Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP21		
Date(s) of Collection:	June 3rd, 2017		
Number/Type Samples & Analyses:	31 sediment samples plus 1 MS/MSD and 4 duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP21. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

CH-SWSD046-SE01, CH-SWSD052-SE01, CH-SWSD062-SE01, CH-SWSD063-SE01, CH-SWSD075-SE01, CH-SWSD075-SE01D, CH-SWSD076-SE01, CH-SWSD077-SE01, CH-SWSD078-SE01, CH-SWSD079-SE01, CH-SWSD112-SE01, CH-SWSD113-SE01, and CH-SWSD114-SE01 samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Two analytes were over calibration in method 8270D SIM in sample CH-SWSD063-SE01 (benzo(b)fluoranthene and fluoranthene). The sample was diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Samples CH-SWSD079-SE01, CH-SWSD046-SE01, CH-SWSD076-SE01, CH-SWSD052-SE01, CH-SWSD113-SE01, and CH-SWSD114-SE01 were analyzed for 8270D SIM however the SECC exceeded the +/- 50% of the expected value from the ICAL. Samples and the SECC were analyzed and the SECC values were once again outside the limits which indicated matrix effects. Both sets of results are comparable. The initial results will be presented.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, barium, calcium, copper, and lead, and thallium LCS percent recoveries were not within QC specification, the percent recovery of nickel in the CCV was not within QC specification and the percent recoveries of the low level check standard for barium and calcium were not within QC specification. Only qualifiers changed.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP22		
Date(s) of Collection:	June 2nd – 3rd 2017		
Number/Type Samples & Analyses:	44 surface water samples plus 3 MS/MSD, 6 duplicate, and 2 equipment blanks for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 11th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP22. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water and equipment blank samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

The original analyses of several samples in method 8270D had low surrogate recovery or benzoic acid detected in the method blank; the lab re-extracted the batch outside of recommended extraction hold times and all samples have acceptable surrogate recovery or no benzoic acid detections. (CH-SWSD069-SW01, CH-SWSD072-SW01, CH-SWSD072-SW01F, CH-SWSD078-SW01, CH-SWSD076-SW01, CH-SWSD057-SW01, CH-SWSD058-SW01, CH-SWSD020-SW01, CH-SWSD119-SW01) The results between the first and second runs are comparable. The initial results will be reported as the final results.

Sample CH-SWSD072-SW01 had low surrogate recovery in method 8270 SIM. The sample was re-extracted but outside the method required holding time. The initial results will be presented as the final results.

Due to method blank contamination in the total chromium result, the calculated chromium III was adjusted to a nondetect in sample CH-SWSD060-SW01 and CH-SWSD060-SW01D.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, manganese was detected in the ICSA and outside of QC limits; however in the ICSAB, manganese was within QC limits.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP23		
Date(s) of Collection:	June 5th – 6th, 2017		
Number/Type Samples & Analyses:	31 sediment samples plus 1 MS/MSD and 5 duplicates for a project-specific list of SVOCs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP23. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Several analytes were over calibration in method 8270D in samples CH-SWSD090-SE01 (fluoranthene, phenanthrene, and pyrene), CH-SWSD091-SE01 (fluoranthene, phenanthrene, and pyrene), CH-SWSD093-SE01 (anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene), CH-SWSD084-SE01 (fluoranthene and pyrene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the calcium LCS percent recovery was lower and the percent recovery in low level check standard for calcium was not within QC specification. Only qualifiers for calcium changed.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP24		
Date(s) of Collection:	June 6th, 2017		
Number/Type Samples & Analyses:	36 surface water samples plus 1 MS/MSD and 7 field duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP24. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Samples CH-SWSD035-SW01D and CH-SWSD112-SW01 were analyzed twice for 8270D for low surrogate recovery. The samples were re-extracted outside method required holding time and QC again was outside acceptance limits. The initial results will be presented as final results.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result for zinc in the associated method blank changed from < 7.5 ug/l to 39.9 ug/l, the CCV percent recoveries for vanadium and calcium were above specifications, and cobalt was detected in the interference check solution A; however in the interference check solution AB, cobalt was within QC limits. Zinc results changed from "J" to an "U" due to the method blank contamination.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP25		
Date(s) of Collection:	June 6th – 8th, 2017		
Number/Type Samples & Analyses:	46 sediment samples plus 4 MS/MSD and 4 duplicate for a project-specific list of SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP25. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

CH-SWSD119-SE01, CH-SWSD120-SE01, CH-SWSD121-SE01, CH-SWSD122-SE01, CH-SWSD123-SE01, CH-SWSD124-SE01, CH-SWSD125-SE01, CH-SWSD115-SE01, CH-SWSD115-SE01D, CH-SWSD116-SE01, CH-SWSD117-SE01, CH-SWSD118-SE01, CH-SWSD099-SE01, CH-SWSD003-SE01, CH-SWSD001-SE01, CH-SWSD002-SE01, and CH-SWSD022-SE01 samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Sample CH-SWSD138-SE01, CH-SWSD129-SE01, CH-SWSD135-SE01, CH-SWSD131-SE01, CH-SWSD133-SE01, CH-SWSD127-SE01, CH-SWSD128-SE01, CH-SWSD126-SE01, CH-SWSD126-SE01D, and CH-SWSD096-SE01 had low surrogate recoveries in method 8270D. Samples were re-extracted but outside method required holding time. The initial analysis will be presented as the final results.

Several analytes were over calibration in method SW8270D for samples CH-SWSD097-SE01 (1-methylnaphthalene, 2-methylnaphthalene, and naphthalene), CH-SWSD018-SE01 (fluoranthene and phenanthrene), and CH-SWSD139-SE01 (fluoranthene). The samples were diluted and re-analyzed. All the analytes were within calibration. Results will be presented in the initial analysis except for these analytes.

Sample CH-SWSD022-SE01 was analyzed two times and sample CH-SWSD002-SE01 was analyzed three times for method 8270D SIM due to their internal standards being outside acceptance limits. The samples were re-analyzed (outside method holding time) and the internal standards were again outside of QC acceptance limits. The initial results will be presented as final.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result for Manganese in the associated method blank changed from < 0.200 mg/kg to 0.184 J mg/kg. The manganese LCS percent recovery was higher in the corrected data package.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP26		
Date(s) of Collection:	June 6th, 2017		
Number/Type Samples & Analyses:	35 surface water samples plus 1 MS/MSD, 3 field duplicates, and 1 equipment blank for a project-specific list of SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP26. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

The original analyses of several samples in method 8270D have low surrogate recoveries; the lab re-extracted the batch outside of recommended extraction hold times and all samples have acceptable surrogate recoveries. Samples affected are CH-SWSD140-SW01 plus MS/MSD, CH-SWSD134-SW01, CH-SWSD135-SW01D, CH-SWSD135-SW01, CH-SWSD132-SW01, CH-SWSD133-SW01, CH-SWSD130-SW01, CH-SWSD030-SW01, CH-SWSD003-SW01, CH-SWSD017-SW01, CH-SWSD021-SW01, CH-SWSD023-SW01, and CH-SWSD022-SW01 The results between the first and second runs are comparable. The initial results will be reported as the final results.

The initial analyses of several samples in method 8270D SIM had surrogate recoveries or laboratory control spike outside acceptance limits; the lab re-extracted the batch outside of recommended extraction hold times and all samples have acceptable surrogate and LCS recoveries. Samples affected are CH-SWSD138-SW01, CH-SWSD139-SW01, CH-SWSD140-SW01, CH-SWSD134-SW01, CH-SWSD135-SW01, CH-SWSD135-SW01D, CH-SWSD127-SW01, CH-SWSD129-SW01, CH-SWSD129-SW01D, CH-SWSD132-SW01, CH-SWSD133-SW01, CH-SWSD130-SW01, CH-SWSD131-SW01, CH-SWSD126-SW01, CH-SWSD030-SW01, and CH-SWSD027-SW01. The results between the first and second runs are comparable. The initial results will be reported as the final results.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result for manganese in the associated method blank changed from < 2.0 ug/l to 1.5 J ug/l. The antimony LCS percent recovery was lower in the corrected data package. Cobalt was detected in the ICSA and outside of QC limits; however in the ICSAB, cobalt was within QC limits.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP27		
Date(s) of Collection:	June 9th – 10th, 2017		
Number/Type Samples & Analyses:	31 sediment samples plus 2 MS/MSD and 1 duplicate for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 18th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for sediment data included in Sample Delivery Group (SDG) APP27. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✗ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Samples CH-SWSD004-SE01, CH-SWSD005-SE01, CH-SWSD006-SE01, CH-SWSD007-SE01, CH-SWSD154-SE01, CH-SWSD155-SE01, CH-SWSD153-SE01, CH-SWSD151-SE01, CH-SWSD152-SE01, CH-SWSD008-SE01, CH-SWSD009-SE01, CH-SWSD015-SE01, CH-SWSD011-SE01, CH-SWSD012-SE01, CH-SWSD111-SE01, and CH-SWSD013-SE01 were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Analytes were over calibration in method 8270D in samples CH-SWSD147-SE01 (fluoranthene) and CH-SWSD146-SE01 (fluoranthene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Samples CH-SWSD151-SE01, CH-SWSD152-SE01, CH-SWSD015-SE01, CH-SWSD011-SE01, CH-SWSD012-SE01, and CH-SWSD013-SE01 were analyzed for 8270D SIM however the SECC exceeded the +/- 50% of the expected value from the ICAL. Samples and the SECC were analyzed and the SECC was once again outside the limits which indicated a matrix effect. Both sets of results are comparable. The initial results will be presented.

Sample CH-SWSD111-SE01 was analyzed twice for regular 8270D due to low surrogate recovery. The sample was analyzed outside the method required holding time. The initial results will be presented.

Sample CH-SWSD111-SE01 was analyzed twice for 8270D SIM due to low surrogate recovery. The sample was analyzed outside the 40 day extract holding time. The initial results will be presented.

This data package was revised 11/9/2017 due to the Eurofins metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. Where we see sample result changes, these are primarily cases where the result exceeded the linear calibration range of the instrument and were changed to be slightly lower than the upper limit of the calibration range.

In this package, the interference check standard percent recovery for vanadium was slightly above the QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP28		
Date(s) of Collection:	June 9th – 10th 2017		
Number/Type Samples & Analyses:	36 surface water samples plus 2 MS/MSD, 1 duplicate, and 2 equipment blanks for a project-specific list of SVOCs, PAHs, PCBs, hexavalent chromium, and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 19th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for surface water data included in Sample Delivery Group (SDG) APP28. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

All the surface water and equipment blank samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Due to method blank contamination in the total chromium result, the calculated chromium III was adjusted to a nondetect in sample CH-SWSD150-SW01-F.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recoveries for arsenic, calcium, cadmium, chromium, and manganese in the low level check standard were not within QC specification. The LCS which is 2 to 5 times the LLC was within specifications for these analytes. The percent recoveries for antimony, calcium, and silver in the CCV were not within QC specification.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page 1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.	
Laboratory SDG:	APP29	
Date(s) of Collection:	June 12th, 2017	
Number/Type Samples & Analyses:	28 soil samples plus 5 MS/MSDs, 4 field duplicates for a project-specific list of SVOCs, PAHs, hexavalent chromium, and metals	
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA	
Completed:	November 21, 2017	

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP29. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

DU06-S007-01-10, DU06-S001-01-10, DU06-S001-01-10D, DU06-S005-00-01, DU06-S005-01-10, DU06-S005-01-10D, DU06-S006-00-01, DU06-S006-01-10, DU06-S012-01-10, DU06-S008-01-10, DU06-S003-01-10, DU06-S003-01-10D, DU06-S002-00-01, DU06-S002-01-10, DU06-S014-01-10, DU06-S009-01-10, DU016-S016-00-01 samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Several analytes were over calibration in method 8270D in samples DU06-S003-00-01 (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, phenanthrene, and pyrene) and DU06-S015-01-10 (fluoranthene and phenanthrene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Sample DU06-S009-01-10 was re-extracted and re-analyzed for 8270D SIM because several target analytes (benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, and pyrene) were detected in the method blank. The re-analysis results will be presented as final except for dibenz(a,h)anthracene.

Several analytes were over calibration in method 8270D SIM in samples DU06-S007-01-10 (benzo(b)fluoranthene, fluoranthene, and pyrene), DU06-S012-01-10 (fluoranthene, phenanthrene, and pyrene), and DU06-S008-01-10 (fluoranthene and pyrene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Sample DU06-S016-00-01 was analyzed for 8270D SIM however the internal standards were outside the QC acceptance limits. The sample was re-analyzed and the internal standards areas were once again outside the limits which indicated a matrix effect. Both sets of results are comparable. The initial results will be presented.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the result for Calcium in the associated method blank changed from < 40.0 mg/kg to 20.3 J mg/kg; the percent recovery of antimony, chromium, and calcium in the CCV was not within QC specification; and the percent recovery for cadmium in the low level check standard as well as the interference check standard was not within QC specification. There were no new qualifiers.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Data Qualifier Summary

Lab Reporting Batch ID: APP29 **Laboratory: LLL**

EDD Filename: APP29-B_ADJ_2a_1 **eQAPP Name: CAMP_HERO_NP_PIII**

Reason Code Legend

Reason Code	*Description*
Eb	Equipment Blank Contamination
Fd	Field Duplicate Precision
Lcs	Laboratory Control Spike Upper Estimation
Ld	Laboratory Duplicate Precision
Mb	Method Blank Contamination
Ms	Matrix Spike Lower Estimation
Ms	Matrix Spike Precision
Ms	Matrix Spike Upper Estimation
ProfJudg	Professional Judgment
Rl	Reporting Limit Trace Value
StoA	Sampling to Analysis Estimation
StoE	Sampling to Extraction Rejection

* denotes a non-reportable result

This page intentionally left blank.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP30		
Date(s) of Collection:	June 12th, 2017		
Number/Type Samples & Analyses:	16 soil samples plus 2 MS/MSD and 1 field duplicate for a project-specific list of SVOCs, PAHs, hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 20th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP30. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✓ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of “J” data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

Several analytes were over calibration in method 8270D in samples DU06-S013-00-01 (1-methylnaphthalene and 2-methylnaphthalene) The sample was diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration

Several analytes were over calibration in method 8270D-SIM in sample DU06-S010-01-10 (fluoranthene and phenanthrene). The sample was diluted and reanalyzed but the sample was not extracted within holding time. All results will be presented in the 8270D results due to SIM dilutions.

This data package was revised 11/9/2017 due to the Eurofins metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. Where we see sample result changes, these are primarily cases where the result exceeded the linear calibration range of the instrument and were changed to be slightly lower than the upper limit of the calibration range.

In this package, the percent recovery for vanadium in the low level check standard was not within QC specification. The LCS which is 2 to 5 times the LLC was within specifications for vanadium.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP31		
Date(s) of Collection:	June 13th, 2017		
Number/Type Samples & Analyses:	20 soil samples plus 2 MS/MSD and 3 field duplicates for a project-specific list of hexavalent chromium and metals		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	November 21, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP31. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✗ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

This data package was revised 11/9/2017 due to the Eurofins SW6020A metals data breach. The majority of the data changes were made to Quality Control (QC) and/or calibration checks, not to actual sample results. The few field sample result changes were due to the originally reported result exceeding the linear calibration range of the instrument; those results were changed to be slightly lower than the upper limit of the calibration range.

In this package, the manganese percent recovery for LCS was not within QC specification. The CCV percent recovery of antimony, arsenic, barium, cadmium, cobalt, copper, nickel, silver, and zinc was not within QC specification. The percent recovery for cadmium in the low level check standard was not within QC specification; however the LCS was within specifications for cadmium. There were no updated qualifiers.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP32		
Date(s) of Collection:	June 13th, 2017		
Number/Type Samples & Analyses:	40 soil samples plus 3 duplicates for a project-specific list of SVOCs and PAHs		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 21th, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP32. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✓ Field rinsate blank data

NA Trip blank data

✓ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✗ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

All the soil samples were run for regular 8270 and 8270 SIM except for DU12-S006-00-01, DU12-S007-00-01, DU12-S010-00-01, and DU16-S013-00-01). The final results will be presented in 8270 SIM.

Analytes in method 8270D were over calibration in sample DU12-S007-00-01 (fluoranthene). The sample was diluted and re-analyzed. The analytes were within calibration. All results will be presented in the initial analysis except for these analytes.

Analytes in method 8270D SIM were over calibration in sample DU16-S005-00-01 (fluoranthene and pyrene). The sample was diluted and re-analyzed. The analytes were within calibration. All results will be presented in the initial analysis except for these analytes.

These 8270D SIM samples were re-extracted (past hold time) and re-analyzed because target analytes (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, naphthalene, and pyrene) were detected in the method blank: DU16-S010-00-01, DU16-S010-01-10, DU16-S006-00-01, DU16-S006-01-10, and DU16-S009-01-10. All these samples will be presented in 8270D results.

The extraction to analysis holding time for 8270D SIM was missed for a batch of samples by a day for samples DU16-S013-01-10, DU16-S001-00-01, DU16-S001-01-10, DU16-S002-00-01, DU16-S002-01-10, DU16-S014-00-01, DU16-S014-01-10, DU16-S011-00-01, DU16-S011-01-10, DU16-S016-00-01, DU16-S016-01-10, DU16-S008-00-01, DU16-S008-01-10, DU16-S004-00-01, and DU16-S004-01-10. Detected analytes were flagged as J- and non-detected analytes were UJ.

The following table defines the data qualifiers assigned by ADR.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.

Site/Project Name:	Remedial Investigation, at Former Camp Hero State Park, Montauk, New York.	Page	1
Laboratory:	Eurofins Laboratories, Inc. – Lancaster, PA.		
Laboratory SDG:	APP33		
Date(s) of Collection:	June 13th, 2017		
Number/Type Samples & Analyses:	30 soil samples and 6 field duplicates for a project-specific list of SVOCs and PAHs		
Data Reviewer:	Devon Chicoine AECOM/Arlington, VA		
Completed:	August 23rd, 2017		

SUMMARY

AECOM conducted a reduced-level data validation on the ADR output for soil data included in Sample Delivery Group (SDG) APP33. This reduced-level data validation verified appropriate application of DV qualifications and reviewed laboratory narrative issues to interpret potential data usability for exceedances noted by the ADR and to identify potential issues not included in the ADR, Data quality requirements can be found in the Final *2017 Sampling and Analysis Plan, Remedial Investigation at Former Camp Hero, Montauk, New York*, prepared by AECOM in June, 2017.

REVIEW ELEMENTS

This reduced-level data validation report included an evaluation of the project-specific DQOs in terms of data accuracy, precision, sensitivity, representativeness, and completeness. The validation procedures employed consisted of the following:

Review of ADR output for the following QC parameters:

✓ Holding times and sample preservation

✗ Laboratory method blank data

✗ Field rinsate blank data

NA Trip blank data

✗ Laboratory control sample (LCS) recoveries

✓ Matrix spike (MS) and/or matrix spike duplicate (MSD) results

✓ Surrogate recoveries

✓ Laboratory duplicate results

✗ Field duplicate results

✓ Quantitation limits and sample results

The following additional reviews were conducted on the hardcopy data package:

✓ Review of COC documents to verify sample identities

✓ Review of laboratory narrative or sample log-in documents to verify any potential problems with custody seals, container integrity, sample preservation, labeling, etc.

✓ Spot-check of "J" data, reported below the RL, as reported in the ADR.

✓ General reporting issues

The symbol (✓) indicates that no validation qualifiers were applied based on this parameter. NA indicates that the parameter was not included as part of this data set or was not applicable to this validation and therefore not reviewed. The symbol (✗) indicates that data were qualified on the basis of this parameter.

FINDINGS

The following table defines the data qualifiers assigned by ADR.

DU12-S014-00-01, DU12-S014-01-10, DU12-S009-01-10, DU12-S013-01-10, DU12-S013-01-10D, DU14-S012-00-01, DU14-S012-01-10, DU14-S012-01-10D, DU14-S015-01-10, DU14-S010-00-01, DU14-S010-01-10, DU14-S010-01-10D, DU14-S008-00-01, DU14-S008-01-10, DU14-S008-01-10D, DU14-S007-00-01, DU14-S007-01-10, DU14-S016-01-10, DU14-S014-00-01, and DU14-S014-01-10 samples were run for regular 8270 and 8270 SIM. The final results will be presented in 8270 SIM.

Samples DU12-S014-00-01, DU12-S014-01-10, DU14-S008-00-01, DU14-S008-01-10, DU14-S008-01-10D, DU14-S007-00-01, DU14-S007-01-10, DU14-S016-01-10, DU14-S014-00-01, and DU14-S014-01-10 were analyzed for 8270D SIM however the internal standard was outside the QC acceptance limits. Samples were re-analyzed and the internal standards areas were once again outside the limits which indicated a matrix effect. Both set of results are comparable. The initial results will be presented.

These 8270D SIM samples were re-extracted (past hold time) and re-analyzed because target analytes (benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, naphthalene, and pyrene) were detected in the method blank: DU12-S013-01-10, DU12-S013-01-10D, DU14-S012-00-01 (RE2), DU14-S012-01-10, DU14-S012-01-10D. All PAH analytes for these samples will be presented in the 8270D.

Analytes were over calibration in method 8270D in samples DU12-S005-00-01 (anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, fluoranthene, phenanthrene, and pyrene), DU12-S005-01-10 (fluoranthene and phenanthrene), DU12-S003-00-01 (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, fluoranthene, phenanthene, and pyrene), DU12-S003-01-10 (fluoranthene, phenanthrene, and pyrene), DU12-S002-00-01 (anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene), DU12-S001-00-01 (acenaphthene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene), DU12-S004-00-01 (anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, chrysene, fluoranthene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene). The samples were diluted and re-analyzed. All results will be presented in the undiluted except for the analytes that were over calibration.

Qualifier	Explanation
J	The analyte was positively identified; the associated numerical value is an estimated quantity with an unknown bias.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Attachment A presents a summary of qualified data. Based on review of the ADR output and laboratory narrative, all DQOs were met with any exceptions appropriately qualified by ADR and ADR Discrepancy reports.
