CH-MW040-02, and CH-MW040-02D) had not been spiked with the PCB compounds. The surrogates were within specifications, and there were no detects for PCBs. The samples were re-extracted with the proper spikes added to the LCS, MS and MSD. The LCS and MS/MSD were within specifications on the re-extracted batch. The re-analysis results will be reported as the final results.

Sample CH-MW038-02 was analyzed twice for 8270D SIM because of low surrogate recovery. The sample was re-extracted outside method holding time. The initial results will be presented as the final results.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for antimony in the initial calibration verification was slightly above QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP55		
Date(s) of Collection:	June 21st, 2017		
Number/Type Samples & Analyses:	6 ground water samples plus 1 MS/MSD and 1 field duplicate for a project-specific list of SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP55. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

NA Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All samples were run for 8270 SIM and regular 8270. The final results will be presented in SVOC SIM.

The recovery for target analytes on samples CH-MW039-02F, CH-MW040-02F, and CH-MW040-02DF in the laboratory control spikes was outside the QC acceptance limits. The samples were re-extracted and the QC was acceptable. Both sets of results are comparable. The re-analysis results will be presented as final.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result in the continuing calibration blank for calcium changed from 15 ug/l to 100 ug/l. The QC specification is less than the absolute value of 280 ug/l. Calcium results were all more than 10 times the blank value thus no qualifier changes were required.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP56		
Date(s) of Collection:	June 22nd, 2017		
Number/Type Samples & Analyses:	15 ground water samples, 3 field duplicates and 1 trip blank for a project-specific list of VOCs, SVOCs, PAHs, hexavalent chromium, metals, and MNA parameters		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP56. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

NA Field rinsate blank data

✓ Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the ground water samples were run for 8270 SIM and regular 8270. The final results will be presented in SVOC SIM.

Sample CH-MW026-02F had low surrogate recovery in method 8270D. The sample was re-extracted outside the method required holding time and the QC was acceptable. Similar results were obtained in the both trials. The initial results will be presented as the final results.

Several analytes were over calibration in method 8270D SIM for samples CH-MW037-02 (acenaphthene) and CH-MW037-02D (acenaphthene). The samples were diluted and re-analyzed. All results will be presented in the undiluted sample except for the analyte over calibration.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for antimony in the initial calibration verification was above QC specification. The result in the continuing calibration blank for calcium changed from 15 ug/l to 100 ug/l. The QC specification is less than the absolute value of 280 ug/l. Calcium results were all more than 10 times the blank value thus no qualifier changes were required.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP60		
Date(s) of Collection:	June 23rd, 2017		
Number/Type Samples & Analyses:	12 ground water samples and 1 trip blank and 1 equipment blank for a project-specific list of VOCs, SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 29th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP60. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✗ Field rinsate blank data

✓ Trip blank data

✗ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All of the ground water samples were analyzed for regular 8270D and 8270D SIM. The final results will be presented in SVOC SIM.

Samples CH-MW021-02, CH-MW032-02, and CH-MW032-02F in method 8270D have low surrogate recoveries. The samples were re-extracted outside the method required holding time. The initial results will be presented as the final results.

Sample CH-MW033-02 in method 8270D SIM had low surrogate recovery. The sample was re-extracted outside the method required holding time. The initial results will be presented as the final results.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP61		
Date(s) of Collection:	June 26th, 2017		
Number/Type Samples & Analyses:	12 ground water samples plus 5 field duplicate and 1 trip blank for a project-specific list of VOCs, SVOCs, PAHs, PCBs, hexavalent chromium, metals, and MNA parameters		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 19th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP61. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

NA Field rinsate blank data

✓ Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the ground water samples were run for 8270 SIM and regular 8270. The final results will be presented in SVOC SIM except for CH-MW024-02F and CH-MW024-02.

Samples CH-MW018-02, CH-MW018-02D, CH-MW018-02F, CH-MW018-02DF, CH-MW024-02F, and CH-MW024-02 have low surrogate recovery in method 8270D. The samples were re-extracted outside the method required holding time and the QC parameters were acceptable. Similar results were obtained in the both analyses. The initial results will be presented as the final results.

Several analytes were over calibration in method 8270D SIM in samples CH-MW024-02F (1-methylnaphthalene, 2-methylnaphthalene, and naphthalene), CH-MW024-02 (1-methylnaphthalene, 2-methylnaphthalene, and naphthalene) The samples were diluted and re-analyzed. All results will be presented in method 8270D SIM except for the three analytes.

Samples CH-MW022-02, CH-MW022-02D had low surrogate recovery in method 8270D SIM. The sample was re-extracted outside the method required holding time and the QC was acceptable. The initial results will be presented as the final results.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for antimony in the continuing calibration verification was slightly below QC specification and the percent recovery for calcium in the continuing calibration verification was slightly above QC specification. The percent recoveries for aluminum and calcium in the low level check standard were not within the QC specification; however, the LCS which is 2 to 5 times the LLC was within QC limits for both analytes. The result in the continuing calibration blank for aluminum changed from 22 ug/l to 220 ug/l which affected two samples, CH-MW020-02 and CH-MW024-02; sample results were adjusted to the LOQ and U qualified. Additional review of the SW6020A instrument calibrations is presented in Appendix B and Table B-1.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Attachment B and Table B-1 present summaries of the SW6020A instrument calibration review.

Aqueous Calibration Data Review Summary for Method SW-846 6020A

The effects of changes in calibration due to the laboratory re-submittal were evaluated. The calibrations used to quantitate investigative samples and quality control samples resulted in changes to the reporting of the analytical results. The attached table B-1 presents the quality control parameters evaluated.

The laboratory quantitated with a two point calibration utilizing a zero point and a high concentration standard. The majority of the quality control samples analyzed did not change. There were a few changes in the instrument blank and calibration verification results but overall the changes were minor and would result in qualification but do not affect the usability of the results.

Three different concentrations of analytical standards and the laboratory control sample (LCS) were evaluated. The initial calibration verification (ICV), continuing calibration verification (CCV), the low level check standard (LLC) and LCS are analyzed at varying concentrations along the calibrated instrument range. The ICVs, CCVs, and LLC do not go through the digestion process and serve as instrument verification without any contribution from the preparation procedure. The analysis of the LCS evaluates the variability of both the analytical and preparation processes.

The ICVs and CCVs serve to measure the accuracy in the middle and the lower end of the calibrated range. The laboratory selected the ICV to be one half the concentrations of the high calibration standard and the CCV at one quarter of the upper calibration standard. Except for one 89% CCV recovery for antimony and one 118% recovery for calcium (limits of 90-110%) the ICV and CCV percent recoveries (%Rs) were acceptable indicating accuracy at those concentrations.

The LLC is used to verify the accuracy at the limit of quantitation (LOQ) which is the lowest concentration where precision and accuracy is known. The LLC was analyzed at the LOQ for water samples. The laboratory used limits of 80-120%R for the LLC. Except for aluminum (132%), barium (125%), and calcium (126%), the observed LLC recoveries were acceptable. The high LLC recoveries do not affect analytes not detected. In addition, because the LCS recoveries were acceptable the LCS can take the place of the LLC. Based on that, detected concentrations less the LCS spike concentration may be affected with a potential high bias and would be qualified as usable but estimated.

Except for aluminum, the instrument and preparation blanks were less than the LOQ. A single aluminum detection was observed in one instrument blank indicating an isolated incident. Only sample results associated to that blank were affected and would be used to qualify any reported results less than ten times the observed blank concentration.

The observed detections in the interferent check (ICSA) for the un-spiked analytes were also less than the LOQ except for cobalt which was slightly greater than the LOQ (1.09 ug/L detected with a LOQ of 1.0 ug/L), indicating the calibration was not significantly affected by interferences. Both detected and non-detect results may be affected with a potential high bias and would be qualified as usable but estimated.

Samples were run on multiple days. The table represents outliers - some samples were not affected.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP62		
Date(s) of Collection:	June 27th, 2017		
Number/Type Samples & Analyses:	9 ground water samples plus 3 MS/MSD and 2 trip blank for a project-specific list of VOCs, SVOCs, PAHs, hexavalent chromium, metals and MNA parameters		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for ground water data included in Sample Delivery Group (SDG) APP62. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR. Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

NA Field rinsate blank data

✓ Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✓ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the ground water samples were run for 8270 SIM and regular 8270. The final results will be presented in SVOC SIM except for CH-MW016-02 and CH-MW016-02F.

Sample CH-MW016-02 had low surrogate recovery in method 8270D. The sample was re-extracted outside the method required holding time and the QC was acceptable. Similar results were obtained in the both analyses. The initial results will be presented as the final results.

Analytes were over calibration in method 8270D for sample CH-MW019-02 (caprolactam). The sample was diluted and re-analyzed. All results will be presented in the undiluted sample except the analytes over calibration.

Several analytes were over calibration in method 8270D SIM for sample CH-MW016-02F (1-methylnaphthalene, 2-methylnaphthalene, and naphthalene). The sample was diluted and re-analyzed. All results will be presented in method 8270D SIM except for the three analytes.

Several analytes were over calibration in method 8270D SIM for samples CH-MW016-02 (1-methylnaphthalene, 2-methylnaphthalene, and naphthalene) as well surrogate recoveries outside QC limits. The sample was re-extracted outside method required holding time however the QC was acceptable. The sample was diluted and all three analytes were within calibration. All results will be presented in method 8270D SIM except for the three analytes.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the altered result for manganese for sample CH-MW016-02F was significantly above the calibration linear range, thus the lab reanalyzed a preserved and within hold time sample, lab duplicate and MS/MSD. The continuing calibration verification (CCV) percent recovery for calcium was slightly above QC specification, and the CCV percent recovery for antimony was slightly below the QC specification. The percent recovery for aluminum and calcium in the low level check (LLC) standard was not within QC specification. The LCS results for aluminum and calcium which are 2 to 5 times the LLC were within QC limits. The result in the continuing calibration blank for aluminum changed from 22 ug/l to 220 ug/l which affected two samples, CH-MW043-02F and

CH-MW19-02F; the adjusted aluminum result for CH-MW043-02F is 200 U and for CH-MW19-02F is 248 U . The QC specification is less than the absolute value of 53 ug/l.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP64		
Date(s) of Collection:	June 12th, 2017		
Number/Type Samples & Analyses:	2 soil samples for a project-specific list of metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	September 28th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP64. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP65 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 8th, 2017		
Number/Type Samples & Analyses:	16 surface water samples for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 4th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP65. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. The original results were nondetects and the lab-filtered results were detected

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP66 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 8th, 2017	
Number/Type Samples & Analyses:	15 surface water samples for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	September 28th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP66. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP67 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 2nd, 2017	
Number/Type Samples & Analyses:	13 surface water samples plus 2 MS/MSDs for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	October 10th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP67. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP68 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 1th, 2017	
Number/Type Samples & Analyses:	14 surface water samples plus 2 field duplicates for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	October 9th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP68. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP69 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 2nd, 2017		
Number/Type Samples & Analyses:	20 surface water samples plus 1 MS/MSD and 2 field duplicates for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 4th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP69. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP70 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 3rd, 2017		
Number/Type Samples & Analyses:	20 surface water samples plus 1 MS/MSD and 3 field duplicates for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 4th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP70. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP71 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 5th, 2017		
Number/Type Samples & Analyses:	17 surface water samples plus 1 MS/MSD and 4 field duplicates for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 11th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP71. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP72 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 6th, 2017	
Number/Type Samples & Analyses:	19 surface water samples plus 3 field duplicates for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	October 11th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP72. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Due to method blank contamination in lead and zinc, the detected results were adjusted to nondetects in samples CH-SWSD031-SW01-F-LF, CH-SWSD031-SW01-LF, CH-SWSD032-SW01-F-LF, CH-SWSD032-SW01-LF, CH-SWSD033-SW01-F-LF, CH-SWSD033-SW01-LF, CH-SWSD034-SW01-LF, CH-SWSD035-SW01-F-LF, CH-SWSD035-SW01-LF, CH-SWSD036-SW01-LF, CH-SWSD037-SW01-LF, CH-SWSD038-SW01-LF, CH-SWSD039-SW01-LF, CH-SWSD040-SW01D-LF, CH-SWSD040-SW01-LF, CH-SWSD041-SW01-LF, CH-SWSD044-SW01-LF, and CH-SWSD112-SW01-LF.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP73 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 9th, 2017	
Number/Type Samples & Analyses:	15 surface water samples plus 2 MS/MSD for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	October 11th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP73. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Due to method blank contamination, the aluminum detect was changed to a non-detect in sample CH-SWSD150-SW01-F-LF.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP74 (data gap lab-filtered surface water samples)	
Date(s) of Collection:	June 9th, 2017	
Number/Type Samples & Analyses:	6 surface water samples plus 1 MS/MSD and 1 field duplicate for a project-specific list of metals (lab filtered samples)	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	October 11th, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP74. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Attachment A: Data Qualifier Summary and ADR Discrepancy Reports

Data Review Summary

Lab Reporting Batch ID: APP74 **Laboratory: LLL**

EDD Filename: APP74-A_2a_1 **eQAPP Name: CAMP_HERO_NP_PIII_METALS**

Validation Area	*Note*
Technical Holding Times	SR
Temperature	A
Initial Calibration	N
Continuing Calibration/Initial Calibration Verification	N
Method Blanks	SR
Surrogate/Tracer Spikes	N
Matrix Spike/Matrix Spike Duplicates	A
Laboratory Duplicates	SR
Laboratory Replicates	N
Laboratory Control Samples	A
Compound Quantitation	SR
Field Duplicates	A
Field Triplicates	N
Field Blanks	N

A = Acceptable, N = Not provided/applicable, SR = See report

The contents of this report reflect findings made by ADR during Automated Data Review, manual applied qualifiers are not considered. Please refer to the Overall Qualifier Summary report for manual qualifiers.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP75 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 7th, 2017		
Number/Type Samples & Analyses:	19 surface water samples plus 1 MS/MSD and 3 field duplicates for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 12th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP75. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected..

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP76 (data gap lab-filtered surface water samples)		
Date(s) of Collection:	June 3rd, 2017		
Number/Type Samples & Analyses:	14 surface water samples plus 1 MS/MSD for a project-specific list of metals (lab filtered samples)		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	October 12th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP76. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✗ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

NA Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

At AECOM's request, the laboratory filtered the surface water samples through a 0.45 µm and analyzed for dissolved metals by 6020A. Since the filtration occurred after receipt in the laboratory, the recommended holding time criteria of 15-minutes was exceeded. The lab-filtered results are flagged "J" and "UJ" for detected and non-detected results, respectively indicating that the results are estimated values. If the original results were nondetects and the lab-filtered results were detected, the result will be rejected ("R" flag).

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The result is rejected and not usable. Original results were nondetects and the lab-filtered results were detected.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Sample ID: **CH-SWSD047-SW01-LF** ***Collected:*** **6/3/2017 11:35:00 AM** ***Analysis Type:*** **Initial/DIS** ***Dilution:*** **1**

Analyte	Lab Result	Lab Qual	DL	DL Type	RL	RL Type	Units	Data Review Qual	Reason Code
ALUMINUM	165	J	50.0	LOD	200	LOQ	ug/L	J	RI, StoE
ANTIMONY	1.0	U	1.0	LOD	2.0	LOQ	ug/L	UJ	StoE

* denotes a non-reportable result

Project Name and Number: Camp Hero - Camp Hero

Data Qualifier Summary

Lab Reporting Batch ID: APP76 **Laboratory: LLL**

EDD Filename: APP76-A_2a_1 **eQAPP Name: CAMP_HERO_NP_PIII_METALS**

Method Category: **METALS**

Method: **6020A** ***Matrix:*** **WATER**

Sample ID: **CH-SWSD047-SW01-LF** ***Collected:*** **6/3/2017 11:35:00 AM** ***Analysis Type:*** **Initial/DIS** ***Dilution:*** **1**

Analyte	Lab Result	Lab Qual	DL	DL Type	RL	RL Type	Units	Data Review Qual	Reason Code
ARSENIC	2.0	U	2.0	LOD	4.0	LOQ	ug/L	UJ	StoE
BARIUM	10		2.0	LOD	4.0	LOQ	ug/L	J	StoE
BERYLLIUM	0.25	U	0.25	LOD	1.0	LOQ	ug/L	UJ	StoE
CADMIUM	0.50	U	0.50	LOD	1.0	LOQ	ug/L	UJ	StoE
