Notary Public, Clayton County, Georgia
My Commission Expires May 10, 1998

UNIAXIAL GEOGRID UX1500HT

The geogrid shall be a regular grid structure formed by uniaxially drawing a continuous sheet of select high density polyethylene material and shall have aperture geometry and rib and junction cross-sections sufficient to permit significant mechanical interlock with the material being reinforced. The geogrid shall have high flexural rigidity and high tensile modulus in relation to the material being reinforced and shall also have high continuity of tensile strength through all ribs and junctions of the grid structure. The geogrid shall have high resistance to deformation under sustained long term design load while in service and shall also be resistant to ultraviolet degradation, to damage under normal construction practices and to all forms of biological or chemical degradation normally encountered in the material being reinforced.

The geogrid shall also conform in all respects to the property requirements listed below.

PROPERTY	TEST METHOD	UNITS	VALUE
Interlock			
• open area	COE Method ¹	%	60 (nom)
Reinforcement			
• creep limited strength ⁶	GRI GG3-87 ² or (ASTM D5262)	lb/ft	2,700 (min)
• flexural rigidity	ASTM D1388-64 ³	mg-cm	4,700,000 (min)
• tensile modulus-MD	GRI GG1-87 ⁴	lb/ft	100,000 (min)
• junctions	GRI GG2-87 ⁵		
- strength		lb/ft	5,000 (min)
- efficiency		%	90 (min)
Material			
- high density polyethylene	ASTM D 1248	%	97 (min)
• carbon black	Type III/Class A/Grade 5 ASTM 4218	%	2.0 (min)
Dimensions			
• roll length		ft	150
• roll width		ft	4.3
• roll weight		lb	84

Notes:

1. Percent open area measured without magnification by Corps of Engineers Method as specified in CWO2215 Civil Works Construction Guide, November 1977.
2. Long term load capacity measured by through the junction tensile creep testing to 10,000 hours as described in Geosynthetic Research Institute test method GG3-87 "Creep Behavior and Long Term Design Load of Geogrids".
3. ASTM D 1388-64 modified to account for wide specimen testing as described in Tensar test method TTM-5.0 "Stiffness of Geosynthetics".
4. Secant modulus at 2% elongation measured by Geosynthetic Research Institute test method GG1-87 "Geogrid Tensile Strength". No offset allowances are made in calculating secant modulus.
5. Geogrid junction strength and junction efficiency measured by Geosynthetic Research Institute test method GG2-87 "Geogrid Junction Strength".
6. The long-term allowable design strength (LTADS) is determined using the method outlined in GRI-GG4 "Determination of the Long Term Design Strength of Stiff Geogrids." The GRI-GG4 method applies various partial factors of safety to account for construction damage, junction strength, connections, chemical and biological degradation.

Geotechnical Fabric Report # December 1994

UNIAXIAL GEOGRID UX1000SB

The geogrid shall be a regular grid structure formed by uniaxially drawing a continuous sheet of select high density polyethylene material and shall have aperture geometry and rib and junction cross-sections sufficient to permit significant mechanical interlock with the material being reinforced. The geogrid shall have high flexural rigidity and high tensile modulus in relation to the material being reinforced and shall also have high continuity of tensile strength through all ribs and junctions of the grid structure. The geogrid shall have high resistance to deformation under sustained long term design load while in service and shall also be resistant to ultraviolet degradation, to damage under normal construction practices and to all forms of biological or chemical degradation normally encountered in the material being reinforced.

The geogrid shall also conform in all respects to the property requirements listed below.

BIAXIAL GEOGRID BX1100 (SS-1)

The geogrid shall be a regular grid structure formed by biaxially drawing a continuous sheet of selected polypropylene material and shall have aperture geometry and rib and junction cross-sections sufficient to permit significant mechanical interlock with the material being reinforced. The geogrid shall have high flexural rigidity and high tensile modulus in relation to the material being reinforced and shall also have high continuity of tensile strength through all ribs and junctions of the grid structure. The geogrid shall maintain its reinforcement and interlock capabilities under repeated dynamic loads while in service and shall also be resistant to ultraviolet degradation, to damage under normal construction practices and to all forms of biological or chemical degradation normally encountered in the material being reinforced.

The geogrid shall also conform in all respects to the property requirements listed below.

SUBSURFACE DRAINAGE

Drainage Fabric

Good drainage is essential for soil stability. In order for drainage structures to be effective — along highways, in embankments, under airfields and athletic fields, or anywhere — they must have a properly designed protective filter.

Traditionally, graded-aggregate filter systems have been used with limited success to prevent soil particles from migrating into subsurface drainage structures. However, these aggregate drains have several inherent problems, including high cost and difficult installation.

Mirafi 140N, a nonwoven filter fabric, provides an effective, cost-efficient alternative to graded-aggregate filters. Among its design features are:

- Easily conforms to the ground or trench surface for fast and trouble-free installation;
- Creates a superior filter media because of its high water flow rate and excellent filtration properties;
- Meets severe stresses of installation with its high puncture and burst resistance.

Mirafi 140N eliminates many of the problems associated with graded-aggregate filters, including:

- Determining the aggregate gradation required to match soil conditions;
- Finding a convenient and economical source of a specific aggregate gradation;
- Transporting and placing a graded aggregate;
- Assuring that the in-place aggregate gradation provides effective filter performance.

An additional benefit of Mirafi 140N is that the drain size can often be reduced when Mirafi fabric is installed because the thick, graded-aggregate layer is eliminated. As a result, less excavation and less aggregate will be required.

Trevira® Spunbond Type 011/350 is a 100% continuous filament polyester nonwoven needlepunched engineering fabric. The fabric is resistant to biological and naturally encountered chemicals, alkalies, acids, and ultraviolet light exposure. Trevira® Spunbond Type 011/350 conforms to the property values listed in the following table:

FABRIC PROPERTY	UNIT	TEST METHOD	TYPICAL VALUE ¹	MINIMUM TEST VALUES ²
Fabric Weight	oz/yd ²	ASTM D-5261	10.5	10.0
Fabric Thickness, t	mils	ASTM D-5199	140	125

Standard Roll Widths ³	ft	12.5 and 15.0		
Standard Roll Lengths ³	ft	300		

MD = Machine Direction CD = Cross Machine Direction

¹ The values listed are average values.

² These minimum values represent minimum test values as determined from Quality Control (QC) testing.

³ Other width and length rolls are available upon request.

**Synthetic Industries 801
Nonwoven Geotextile**

Synthetic Industries 801 is a polypropylene, staple fiber, needlepunched nonwoven geotextile. The fibers are needled to form a stable network that retain dimensional stability relative to each other. The geotextile is resistant to ultraviolet degradation and to biological and chemical environments normally found in soils. Synthetic Industries 801 conforms to the property values listed below:

<u>PROPERTY</u>	<u>TEST METHOD</u>	<u>MINIMUM AVERAGE ROLL VALUES¹</u>	
		<u>English</u>	<u>Metric</u>
<u>Mechanical</u>			
Grab Tensile Strength	ASTM D4632	200 lbs	890 N
Grab Elongation	ASTM D4632	50 %	50 %
Puncture Strength	ASTM D4833	130 lbs	580 N
Mullen Burst	ASTM D3786	400 psi	2756 kPa
Trapezoidal Tear	ASTM D4533	85 lbs	380 N
<u>Hydraulic</u>			
Apparent Opening Size (AOS)	ASTM D4751	80 US Std. Sieve	0.180 mm
Permittivity, Ψ	ASTM D4491	1.50 sec ⁻¹	1.50 sec ⁻¹
Permeability, $k = \Psi \cdot t$	ASTM D4491	0.38 cm/sec	0.38 cm/sec
Water Flow Rate	ASTM D4491	110 gpm/ft ²	4482 l/min/m ²
<u>Endurance</u>			
UV Resistance (% retained @ 500 hours)	ASTM D4355	70 %	70 %

Notes:

¹ Values shown are in weaker principal direction. Minimum average roll values represent a 95 percent confidence level, calculated as mean minus two standard deviations.

Standard Roll Size Information: 15.0' x 300' = 500 sq. yds.

Miragrid MX 1 Technical Data

Product Description

Miragrid **MX 1** is a bi-directional grid with comparable strength in both the machine direction and cross-machine direction. Miragrid **MX 1** is manufactured by extruding and orienting U.V. stabilized polypropylene to form a monolithic grid structure. Miragrid **MX 1** features high tensile strength and modulus with excellent resistance to construction and environmental damage. Miragrid **MX 1** conforms to the property values listed in the following table.

Grid Property	Test Method	Unit	Minimum Average Roll Value	
			MD	CD
Ultimate Tensile Strength	GRI GG-1	lb/ft	950	1,350
Secant Modulus @ 2% Strain	GRI GG-1	lb/ft	14,000	21,000
Junction Strength	GRI GG-2	lb/ft	855	1,215

 CD - Cross-machine Direction

GUNDLOCK INSTALLATION GUIDE

Gundlock is a High Density Polyethylene (HDPE) extruded shape designed to provide a mechanical anchor attachment for Gundline HD (High Density Polyethylene liner). Gundlock is designed to embed in any face of new cast-in-place or precast concrete construction and can be fabricated to maneuver around shapes and corners.

Any thickness of Gundline HD can be welded to the Gundlock. If unexpectedly high tensile loads are experienced by the liner, the liner is designed to yield before the Gundlock yields or pulls out of the concrete. The Gundlock profile is detailed in Figure 1.

GUNDLOCK
NOT TO SCALE

FIGURE-1

Attachment of Gundline HD to Gundlock is performed by grinding the Gundlock and Gundline HD and then extrusion welding the Gundline HD to the Gundlock.

Gundlock should not be used as a waterstop for most installations although it may be utilized as such in special

applications. Please consult Gundlock Lining Construction for further information.

Proper installation techniques must be observed to insure a secure embedment of the Gundlock and a sound weld to the Gundline HD sheeting.

GUNDLOCK INSTALLATION

Gundlock must be cut and butt welded together to fit corners and shapes. (Figures 2 - 4) This cutting and welding, if performed correctly will provide a continuous support for the liner, and secure a seal. Suggested procedures can be found on page 5. Corners and "T" connections can be supplied pre-fabricated.

FIGURE-2

FIGURE-3

FIGURE 4

ATTACHMENT OF GUNDLOCK TO FORMS

Gundlock is attached to the inside of a concrete form by finishing nails prior to concrete placement. (Figure 5). The size of the finishing nails must be 1" long or shorter. The nails must be driven flush with the back of the Gundlock to allow for their easy removal when the forms are wrecked. The Gundlock should be attached at sufficient points to insure a flush fitting with the form. Alternate methods of

FIGURE-5

attachment are staples or shot in anchors. Examples are shown in figures 6 and 7. Any of the aforementioned methods will provide a proper attachment of the gundlock to wood, steel, concrete, or plastic. Other materials may require special methods of attachment.

FIGURE-6

FIGURE-7

EMBEDMENT OF GUNDLOCK

proper embedment of the gundlock requires careful attention. The main shape of the section can entrap air if sufficient consolidation of the concrete is not achieved. Concrete placed around gundlock must be properly vibrated to ensure

the concrete fills void spaces. Caution: If the concrete surrounding the gundlock is not consolidated (vibrated), the gundlock cannot develop the full pull out strength of the lock.

GUNDLOCK PREPARATION

After the concrete has set and the forms wrecked, the finishing nails, staples or anchors can be removed. Occasionally concrete will get between the gundlock and the form and must be chipped away to reveal the gundlock. The sharp edges thus created by the chipping back of the concrete must be beveled to prevent possible cutting or puncturing of the liner.

SUGGESTED METHOD: HEAT FUSION WELDING OF GUNDLOCK

The recommended method of butt welding HRP gundlock is the heat fusion welding method which yields a continuous strip of material. The following is a list of tools and procedures required to perform the heat fusion welding method:

1. Carpenters Power Chop Saw or any saw which can cut material squarely. (Note: A hand saw or hacksaw will not cut it squarely.)
2. Utility knife
3. 110V Letter File
4. Tensile Welding Mixer

Re: Pelham Bay Landfill Closure

Dear Sirs:

The following are the gradational analyses of the materials being submitted for use at the above referenced site, as compared with the specifications given.

Pipe & MH Bedding

<u>Sieve Size</u>	<u>Tomkins Cove 3/8"</u>	<u>Spec. Given</u>
1/2"	100 ✓	100
3/8"	87.8	90-100
#8	1.2 ✓	0-15
#30	0 ✓	0-3

Structural Backfill

<u>Sieve Size</u>	<u>Haverstraw Screenings</u>	
3/8"	100	
#4	99.2	(60-95)
#8	74.4	
#16	52.0 ✓	(30-72)
#30	35.9	
#50	24.2 ✓	(20-50)
#100	14.6	
#200	7.7 ✓	(2-20)

-2-

The Rip/Rap material produced at the Tilcon New York Inc. Haverstraw plant is made to conform to N.Y. State D.O.T. specifications.

The items submitted for Rip/Rap Class II is Light Stone Fill, for Rip/Rap Class IV, Medium Stone Fill and 18" top size material for Rip/Rap Class III.

Rip/Rap Class II

<u>Light Stone Fill</u>	<u>% Of Total By Weight</u>
Lighter than 100 lbs.	90-100
Larger than 6 inches	50-100
Smaller than 1/2 inch	0-10

Rip/Rap Class IV

<u>Medium Stone Fill</u>	<u>% of Total By Weight</u>
Heavier than 100 lbs.	50-100
Smaller than 4 inches	0-10

It is advised that all Rip/Rap items be visually inspected by the customer prior to shipment.

If you have any questions, please call me.

Sincerely,

Morsia Thomas ③

SOLUBLE HYDRO-STARTER

18-20-10

20% Organic Powder Blue

QUARANTEED ANALYSIS

Total Nitrogen (N).....	18%
2.8% W.I.N.	
3.7% Ammoniacal Nitrogen	
11.5% Urea	
Available Phosphoric Acid (P ₂ O ₅).....	20%
Soluble Potash (K ₂ O).....	10%

Rockland Soluble Hydro-Starter, containing the Premium Nitrogen source, Powder Blue Nitroform® is a suspension type formula which will not leach or volatilize. Hydro-Starter is formulated to give the grass seedling a balanced feeding of required nutrients for maximum results. Hydro-Starter's powder-like consistency contains quick and slow release Nitrogen that will not damage seed in the slurry mix. Equipment wear and tear is significantly reduced. Hydro-Starter may also be used for improved rooting of sod, either before or after planting.

APPLICATION RATES AND YIELDS:

	Coverage	N/1000 sq. ft.	Phosphorus/1000 sq. ft.
40 Lb. Bag	10,000 sq. ft.	.72 lbs.	.8 lbs.
	12,500 sq. ft.	.58 lbs.	.84 lbs.
	15,000 sq. ft.	.48 lbs.	.53 lbs.

Pre-Plant Sod Rates: Mix 40 lbs. in 180 to 200 gallon tank with Mechanical agitation and apply to 10,000 Sq. Ft.

SEED AND FERTILIZER - MULCH
STABILIZER

TACKING AGENT III

TERRA-MULCH TACKING AGENT III IS A COMBINATION OF ORGANIC POLYMERS DESIGNED TO STABILIZE SOIL BY SUSPENDING WATER WITHIN THE FIBER MULCH MATRIX, REDUCING EROSION, WHILE INCREASING WATER ABSORPTION INTO THE SEED BED. THIS UNIQUE PRODUCT PROVIDES FOR A BETTER ENVIRONMENT FOR SEED TO GERMINATE IN WHILE INCREASING THE SURFACE TENSION OF ALL TYPES OF HYDRO-SEEDING MULCH MATERIALS - WOOD FIBER, PAPER FIBER AND COMBINATIONS OF WOOD AND PAPER. TACKING AGENT III IS A HIGH VISCOSITY POLYMER TACKIFIER THAT EXCEEDS MINIMUM REQUIREMENTS FOR NON-ASPHALTIC EMULSIONS. A STANDARD APPLICATION OF TACKING AGENT III TREATS AN EQUIVALENT OF 100 LBS OF GRASS SEED WITH AN ACRYLIC CO-POLYMER GEL SEED TREATMENT IMPROVING STRESS TOLERANCE OF YOUNG SEEDLINGS.

PHYSICAL PROPERTIES

NET WEIGHT	8-25-50 LB / BAGS
pH RANGE	7.0 +/- .2
VISCOSITY (SAYBOLT) [^]	102 CPS +/- 2
VISCOSITY (SAYBOLT) [•]	197 CPS +/- 2
SURFACE TENSION [•]	73.9 DYNES / CM
SPECIFIC GRAVITY	.7281

[^] VALUE BASED ON 30 LBS PER 1000 GALLONS OF WATER
[•] VALUE BASED ON 60 LBS PER 1000 GALLONS OF WATER

VISCOSITY AND SURFACE TENSION TESTING BASED ON SIMULATED FIELD APPLICATION AFTER 5 MINUTES OF MECHANICAL AGITATION.

APPLICATION RATES

MULCH BINDING

6 / 1 TO 4 / 1 SLOPE	20 LBS PER ACRE
4 / 1 TO 2 / 1 SLOPE	30 LBS PER ACRE
2 / 1 TO 1 / 1 SLOPE	40 LBS PER ACRE
> THAN 1 / 1 SLOPE	60 LBS PER ACRE

STRAW & HAY MULCH BINDING

30 LBS TACK III & 150 LBS CELLULOSE FIBER AND 1000 GALLONS OF WATER PER ACRE OR 50 LBS OF TACK III PER 1000 GALLONS OF WATER PER ACRE.

TERRA-MULCH TACKING AGENT III CONTAINS THE KNOWN FLOCCULANT POLYACRYLAMIDE (PAM). IN 1994 TACKING AGENT III WAS EVALUATED BY A MAJOR TURF UNIVERSITY TO DETERMINE ITS VALUE AS A SOIL STABILIZER. TACK III WAS APPLIED ALONE AT A RATE 60 LBS PER ACRE ON A 45% SLOPE. THE TEST PLOTS WERE SUBJECTED TO SIMULATED RAINFALL OF 12 INCHES PER HOUR FOR 30 MINUTES, THE SIMULATION TOOK PLACE WITHIN 2 HOURS OF SEEDING. TACKING AGENT III REDUCED EROSION VERSUS THE CONTROL BY 68.6% AND REDUCED WATER RUNOFF BY 21.7%. TACKING AGENT III CONTAINS A MARKER DYE FOR EASY METERING OF THE SPRAYED AREA WHEN TACKING HAY AND STRAW MULCHES. TACKING AGENT III BECOMES SLIPPERY WHEN WET. CLEAN UP ALL SPILLS THOROUGHLY. ASK YOUR DEALER ABOUT OUR TERRA-MULCH SATISFACTION GUARANTEE.

MULCH FOR HYDROSEEDING

RE FIBER™ Wood

100% Recycled Wood Fiber

RE-FIBER Wood is a wood fiber mulch designed for hydraulic seeding and erosion protection that's manufactured using wood that is 100% recycled. It is engineered for discriminating landscape professionals and is created in harmony with today's environmental concerns.

► RE-FIBER Wood is university-tested.

In field and laboratory tests, Re-Fiber Wood allowed significantly less soil runoff and produced greater plant size and bulk than its competitors. Its custom-designed fiber length assures rapid and efficient absorption of water for a homogeneous mixture in hydraulic mulching equipment. Hydroseeders can count on easy handling and a uniform application.

► RE-FIBER Wood is 100% biodegradable.

It is specially formulated to protect the seed and soil from wind and heavy rainfall and gradually decompose as the lush carpet of lawn is established. The mulch contains no germination or growth-inhibiting materials.

► RE-FIBER Wood SPECIFICATIONS

Moisture Content (total weight basis)	12%±3%
pH (average)	5.4
Organic Content (minimum)	99%
Inorganic (ash) Content (maximum)	1%
Water Holding Capacity (minimum)	1 gal./lb.
Bag Net Weight	50 lb.-22.6 kg

RE-FIBER Wood is packaged in 50 pound color-coded bags for easy measurement and convenience. The durable bags are constructed from recyclable plastic and are suitable for outside storage.

Printed on Recycled Paper

SERIES 4 Versare Primers

PRODUCT PROFILE

GENERIC DESCRIPTION Modified Alkyd

COMMON USAGE Rust inhibitive primer for shop and field coating of structural and miscellaneous steel, tanks and machinery. Used under alkyd and water base acrylic topcoats.

COLORS 55 Red, 56 Gray, 57 White

PERFORMANCE CRITERIA Extensive test data available. Contact your Tnemec representative for specific test results.

COATING SYSTEMS

TOPCOATS Series 2H, 6, 7, 23, 43-38, 82, 113, 114. Note: Some systems are not for use on surfaces that are continually wet or sweat frequently. Reference the applicable topcoat data sheet for additional information.

SURFACE PREPARATION

STEEL SSPC-SP2 Hand Tool or SSPC-SP3 Power Tool Cleaning
SSPC-SP6 Commercial Blast Cleaning when extended field exposure is expected.

ALL SURFACES Must be clean, dry and free of oil, grease and other contaminants.

TECHNICAL DATA

VOLUME SOLIDS* 54.0 ± 2.0%

RECOMMENDED DFT 2.0 to 3.5 mils (50 to 90 microns) per coat.

CURING TIME

Temperature	To Handle	To Recoat
75°F (24°C)	4 hours	12 hours

Curing time varies with air & substrate temperature, air movement, humidity and film thickness.

VOLATILE ORGANIC COMPOUNDS

Unthinned	Thinned 10%
2.88 - 3.05 lbs/gallon (345 - 366 grams/litre)	3.20 - 3.36 lbs/gallon (384 - 403 grams/litre)

THEORETICAL COVERAGE* 866 mil sq ft/gal (21.3 m²/L at 25 microns). See APPLICATION for coverage rates.

NUMBER OF COMPONENTS One

PACKAGING 55 gallon (208.2L) drums, 5 gallon (18.9L) pails and 1 gallon (3.79L) cans.

NET WEIGHT PER GALLON* 12.14 ± 0.25 lbs (5.51 ± .11 kg)

STORAGE TEMPERATURE Minimum 20°F (-7°C) Maximum 110°F (43°C)

SHELF LIFE 24 months at recommended storage temperature.

FLASH POINT - SETA 100°F (38°C)

HEALTH & SAFETY Paint products contain chemical ingredients which are considered hazardous. Read container label warning and Material Safety Data Sheet for important health and safety information prior to the use of this product. Keep out of the reach of children.

Tnemec Data

APPLICATION**COVERAGE RATES***

	Dry Mills (Microns)	Wet Mills (Microns)	Sq Ft/Gal (m ² /Gal)
Suggested	2.5 (65)	4.5 (115)	346 (32.2)
Minimum	2.0 (50)	3.5 (90)	433 (40.2)
Maximum	3.5 (90)	6.5 (165)	247 (23.0)

Allow for overspray and surface irregularities. Film thickness is based upon closest 0.5 mil (5 microns). Application of coating below minimum or above maximum recommended dry film thicknesses may adversely affect coating performance.

MIXING

Stir thoroughly, making sure no pigment remains on the bottom of the can.

THINNING

Use No. 1 Thinner or mineral spirits. For air spray, thin up to 10% or ¼ pint (380 mL) per gallon. For airless spray, brush or roller, thin up to 5% or ¼ pint (190 mL) per gallon.

SURFACE TEMPERATURE

Minimum 40°F (4°C) Maximum 120°F (49°C)
The surface should be dry and at least 5°F (3°C) above the dew point.

APPLICATION EQUIPMENT*Air Spray*

Gun	Fluid Tip	Air Cap	Air Hose ID	Mat'l Hose ID	Atomizing Pressure	Pot Pressure
DeVilbiss MBC or JGA	E	765 or 78	5/16" or 3/8" (7.9 mm or 9.5 mm)	3/8" or 1/2" (9.5 mm or 12.7 mm)	60-80 psi (4.2-5.5 bar)	10-20 psi (0.7-1.4 bar)

Low temperatures or longer hoses require higher pot pressure.

Airless Spray

Tip Orifice	Atomizing Pressure	Mat'l Hose ID	Manifold Filter
0.015"-0.019" (380-485 microns)	1800-3000 psi (124-207 bar)	1/4" or 3/8" (6.4 mm or 9.5 mm)	60 mesh (250 microns)

Use appropriate tip/atomizing pressure for equipment, applicator technique and weather conditions.

Roller: Use high quality synthetic nap covers. Use 1/4" to 1/2" (6.4 mm to 12.7 mm) nap depending on surface roughness.

Brush: Use high quality natural or synthetic bristle brushes.

CLEANUP

Flush and clean all equipment immediately after use with the recommended thinner or mineral spirits.

* Values may vary with color.

WARRANTY & LIMITATION OF SELLER'S LIABILITY: Tnemec Company, Inc. warrants only that its coatings represented herein meet the formulation standards of Tnemec Company, Inc. THE WARRANTY DESCRIBED IN THE ABOVE PARAGRAPH SHALL BE IN LIEU OF ANY OTHER WARRANTY, EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. THERE ARE NO WARRANTIES THAT EXTEND BEYOND THE DESCRIPTION ON THE FACE HEREOF. The buyer's sole and exclusive remedy against Tnemec Company, Inc. shall be for replacement of the product in the event that a defective condition of the product should be found to exist. NO OTHER REMEDY (INCLUDING, BUT NOT LIMITED TO, INCIDENTAL OR CONSEQUENTIAL DAMAGES FOR LOST PROFITS, LOST SALES, INJURY TO PERSON OR PROPERTY, OR ANY OTHER INCIDENTAL OR CONSEQUENTIAL LOSS) SHALL BE AVAILABLE TO THE BUYER. The sole purpose of this exclusive remedy shall be to provide buyer with replacement of the product if any defect in materials is found to exist. This exclusive remedy shall not be deemed to have failed its essential purpose so long as Tnemec Company, Inc. is willing and able to replace the defective materials. Technical and application information herein is provided for the purpose of establishing a general profile of the coating and proper coating application procedures. Test performance results were obtained in a controlled environment and Tnemec Company makes no claim that these tests or any other tests, accurately represent all environments. As application, environmental and design factors can vary significantly, due care should be exercised in the selection and use of the coating. SERIES 23

Enduratone

PRODUCT PROFILE

GENERIC DESCRIPTION

Alkyd

COMMON USAGE

Semi-gloss industrial enamel. Good flow, hiding and protection for most surfaces in mild to moderately severe exposures. Not for use on surfaces that are continually wet or sweat frequently.

COLORS

Refer to Tnemec ColorBook.

FINISH

Semi-gloss

SPECIAL QUALIFICATIONS

Certain colors meet USDA requirements for use in federally inspected meat and poultry plants.

PERFORMANCE CRITERIA

Extensive test data available. Contact your Tnemec representative for specific test results.

COATING SYSTEMS

PRIMERS

Steel: Series 4, 10, 37H, 50-330, 59

Galvanized Steel and Non-Ferrous Metal: Series 27. **Note:** Apply an intermediate coat of Series 27 or scarify the surface of Series 27 that has been exterior exposed for 3 weeks or longer prior to topcoating with 23. Brush blasting with fine abrasive is the preferred method of scarification.

Interior Drywall: 51-792

Wood: 36-603

SURFACE PREPARATION

ALL SURFACES

Must be clean, dry and free of oil, grease and other contaminants. Remove rust and paint not tightly bonded. Spot prime.

TECHNICAL DATA

VOLUME SOLIDS*

55.5 ± 2.0%

RECOMMENDED DFT

1.5 to 3.0 mils (40 to 75 microns) per coat. **Note:** Number of coats required will vary depending on color, substrate (surface) and other variables. Contact your Tnemec representative for specific recommendations.

CURING TIME

Temperature	To Touch	To Handle	To Recoat
75°F (24°C)	5-7 hours	9-13 hours	12-18 hours

Curing time varies with air & substrate temperature, air movement, humidity and film thickness. **Water Tank Exteriors:** Five days or more curing time required before filling with water.

EXPLOSIONPROOF PUMPS

These units are special versions, model number suffix (X), of ITT Flygt's standard wastewater pumps constructed to meet explosionproof requirements and are Factory Mutual Systems approved for use in hazardous locations defined as Class 1, Division 1, Groups C and D (gasses and vapors) Class 2, Div. 1, Groups E & G (dusts), Class 3, Div. 1, (fibers and flyings).

To achieve this approval, pumps are assembled from selected castings that are redesigned with longer flame paths and closer tolerances. Cable entries are specially designed as well.

Model	Horsepower
3085 (X)	1.5 - 3
3102 (X)	5.0 - 5
3127 (X)	6.4 - 40
3152 (X)	14.0 - 25
3170 (X)	25.0 - 30
3201 (X)	29.0 - 47
3206 (X)	400.0 - 214
3300 (X)	32.0 - 120
3305 (X)	100.0 & 140
3311 (X)	104.0 - 923
3355 (X)	74.0 - 448
3500 (X)	100.0 - 280
3520 (X)	100.0 - 600
3531 (X)	100.0 - 600
3601 (X)	100.0 - 800
3602 (X)	100.0 - 900

FIBROUS WASTE CUTTER PUMPS

These units, FP and FS prefix to model number, are constructed of cast iron and have non-clogging type impellers with cutter attachment for pumping wastewater containing stringy or fibrous materials or agricultural waste.

Model	Horsepower
F-3085	2.3 - 3
F-3102	4.0 - 5
F-3127	7.6 - 7.6
F-3152	16.0 - 20

RAW WATER PUMPS

These submersible pumps are for use in clean or raw water applications with capacities exceeding 2,500 GPM and total dynamic heads up to 320 feet. Motor output ranges from 32 to 214 HP. Hydraulic efficiencies of between 71% and 77% are obtained at the best efficiency points.

Model	Horsepower
3230	120 - 214
3300	32 - 120

Impellers are of multi-vane design.

Lifting Chain & Cable

CHAIN

Chain is hot dipped galvanized carbon steel and may be ordered in any length. Fittings consist of two end shackles and are available in kits.

PUMP MODELS:	CHAIN SIZE:
3067, 3080, 3085, 3085/82, 3102, 3127.	5/0 Straight Coil
3140, 3152	5/16" Proof Coil
3170, 3201	3/8" Proof Coil
3230, 3300, 3305, 3355	7/16" Hi-Test
3311	1/2" Hi-Test
3351, 3500, 3530, 3531, 3601, 3602	Contact ITT Flygt Engineering

CABLE

Cable is stainless steel and may be ordered in the lengths shown below. For other lengths, contact ITT Flygt Application Engineering. Fittings consist of two end shackles and are available in kits.

PUMP MODELS:	CABLE SIZE:
3067 Thru 3152	1/4" - (316 stainless steel)
3170, 3201, 3230, 3300, 3305, 3355	3/8" - (304 stainless steel)
3311, 3351, 3500, 3530, 3531, 3601, 3602	Contact ITT Flygt Engineering

LENGTHS:

For Models 3067 Thru 3152 - 316 stainless steel cable is available in 20 to 55 foot lengths (in 5 foot increments).

All other models - 304 stainless steel cable is available in 20, 25, and 30 foot lengths.

TECHNICAL MANUAL

ITT FLYGT CORPORATION

P. O. Box 5657, Norwalk, Connecticut 06856

FLYGT

PRODUCT DESCRIPTION

ITT Flygt MiniCAS II is a supervision relay for temperature and leakage sensors. It is designed for the ITT Flygt pump range 3085 - 3300 and for the ITT Flygt mixer program.

There are three types of sensors that can be connected to the MiniCAS II: Stator thermal switches, CLS water-in-oil sensor and the FLS sensor for leakage detection in the stator housing. The sensors can be used in every combination that is desired.

On the front there are two indication lamps, one for supply and temperature, one for leakage and a two position "Manual Reset" and "Auto Reset" toggle switch. Only two wires are needed for the communication between the pump and the MiniCAS II. The MiniCAS II is designed to be plugged into a standard 11 - pin socket.

Technical data

- Operation principle: Current sensing
- Environment: 0 - 50°C (123°F), maximum 90% relative humidity
- Supply voltage: 24 VAC (50 - 60 Hz) + 10 to - 15%
- Relay contact rating: 16 A @ 277 VAC
- Voltage to sensor: 12 VDC ± 10%
- Values of operation:
 - 2.5 mA < I < 5 mA = OK condition
 - I < 2.5 mA = High Temperature (or Interrupt)
 - I > 5.2 mA = Leakage (or short circuit)
 - (I = current measured by MiniCAS II)

Communication

- Leakage: Form "C" Relay (normally closed contact for interlocking)
Automatic reset (normally open contact for alarm)
Red LED for indication - follows the relay
 - Red indication lamp on = leakage indicated
 - Red indication lamp off = no leakage indicated
- Temperature: Form "C" Relay (normally closed contact for interlocking, normally open contact for alarm) Manual reset (by interrupting the supply 1 sec. or switching the toggle switch).
- Autoreset Option: The control and status unit (ITT Flygt Part Number 14-40 71 13) MiniCAS II provides both a manual and auto reset option for the over temperature function. The auto or manual reset can be selected by a toggle switch located on top of the unit.

- Green LED for indication - follows the relay
 - Green indication lamp on = supply voltage on and no over temperature
 - Green indication lamp off = over-temperature or no supply voltage

Physical size

Width: 1.75"
Height: 2.36"
Depth: 3.575" with toggle switch

Part numbers

MinICAS II 14-40 71 13
Socket, 11-pin 14-40 70 79

MODE OF OPERATION

In the manual mode of operation, if an over temperature condition occurs, the unit will turn the pump off and lock it out. The only way power can be restored to the pump is by a manual restart, and only after the temperature has cooled to a point of safe operation.

In the auto reset mode, if an over temperature condition occurs, the pump will be shutdown. The pump will be automatically restarted once the temperature has cooled to a point of safe operation.

NOTE: When selecting the "Automatic Reset" mode, the control panel should include a latching type circuit for over temperature alarm display. This circuit will retain the information that an over temperature situation has occurred and the operator should check the possible cause for motor over temperature.

The leakage function operates in the same manner in both auto and manual modes. Specifically, once leakage is detected, there is a 5 second delay after which the pump will be shutdown or an alarm activated. Once the leakage clears, power will be restored to the pump whether in manual or auto reset mode.

TEST PROCEDURE

1. FOR MINI-CAS II WITH FLS

Test Condition:

- Power supply 24VAC
- 2 (two) multimeters

Test Schematic (See Attached):

Note: For a shop test, the FLS can be simulated by a toggle switch and two resistors (375 ohms and 1500 ohms connected per attached schematic).

The thermal switch can be simulated by a toggle switch.

Unpowered Conditions:

Mini-CAS II contact status: 1 - 3 open
1 - 4 close
11 - 8 close
11 - 9 open

Normal Powered Conditions:

No leakage, no over temperature, 24 VAC supply.

- Leakage switch is open; FLS resistance is 1,500 ohms;
- The green light on Mini-CAS II is on, the red light is off;
- A1 should read 110 mA (AC). A2 should read between 2.5 and 5mA DC - typical 4.0 mA DC.
- Mini-CAS II contact status: 1 - 3 and 11 - 8 close
1 - 4 and 11 - 9 open

Leakage Condition - 24 VAC Supply

- Thermal switch is closed;
- Leakage switch is closed; combined resistance of FLS is 300 ohms.
- The green and red lights on Mini-CAS II should be on.
- Ammeter readings: A1 150 mA (AC)
A2 - over 5.2 mA (DC) - Typical 6.5 mA (DC)
- Mini-CAS II contacts status: 1 - 3 and 11 - 9 close
1 - 4 and 11 - 8 open

Over-temperature Condition - 24VAC Supply

- Thermal switch is open;
- The green and red lights are off;
- No reading on A2 (open circuit);
- A1 should read 60 mA
- Mini-CAS II contacts status: 1 - 3 and 11 - 9 open
1 - 4 and 11 - 8 open

~~2. MINI-CAS II WITH CLS-30~~

~~Mini-CAS II should work the same way with a CLS-30 leakage sensor.~~

~~Typical readings for A2 with CLS-30:~~

- ~~• Normal conditions 2.9 mA DC~~
- ~~• Leakage conditions 5.75 mA DC~~

~~3. MINI-CAS II WITH FLS IN PARALLEL WITH CLS-30~~

~~Typical readings for A2:~~

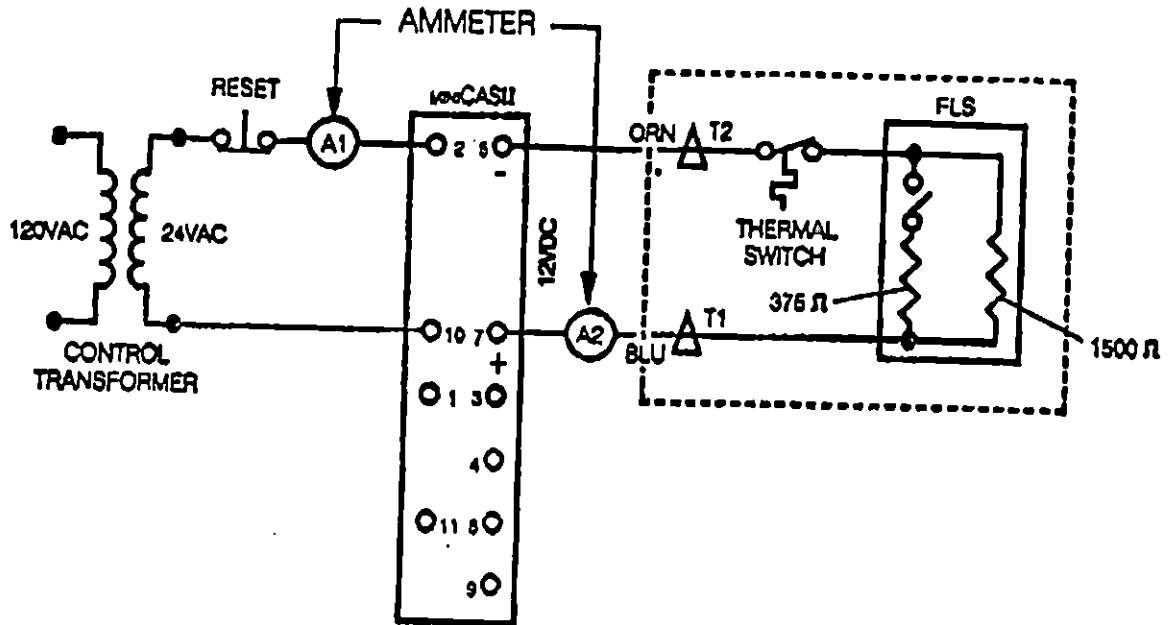

- ~~• Normal conditions: 4.80 mA~~
- ~~• Leakage conditions: 6.10 - 6.45 mA~~

REMARKS:

1. Voltages over maximum allowed by manufacturer (26 AVC) will affect the unit's lifetime but does not lead to an immediate failure. The situation is worse if a permanent leak persists and the fault is not cleared.
2. A ground fault in DC circuits, of (+) leads, will cause unit failure. The worst possible situation is a simultaneous occurrence of a high voltage supply and a ground fault in (+) circuit.
3. Whenever a Mini-CAS II fails, check the supply voltage and check for a ground fault. **DO NOT REPLACE A DEFECTIVE MINI-CAS II UNTIL A POSSIBLE GROUND FAULT WAS CHECKED AND CLEARED.**

EXPLOSIONPROOF PUMPS

These units are special versions, model number suffix (X), of ITT Flygt's standard wastewater pumps constructed to meet explosionproof requirements and are Factory Mutual Systems approved for use in hazardous locations defined as Class 1, Division 1, Groups C and D (gasses and vapors) Class 2, Div. 1, Groups E & G (dusts), Class 3, Div. 1, (fibers and flyings).

To achieve this approval, pumps are assembled from selected castings that are redesigned with longer flame paths and closer tolerances. Cable entries are specially designed as well.

Model	Horsepower
3085 (X)	1.8 - 3
3102 (X)	5.0 - 9
3127 (X)	7.6 - 14
3152 (X)	14.0 - 20
3170 (X)	25.0 - 30
3201 (X)	40.0 - 47
3230 (X)	120.0 - 214
3200 (X)	32.0 - 120
3205 (X)	400.0 - 448
3311 (X)	484.0 - 328
3355 (X)	74.0 - 148
3500 (X)	700.0 - 280
3530 (X)	700.0 - 800
3531 (X)	100.0 - 800
3601 (X)	100.0 - 800
3602 (X)	100.0 - 800

FIBROUS WASTE CUTTER PUMPS

These units, FP and FS prefix to model number, are constructed of cast iron and have non-clogging type impellers with cutter attachment for pumping wastewater containing stringy or fibrous materials or agricultural waste.

Model	Horsepower
F-3085	2.3 - 3
F-3102	4.0 - 9
F-3127	7.6 - 7.6
F-3152	16.0 - 20

RAW WATER PUMPS

These submersible pumps are for use in clean or raw water applications with capacities exceeding 2,500 GPM and total dynamic heads up to 320 feet. Motor output ranges from 32 to 214 HP. Hydraulic efficiencies of between 71% and 77% are obtained at the best efficiency points.

Model	Horsepower
3230	120 - 214
3300	32 - 120

Impellers are of multi-vane design.

Note: Not available in HDPE

Kamatlex 101-PS suction hose is specially designed for use in methane recovery at landfill sites. It performs well as a flexible pipeline from wellhead to main header and as a connection between rigid pipes of the same size. It is also ideal for quick emergency repairs of broken rigid lines.

Kamatlex

Flexible Hose - Gas Extraction Well

101-PS

Kanaflex® 101-PS

Corrugated exterior for superior flexibility.

Weatherproof . . . highly resistant to ozone, salt water and ultraviolet light.

Pliable . . . fits over pipe ends for flexible installations where ground or structure is subject to possible movement.

Smooth bore for unrestricted flow.

Functional . . . can be "welded" to rigid PVC pipe using conventional PVC cements.

Secure . . . provides a superior hold to rigid pipe when used with Kanaflex pipe-size "Power Lock" clamps. (see illustration)

Available in lengths of 100 ft. for rapid installation and lower labor costs.

Universal StopCocks®

Test Point - Gas Wellheads

The Hayward Universal StopCock affords simplicity and flexibility in all quarter turn valves. For on/off, restricted flow, or sampling applications, the Hayward StopCock is easily adaptable to any piping connection. 1/4" NPT female pipe thread, 1/4" NPT male pipe thread, and hose barb end connectors, for 1/4" through 7/16" I.D. tubing are furnished with the valve. These allow the valve to be fitted with up to six different end connection combinations. Simply attach the end connections you need, they are all supplied with each valve. The end connector's piston O-ring seal enables their connection to the valve without the use of adhesives, pipe sealant, or Teflon tape. A hex wrench is included to securely attach the end connectors to the valve. For added convenience, there are graduation marks on the valve body at 0°, 45°, and 90° to assist in making flow adjustments.

Universal StopCocks are available in PVC, with EPDM seats and seals, and are manufactured from NSF approved materials.

Engineering Specifications

All Universal StopCocks shall be PVC (Polyvinyl Chloride) with EPDM seats and seals. StopCocks to be furnished with all necessary end connectors to make the following connections: FPT x FPT, FPT x MPT, FPT x Hose, MPT x MPT, MPT x Hose, and Hose x Hose. End connectors shall attach to valve body with a piston O-ring seal. Valve body to have graduation marks at 0°, 45°, and 90° to assist in flow adjustment. As manufactured by Hayward Industrial Products, Inc.

Features

- All PVC construction - will not corrode
- EPDM seats and seals
- Six end connections with single valve
- End Connection combinations: FPT x FPT, FPT x MPT, FPT x Hose, MPT x MPT, MPT x Hose, Hose x Hose
- Includes hex wrench to securely attach end connectors to the valve
- Ideal for sampling
- Ideal for laboratories, monitoring systems, original process equipment
- Flow rates down to drops per minute

Universal StopCock Parts List

- 1 EPDM O-Ring
- 2 End Connector
- 3 EPDM Seat
- 4 Body

WORTHINGTON PROPANE CYLINDERS

WORTHINGTON PROPANE CYLINDERS: EXCEPTIONAL QUALITY, SERVICE AND SELECTION FOR ALL APPLICATIONS.

Outstanding service and unmatched quality make Worthington cylinders the most saleable on the market...in 15 size configurations for virtually all your propane applications.

And all Worthington LP-Gas cylinders sold in the USA are made in the USA. Worthington operates five plants and five warehouses in the United States, plus two Canadian plants for products sold in Canada. This helps assure quick, on-time delivery and competitive pricing in all market areas.

SPECIFICATIONS.

- 15 sizes (in pounds): 4½, 6, 10, 11, 20, 25, 30, 40, 60, 100, 200 and 420 lb. Also aluminum forklift cylinders in 20, 33½ and 43½ lb.
- Up to 30-inch diameter.
- Rust/corrosion-resistant finish: polyurethane paint on sizes 4½ lb. through 100 lb. Larger sizes are powder coated.
- Cylinders are manufactured in accordance with DOT 4BA or DOT 4BW specifications.
- Optional liquid level gauges.

RV-80 SERIES *Gas Cylinder Regulator Valves*

SINGLE STAGE REGULATORS

RV8010

The popular RV-80 regulators are a heavy duty dependable full-flow design for medium to heavy duty use for a wide variety of applications. Ease of seat service is provided by a removable back plug.

- Gauges: 2-1/2" with 1 piece polycarbonate lens
- Body and Bonnet: Forged Brass
- Diaphragm: Stainless steel
- Filter: Sintered metal cone
- Adjusting screw: Forged T-handle with precision stainless steel ball
- Safety relief valve: Reseating, non-adjustable +, ++
- Seat: Stem-type safety check, closes with inlet pressure impact
- Nozzle: Stainless Steel

RVT-80 SERIES

TWO STAGE REGULATORS

RVT8010

The RVT-80 heavy duty regulators are designed for precision service use in a variety of medium to heavy duty applications. They give dependable, accurate steady working pressure and flow.

GOSS

Pro-FLAME

Heavy-Duty Torches and Burners

This equipment can be used for wood burning, drying, heating, melting, and other applications requiring large volumes of heat. Each uses vapor propane fuel and has a durable handle with rear on/off control valve. They are used by roofers, contractors, and farmers as well as road, railway, and industrial maintenance crews.

BP-100-XB (Vapor LP) Tar Kettle Burner

A 4 in. diameter heavy gauge steel burner which fits most tar buggies. Complete with bent tube and rear on/off control valve.

Regulators

High Pressure Vapor Regulators

All brass regulators used with LP torches and furnaces. Adjustable pressure from 5 to 60 PSI. U.L. listed with P.O.L. inlet spud and nut, 1/4 in. NPT openings, and 9/16 - 18 LH hose outlet.

EP-70G

Has 0 to 60 PSI outlet pressure gauge

XP-2,14

Low Pressure Regulators

This regulator has a 1 in. water column outlet pressure meters for applications requiring low gas pressure. U.L. listed with 1/4 in. NPT inlet and 3/8 in. NPT outlet. Do not use with any Goss LP torch or furnace equipment.

- EP-60— Body only, no fitting
- EP-60-1 P.O.L. inlet, 1/2 in. flare outlet
- EP-60-2 P.O.L. inlet, 1/2 in. flare outlet
- EP-60-3 P.O.L. inlet, LH hose outlet
- EP-60-4 T-Block inlet, 1/2 in. flare outlet
- EP-60-5 P.O.L. inlet, less outlet

Nose

Liquid or Vapor LP Gas Nose with Spring Guard Fittings

U.L. listed with standard 9/16 - 18 LH hose fittings. Working pressure: 350 PSI. Outside diameter - 5/8 in. Inside diameter: 1/4 in.

Hose No.	Length
HPE-15	10 ft.
HPE-15	15 ft.
HPE-20	20 ft.
HPE-30	30 ft.

Vapor LP Gas Nose

U.L. listed with standard 9/16 - 18 LH hose fittings. Working pressure: 350 PSI. Outside diameter - 9/16 in. Inside diameter: 1/4 in.

Hose No.	Length
HEF-6	12 ft.
HEF-10	12 ft.
HEF-12	12 ft.
HEF-20	20 ft.

NOTE: Recommended that a regulator be used for safety, economy, and better operation in all applications of propane equipment.

*EP-70G Regulator with dust cap and heavy duty inlet nut

Standard Ranges — Dual Scale (Other Ranges Available)

Fahrenheit (outer scale)			Celsius (inner scale)		
Range	Fig. Interval	Div.	Range	Fig. Interval	Div.
-100 to 150°	20°	2°	-70 to 70°	10°	1°
-40 to 120°	20°	2°	-40 to 50°	10°	1°
-25 to 125°	10°	1°	-5 to 50°	5°	1/2°
0 to 140°	10°	1°	-20 to 60°	5°	1/2°
0 to 200°	20°	2°	-15 to 90°	10°	1°
0 to 250°	20°	2°	-20 to 120°	10°	1°
20 to 240°	20°	2°	-5 to 115°	10°	1°
50 to 300°	20°	2°	10 to 150°	10°	1°
50 to 400°	50°	5°	10 to 200°	20°	2°
50 to 500°	50°	5°	10 to 250°	20°	2°
150 to 750°	100°	10°	95 to 400°	50°	5°
200 to 1000°	100°	10°	120 to 500°	50°	5°

*Not recommended for continuous use over 800°F or 425°C.

**Not available with 2 1/2" (63.5 mm) stem.

For complete list of available ranges, including Celsius only and Fahrenheit only, please see page 13.

Side Angle Connection

Add suffix letter to catalog number.
LS for left side angle. (Shown Above)
RS for right side angle.

How to Order

The catalog number shown indicates only the dial size, angle form and stem length. For complete, descriptive part number please use the tables listed on page 13.

See General Specifications on page 2 for construction features and for available accessories and options.

Note Temperature Range 50-300° F,
Not 0-300° as specified

Indicate low air or gas pressures—positive, negative or differential. Accurate within 2%. 81 Ranges.

Patent Nos. 4,090,583
6,012,678

To be provided:

- (1) Vacuum gauge 0-10" Hg (inlet)
- (3) Vacuum gauges 0-5" Hg (space)
- (2) Pressure gauges 0-100" H₂O (15 psig)

Select the Dwyer Magnehelic® gage for high accuracy — guaranteed within 2% of full scale — and for the wide choice of 81 ranges available to suit your needs precisely. Using Dwyer's simple, frictionless Magnehelic® movement, it quickly indicates low air or non-corrosive gas pressures — either positive, negative (vacuum) or differential. The design resists shock, vibration and over-pressures. No manometer fluid to evaporate, freeze or cause toxic or leveling problems. It's inexpensive, too.

Widely used to measure fan and blower pressures, filter resistance, air velocity, furnace draft, pressure drop across orifice plates, liquid levels with bubbler systems and pressures in fluid amplifier or fluidic systems. It also checks gas-air ratio controls and automatic valves, and monitors blood and respiratory pressures in medical care equipment.

Flush...Surface...or Pipe Mounted

Mounting. A single case size is used for most ranges of Magnehelic gages. They can be flush or surface mounted with standard hardware supplied. With the optional A-610 Pipe Mounting Kit they may be conveniently installed on horizontal or vertical 1/4" - 2" pipe. Although calibrated for vertical position, many ranges above 1 inch may be used at any angle by simply re-zeroing. However, for maximum accuracy, they must be calibrated in the same position in which they are used. These characteristics make Magnehelic gages ideal for both stationary and portable applications. A 4 1/16" hole is required for flush panel mounting. Complete mounting and connection fittings plus instructions are furnished with each instrument.

Vent valves
In applications where pressure is continuous and the Magnehelic gage is connected by metal or plastic tubing which cannot be easily removed, we suggest using Dwyer A-310A vent valves to connect gage. Pressure can then be removed to check or re-zero the gage.

HIGH AND MEDIUM PRESSURE MODELS
Installation is similar to standard gages except that a 4 1/16" hole is needed for flush mounting. The medium pressure construction is rated for internal pressures up to 35 psig and the high pressure up to 80 psig. Available in all ranges. Because of larger case, will not fit in portable case. Weight 1 lb., 10 oz. (Installation of the A-321 safety relief valve on standard Magnehelic gages often provides adequate protection against infrequent overpressure; see Bulletin S-1011).

PHYSICAL DATA

- Ambient temperature range: 20° to 140° F*
- Rated total pressure: -20" Hg. to 15 psig.†
- Overpressure: Relief plug opens at approximately 25 psig.
- Connections: 1/4" NPT female high and low pressure taps, duplicated — one pair side and one pair back.
- Housing: Die cast aluminum. Case and aluminum parts finite-dipped to withstand 100 hour salt spray test. Exterior finish is baked dark gray hammeroid.
- Accuracy: Plus or minus 2% of full scale (3% on -0 and 4% on -00 ranges), throughout range at 70°F.
- Standard accessories: Two 1/4" NPT plugs for duplicate pressure taps, two 1/4" pipe thread to rubber tubing adapters, and three flush mounting adapters with screws. (Mounting ring and snap ring retainer substituted for 3 adapters in MP & HP gage accessories.)
- Weight: 1 lb. 2 oz.

*Low temperature models available as special option.
†For applications with high cycle rate within gage total pressure rating, next higher rating is recommended. See Medium and High pressure options at lower left.

OPTIONS AND ACCESSORIES

Transparent overlays
Furnished in red and green to highlight and emphasize critical pressures.

Adjustable signal flag
Integral with plastic gage cover; has external reset screw. Available for most ranges except those with medium or high pressure construction. Can be ordered with gage or separately.

LED Setpoint Indicator
Bright red LED on right of scale shows when setpoint is reached. Field adjustable from gage face; unit operates on 12 - 24 VDC. Requires MP or HP style cover and bezel.

Portable units
Combine carrying case with any Magnehelic gage of standard range (not high pressure). Includes 9 ft. of 1/4" I.D. rubber tubing, stand-hang bracket, and terminal tube with holder.

Air filter gage accessory package
Accepts any standard Magnehelic for use as an air filter gage. Includes aluminum surface-mounting bracket with screws, 5 ft. lengths of 1/4" aluminum tubing, two static pressure taps and two molded plastic vent valves. Integral compression fittings on both taps and valves.

Quality design and construction features

Bezel provides flange for flush mounting in panel.

Clear plastic face is highly resistant to breakage. Provides undistorted viewing of pointer and scale.

Precision litho-printed scale is accurate and easy to read.

Red tipped pointer of heat treated aluminum tubing is easy to see. It is rigidly mounted on helix shaft.

Pointer stops of molded rubber prevent pointer over-travel without damage.

"Wishbone" assembly provides mounting for helix, helix bearings and pointer shaft.

Sapphire bearings are shock-resistant mounted; provide virtually friction-free motion for helix. Motion damped with high viscosity silicone fluid.

Zero adjustment screw is conveniently located in plastic cover, accessible without removing cover. "O" ring seal provides pressure tightness.

"O" ring seal for cover assures pressure integrity of case.

Blowout plug of silicone rubber protects against overpressure on 15 PSIG rated models. Opens at approximately 25 PSIG.

Die cast aluminum case is precision made. Iridite-dipped to withstand 168 hour salt spray test. Exterior finished in baked dark gray hammeroid. One case size used for all standard pressure ranges, and for both surface and flush mounting.

Silicone rubber diaphragm with integrally molded "O" ring is supported by front and rear plates. It is locked and sealed in position with a sealing plate and retaining ring. Diaphragm motion is restricted to prevent damage due to overpressures.

Calibrated range spring is a flat leaf of Swedish spring steel in temperature compensated design. Small amplitude of motion assures consistency and long life. It reacts to pressure on diaphragm. Live length adjustable for calibration.

Alnico magnet mounted at one end of range spring rotates helix without mechanical linkages.

Helix is precision milled from an alloy of high magnetic permeability, deburred and annealed in a hydrogen atmosphere for best magnetic qualities. Mounted in jeweled

bearings, it turns freely to align with magnetic field of magnet to transmit pressure indication to pointer.

SERIES 2000 MAGNEHELIC® — MODELS AND RANGES

The models below will fulfill most requirements. Page 5 also shows examples of special models built for OEM customers. For special scales furnished in ounces per square inch, inches of mercury, metric units, etc., contact the factory.

Suggested Specifications

A differential pressure gage for measuring (state purpose) shall be installed. Gage shall be the diaphragm-actuated dial type 494" O.D., with white dial, black figures and graduations and pointer zero adjustment. Gage shall be Dwyer Instruments, Inc., Magnehelic, Catalog No. _____ reading to _____ water column, in _____ divisions.

Quick Set-Up Guide

The quick set-up chart below summarizes much of the information presented in the manual. It does not, however, contain all the information you may need for safe and satisfactory installation of your 455. Kurz Instruments recommends that you read the manual before attempting installation.

Important Note: Do NOT install the junction box close to a hot duct or stack. The ambient temperature around the junction box should not exceed 50° C.

GASCOPE® COMBUSTIBLE GAS INDICATORS

08-01-04

FEATURES

- Effective measurement of combustible gases and vapors
- Excellent for pinpointing leaks
- 3 Models to meet differing detection needs
- Impact-resistant, waterproof case
- Equipped with neck and waist straps for hands-free operation

DESCRIPTION

Gascope Combustible Gas Indicators are portable instruments for use in detecting, measuring and pinpointing leaks of combustible gases and vapors. Housed in a high-impact-resistant and waterproof case, Gascope units measure 6 1/2" high by 7 1/4" long by 4" wide. Each unit is easily carried with integral neck and waist straps, leaving hands free for climbing, operating the instrument, or carrying additional equipment.

Meter movement is of core magnet type to prevent errors caused by stray magnetic fields such as those encountered in manholes or electric utility vaults.

Sampling Equipment

The gas flow is cast as an integral part of the case, eliminating internal tubing and connections, and the possibility of leaks that could dilute samples. Flow systems incorporate a cylindrical filter chamber; the standard cotton filter prevents dirt from entering the system. A special charcoal filter can be used when necessary to distinguish between natural gas and petroleum vapors. A special line trap assembly is available to prevent water from being drawn into the indicator.

Powered by 8 zinc carbon batteries, Gascope Indicators can operate continuously for over 8 hours.

A panel indicator signals the unit's operational readiness, as well as the strength of the batteries.* Separate adjustment knobs for each measuring circuit are clutch-type to help prevent accidental changing of zero settings. A hinged case lid, with operating instructions affixed to the inside, protects the unit when not in service. When in use, the lid lies flat against the back of the case. The instrument is automatically turned off when the lid is closed.

Three Gascope Combustible Gas Indicator Models

The Model 60 is designed for use by gas utility companies in routine testing for methane-in-air concentrations in manholes, sewers, curb boxes and other street openings. The unit reads 0 to 5% by volume methane-in-air, and 0-100% by volume methane-in-air.

The Model 62S, also suitable for use by gas utility companies, is designed for reading 0-100% LEL methane-in-air and 0-100% by volume methane-in-air.

The Model 62 is designed for general industrial use. The unit provides quick detection of most combustible gases and, therefore, has a number of applications, such as testing tank and vessel interiors; locating pipeline and process system leaks; and checking confined areas in steel mills, paint factories, sewage disposal plants,

* U.S. Patent No. 4,127,024 dated Nov 28, 1973 covers battery voltage regulating and condition indicating circuit for measuring instruments.

chemical manufacturing facilities and other industrial applications. The unit is factory-calibrated on pentane-in-air to simulate the qualities of petroleum vapors. The Model 62 reads 0-100% LEL pentane-in-air and 0-100% by volume pentane-in-air.

APPROVALS & STANDARDS

Gascope Combustible Gas Indicators have been tested to Factory Mutual Approval standard for Combustible Gas Detector, Class Nos. 6310-6330 (7/1/78). Suitable for use in Class I, Division 1, Groups C and D hazardous locations as defined by the National Electrical Code.

OPERATION

The Gascope Combustible Gas Indicator is prepared for operation by turning the switch to the ON position, and setting the selector switch for high or low scale. A sample is drawn in by squeezing the aspirator bulb. The instrument uses two different types of filaments: a catalytic combustion filament for the low range, and a thermal-conductivity filament for the high range.

Concentrations on the low ranges are measured by the hot-wire, Wheatstone bridge method. The filament is one arm of the bridge. When a gas sample is passed across this filament, combustibles are burned, raising the temperature of the filament. As a result, resistance is increased and the bridge becomes unbalanced.

The imbalance is proportional to the concentration of the combustibles, and is indicated on the low range of the meter.

For measuring in or above the explosive range, a thermal-conductivity filament is used. Combustibles in the sample cool this filament, causing the Wheatstone bridge to go out of balance. The imbalance, proportional to the gas concentration, is measured by the meter and read as percent-by-volume. The filament is field replaceable.

LIMITATIONS

Silanes, silicones, silicates and other compounds containing silicon in the tested atmosphere may seriously impair the response of this instrument. Some of these materials rapidly poison the catalytic combustion filament so that it will not function properly. When there is even a suspicion that such materials are in the atmosphere being tested, the instrument must be checked frequently (at least once every five uses). Calibration kits are available to conduct this test. Leaded gasoline vapors can also poison the catalytic combustion filament. To prevent this, an inhibitor filter (Part No. 47740) should be used to nullify their effect.

MICROGARD PORTABLE ALARM

RESET LIGHT
 ON/OFF
 SELECT BATT VOLTS

FEATURES

- State-of-the-Art Surface Mount Device (SMD) Electronics
- Seven Audible/Visual Alarms
- Rugged Housing
- Easy to Use Membrane Keypad Controls
- Rechargeable or Primary (Alkaline) Battery
- Optional Pump Module and
- Optional Aspirator Bulb Sampling Adapter
- RFI and Static-Resistant Case.

DESCRIPTION

MicroGard Portable Alarms are new generation pocket-sized instruments for simultaneously monitoring combustible gas and oxygen concentrations in work-place atmospheres and confined spaces, such as manholes, storage tanks, tank cars and ship-yards. The MicroGard features state-of-the-art, compact SMD circuitry coupled with proven MSA combustible gas and oxygen sensors for reliable protection. In the diffusion mode, the instrument is ideal for hand-held, pocket, or belt-pouch use.

The MicroGard is very compact, and fits comfortably in most shirt pockets. Other modes of use include optional shoulder strap, wrist strap,

and belt pouch. The rugged case is made of flame-resistant Noryl® Plastic.

An ON/OFF switch, located on the front of the instrument behind a weather-resistant rubber boot, activates the unit. All other front-panel controls are contained within a sealed, membrane-switch keypad, and include SELECT, RESET, LIGHT, and BATT VOLTS.

MicroGard combustible gas circuitry features either one of two combustible gas calibrations and readouts, depending upon model: 0-100% LEL (Lower Explosive Limit) with a general-purpose Pentane calibration, and 0-5% Methane-by-volume calibration; the latter model is primarily suited for gas utility and mining applications.

If the level of combustible gas concentrations in air exceeds the factory-set limit of 25% LEL (1.0% CH₄ on Methane-calibrated model), a blinking red LED and buzzer will activate, signifying an alarm condition. If the combustible gas indication reaches approximately 100% LEL (5% CH₄ on Methane model), the alarms latch and the display blanks to signify a possible over-range condition due to gas concentrations in the UEL range. An additional combustible alarm sounds if the sensor indicates a moderate below-zero signal, signifying one type of sensor failure.

MicroGard oxygen circuitry monitors the atmosphere for both oxygen-deficient and oxygen-enriched conditions. If oxygen concentrations, as measured by the partial pressure of oxygen, rise above the factory setpoints of 23% or below 19.5%, the Oxygen Alarm LED and buzzer will sound. Both the combustible gas and oxygen alarm circuits are latching, requiring activation of the RESET button to silence alarms. However, as a protective feature, all combustible gas and oxygen alarms cannot be reset until conditions have returned to levels within alarm setpoints.

MicroGard combustible gas and oxygen sensors are easily replaceable too, due to their plug-in design. The circuitry is designed for RFI resistance.

Battery condition of the MicroGard is monitored at all times, and low battery condition is communicated via

MicroGard Alarm with Sampling and Calibration Adapter (PIN 478530).

two-stage alarm. In the first stage, "BATT" appears in the display, to warn of impending battery shutdown. When battery condition falls below levels to properly operate the instrument, audible and visual alarms activate and the display blanks.

For high-noise applications, an earphone is provided with the instrument. An optional external alarm module can also be used. This alarm module is powered by its own battery and can be clipped to a user's shoulder. Remote sampling with the MicroGard can be achieved via either Pump Module or Aspirator Bulb Adapter. The Pump Module is fully-integrating, providing a uniquely-compact device; the MicroGard battery pack is removed, and the remaining instrument body is inserted into the Pump Module. The Pump Module's battery pack (rechargeable Nicad or alkaline) will power both the pump and instrument for full-shift (8-hour) operation. MSA Probe Tubes and standard Sampling Lines, in

Pocket clip and protective screen covering sensors.

MicroGard Alarm with integral pump module.

lengths from 5 to 50 feet, connect directly to the Pump Module.

Manual Aspirator Bulb remote sampling is accomplished via simple, slip-on adapter. MSA Probe Tubes and Sampling Lines attach to the flow-through aspirator bulb.

Caution: The combustible gas portion of the MicroGard Alarm has been designed to detect combustible gases and vapors in air. It is not capable of measuring the percentage of vapors in steam or inert atmospheres because of a lack of oxygen which is necessary to support combustion in the filament chamber. Neither will the instrument indicate the presence of explosive or combustible mists or sprays formed, as for example, by lubrication oils, or explosive dusts formed by grain or coal. The MicroGard is designed for use in air and is not to be used for the measurement of combustibles in atmospheres containing more than 25% or less than 10% oxygen by volume.

Limitations: Silanes, silicones, and other compounds containing silicon in the tested atmosphere may seriously impair response of this instrument. Some of these materials rapidly "poison" the detector filament so that it will not function properly. When there is even a suspicion that such materials are in the atmosphere being tested, the instrument must be checked frequently (at least after each five tests). A calibration kit is available to conduct this test. Loaded gasoline vapors can also poison the detector filament of this instrument. Oxygen-deficient (less than 10%) atmospheres may not indicate the true concentrations of combustible gas.

APPROVALS & STANDARDS

All MicroGard Portable Alarms are Classified by Underwriters' Laboratories, Inc. as to intrinsic safety only for use in hazardous locations, Class I Groups A, B, C, and D. They will perform within basic performance specifications when exposed to an RF field at the limits of acceptable human exposure as defined in ANSI C95.1.

All MicroGard Alarms (except LEL-only versions) are CSA Approved Class I, Groups A, B, C, and D. The single-unit 120-volt charger, Part Number 633548, is listed with Underwriters' Laboratories and CSA.

SPECIFICATIONS

Performance Characteristics:
(at 25° C ambient temperature after a 15-minute warm-up period)

Accuracy:

Oxygen: ± 0.3% oxygen at constant temperature and atmospheric pressure. ± 0.5% oxygen with temperature changes from calibration temperature over the range 0° to 40°C.

Combustible Gas: ±3% LEL for 0 to 50% LEL and ±5% LEL for 50 to 100% LEL for Pentane-calibrated models. ±0.2% CH₄ for 0 to 2.5% CH₄ and ±0.3% CII, for 2.5 to 5.0% CH₄ for methane-calibrated models.

Ranges:

Oxygen: 1 to 25%

Combustible Gas: 0 to 100% LEL in air for Pentane models; 0 to 5.0% CH₄ in air for Methane models

Response Time (Aspirator Mode):

Oxygen: 90% of final reading in 10 seconds at 32° to 104°F (0° to 40° C)
90% of final reading in 3 minutes at 0°F (-18° C)

Combustible Gas: 90% of final reading in 8 seconds

Oxygen Sensor Life:

One year warranty when used at atmospheric pressure containing 20.9% oxygen or less without the presence of poisoning agents.

Operating Temperature Range:

Oxygen: 32° to 104°F (0° to 40° C) normal; Low limit is 0°F (-18° C) when calibrated at temperature of use. High

limit is 122° F (50° C) when calibrated at temperature of use; however, service life may be reduced with prolonged exposure to this temperature.
Combustible Gas: 32° to 122°F (0° to 50° C); Low limit 0°F (-18° C) if calibrated at temperature of use.

Operating Characteristics:

Power Supply:

Nicad: Sealed, rechargeable 2.4 volt, 2.0 ampere-hour nickel-cadmium battery pack.

Operating Time: 8 to 10 hours nominal continuous usage at normal ambient temperature, with fully charged Nicad battery pack. 8 hours at 32°F (0° C), with fully charged Nicad battery pack, depending upon battery condition.

Alkaline: 3-volt alkaline battery pack with two-user replaceable "C" Cells. (Duracell MN 1400 only)

Operating Time: Up to 24 hours

continuous usage at normal operating temperature, with alkaline batteries.

8+ hours nominal continuous usage at 32°F (0° C) with fresh alkaline batteries.

Readout:

Liquid Crystal Display (LCD) with 0.5" high digits

Physical Characteristics:

Case Construction:

Flame, RFI and Static-Resistant Noryl Plastic filled with stainless steel fibers.

Dimensions:

5-3/4" high x 2-3/4" wide x 1-1/8" deep (Instrument only)

8-1/4" high x 2-3/4" wide x 2-1/2" deep (Instrument in Pump Module)

Weight:

14.3 ounces (0.41 kg) (Instrument only)

27.9 ounces (0.79 kg)

(Instrument in Pump Module)

Supplied Accessories:

Wrist Strap

Earphone

ESCORT SAMPLING PUMP

08-00-01

FEATURES

- Resistant to water spray while running
- Inlet filter traps moisture and particulate matter
- Stainless steel impregnated ABS plastic case provides RFI/EMI protection
- Weighs only 19 ounces
- Exceptionally quiet operation
- Elapsed time readout
- Flow-Fault Indicator shows if sample inlet is blocked
- Low-Battery Indicator
- State-of-the-art electronic flow control
- Designed to meet IP66 standard for water and dust tightness

DESCRIPTION

The Escort Sampling Pump can be used with a variety of personal and area sampling devices to collect such airborne contaminants as asbestos fibers, toxic gases, vapors, particulates, fumes and mists. It can also be used to sample silica dust, coal dust and organic vapors.

Escort Pumps provide regulated flow for many types of sample collection media, including filter discs, charcoal tubes and other sorbent tubes, impingers and reagent filter discs.

Exceptionally compact, lightweight and quiet in operation, the Escort Pump promotes rapid user acceptance. Engineered for exposure to the elements, the unit can be exposed to water spray while operating.

MSA

State-of-the-art electronics provide constant flow (volume) control, with $\pm 5\%$ regulation of flow rate and automatic compensation for changes in battery voltage, temperature, altitude and sample load.

The circuit board is assembled with surface-mount devices (SMD) which provide an extremely compact module.

The internal diaphragm pump provides vacuums comparable to heavier, bulkier pumps. Normal flow range of the Escort Pump is 0.5 to 3 liters per minute (lpm), covering most industrial hygiene applications. Flow rates down to 1 milliliter per minute (mlpm) are attainable when the Gemini™ Twin-Port Sampler is used (See page 3).

The stainless steel-filled plastic case provides protection against electromagnetic or radio-frequency interference (EMI and RFI, respectively). The unit is assembled with rust-proof stainless steel screws. A belt clip allows the unit to be worn at the waist.

The Escort Pump has three controls — an ON/OFF key, a RUN/HOLD key, and a flow-rate potentiometer, all of which are located behind a tamper-resistant cover held in place with a set screw. This cover helps prevent unauthorized access to control functions.

The multi-turn potentiometer provides precise adjustment of flow rate, which can be viewed on the integral flow meter. The flow meter is graduated in 0.2 lpm divisions and is easier to read because it has a higher resolution than flow meters on many other pumps.

To help avoid accidental shut-off of the pump, the ON/OFF key has a time-

delay switch that requires the user to hold it down for two full seconds before the unit turns on or off. When the Escort Pump is on, an amber light-emitting diode (LED) illuminates.

The RUN/HOLD key works like a "pause" button, allowing the user to temporarily stop sampling without resetting the elapsed time reading. The amber LED flashes when the unit is in the hold mode. Pressing the key again restarts the pump as well as the elapsed time indicator.

For protection against moisture, the ON/OFF and RUN/HOLD keys are membrane keys, protected by a sealed plastic overlay.

Three gaskets seal the case, making the unit resistant to water spray and dust while running. This feature is especially important to asbestos abatement workers who pass through decontamination showers while wearing the unit. The gaskets are located between: the main body of the pump and front face; battery pack connection and main body; and the inlet filter and tubing connector.

A special Teflon® filter prevents water and dust from being drawn into the pump mechanism, thus increasing service life. A transparent view window over the filter on the inlet lets the user see anything that has accumulated on the filter. The inlet filter is field replaceable.

The four-digit elapsed time readout is a liquid crystal display (LCD) that shows cumulative minutes of operation for easy calculation of time-weighted averages (TWAs). It retains the last reading when

the pump is off, in the hold mode, or in the event of flow blockage or low-battery shut-down.

The Escort Pump includes separate red LEDs to indicate flow blockage and low battery.

The state-of-the-art mechanical design of the Escort Pump is highly efficient, allowing the use of a compact rechargeable NiCad battery pack. Its compact size helps keep the overall weight of the pump low.

Battery life varies, depending on the selected flow rate and the pneumatic load imposed by the chosen sampling device, but in most cases the Escort Pump will operate for a full eight-hour shift before charging is necessary (see Figure 1).

The port for the charging jack is located on the battery pack, rather than the pump module, so that the battery can be charged either while on the unit, or when removed.

Sample collection media.

OPERATION

The Escort Pump is designed for simple operation. Set-up is easily accomplished by:

- 1) Attaching a sample collection device, such as a filter cassette, to the pump's inlet fitting;
- 2) Loosening and rotating the front cover;
- 3) Pressing and holding the ON/OFF membrane key for two seconds;
- 4) Setting the flow rate to the desired level by adjusting the potentiometer with the supplied screwdriver; and
- 5) Closing and tightening the front cover.

During pump operation, an electronic signal output proportional to the motor speed is generated.

This signal is then compared via an error amplifier with a set-point voltage established by the flow control. If the motor speed signal is not equal to the set-point voltage, the error amplifier adjusts the motor drive circuit to make the flow rate equal to the set-point value. Sample flow is then closely controlled at this rate until a flow adjustment is made by the user.

When the flow control potentiometer is turned to increase or decrease the sampling flow rate, the error amplifier output

causes the motor drive circuit to increase or decrease pump speed. When the flow signal reaches the set-point level, the pump is held at a constant speed, and hence, sample flow is maintained at a new fixed rate.

If ambient pressure, temperature or sample-loading changes occur, the speed is automatically adjusted to compensate for a decrease or increase in flow rate.

The LCD display automatically sets itself to zero when the pump is first turned on. The timer accumulates and displays total elapsed running time in minutes. When the pump is turned off, the elapsed running time remains on the display so that it can be recorded by the user. Only when the pump is turned on again will the timer reset to zero.

In the event that a flow blockage occurs, the Flow-Fault Indicator circuitry illuminates a red LED to alert the user. Within one minute, the pump automatically shuts off, but the cumulative elapsed time remains on the display.

If the battery drops below 4.1 volts, a low-battery condition results. When this condition occurs, a separate red LED illuminates and the pump immediately shuts off. The reading on the timer is retained for user reference. Further battery drain is limited to just a few milliamperes, which helps prevent damage to the battery pack through deep discharge.

Typical flow and load regime for Escort Pump.

SPECIFICATIONS

Electrical Characteristics:

Power Supply: 4.8-volt battery pack of four nickel cadmium cells

Battery Pack Capacity: 1.7-1.8 ampere hour

Battery Pack Recharge Time: 14-16 hours (overnight) with Omega™ Charger

Typical Battery Pack Life: 300 or more charging cycles

Operating:

Flow Control: Volumetric flow rate held within $\pm 5\%$ of set-point over entire operating range, with automatic compensation for battery voltage, altitude, temperature and sample load changes of 10 inches of water.

Flow Rate: Flow rate adjustable between 0.5 and 3 lpm; lower flow rates attainable (to 1 mlpm) with optional Gemini™ Twin-Port Sampling accessory

Flow Indication: Integral Flow meter graduated in 0.2 lpm divisions

Operating Range: 30 inches of water load up to 2 lpm; 20 inches up to 2.5 lpm and 10 inches up to 3 lpm

Flow Blockage Detection: Flow-Fault LED comes on immediately when block is detected. Pump shuts down within one minute if block is not cleared.

Elapsed Time Readout: To 9999 minutes with a resolution of 1 minute. Holds last reading after either flow or battery shut-down and when pump is off or in hold mode.

Operating Time: Varies with flow rate and sampling device loading. Minimum eight-hour operation at 2.5 lpm with 15-inch water load.

Operating Temperature Limits: 32-113°F (0-45°C); While charging, 50-86°F (10-30°C)

Altitude Compensation: Below sea-level to at least 10,000 feet (3,035 meters) above sea level.

Physical:

Weight: 19 oz (550 gm), with battery pack
Dimensions: 2" deep x 4" high x 3-7/8" wide (5.1 cm x 10.3 cm x 9.8 cm), with battery pack

Serial Number Identification: Located inside housing

ORDERING INFORMATION

Part No.	Description
803371	Escort Pump Kit, includes pump, tubing, screwdriver (for potentiometer adjustment), and instruction manual
* 802876	Escort Pump Kit, same as above, but includes single-unit 110v Omega Charger.
802877	Escort Pump/Gemini Sampler Kit, includes: Part Nos. 802876 and 497697
802626	5-Pump Escort Kit, includes five Escort Pumps, tubing, instruction manuals and 5-unit battery charger (Part No. 801759)

Chargers (all 50/60 Hz)

* 494716	110v Single-unit Omega Charger
495965	220v Single-unit Omega Charger
801759	Five-unit Omega Charger, 110/220v adaptable

Replacement Parts

497702	Battery pack with O-Ring
802897	One Replacement Inlet Filter
800503	Replacement Instruction Manual
802922	Escort Pump Overhaul Kit (contains common components needed for routine maintenance.)

ACCESSORIES

Gemini® Twin-Port Sampler

For low-flow control when sorbent tubes are used, the Gemini Twin-Port Sampler is a valved mechanism that allows flow adjustment down to 1 mlpm (0.001 lpm).

As an added benefit, the Gemini accessory permits simultaneous sampling from two sorbent tubes, with independently controlled flow rates of each.

Dual sampling means two like sorbent tubes can be attached for simultaneous sampling at different flow rates, or two different tubes can be used to sample two types of substances at once.

497697	Gemini Twin-Port Sampling Kit, includes: Gemini Sampler, tube protectors, Y-connector, clips, and carrying case.
--------	--

Tamper-Evident Labels

Special tamper-evident labels are available from MSA to indicate if an unauthorized worker attempts to access the control functions. These adhesive backed labels are applied over the front cover set screw after the unit is set up. These labels will not remain intact if removed.

802698	Sheet of 10 Tamper-Evident Labels
--------	-----------------------------------

Flow Indicators

Part No.	Description
635477	OptiFlow™ Digital Flow Indicator, Model 660, 5 mlpm to 5 lpm
635478	OptiFlow Digital Flow Indicator, Model 735, 0.1 lpm to 16.5 lpm
635479	PC Link Data Package and computer interface box (compatible with IBM-type machines having DOS 2.0 or higher and a male DB25 RS-232 port)

APPROVALS & STANDARDS

Escort Sampling Pumps are U.L. Listed as intrinsically safe for use in hazardous locations - Class I, Groups A, B, C, D; Class II, Groups E, F and G; and Class III, Division I locations.

SERVICE

MSA's strategically located Regional Service Centers are staffed with specialists who have the knowledge and the equipment to provide testing, calibration and repair of Escort Pumps, with genuine MSA replacement parts. Product modification or repair by anyone other than certified MSA personnel may void warranties and approvals.

Call MSA toll-free at 1-800-MSA-2222 for the location of your nearest Service Center.

Note: This Data Sheet contains only a general description of Escort Sampling Pumps and Accessories. While uses and performance capabilities are described, under no circumstances should the product be used, except by qualified, trained personnel, and not until the instructions, labels or other literature have been carefully read and understood and the precautions therein are fully followed. Only they contain the complete and detailed information concerning these products.

AIR/GAS SAMPLING BAGS

THE PRACTICAL METHOD FOR DATA COLLECTING

Our 5-layer (U.S. Pat.) Sampling Bags provide a simple, economical method of collecting and transferring air/gas samples to a centrally located laboratory or test instrument for analysis.

- Extremely simple to use and maintain
- Does not require highly trained technicians to operate
- Will pinpoint IF and WHERE a gas or pollution problem is present without investing in expensive equipment
- Ideal for hard to reach locations

FIG. 1

In contrast to other single-layer plastic materials generally in use, the silver Calibrated Instruments Gas Sampling Bags are made by a special process (U.S. Patent) of 5 different layers of materials bonded together to form a single flexible material 5.5 mil thick.

FIG. 2

These bags have many applications, since the 5 layers will not permeate any gases in or out, will not chemically interact with gases, and will not absorb or adsorb to any degree. The bags can also be used to collect vapors and for use with odor test panels.

FEATURES:

- A syringe for entry and withdrawal can be used with the silicone rubber septum attached to the outside of the bag. The septum is not in contact with gas on the inside until the syringe needle penetrates. (Fig. 1)
- A special ON/OFF valve combination hose bib easily connects to standard tubing and can be opened and shut as required.
- The Snout Entry Bag comes sealed. Easily snipped open to connect to special bubble tubing, and can be resealed many times.

The bags can withstand pressures to approx. 46 atm - 6 to 7 lbs. and temperatures up to 150°F. Exposing to higher temperatures for short periods is acceptable. If high-temperature stack gases are to be collected, tubing long enough to allow the gases to cool to 190°F before they enter the bag should be used.

PULSE PUMP Model #3 (Fig. 3)

The sampling bags may be used in conjunction with a battery-operated pump that can be worn by the individual doing the sampling (Fig. 2) or can be mounted at the test site. The pump has infinitely adjustable flow rates from approximately 1 to 85 liters per hour (.0166 liters per minute to 1.5 liters per minute). Inlet and outlet ports for filling of gas sampling bags as well as for use with charcoal tubes and mini impingers.

APPLICATIONS FOR *Cali-5-Bond™* GAS SAMPLING BAGS

Cali-5-Bond™ Gas Sampling Bags have been a valuable means for establishing standards in industrial hygiene for many years. One of the most popular uses of the Cali-5-Bond™ bags is to determine if indeed there is a problem, the severity of the situation, and possibly where it occurs. This is far simpler and, of course, more economical than using expensive, dedicated and sophisticated gas analytical instruments at the site.

To cite examples:

When a new process is introduced in manufacturing, to assure a safe workplace.

To check the Time Weighted Average quality of ventilated air in a coal mine.

To trace and evaluate a plume of stack gas in the open.

To quickly ascertain the safety for breathing in a confined space (manhole, etc.).

To determine the extent of a gas leak or spill, etc.

These are direct methods not subject to the many possible errors with other sampling techniques which require intermediate steps. Gas

sampling technology offers another advantage. It is not necessary to keep track of the precise volume collected or the elapsed time required to obtain the sample. When this method is used correctly, the collected sample is truly representative of the environment when and where collected, either as a grab sample or a Time Weighted Average over a selected period of time.

Further, employing sophisticated, expensive gas analyzers to establish concentration levels usually means being restricted to one fixed monitoring point. In contrast, totally portable gas sampling bags permit absolute freedom of movement and measurement over a wide area of selected points.

Any gas sampling bag technique is dependent upon the quality of the sampling bag used. Sample bag construction and materials must insure the physical integrity of any sample taken. In order for a collected sample to be truly representative of the environment when it was collected and to store the sample without change for a reasonable length of

time, it is essential that bags have these properties:

- Bag material should be chemically inert
- Bags must not absorb or adsorb collected gas samples
- Bags must be impermeable (in or out)
- Bags should not become brittle (especially around valve) or otherwise deteriorate with time.
- Bags should be mechanically strong to resist rough and repeated handling in the field
- Bag material should be opaque rather than transparent to protect collected gases from changes due to ultraviolet or other light exposure

Our Cali-5-Bond™ Gas Sampling Bags fulfill all of these requirements. Gas sampling bags are useful for still many more applications. The precision gas standards prepared according to I.S.O. procedures are easily accomplished. Cali-5-Bond™ Gas Sampling Bags may be purchased with the new Lucr-Fit Valve™ and/or a self-sealing silicon septum to permit easy syringe injection or withdrawal.

Gas analyzers may be calibrated in remote field locations by taking these same calibration gases in Cali-5-Bond™ Gas Sampling Bags to the instrument site.

We can manufacture bags in any size and type to your exact specifications.

CALIBRATED INSTRUMENTS, INC.

200 SAW MILL RIVER ROAD HAWTHORNE, NEW YORK 10532

AIR/GAS SAMPLE COLLECTION SYSTEM COMPONENTS AND ACCESSORIES

Cali-5-Bond™ GAS SAMPLING BAGS

Truly non-permeable Cali-5-Bond™ Gas Sampling Bags are made by a special bonding process (U.S. Patent) of layering 5 different materials into a single inert flexible sheet 5.5 mil thick. This material ensures the integrity of collected sample until field or lab analysis is completed.

An outer layer of polyester provides added strength and surface durability to these flexible metal containers. Totally opaque, a middle layer of aluminum foil prevents UV degradation of collected samples. Cali-5-Bond™ Bags may also be used for sampling liquids for gas-liquid combinations.

PILLOW-SHAPE BAG

Cali-5-Bond™ Bags are available in Pillow or Snout shape. Standard sizes up to 170 liters are supplied with the new Luer-Fit Valve™ or the ON/OFF (twist-type) with hose bib tubing connection.

SNOUT TYPE BAG

Snout entry bags come sealed. Easily snipped open to receive a special bubble tubing, the snout can be used as a purging port prior to reusing the bag. Snout ports are resealable.

LUER-FIT VALVE™

- Secure, self-closing valve
- Cannot be opened or left opened accidentally. **NO LOST SAMPLES!**
- Fits any standard Luer taper syringe barrel
- Eliminates dangerous needles
- Lasts indefinitely
- Use with Hann-Pump™ and with Quik-Mate™ Connector

QUIK-MATE™ CONNECTOR

Flow-through adaptor for instant (push-pull) connection of tubing to Luer-Fit Valve™.

HANN-PUMP™

- Provides the simplest, most economical grab sampling available. Foolproof.
- Mates directly with new Luer-Fit Valve™. Just squeeze the pump.
- Dual purpose: fill or empty bags. Move gas samples in and out of bags by reversing ends of the Hann-Pump™.
- Discard after use. Eliminates costly and time-consuming decontamination.

OPTIONAL VALVES

- * 1. Luer-Fit Valve™
- 2. Twist-type, 1.0" high, with hose bib connection
- 3. Twist-type, 1.5" high, with hose bib connection
- 4. 1/4" I.D. straight through connection with threaded cap closure. Also use as additional purging port.
- 5. Large cross-section entry nozzle (3/4" I.D.) for human breathing, physiological testing, etc.

PULSE PUMP™ MODEL III

Air Sampling Pump. Operates on 2 standard batteries (1.5 v/9v) which provide up to 42-46 hours of continuous operation. Adjustable flow rates from 1-85 liters per hour. Measures approximately 5" x 3" x 2". Weighs 13 oz.

SYRINGES

Syringes for withdrawal or injection through silicone rubber septum or Luer-Fit Valve™. Sizes 10cc and 50cc.

SYRINGE CHECK VALVE

Provides needleless syringe entry into open-ended tubing.

New

Squirt™ Gas Bump Tester

Provides a lightweight, convenient and inexpensive way to check the sensor response of MSA Instruments. The bump tests supplement regular calibration at a service center or maintenance department. It uses a disposable cylinder with 11 liters of gas, works without a regulator and gives you a reading as fast as 15 seconds. Its ease of use promotes tests in the field, on the shop floor or in the truck. The kit comes with three balloons and all the necessary tubing and fittings to attach to the instrument, packed in a vinyl carrying bag.

* Requires calibration adapter

Model R Calibration Check Kits

Model R Check Kits consist of a regulating valve which includes a gauge to measure container pressure; an adapter hose with sampling line connection; an adapter hose without a sampling line connection; sensor adapters (where applicable); instructions; and a case fitted with room for two cylinders of calibration check gas.

The cylinders of calibration check gas for use with Model R Kits are small light-weight steel containers approximately 10 1/2 inches high and 2 1/2 inches in diameter and, depending upon the individual pressure requirements, contain 16 to 20 liters of a specified gas mixture of a known (± 5% tolerance) concentration. See page 137 for calibration check gas.

CALIBRATION CHECK KITS FOR USE WITH MSA PORTABLE INSTRUMENTS

08-00-28

Among the convenient MSA Calibration Check Kit options are: the Model R Calibration Check Kit shown used with a Gascope Model 300; an Ampoule-Type Check Kit, used with a Passport Personal Alarm; and an Aerosol-Type Check Kit used with an Explosimeter Indicator.

FEATURES

- Quick and easy to use to verify the accuracy and response time of MSA portable electronic instruments
- All kits provide convenience in performing calibration checks in accordance with NIOSH, OSHA, NFPA and ISA standards
- Wide selection of kits and calibration gases to meet varying user needs
- Three basic types of kits available: Model R and RP; Aerosol-Type and Ampoule-Type

DESCRIPTION

MSA Calibration Check Kits, when used with the appropriate calibration check gas, offer a quick, convenient and economical method of checking the response of MSA gas detection instruments.

The Model R and RP Check Kits use cylinder containing a specific concentration of compressed calibration check gas. These kits are used for combustible gas detectors and certain multi-gas detectors.

Aerosol-type check kits use a convenient three-liter pressurized can for added portability. These are used for combustible gas.

Ampoule-type check kits are used for specific toxic gases and eliminate the need for gas cylinders, regulators or constant temperature devices.

MSA

Model R & RP Calibration Check Kits

With the Model R and RP Calibration Check Kits, a cylinder pressurized with a specific calibration gas is used to introduce a known concentration of gas into the gas detection instrument.

The primary difference between the two kit models is the size of the cylinders used (Model RP cylinders contain more calibration gas), the delivered gas flow rate, and the selection of cylinders available.

Both kit models include: a regulating valve, which controls the flow and includes a gauge to measure pressure of the calibration gas cylinder; appropriate calibration tubing to connect the calibration gas cylinder to the instrument; sensor adapters, as needed; instructions; and a rugged high-density polyethylene carrying case with room for two cylinders of calibration check gas.

Model RP Calibration Check Kit (477149) and Calibration Gas.

MSA offers two types of Model R and Model RP check kits, depending on the type of instrument being calibrated.

Depending on the kit, the regulator supplies calibration gas at either 0.25 liters per minute (lpm) or 1.5 lpm. The 0.25 lpm regulators are for diffusion-

ORDERING INFORMATION

Important: Calibration Check Kits are designed for use with specific instruments. Please see the Selection Guide on pages 6 - 8 for applicability of kits.

Part No.	Description
476610	Model R Calibration Check Kit, less calibration gas. Includes:
459949	0.25 lpm Regulator
449401	30-inch Calibration Tube with Fitting
449482	30-inch Calibration Tube
457364	Sensor Adapter for Spotter Methane Detector
458302	Sensor Adapter for Explosilarm, Model 100
636246	Tubing Adapter for Passport and Gascope Models 300 & 300L
465898	Sensor Adapter for MiniCO Indicators
628474	Zero Plug for MiniCO Indicators
* 476609	Model R Calibration Check Kit, less calibration gas. Includes:
459948	1.5 lpm Regulator
449401	30-inch Calibration Tube with Fitting
449482	30-inch Calibration Tube

Cylinders for Model R Calibration Check Kits

Part No.	Concentration	Back-ground	Part No.	Concentration	Back-ground
Methane			Carbon Monoxide		
461047	1.25% Methane (25% LEL)	Air	477888	20 ppm Carbon Monoxide	Air
459945	2.0% Methane (40% LEL)	Air	461768	60 ppm Carbon Monoxide	Air
459942	2.5% Methane (50% LEL)	Air	459944	150 ppm Carbon Monoxide	Air
Hydrogen			461769	300 ppm Carbon Monoxide	Air
459946	0.8% Hydrogen (20% LEL)	Air	Oxygen		
Pentane			476302	5% Oxygen	N ₂
466193	0.75% Pentane (50% LEL)	Air	468248	20.8% Oxygen	N ₂
476303	1,000 ppm Pentane (6.7% LEL)	Air	Butane		
476304	0.75% Pentane (50% LEL) & 15% Oxygen	N ₂	460345	8% Butane	85% N ₂ , 15% CO ₂
Propane			459943	0.6% Propane (29% LEL)	Air

Note: N₂ is nitrogen; CO₂ is carbon dioxide.

type instruments, Passport and certain Gascope models, whereas the 1.5 lpm devices are for sample-draw instruments.

Calibration check gas cylinders must be purchased separately.

The cylinders of calibration check gas for use with Model R Kits are small lightweight steel containers approximately 10-5/8 inches high and 2-5/8 inches in diameter and, depending upon the individual pressure requirements, contain 20 liters of a specified gas mixture of a known ($\pm 5\%$ tolerance) concentration. Note: The butane cylinder, Part No. 460345, contains 10 liters.

The cylinders of calibration check gas for use with Model RP Kits are lightweight steel containers (or aluminum in the case of hydrogen sulfide) approximately 14-1/4 inches high and 3-1/2 inches in diameter and, depending upon the type of cylinder, contain 100

liters of a specified gas mixture of a known ($\pm 5\%$ tolerance) concentration. Note: Hydrogen sulfide cylinders contain 58 liters.

OPERATION

To prepare a Model R or RP Check Kit for use, the regulator assembly is connected to the cylinder. Then the adapter hose is connected between the outlet of the regulator assembly and the inlet of the instrument, using the appropriate sensor adapter where required.

Detailed instructions for calibration and instrument checks are provided in the instruction manual of the specific instrument.

When not in use, the regulating valve and adapter hose can be easily detached from the expendable cylinder for convenient storage.

Model R and Model RP Cylinders

Part No.

477149 Model RP Calibration Check Kit, less calibration gas. Includes:

- 467895 0.25 lpm Regulator
- 485030 30-inch Calibration Tube
- 636246 Adapter for Passport and Gascope, Models 300 & 300L
- 465898 Sensor Adapter for MiniCO Indicators
- 628474 Zero Plug for MiniCO Indicators

477150 Model RP Calibration Check Kit, less calibration gas. Includes:

- 467896 1.5 lpm Regulator
- 449401 30-inch Calibration Tube with Fitting
- 485030 30-inch Calibration Tube

Cylinders for Model RP Calibration Check Kits

Nitric Oxide	Ampoule	471735	NO 50 ppm	493663

* Contains a pentane simulant.

CALIBRATION FREQUENCY

Instructions specific to the calibration of various instruments are supplied with the instrument being calibrated. MSA recommends that response checks be conducted before each day's use of an instrument — more frequently if sensor contamination is suspected. A response check is a simple check in which no adjustments are made to the instrument unless the check shows that the instrument is not operating within specified limits. Then, full calibration by authorized personnel may be warranted.

Daily calibration checks are also specified in the Occupational Safety &

Health Administration (OSHA) Technical Manual, the National Institute for Occupational Safety & Health (NIOSH) Resource Manual for Protection in Confined Spaces, the National Fire Protection Association (NFPA) Standard 306 for the Control of Gas Hazards on Vessels, and the Instrument Society of America (ISA) Recommended Practices for Hydrogen Sulfide Instruments, among others.

SERVICE

MSA's strategically located Regional Service Centers are staffed with specialists who have the knowledge and equipment to provide testing, calibration and repair of MSA instruments with genuine MSA replacement parts. Product modification or repair by anyone other than certified MSA personnel may void warranties and approvals.

Call MSA toll-free at 1-800-MSA-2222 for the location of your nearest Service Center.

Note: This Data Sheet contains only a general description of Calibration Check Kits and accessories. While use and performance capabilities are described, under no circumstances should these products be used until the instructions, labels or other literature accompanying the products have been read and understood and the precautions therein set forth followed. Only they contain the complete and detailed information concerning these products.

In reference to paint for the flare stack, I have attached specifications on Sherwin Williams paint.

Zinc Clad I - 9.01: John Zink standard primer paint.

Kem Hi-Temp 900-SA - 7.06: John Zink prefers to use this as the top coat. Can pick different colors, but note temperatures to right of color. If stack temperature exceeds this temperature then there may be discoloration. Expected stack temperature for this unit is minimum of 300 deg. F to a maximum of 500 deg. F.

* Kem Hi Temp Aluminum - 7.11: This paint is aluminum in color and is good for temperatures up to 1000 deg. F. No discoloration with this paint.

If you have any questions, please contact me at 918-234-2946.

Regards.

Industrial Maintenance Coatings

PRODUCT DATA

ZINC CLAD™ I

A ONE-PACKAGE INORGANIC ZINC-RICH COATING

B69A56

PRODUCT DESCRIPTION

ZINC CLAD™ I is a solvent-based inorganic ethyl silicate one-package zinc-rich coating.

USES

- o As a 1-coat maintenance coating or as a permanent primer for severe environment service
- o Bridges
- o Drilling Rigs
- o Economical replacement for galvanizing with similar performance levels
- o Low temperatures or very high temperature and/or high humidity conditions
- o Refineries
- o Shop or field application
- o Water intake and discharge lines (non-potable)
- o Where organic solvent or fuel resistance is required
- o Where tough abrasion resistance and hardness of a primer are necessary
- o Not recommended for severe acid or alkali exposure.

USE UNTOPCOATED:

- o Light and moderate corrosive atmospheric exposure
- o Fresh and demineralized water immersion service (non-potable)

PERFORMANCE INFORMATION:

- o Fast dry
- o Provides cathodic/sacrificial protection by the same mechanism as galvanizing. Also protects steel by forming an inorganic moisture and solvent barrier
- o 10-15 years performance in normal atmospheric exposure
- o Coating self-heals to resume protection if damaged
- o Functions better than galvanizing because of self-healing characteristics

PHYSICAL PROPERTIES:

- o Abrasion resistance 1.9 g. (ASTM D4060 CS-17 wheel, 1,000 cycles, 1 kg Taber Abraser)
- o Dry Heat Resistance (ASTM D2485) 700°F
- o Elcometer Adhesion (ASTM D4341) 320 psi
- o Moisture Condensation Resistance No failure (ASTM D4585, 100°F, 1000 hours)
- o Panel Hardness (ASTM D3363) 7H
- o Salt Fog Resistance No failure (ASTM B117, 1000 hours)
- o Thermal Shock Excellent (ASTM D2248, 250 cycles)
- o Wet Heat Resistance 115°F

RESISTANCE GUIDE (per ASTM D3912, untopcoated)

- o Immersion Resistance @ 77°F
Fresh and demineralized water
 - o Resistance to Fumes, Spills and Spillage
Organic solvents/fuels Severe (except chlorinated solvents)
 - o Animal fats and oils Severe
- Consult your Sherwin-Williams representative for specific application and performance recommendations.

Zinc Rich 9.01; MC56 A24; 1/84 200007

CHARACTERISTICS

- o Color/Finish: Gray-Green/Flat
- o Curing Mechanism: Solvent evaporation and polymerization due to moisture absorption.
- o Drying Schedule: (temperature & humidity dependent)
@ 77°F, 50% RH @ 5 mils wet
Rain resistant: 20-30 minutes
To Touch: 30 minutes
Tack Free: 1 hour
To Recoat: 18 hours
To Cure: Atmospheric 7 days
Immersion 30 days
- o Flash Point: 72°F (Pensky Martens Closed Cup)
- o Packaging: 3 gallon containers
- o Recommended Spreading Rate: wet mils: 5.0-7.0
dry mils: 3.0-4.0
approx. sq.ft./gal.: 220-295
- o Spreading Rate Coverage: 882 sq.ft./gal. @ 1 mil dry (theoretical, no loss)
- o Shelf Life: 6 months unopened @ 90°F maximum
- o Shipping Classification: X003
- o Shipping Wt: 61.0 lbs.
- o VOC: 550 g/l; 4.58 lbs/gal
- o Volume Solids: 55 ± 2% (ASTM D2697)
- o Weight Solids: 76 ± 2%
- o Weight/Gallon: 18.0 lbs.
- o Zinc Dust Pigment Content in Dry Film: 88%
- o Zinc Dust Pigment/gal.: 12.43 lbs.
- o Zinc Dust Pigment/sq.ft. @ 2 mils dry: 0.87 oz.

Analysis (mixed):

Pigment by weight		
Zinc Dust (ASTM D520, Type I)	65.4%	
Silicates	4.1%	
Yellow Iron Oxide	0.8%	
Additives	0.3%	
Vehicle by weight	29.6%	
Hydrolyzed Ethyl Silicate	3.4%	
Acrylic Polymer	1.6%	
Aromatic Hydrocarbons	18.4%	
Alcohols	5.5%	
Additives	0.7%	
Total	100%	100%

SURFACE PREPARATION

Zinc rich coatings require direct contact of the zinc pigment in the coating and the metal substrate for optimum performance. Surface must be dry, free from oil, dirt, dust, mill scale, or other contaminants to ensure good adhesion.

Application within 8 hours of preparing surface is mandatory.

Steel: (Atmospheric)
Remove grease and oil by Solvent Cleaning per SSPC-SP1.

To achieve maximum cathodic protection of Zinc Clad I, substrate should be Near White Blast clean per SSPC-SP10. Minimum surface preparation should be Commercial Blast Cleaning per SSPC-SP6.

NOTE: If blast cleaning with steel media is used, an appropriate amount of steel grit blast media should be incorporated into the work mix to render a dense, angular 1.5-2.0 mil surface profile. Do not apply Zinc Clad I over steel shot blast prepared steel.

Steel: (Immersion Service)
Remove grease and oil by solvent cleaning per SSPC-SP1. Then prepare surface to white metal blast per SSPC-SP5.

Pickling:
Acceptable (last step - flush with hot water for complete neutralization).

Galvanized Steel:
Wire brush small areas and wipe clean. Large areas must be Brush Blasted per SSPC-SP7.

Weathered Zinc-Rich Primer:
Remove zinc salts by either high pressure water washing and scrubbing with stiff brushes or sweep blast followed by water flush. Allow to dry.

Repair or Touch-Up:
Needle gun or spot blast to near white metal. Clean surrounding weathered zinc primer as above.

NOTE: Oil Base, Alkyd, Epoxy Ester, Silicone Alkyd Topcoats are not recommended. Polyureth topcoats require a tie coat of catalyzed ep. Consult the Sherwin-Williams data sheet for Clad II Epoxy, Heavy Duty Epoxy, Blid & Finish Epoxy or Recoatable Epoxy for specific system recommendations.

PRODUCT DATA

ZINC CLAD™ I

A ONE-PACKAGE INORGANIC ZINC-RICH COATING

B69A56

RECOMMENDED SYSTEMS

- o **Zinc Primer/Finish (Immersion or Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
Total DFT mils: 3
- o **Acrylic Latex Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
1 ct. DTM Acrylic Gloss Coating B88 Series @ 3 mils DFT
Total DFT mils: 6
- o **Acrylic Latex Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
2 cts. Metalatex Semi-Gloss Coating @ 1.5 mils DFT/ct.
Total DFT mils: 6
- o **Coal Tar Epoxy Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
Hi-Mil Sher-Tar Epoxy B69B40/B60V40 @ 0 mils DFT
Total DFT mils: 19-23
- o **Epoxy Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
1 or 2 cts. Heavy Duty Epoxy B67 Series/B60V3 @ 6 mils DFT/ct.
Total DFT mils: 9-15
- o **Epoxy Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
2 cts. Tie Clad II Epoxy B62 Series/B60V70 @ 4 mils DFT/ct.
Total DFT mils: 11
- o **Urethane Topcoat (Atmospheric)**
1 ct. Zinc Clad I, B69A56 @ 3 mils DFT
1 ct. Tie Clad II B62 Series/B60V70 @ 4 mils DFT (Heavy Duty Epoxy also acceptable.)
NOTE: Topcoat within 30 days:
1 ct. Hi-Bid Polyurethane B65 Series/B60V2 @ 2-3 mils DFT
Total DFT mils: 0-10
(Hi-Solids Polyurethane B65W300 Series also acceptable.)

APPLICATION

Apply a full wet coat using 50% overlap. Take extra precaution to avoid "dry spraying." Double coat edges, welds, bends, etc. During application, film thickness is best checked by monitoring material consumption, allowing a 25% loss factor. After drying, check for dry film thickness using film gauge.

o **Curing:** This coating cures by absorbing moisture. In low humidities or indoors, frequent repeated mist coats of water will accelerate cure. It is preferable to leave coated objects exposed to the weather elements for two weeks or more to achieve maximum cure.

o **Topcoating:** Note minimum cure times at normal conditions before topcoating. Longer drying periods are required if primer cannot be water mist sprayed when humidity is low.

Occasionally topcoats will pinhole or delaminate from zinc-rich coatings. This is usually due to poor ambient conditions or faulty application of topcoats. This can be minimized by:

- Providing thorough ventilation and suitable application and substrate temperature.
- Avoid dry spray of topcoat.
- Applying a wet full coat, but at minimum film build, usually not greater than 5 mils wet.
- If pinholing develops, apply a mist coat, reduced up to 50%. Allow 10 minutes flash off and follow with a full coat.

Recoating itself: Recoat preferably when the first coat is in dry-to-tack state. Reduce second or touch-up coat up to 15% with R7K5E. If first coat has weathered and exhibits salt formation, salts should be removed as above.

Application Conditions:
Temperature: 40°-100°F (air, surface, material)
(at least 5°F above dew point)
Relative Humidity: 20-95%

o **Methods:** Conventional and Airless Spray (Brush - small areas)

Airless Spray: (continuous agitation during application mandatory)

Unit: 30 CFM, 1800-2000 psi pressure, 30:1 (without siphon). Set ball checks to maximum travel for viscous material. Use friction packings. Tip: .017" to .021" Filter: None. Fluid Hose: 3/8" ID. For continuous operation in larger areas, use Spee-Flow Airless Commander Zinc Pump or equivalent airless spray equipment.

Brush: For touch-up and repair only. Keep material well-agitated at all times.

Conventional Spray: (Continuous agitation during application mandatory) Moisture trap required in air line. Blinco 18 gun, 66 fluid oz. nozzle, 63 PSI air nozzle, 1/2" ID fluid hose (50' max. length), 1/2" ID air hose (50' max. length) 30-40 psi atomization pressure, 10-20 psi fluid pressure or equivalent equipment.

Keep pressure pot at level of applicator to avoid blocking of fluid line due to weight of material. Blow back coating in fluid line at intermittent shut-downs; if it continues to be blocked, use of compressor not

Industrial Maintenance Coatings

o **Mixing Instructions:** Thoroughly mix material to a uniform consistency. Pour mixture through 40-60 mesh screen. Continued agitation of mixture during application is required, otherwise zinc dust will quickly settle out. Keep original container tightly closed to prevent contact with atmospheric moisture. Do not reclaim thickened material with solvent.

o **Reduction:** Below 80°F: Xylene R2K4
Above 80°F: R7K5E

o **Reduction:** Up to 10% by volume as necessary to be compatible with the existing application and environmental conditions. Cut back atomization pressure as much as possible. Avoid dry spray.

o **Clean-Up:** Use Xylene, following supplier's safety cautions.

SHERWIN-WILLIAMS USE
SMIS

35 — 6401-97018

PRECAUTIONS

Contents are **FLAMMABLE**. Keep away from heat, sparks and open flame. During use and until all vapors are gone, keep area ventilated; do not smoke; extinguish all flames, pilot lights and heaters; turn off stove, electric tools and appliances and any other source of ignition. Contamination with water, acids or alkalis will produce pressure in a closed container.

CONTAINS XYLENE AND LEAD.

VAPOR AND SPRAY MIST HARMFUL. Use only with adequate ventilation. To avoid overexposure, open windows and doors or use other means to ensure fresh air entry during application and drying. If you experience eye watering, headaches or dizziness, increase fresh air or wear a vapor/particulate respirator (TC23C or equivalent) or leave the area. **THE RESPIRATORY PROTECTION MUST BE WORN DURING SPRAY APPLICATION** and sanding, wirebrushing or other types of abrading, and while burning, brazing or welding the dried film of lead-containing coatings.

Avoid contact with eyes and skin. If ingested, seek medical attention immediately. Wash hands after using. Keep container closed when not in use. Do not transfer contents to other containers for storage.

NOTICE: Reports have associated repeated and prolonged overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents can be harmful or fatal.

**DO NOT TAKE INTERNALLY.
KEEP OUT OF THE REACH OF CHILDREN.**

CONTAINS LEAD: Do not apply on toys and other children's articles, furniture or any interior surface of a dwelling or facility which may be occupied or used by children. Do not apply on any exterior surface of dwelling units, such as window wells, porches, or railings to which children may commonly be exposed.

PRODUCT DATA 7.06

Industrial Maintenance Coatings

KEM HI-TEMP COATINGS NO. 900-SA SERIES

LOW TEMPERATURE CURING
HIGH PERFORMANCE HEAT RESISTANT COATING
*Maximum Service Temperature - No. 2 Silver 900°F (482°C)
*All Other Colors Up To 700°F (371°C), [See *Note Section]

PRODUCT DESCRIPTION:

Kem Hi-Temp No. 900-SA is a low temperature curing, heat resistant coating, curable at temperatures as low as 300F (149C) in sixteen hours or at 400F (204C) in one hour. No. 900-SA is formulated from a specially modified silicone acrylic resin and pure high temperature pigments. Only the finest ingredients available are used to produce this unique coating. The cured film will withstand continuous operating temperatures up to 900F (482C), see "Heat Resistance of Standard Colors" section below for specific temperature capabilities of each color. Kem Hi-Temp No. 900-SA contains no saponifiable resins and is, therefore, suitable for application over zinc rich primers; also suitable for use on stainless steel surfaces where stress corrosion cracking is a major concern. No. 900-SA is formulated with special ingredients to minimize contamination from chlorides, other halides, sulfides, nitrates and metals which are known to induce external stress corrosion cracking of stainless steel. If contains no free metallic zinc and therefore, will not contribute to embrittlement of stainless steel welds.

RECOMMENDED USES:

A protective and decorative coating for use on mufflers, furnaces, boilers, stacks, pipes, and other metal surfaces that will have service temperatures up to 900F (482C). Can be applied direct to any metal surface that has been sandblasted to a white metal finish, or can be applied over organic or inorganic zinc rich primers. Use wherever a low temperature curing, silicone-acrylic, heat resistant coating is desired. Not recommended for use on the inside of ovens, stacks, etc.

PERFORMANCE INFORMATION:

No. 900-SA dries by solvent evaporation and by polymerization, however, the coating must be heat-cured for sixteen hours at 300F (149C) or one hour at 400F (204C) to obtain maximum film properties, resistance to chemicals and heat. Thoroughly cured, the coating shows remarkable ability to withstand prolonged exposure to temperatures up to 900F (482C) see "Heat Resistance of Standard Colors" section below for specific temperature capabilities of each color. No. 900-SA is suitable for application over "Zinc Clad Inorganic Primers". The coating possesses excellent adhesion to zinc rich primers.

When applied over Zinc Clad No. 1, the primer has a tendency to bleed into the No. 900-SA coating, causing the colors to appear slightly lighter. The heat resistance of No. 900-SA is affected by zinc rich primers, due to the lower temperature limits of zinc primers, see "Heat Resistance of Standard Colors" section below.

CHARACTERISTICS:

Finish (*) Gloss
Resin Type Modified silicone acrylic
Type of Cure Solvent evaporation/
polymerization
Drying Time @ 77F (25C) & 50% R.H.

† Heat Resistance of Standard Colors
 No. 900-SA Over Zinc Clad No. 7 Primer
 No. 1 Black.....Up to 500F (260C)
 No. 2 Silver.....Up to 500F (280C)
 Colors, No. 9
 through 19 & 21-22 . . . Up to 450F (232C)

NOTE: When applied direct to metal, all standard colors will withstand dry service temperatures up to 700°F (371°C), No. 2 Silver up to 800°F (462°C). However, during the initial heating cycle, there will be a significant darkening of the asterisk () colors, as the temperatures range from 450F (232C) to 650F (343C). As the temperature increases, the color will lighten to a color very closely resembling the original color, and not appreciably change on cooling and reworking. Should the surface temperature not exceed 650F (343C), the color will remain considerably off color.

† When applied over Zinc Clad Primers, the maximum service temperature is no greater than the Zinc Clad Primer used.

SURFACE PREPARATION:

METAL: All metal surfaces must be sandblasted to a white metal finish, a low profile blast is preferred, as it will give best results. Coat immediately after blasting with desired Zinc Clad Primer or apply No. 300-SA direct to the blasted surface. All surfaces must be clean, dry and free of all contaminants or coating will not form a proper bond. When applied over Zinc Clad Primers, make sure primer is fully cured and dry.

APPLICATION:

Mix thoroughly by boiling or slowly stirring, avoid incorporating air into the paint. Can be applied by brush or spray. Spray application is preferred, as a more uniform film is generally obtained. Thin only as necessary with Xylol (Xylene). No other reducer should be used. Do not apply heavier films than specified, as the coating may blister.

ML
 kind sandblasted metal, apply two coats
 900-SA at the specified coverage rate.
 [††† Characteristics Section (Spreading Rate, Per Coat)] Allow at least 1 1/2 hours drying time at ambient [77F (25C)] temperature. Longer drying time will be required at lower temperatures. Two coats are recommended for heat resistance.

Primed metal. Be sure primer is fully cured. Allow adequate time at recommended temperature and humidity level for complete curing of Zinc Clad Inorganic Zinc Rich Primer. Primer surface must be clean and free of all contaminants. Apply only one coat of 900-SA. NOTE: Colors No. 20 and 23 are not recommended for use on galvanized steel or over zinc rich primers.

SPRAY APPLICATION: No. 900-SA should be reduced approximately 10% by volume, with Xylol (Xylene) thinner before application. Apply at the specified coverage rate, [††† Characteristics Section (Spreading Rate Per Coat)]. A couple of passes may be required to obtain the desired film thickness. Allow to dry a minimum of 1 1/2 hours or until dry before proceeding.

BRUSH APPLICATION: Apply full bodied coats at the specified coverage rates, [††† Characteristics Section (Spreading Rate Per Coat)]. Allow to aldry a minimum of 1 1/2 hours or until dry before proceeding.

CURING: Kem Hi-Temp No. 900-SA must be heat-cured to obtain maximum properties. After final coat has been applied, allow one hour increasing the temperature to 300F (148C), hold for sixteen hours or 400F (204C) for one hour. For temperature between 300F (148C) and 400F (204C), adjust time proportionally.

After curing, for best performance, it is essential that the temperature be taken up slowly, over a period of hours, to the normal operating temperature.

APPLICATION EQUIPMENT:

- Conventional Spray
- Air Supply 12 CFM, 60 psi at nozzle, fluid 15-20 psi
- Gun Graco 217-900 to 217-918 External mix
- Reduction Up to 10%
- Adhes Spray
- Pump Mauler 11 (minimum) 2500 psi
- Strainer 100 Mesh
- Fluid hose 1/4" diameter
- Gun G-10N
- Tip 015 - 020
- Reduction Up to 10%

PRECAUTIONS:

WARNING! FLAMMABLE LIQUID & VAPOR: CONTAINS XYLENE & PETROLEUM DISTILLATES. VAPOR HAZARDOUS. MAY AFFECT THE BRAIN OR NERVOUS SYSTEM CAUSING DIZZINESS, HEADACHE OR NAUSEA. CAUSES EYE, SKIN, NOSE AND THROAT IRRITATION. NOTICE: Reports have associated repeated and prolonged occupational overexposure to solvents with permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents may be harmful or fatal. Keep away from heat, sparks and flame. VAPORS MAY CAUSE FLASH FIRE. Do not smoke. Extinguish all fires, motors and other sources of ignition during use and until all vapors are gone. Prevent build-up of vapors by opening all windows and doors to achieve cross-ventilation.

USE ONLY WITH ADEQUATE VENTILATION. Do not breathe vapors or spray mist. Ensure fresh air entry during application and drying. If you experience eye watering, headache or dizziness or if monitoring demonstrates vapor/mist levels are above applicable limits, wear an appropriate, properly fitted respirator (NIOSH/MSHA approved) during and after application. Follow respirator manufacturer's directions for respirator use. Close container after each use. Avoid contact with eyes, skin and clothing. Wash thoroughly after handling.

FIRST AID: If you experience difficulty in breathing, leave the area to obtain fresh air. If continued difficulty is experienced, get medical assistance immediately. In case of eye contact, flush immediately with plenty of water for at least 15 minutes with soap and water. If swallowed, get medical attention immediately. If applied, contain spilled material and remove with inert absorbent. Dispose of contaminated absorbent, container and unused materials in accordance with local, state and federal regulations.

Information provided herein is based on tests believed to be reliable. In as much as we have no control over the use or application to which others may put this material, we make no guarantee or warranty. This product is sold on the condition that each user of the material make their own evaluation to determine the material's suitability for their own particular use.

KEM HI-TEMP ALUMINUM

100-A-518

PRODUCT DESCRIPTION

KEM HI-TEMP ALUMINUM is a silicone leaching aluminum coating for use where operating temperatures range up to 1000°F. It is self-priming and has excellent exterior durability. An optional catalyst may be used to assure full cure at normal ambient temperatures if the coating cannot be brought up to a minimum temperature of 450°F for 30 minutes.

USES:

- o High temperature steel:
 - ductwork
 - stacks
 - mufflers

RESISTANCE GUIDE:

- o Temperature resistance.....1000°F

CHARACTERISTICS

- o Color: Aluminum
- o Drying Schedule @ 75°F, 50% RH
 - To touch: 2 hours
 - To recoat: 18-24 hours
 - Full cure: 3 days
- o Flash Point: 51°F
- o Number of Components: One (optional catalyst)
- o Packaging: 1 gal.
- o Pot life: 3-5 hours @ 70°F (if catalyzed with 700-C-418)
- o Recommended Spreading Rate: wet mils: 3.0-3.5
dry mils: 1.0-1.2
approx. sq.ft./gal.: 569-700
- o Spreading Rate Coverage: 569 sq.ft./gal. @ 1 mil DFT (theoretical, no loss)
- o Volume Solids: 35%
- o Weight/gal.: 8.7 lbs/gal.
- o VOC: 532 g/l, 4.4 lbs/gal.
- o Shelf Life: 12 months unopened @ 75°F

SURFACE PREPARATION

Remove all grease, oil, dirt or other contaminants by Solvent Cleaning per SSPC-SP1 prior to further surface preparation.

Steel:

- Preferred: SSPC-SP5 White Metal Blast Cleaning
- Minimum: SSPC-SP10 Near-White Metal Blast Cleaning
- Profile height: 0.8 - 1.0 mils.

Remove all weld spatter and round all sharp edges by grinding. Blast clean all surfaces with a sharp, angular abrasive for optimum surface profile. Coat blast-cleaned surfaces within 8 hours of blast-cleaning or before flash rusting occurs.

Industrial Maintenance Coatings

KEM HI-TEMP ALUMINUM

100-A-518

RECOMMENDED SYSTEMS

- o Steel: up to 1000°F
2 cts. Kem Hi-Temp Aluminum @ 1 mil DFT/ct.
Total mils DFT: 2
- o Steel: up to 800°F
1 ct. Kem Hi-Temp Primer 411-A-002 @ 1 mil DFT
1 ct. Kem Hi-Temp Aluminum @ 1 mil DFT
Total mils DFT: 2.0

APPLICATION

- o **Mixing Instructions:**
Stir container thoroughly with power agitation. If using 700-C-418, Catalyst, add 5 fluid oz. per gallon and mix thoroughly.
NOTE: If catalyst is used, it must be used in both coats.
- o **Methods:**
Brush or spray.
- o **Equipment:**
Conventional Spray

	Graeco	Binks
Gun	900	18
Tip and needle	055	83C/83A
Air cap	842	83PE
Atomizing pressure	50-60 psi	50-60 psi
Fluid pressure	10-12 psi	10-12 psi

Airless Spray

Pump ratio	30:1
Tip orifice	.015
Fan width at 12"	12 inches
Fluid pressure	1800 psi
Filter screen	60 mesh
Hose	1/4"
- o **Thinning:**
Up to 10% with Xylol, R2K4.
- o **Induction Time:** 15 minutes @ 77°F (if catalyzed)
- o **Temperature:**
Do not apply at temperatures below 50°F. Surface temperature must be at least 5°F above the dew point.
- o **Ofset Up:**
Xylol, R2K4.

PRECAUTIONS

Contents are **FLAMMABLE**. Vapors may cause flash fires. Keep away from heat, sparks and open flames. During use and until all vapors are gone: keep area ventilated; do not smoke; extinguish all flames, pilot lights and heaters. Turn off stoves, electric tools, appliances, and any other sources of ignition.

CONTAINS ALIPHATIC HYDROCARBONS, AROMATIC HYDROCARBONS, METALLIC PIGMENT.

VAPOR HARMFUL. Use only with adequate ventilation. To avoid overexposure, open windows and doors or use other means to ensure fresh air entry during application and drying. If you experience eye watering, headaches or dizziness, increase fresh air or wear respiratory protection (NIOSH/MSHA TC23C or equivalent) or leave the area.

Avoid contact with eyes and skin. Wash hands after using. Keep container closed when not in use. Do not transfer contents to other containers for storage.

Avoid contamination with water. Water can cause evolution of gas which may result in dangerously increased pressure in closed container.

FIRST AID: In case of eye contact, flush thoroughly with large amounts of water for 15 minutes and get medical attention. For skin contact, wash thoroughly with soap and water. In case of respiratory difficulty, provide fresh air and call physician. If swallowed, get medical attention immediately.

DELAYED EFFECTS FROM LONG TERM OVER-EXPOSURE: Contains solvents which can cause permanent brain and nervous system damage. Intentional misuse by deliberately concentrating and inhaling the contents can be harmful or fatal.

DO NOT TAKE INTERNALLY

KEEP OUT OF THE REACH OF CHILDREN

FOR PROFESSIONAL USE ONLY

NOT FOR RESIDENTIAL USE.

MANUFACTURER'S PRODUCT SPECIFICATION

Schedule 40 & 80 PVC Industrial Pipe

Gas Extraction / Chloro-PVC Pipe, Fittings, and Valves

Scope:

This specification sheet covers the manufacturer's requirements for PVC Schedule 40 and Schedule 80 IPS pressure pipe. This pipe meets or exceeds the industry standards set forth by the American Society for Testing and Materials and the National Sanitation Foundation.

PVC Materials:

Rigid PVC (polyvinyl chloride) used in the extrusion of Schedule 40 and 80 pipe is of Type I, Grade 1 compound as stated in ASTM D-1784. Raw material used in extrusion shall contain the specified amounts of color pigment, stabilizers, and other additives approved by the National Sanitation Foundation.

Dimensions:

Physical dimensions and tolerances of PVC Schedule 40 and 80 pipe meet the requirements of ASTM standard specification D-1785.

Marking:

PVC Schedule 40 and 80 pipe is marked as prescribed in ASTM D-1785 to indicate the manufacturer's name or trademark, material designation code, the nominal pipe size, the Schedule size with the pressure rating in PSI for water at 73°F, the ASTM designation number D-1785, and the NSF seal for potable water.

Sample Specification:

All PVC Schedule 40 and 80 pipe shall conform to ASTM D-1785. Schedule 40 fittings shall conform to ASTM D-2466. Schedule 80 socket fittings to ASTM D-2467 and ASTM D-2484 for threaded Schedule 80 fittings. Both pipe and fittings shall be the product of one manufacturer, as manufactured by Eslon Thermoplastics, Charlotte, North Carolina, 1-800-438-7681, or approved equal.

DIMENSIONS - PIPE AND DUCT

MANUFACTURER'S PRODUCT SPECIFICATION

Schedule 80 PVC Fittings

Scope:

This specification sheet covers the manufacturer's requirements for PVC Schedule 80 pipe fittings. These fittings meet or exceed the standards set by the American Society for Testing and Materials and the National Sanitation Foundation.

PVC Materials:

Rigid PVC (polyvinyl chloride) used in the manufacture of Schedule 80 fittings is of Type I, Grade 1 compound as stated in ASTM D-1784. Raw material used in molding shall contain the specified amounts of color pigment, stabilizers, and other additives approved by the National Sanitation Foundation.

Dimensions:

Physical dimensions and tolerances of PVC Schedule 80 IPS fittings meet the requirements of ASTM standard specification D-2467 for socket-type fittings and ASTM D-2464 for threaded fittings. Threaded fittings have Taper Pipe Threads in accordance with ANSI/ASME B1.20.1.

Marking:

PVC Schedule 80 fittings are marked as prescribed in ASTM D-2464 and D-2467 to indicate the manufacturer's name or trademark, material designation, the NSF mark, size of fitting, and ASTM designation D-2464 (threaded) or D-2467 (socket).

Sample Specification:

All Schedule 80 socket fittings shall conform to ASTM D-2467, and ASTM D-2464 for threaded fittings. Both pipe and fittings shall be the product of one manufacturer, as manufactured by Eslon Thermoplastics; Charlotte, North Carolina, 1-800-438-7681, or approved equal.

NOTES:

Physical dimensions and tolerances meet the requirements of ASTM Standards D-2467 for socket type fittings and D-2464 for threaded fittings. PVC material meets ASTM Standard D-1784.

All dimensions are in inches unless otherwise specified.

Dimensions are subject to change without notice. Contact factory for certification.

TO SPECIFY OR PLACE AN ORDER
USE THE FIGURE NUMBER AND SIZE CODE
EXAMPLE: 801-020 = 2" TEE SXSXS

* Note: All weights are for PVC I Grey and are listed in pounds each. For CPVC weights multiply by 1.09.
Complies with ASTM Standard D-2467.

** 6" FLANGE IS 3.50 DEPTH

2-1/2"-6" Safe Block™ True Union Ball Valves

Hayward 2-1/2" through 6" Safe Block True Union Ball Valves are rated to 225 psi. They provide quick quarter turn shut off and eliminate the need for unions.

Hayward True Union Valves are safe blocked in all sizes and materials. Large size Hayward safe blocked valves feature O-ring backed, reversible teflon seats. This provides a low running and seating torque which extends the cycle life of the valve. Furthermore, should the seats ever become scratched or scored, simply unscrew the seal retainer and reverse the teflon seats for twice the service life. The valve has a highly visible OSHA orange handle that also serves as a special tool used to adjust the seal retainer when compensating for seat wear.

Hayward Safe Block Ball Valves are often used in applications where the fluids being conveyed are highly corrosive and run the full range of the PH scale. Hayward large sized ball valves afford twice the protection against fugitive emissions. A double O-ring stem seal provides a double barrier, preventing chemical seepage through the valve stem.

For added safety, the safe block seal retainer features a left hand thread. The union nut can be disassembled without risk to the seating torque on the ball, or the seating position of the seal retainer. Hayward large size ball valves can be actuated while in service. A unique actuation adaptor kit permits perfect alignment and proper support of Hayward pneumatic and electric actuators.

Hayward 2-1/2" through 4" safe block ball valves are a full port design, while the 6" is venturied from a 4" valve. They are made from NSF approved material and are available in PVC, CPVC, and Polypropylene with Viton or EPDM O-rings.

Features

- 225 psi rated
- Safe Block design
- Internals can be inspected and serviced
- Threaded seal retainer to adjust for seat wear
- Reversible Teflon seats doubles the life of the valve
- Full Port design for greater Cv values
- O-ring backed Teflon seats for low running and seating torque
- Double O-ring stem seals for added sealing against chemical and abrasive attack
- OSHA orange handle designed as adjustable tool
- Simple maintenance performed with no special tools

Options

- 2" Square Operating Nuts
- Valve Safe Lock Outs
- Electric & Pneumatic Actuators

2-1/2"-6" Safe Block True Union Ball Valves Parts List

- 1 Handle
- 2 O-Ring Seals
- 3 End Connector
- 4 Seal Retainer
- 5 Union Nut
- 6 Ball
- 7 Body
- 8 Teflon Seat
- 9 Stem

Selection Chart

Size	Material	End Connection	Seals	Pressure Rating
2 1/2"-4"	PVC	Socket Threaded	Viton	225 psi @ 70° F non shock
3"-4"	CPVC	Socket Threaded or Flanged	EPDM	
6"	PVC	Flanged	Viton or EPDM	
3"-4"	PPL	Threaded or Flanged	Viton	

Engineering Specifications

All True Union Ball Valves 2-1/2" through 6" shall be PVC (Polyvinyl Chloride), CPVC (Chlorinated Polyvinyl Chloride) or Polypropylene with (Socket, Threaded, or Flanged) end connections. Seals shall be (Viton or EPDM) with Teflon seats. Valves 2-1/2" through 4" valve shall be a full port design, 6" shall be venturied from a 4" valve. The valves shall have reversible, O-ring backed Teflon seats, be safe blocked, adjustable for seat wear, and serviceable by removal of the seal retainer. The stems shall have double O-ring seals for added safety. For future automation, the valves shall be adaptable for field mountable actuation. As manufactured by Hayward Industrial Products, Inc.

Introduction

Driscopipe 6400 Polyethylene Piping Systems offer the energy industry and the environmental engineer economic, innovative and modern solutions to age-old problems. This Driscopipe system provides the contemporary engineer proven engineered answers to many traditional problems and new applications.

The plastics industry is over 100 years old, but polyethylene resins were not discovered until the 1930s. The polyethylenes used today in modern piping systems were developed in the early 1950s. One of the first applications was in oil and gas gathering piping systems. Phillips Petroleum Company was one of the pioneers in utilizing the advantages of polyethylene in this area and has over 30 years experience to offer the industry.

Phillips was also one of the first major oil and gas producing companies to diversify into the petrochemical field to upgrade by-products of their producing and refining processes. Phillips is one of the world's largest producers of polyolefin plastics, as well as many other petrochemicals. Polymerization processes developed by Phillips are used worldwide. Today, much of the world's high density polyethylene is made by the Phillips process. It is through this leadership and long established technical know-how that specialized pipe resins were developed.

Driscopipe Piping Systems are the result of a continued team effort by Phillips Petroleum and its subsidiaries — Phillips 66 Company and Phillips Driscopipe, Inc. — to research and develop complete polyethylene piping systems of exceptional quality for demanding applications. Phillips 66 Company takes raw natural gas liquid products produced by Phillips and converts them into base petrochemical feedstocks, such as ethylene. At other plants, Phillips 66 Company converts these feedstocks into numerous polyolefin plastics which are sold under the familiar Marlex® trademark. Some of these Marlex resins are tailor-made for polyethylene pipe. For example, Marlex resins are used to manufacture Driscopipe products which are extremely tough and durable. Phillips has developed special processing techniques and equipment for these resins which achieve finished products unmatched in the industry in quality, engineering properties and performance.

Driscopipe Piping Systems have been installed worldwide. Literally thousands of miles of this pipe are in service in hundreds of different industrial, municipal and general applications. Engineers have used Driscopipe to solve a wide range of problems related to cost, corrosion and serviceability which elude traditional materials.

Phillips Petroleum and its subsidiaries, Phillips 66 Company and Phillips Driscopipe, Inc., form a totally integrated effort from the natural resource raw materials at the well head to the finished piping product. This total organization has been developing, testing and providing polyethylene compounds, piping components and systems since the 1950s.

Lightweight — Flexible

The inherent light weight and flexibility of Driscopipe 6400 provide many cost saving benefits related to handling, storage, hauling, unloading, stringing, joining and installation. Because of its light weight, Driscopipe 6400 can be moved, handled and placed in the ditch with smaller and less expensive construction equipment. Usually, manpower requirements are also reduced.

Driscopipe 6400 weighs less than water. It has a specific gravity of .955-.957 and will float. The combination of light weight and flexibility provides opportunity to heat fusion join the pipe in a convenient work area and pull it into position where terrain or other obstacles present installation problems. The pipe can be joined above ground and rolled or lowered into the trench, allowing the use of smaller trench widths, and eliminating the necessity of placing men and equipment inside the trench. Such installation methods can dramatically reduce the time required for installation in many instances.

The flexibility of Driscopipe 6400 allows it to be curved over, under and around obstacles, and to make elevation and directional changes, thus eliminating the need for some fittings and reducing installation costs. The pipe can be cold bent as it is installed to a nominal radius of 20-40 times the pipe diameter.

DRISCOPIPE

Chemical Resistance

Driscopipe 6400, for all practical purposes, is chemically inert. There are only a few chemicals which will affect it. Naturally occurring chemicals in the soil will not attack Driscopipe or cause it to degrade in any way. It is not an electrical conductor; it does not rot, rust or corrode by electrolytic action or require cathodic protection. It neither supports the growth of, nor is affected by, algae, bacteria or fungi, and is resistant to marine biological attack. Dry, gaseous hydrocarbons have no adverse effect on expected service life. Liquid hydrocarbons will permeate the wall and reduce hydrostatic strength, but will not degrade the material. Upon evaporation of the hydrocarbon, the pipe will regain its original physical properties. When in continuous contact with hydrocarbons, the pipe's hydrostatic strength or

allowable operating pressure must be derated. The method of derating for environmental conditions is covered further in the section entitled, "Temperature and Environmental Service Factors". Driscopipe 6400 will tolerate most downhole corrosion inhibitors, hot soils and sour gas.

Data on specific chemicals and downhole inhibitors is outlined in the following table.

Some reagents are marked with an asterisk (*). Although Driscopipe 6400 is chemically resistant to these agents, under certain conditions they may cause stress cracking.

When handling reagents listed under the "Marginal", "Unsatisfactory", "Not Known" or asterisk categories, consult a Driscopipe Sales Representative for assistance in designing piping systems.

*Test conducted with no failures

Toughness

The overall "toughness" of Driscopipe 6400 is an important characteristic of the pipe. "Toughness" is derived from many of the chemical and physical properties of the material. The pipe is not brittle. It flexes, bends and absorbs impact loads over a wide temperature range of -180°F up to its softening temperature of 260°F. Temperature will affect operating conditions. The method of derating is covered in the Environmental Service Factors section. This inherent resiliency and flexibility of Driscopipe 6400 allows the pipe to absorb surge pressure, vibration and stresses caused by soil movement. Driscopipe can be deformed without permanent damage and with no adverse effect on long term service life.

Driscopipe 6400 is easily cold bent in the field to a minimum radius of 20 to 40 times the pipe diameter. It is flexible for conjoining to installation conditions, and can be heat fused together in one location and pulled into difficult locations to facilitate easy installation. It can be assembled above ground and rolled into less expensive narrow trenches. Driscopipe 6400 has low notch sensitivity, high tear strength and excellent abrasion resistance. Its high resistance to environmental stress cracking ensures no effect on long term service life from installation scratches. The relative toughness of Driscopipe is one of its outstanding engineering characteristics which permits innovative piping design.

Factors

Driscopipe polyethylene pipe has a very smooth inside surface. It maintains excellent flow properties throughout its service life due to its excellent chemical and abrasion resistance. Because of smooth walls and the non-wetting characteristic of polyethylene, high flow capacity and reduced friction loss is possible with Driscopipe 6400. In many cases, this high flow capacity may permit the use of smaller diameter pipe. A "C" factor of 155 is used in water flow calculations (Hazen-Williams Formula).

When the system is to handle "wet gas" with up to 5% concentrations of hydrocarbons, it may require pigging on a regular basis.

In low pressure systems, such as 20 to 25 psig or in small diameter lines, pigging can be accomplished utilizing a long polyurethane or rubber cylinder. The size of the pig should be determined by the inside diameter (I.D.) of the line, which will permit it to pass over the internal fusion bead.

Systems which will be operating at higher pressures may use a polyurethane pig. The corrosion resistance of Driscopipe 6400 and its ability to withstand scale buildup preclude the need for an abrasive pig, nor are they recommended. Crude lines which have paraffin buildup may utilize a crisscross pig.

DRISCOPE

Vacuum or Suction Pipelines

Driscopipe 6400 may be subjected to internal pressure or internal vacuum. There are three general types of vacuum pipelines; above ground, underwater and underground. Each type must be analyzed differently.

Since most oil-patch applications involve above ground or below ground (buried) piping, these two types will be discussed in this brochure.

Typical cases of vacuum or suction pipelines are gravity flow, downhill siphon lines, pipelines which are cleaned by vacuum and gas gathering lines operating under vacuum. When subjected to a vacuum, a sufficiently heavy wall pipe must be selected to resist the collapsing forces. Basically, the pipe's dimension ratio (DR) governs the amount of vacuum a pipeline can support on a short or long term basis. Selection of thicker wall pipe will allow full vacuum for a long time. The above ground vacuum capabilities given in Chart 1 are the practical,

maximum levels of vacuum that Driscopipe 6400 of a given DR can withstand. The data shown in this chart is based on a maximum of 10% ovality at 73.4°F (23°C) and is applicable to environmental conditions which do not affect polyethylene, such as water. Conditions such as ovality, temperature and the presence of liquid hydrocarbons have a significant effect on external pressure loading caused by vacuum conditions. These factors sharply decrease the pipe's vacuum capability. For example, thicker wall pipe will be required to sustain full vacuum at high temperatures.

If the pipe's vacuum rating is exceeded for any length of time, pipeline collapse may be accelerated. Under excessive vacuum, the mode of failure is not immediate closure or collapse but progressive oval deflection. Unlike other types of pipe, collapse by vacuum is not catastrophic for Driscopipe 6400. It can be compressed to over half its original diameter and then restored to roundness (without damage) by applying internal pressure for a short period of time. However, by properly applying Chart 1, the possibility of collapse is minimized.

Chart 1
Vacuum Plus External Load Resistance
Inches of Mercury at 73.4°F

In many cases, as a general rule of thumb, DR 15.5 or DR 17 pipe can be used safely at 70°F or lower temperatures to carry full vacuum. For vacuum pipeline fittings, lower DR (thicker wall) is selected for working fittings. For example, a buried vacuum pipeline using DR 17 pipe would use fittings made from DR 11 pipe.

In below ground or buried pipelines, soil support will provide greater values for external pressures than those in Chart 1. There are many sources of external pressure on a buried pipe such as the static load, the live load and the effective external pressure due to negative internal operating pressure (vacuum).

A buried pipeline operating under a negative pressure (vacuum) not only has the static and live loads acting on the pipe but, also has a vacuum condition which tries to collapse the pipeline. An internal vacuum generates external pressure, expressed in pounds per square foot (psf or lb/ft²), equal in magnitude to the value of the vacuum in psf. The maximum apparent external pressure due to a vacuum inside the pipe is 14.7 psig or approximately 2100 psf.

Generally speaking, when the primary backfill immediately surrounding the pipe is compacted to 85% or better standard proctor density, the pipe soil system is capable of sustaining all external loads placed on it, including the vacuum condition.

All design parameters must be reviewed to make sure the performance limitations of Driscopipe 6400 are not exceeded. Safety factors can be calculated to ensure short term and long term performance of the buried pipeline. Further evaluation of external loads on a buried pipeline can be found in the Driscopipe "Systems Design" brochure, available from a Driscopipe representative.

Weatherability

Driscopipe 6400 is protected against degradation caused by ultraviolet rays from direct sunlight. The raw material contains 2½% of finely divided carbon black . . . which also accounts for the black color of Driscopipe 6400. Carbon black is the most effective single additive for enhancing the weathering characteristics of plastic materials. The protection that even relatively low levels of carbon black impart to the plastic is so great, that it is not necessary to use other UV absorbers.

Weatherability tests indicate that Driscopipe 6400 can be safely stored outside in most climates for periods of many years without danger of loss of physical properties due to UV exposure.

Applications

Driscopipe 6400 is extruded from a Type III, Class C, Category 5, Grade P34 compound as described in ASTM D 1248. It is classified as cell 345434C according to ASTM D 3350 and has the material designation of PE 3408. The pipe is manufactured to meet the requirements of ASTM D 2513 which is necessary to meet the Pipeline Safety Regulations Part 192, Minimum Federal Safety Standards for the transport of natural gas. Driscopipe 6400 also meets the requirements of API 15LE (American Petroleum Institute's Standard for Plastic Pipe).

By meeting the requirements of these two important specifications, Driscopipe 6400 is well qualified to meet the demanding needs of the energy market in applications such as oil and gas gathering systems, methane recovery from coal seams and landfills, and water supply lines for oil recovery systems.

The properties discussed in the preceding sections, plus the excellent flow characteristics of high density polyethylene piping, enhance the performance of Driscopipe 6400.

A thorough discussion of installation, design and hydraulic parameters is available through a Driscopipe representative.

ings

Driscopipe offers a complete line of fittings. Fittings larger than 12" are available as fabricated items made from pipe segments. Molded butt fusion fittings are available up to and including 12". A complete listing of available fittings may be obtained from a Driscopipe representative.

Working Pressure

The working pressure for Driscopipe 6400 applications are determined as follows.

$$P = \frac{2S}{DR - 1} \times SF \times EF$$

- Where: S = 1600 psig (Hydrostatic Design Basis)
- P = Pressure Rating, psig
- DR = $\frac{\text{Outside Diameter (Inches)}}{\text{Minimum Wall Thickness (Inches)}}$
- SF = Design Safety Factor
- EF = Environmental Service Factor

Design Safety Factor

The Design Safety Factor is a derating factor to compensate for system variables in a thermoplastic piping installation. A factor of 0.5 is recommended for water or for dry natural gas in areas not affected by Federal regulations.

The Design Safety Factor for dry natural gas in areas under the jurisdiction of the Federal Department Of Transportation (DOT), according to Title 49, CFR, Subchapter D, Part 192.123, is 0.32 with a maximum allowable operating pressure of 100 psig. Higher pressure systems may be granted by a waiver from DOT.

Environmental Service Factors

The Environmental Service Factor is an additional derating factor to compensate for high temperatures or other environmental conditions of the installation. The use of this derating factor is recommended in API Spec 15LE.

Using both the Design Safety Factor (.5) and the appropriate derating factor for each temperature (see table), the following operating pressures may be used for Driscopipe 6400 for water, dry natural gas or dry recovered methane.

Working Pressures For PE3408 at Various Temperatures For Water Or Dry Gas (SF = .5 Included) (See Following "CAUTION"):

Temp.	EF Temp.	SDR 7	SDR 9	SDR 11	SDR 17
73.4°F	1.00	265 psig	200 psig	160 psig	100 psig
100°F	0.79	210 psig	158 psig	126 psig	79 psig
120°F	0.62	165 psig	125 psig	100 psig	63 psig
140°F	0.50	133 psig	100 psig	80 psig	50 psig

CAUTION: Derating Factor For Wet Gas Or Crude Oil

If polyethylene pipe is to be in continuous contact with crude oil and wet gas (liquid hydrocarbons), the operating pressure selected from these charts should be reduced an additional 50% (EF = 0.5) for 73°F operation.

Example Calculations:

(a) DR 11 pipe (any size) to move dry gas at 100°F.

$$P = \frac{2 \times 1600}{10} \times .5 \times .79 = 128 \text{ psig}$$

(b) DR 7 pipe (any size) for crude oil line service at 70°F.

$$P = \frac{2 \times 1600}{6} \times .5 \times 1.0 \times .5 = 133 \text{ psig}$$

PE 3408 Material Designation

Materials designated as PE 3408 have a hydrostatic design basis of 1600 psig for water at 73°F. After applying the 0.5 design safety factor, the design working stress for 73°F is 800 psig. Thus, a Grade P34 polyethylene material is designated as PE 3408. Driscopipe 6400 qualifies for this material designation.

Life Expectancy

The hydrostatic design basis for Driscopipe 6400 is based on hydrostatic testing data evaluated by standardized industry methods. Life expectancy is estimated conservatively to be in excess of 50 years when proper design and environmental service factors are used to match the pipe design working pressure to the application condition.

Joining

Driscopipe 6400 can be joined by heat fusion, flanging or utilizing mechanical fittings.

Butt heat fusion joining is the recommended method for joining Driscopipe 6400. Phillips has utilized butt heat fusion for over 30 years of Driscopipe's polyethylene piping experience in the oil fields. Butt heat fusion has proven to be fast, economical and highly reliable. The butt heat fusion joints are stronger than the pipe wall as shown in Fig. 1 where the quick burst test shows the ductile break in the wall and not in the fusion joint. This is also shown in Fig. 2 in a tensile pull test.

Figure 1
Quick Burst Test

Figure 2
Tensile Pull Test

Figure 3
Molded Flange Adapter

ed connections, steel to plastic and plastic to plastic, may be made with Driscopipe flange adapters (See Fig. 3).

Iron pipe sized mechanical or compression fittings will also join Driscopipe 6400. Close fitting, properly sized internal stiffeners are recommended. In corrosive applications, the stiffener should be stainless steel or coated steel.

The superior chemical resistance of Driscopipe 6400 will not permit solvent cement joining. Threading of the pipe is not recommended.

A complete line of steel to polyethylene transition fittings are also available.

Heat Fusion

The heat fusion method is a highly efficient, economical method for joining Driscopipe 6400. The heat fusion method of joining high density polyethylene pipe began shortly after the first commercial production of high density polyethylene pipe in the mid-1950s by Phillips Petroleum Company.

The modern day joint is the same as the joint which was made on the first crude fusion equipment in 1956. However, the equipment has evolved to gain efficiency, reliability and convenience. The many principles learned on that early equipment for making a successful joint are still in use today. Phillips Petroleum Company designed, developed and built many new models of heat fusion equipment from 1956 until the early 1970s. Since that time, Phillips Driscopipe personnel have guided this development by others. Phillips pioneered the idea and development of the heat fusion joining system, and has used it exclusively in polyethylene piping systems sold by Phillips since 1956. There are millions of these joints in service today.

Phillips Driscopipe, Inc. does not manufacture fusion equipment but a Driscopipe representative can supply equipment sources.

The heat fusion method is an uncomplicated, visual procedure with straightforward instructions. No "timing cycles" are necessary. The visual procedure allows the operator to concentrate on his work, rather than a clock. Visually, he knows when the pipe ends have melted to the degree required to fuse them together. He controls fusion pressure by observing the amount and configuration of the fusion bead as it is formed.

The principle of heat fusion is to heat two pipe surfaces to the proper temperature, then bring the two surfaces together and allow them to fuse by application of pressure. The pressure causes the melted materials to flow together, effecting mixing and, thus, fusion. On cooling, the original interfaces are gone and the two parts are united. Nothing is added to, or changed chemically, between the two pieces being joined. Fusion demonstrations and training can be arranged through a Driscopipe representative.

Burial

The high possibility of physical damage and environmental concerns are important factors in recommending that Driscopipe 6400 be buried. Engineering details and other burial considerations are discussed in other Driscopipe brochures.

Trenching

The width of the trench is usually determined by the diameter of the pipe. The pipe should have some slack and the trench should be wide enough to provide for good compaction of soil around the pipe. Detector tapes are available from other sources for pipeline detection.

The depth of the trench should be sufficient to provide a minimum of 30 inches of cover. In cultivated areas this should be increased to 36 inches.

Valve locations should be planned so that "bell holes" can be provided which will permit the pipe to lay flat on the trench bottom after being connected and before initial backfill and compaction.

Since gas liquids, including water, will collect in the low spots of any gathering system, it may be desirable to establish "drip pots" at the collecting points to provide for removal of the liquids.

A reasonable distance should be established and maintained from any source of heat.

where the terrain or topography may dictate, Driscopipe 6400 has been joined in a more practical area, then pulled or pushed into place. This has been done with lengths of 1000 feet or more.

Although fittings are available, the ability to cold bend Driscopipe 6400 in the field to a radius of 20 to 40 times its nominal O.D. eliminates the need for fittings required in other systems.

Backfill

Prior to any backfilling, the system should be pressure tested. Clean backfill, free of stones, debris, etc., should be placed around the haunches of the pipe, in lifts, and over the pipe to a minimum of 4 inches in depth. After compacting this primary bedding, less suitable material may be used to backfill to grade. Compaction utilizing heavy equipment is not advisable unless a minimum of 15 psi pressure is maintained in the pipe and then only after a minimum of 20 inches of cover has been established.

Due to expansion and contraction, inherent in thermoplastics, it is recommended that sufficient time be provided to permit the pipe to attain the lower ground temperatures before the pipe is joined to other sections or the system is terminated.

Special Considerations

Polyethylene pipe will develop very high static electricity charges under certain conditions. One of these conditions occurs during the squeeze-off procedure. Special precautions must be taken to accommodate this phenomenon.

Properly designed tools must be used when squeezing off Driscopipe 6400.

Phillips Driscopipe, Inc. has developed Technical Notes which are available upon request, addressing the above items as well as other topics.

BarbVark™ Quick Connect Pipe Joints

Patent Pending

Interlocking Barbs give the BarbVark™ Pipe Joint a fast, simple and strong connection in a fraction of the time it takes to fusion weld.

FITTINGS

Tees, elbows, caps etc. are available with BarbVark™ Quick Connect Pipe Joints. Call for dimensions.

- A. Align joints. B. Push together.
- C. Joint assembles in seconds.

Available on all our polyethylene pipe, slotted or blank.

REUSABLE QUICK CONNECT/DISCONNECT JOINT

Reusable BarbVark™ Quick Connect Joint available for installations that require moving from time to time. Using our assembly tool, simply snap the joint together, and when desired snap apart again.

Assembly Comparison

**BarbVark™
Quick Connect
Pipe Joints**

VERSUS

**Fusion
Welding**

In many collection and screen applications the installation of polyethylene pipe by fusion welding is too slow and expensive. Often work crews sit and wait for the painfully slow pipe fusion welding process and eat up thousands of dollars of unproductive time. Fortunately there is an alternative: BarbVark™ Quick Connect Pipe Joints. These snap together joints cut the assembly time of polyethylene pipe into a small fraction of the time used in fusion welding.

Using an example of a 4" SDR 15.5 Polyethylene Slotted Pipe Installation on a geomembrane liner we can accurately estimate the time savings provided by using BarbVark™ Pipe Joints. After laying the 20 foot lengths end to end on the liner let's compare the time to assemble a 3,000' length between fusion welding and BarbVark™ Pipe Joints.

BarbVark™ Quick Connect Pipe Joints

Patent Pending

Requirements: 1 one person crew, \$ _____ .00 a day
(no training or special abilities needed)
: Assembly tool rental, \$75.00 day

Assembly time per joint: 2 minutes = 600' hour
3,000' ÷ 600' hour = 5 hours

Fusion Welding

Requirements: 2 person crew, \$ _____ .00 a day
(one worker should be a certified fusion welder)
: fusion welder rental, \$75.00 day

Assembly time
per joint: 10 minutes = 120' hour
3,000' ÷ 120' hour = 25 hours or 3+ days

CONCLUSION

Labor:	Fusion welding: 50 man hours*
	BarbVark™: 5 man hours
Tool Rental:	Fusion welding: \$300.00
	BarbVark™: \$ 75.00
Assembly Time:	Fusion welding: 25 hours
	BarbVark™: 5 hours

D-6-A

Use these assembly times to estimate the costs of down time for other crews waiting for completion of pipe installation.

*Expenses can be much greater if a certified welder is brought in to perform fusion welding.

Pressure Rating

All molded fittings and reducers, flange adapters, stub ends, branch saddles, branch saddle reducing tees, and transition fittings are fully pressure rated to match the pipe SDR pressure rating to which they are made. The shape of fabricated fittings are substantially different than the shape of straight pipe. As a result, stresses imposed on fabricated fittings are higher than those imposed on pipe. Therefore, it is recommended that the pressure rating of fabricated ells, wyes and tees be re-rated to approximately 75% of the pressure rating of the pipe used to fabricate the fitting. If the full pressure rating of the pipe is required, *Phillips Driscopipe* recommends using a heavier wall fitting (25%) where available. As an alternate measure, when properly designed concrete encasement or other external reinforcement is used on ells, wyes and tees, the pressure rating can be increased to the working pressure of the pipe from which it is fabricated. Specific recommendations for concrete encasement are shown in the *Driscopipe® Systems Installation brochure*.

Installation Precautions

Driscopipe® fabricated tees, elbows and wyes are made by butt fusing or sidewall fusing together special cut segments of Driscopipe® pipe to obtain the desired fitting. The configuration of these fittings, and the fact that they are fabricated rather than molded, requires that certain precautions be taken when installing them into a piping system.

The installation procedures should provide the least possible amount of lifting and moving of the assembled pipe and fabricated fittings. If it becomes necessary to pull the assembly along side the ditch to properly position it, the fabricated fitting should never be used as the point of attachment for the pulling.

The fusion joining of a fabricated tee and wye into a system becomes complicated because of the third side. It is not too difficult to keep strain off the fitting when fusing pipe to the running side of the tee and lifting and lowering this much of the assembly into position in a ditch. It is when sufficient pipe is added to the third (branch) side to permit the laying of pipe in this direction, that the assembly becomes very difficult to handle. Final handling and positioning of these assemblies requires extra handling equipment and additional precautions to prevent damage to the fabricated fitting.

Recommended Alternate Method: The need for extra equipment and much of the possibility of damage can be eliminated by altering the method of installing the fabricated tee and wye to include the use of a flanged connection on the branch side. This will allow final positioning to take place before the branch side is connected. There will be some instances where it will prove very advantageous from an installation viewpoint to use flanged connections on two sides of a tee or wye and also one side of the elbow. This allows the pipe to be laid from either direction, pushed or pulled into tight locations, rolled into the ditch, and generally handled much easier and faster...before the final connection is made at the tee, wye, or elbow. From the standpoint of economy, speed and ease of installation, and eliminate the occurrence of excessive installation stresses of fabricated fittings, it is recommended that flanged connections always be used on the branch side of tees and wyes and on one end of elbows for larger diameter pipes.

-
- Driscopipe® 1000/6400 Molded fittings are made from the same resin as the Driscopipe® 1000 & 6400 series pipe.
 - Driscopipe® Fabricated fittings are manufactured from Driscopipe® 1000 & 6400 piping systems. Fabricated ells, wyes and tees are made by butt fusing together mitre cut segments of pipe to obtain the desired shape.
 - Fabricated elbows: Due to the nature of polyethylene and the mitered fusion process, the tolerance is generally plus or minus one degree per segment. The broad tolerance typically causes no installation problems due to the flexibility of polyethylene.
 - Driscopipe® special fittings are custom designed for your specific application through your Phillips Driscopipe, Inc. representative.

Slip-On Metal Flanges

Slip-on flanges are made from ductile iron. Flanges from other materials can also be supplied for specific applications. The metal flanges are drilled to ANSI B16.5 bolt circles. Flanges can be supplied with corrosion resistant coatings.

Ductile Iron

Polyethylene Stub-Ends

For joining SCLAIRPIPE high-density polyethylene pipe to other piping materials, to ancillary equipment, or to special fittings, a mechanical fitting is usually required. For these types of connections a flange assembly is the preferred method. This assembly consists of a slip-on metal flange and a polyethylene stub end. These stub ends carry the same pressure rating as the pipe and are butt fused to the pipe end. A stub end must be the same DR rating as the pipe to which it is joined. (i.e. a DR 15.5 stub end must be used with DR 15.5 SCLAIRPIPE)

Joining Sclairpipe to other materials

Because of the many variations of flange styles and dimensions, it would be beyond the scope of this brochure to detail all connections. The line drawing and table below show dimension "A" - the combined thickness of a SCLAIRPIPE stub end and of a standard flange. The designer should supply dimension "B" based on the actual flange thickness being used on the connecting pipe, plus gasket and washer thicknesses. Then

by allowing for the nut and clear thread the bolt length "L" can be determined. The designer should always ensure that dimension "C" is less than the available thread length.

Sclairpipe to Sclairpipe Flanged Connection

The tables below detail the bolt length "L" requirements for a SCLAIRPIPE to SCLAIRPIPE connection using standard flange assemblies supplied by KWH Pipe. The dimensions supplied are based on the use of carbon-steel bolts and nuts, with the nuts being semi-finished heavy hex and bolt heads being regular heavy hex. An additional allowance of 3 in. of threaded length should be made to bolt lengths for underwater connections for ease of assembly.

Toughness

The overall "toughness" of Driscopipe 6400 is an important characteristic of the pipe. "Toughness" is derived from many of the chemical and physical properties of the material. The pipe is not brittle. It flexes, bends and absorbs impact loads over a wide temperature range of -180°F up to its softening temperature of 260°F. Temperature will affect operating conditions. The method of derating is covered in the Environmental Service Factors section.

This inherent resiliency and flexibility of Driscopipe 6400 allows the pipe to absorb surge pressure, vibration and stresses caused by soil movement. Driscopipe can be deformed without permanent damage and with no adverse effect on long term service life.

Driscopipe 6400 is easily cold bent in the field to a minimum radius of 20 to 40 times the pipe diameter. It is flexible for contouring to installation conditions, and can be heat fused together in one location and pulled into difficult locations to facilitate easy installation. It can be assembled above ground and rolled into less expensive narrow trenches.

Driscopipe 6400 has low notch sensitivity, high tear strength and excellent abrasion resistance. Its high resistance to environmental stress cracking ensures no effect on long term service life from installation scratches. The relative toughness of Driscopipe is one of its outstanding engineering characteristics which permits innovative piping design.

Key Factors

Driscopipe polyethylene pipe has a very smooth inside surface. It maintains excellent flow properties throughout its service life due to its excellent chemical and abrasion resistance. Because of smooth walls and the non-wetting characteristic of polyethylene, high flow capacity and reduced friction loss is possible with Driscopipe 6400. In many cases, this high flow capacity may permit the use of smaller diameter pipe. A "C" factor of 155 is used in water flow calculations (Hazen-Williams Formula).

When the system is to handle "wet gas" with up to 5% concentrations of hydrocarbons, it may require pigging on a regular basis.

In low pressure systems, such as 20 to 25 psig or in small diameter lines, pigging can be accomplished utilizing a long polyurethane or rubber cylinder. The size of the pig should be determined by the inside diameter (I.D.) of the line, which will permit it to pass over the internal fusion bead.

Systems which will be operating at higher pressures may use a polyurethane pig. The corrosion resistance of Driscopipe 6400 and its ability to withstand scale buildup preclude the need for an abrasive pig, nor are they recommended. Crude lines which have paraffin buildup may utilize a crisscross pig.

Vacuum or Suction Pipelines

Driscopipe 6400 may be subjected to internal pressure or internal vacuum. There are three general types of vacuum pipelines: above ground, underwater and underground. Each type must be analyzed differently.

Since most oil-patch applications involve above ground or below ground (buried) piping, these two types will be discussed in this brochure.

Typical cases of vacuum or suction pipelines are gravity flow, downhill siphon lines, pipelines which are cleaned by vacuum and gas gathering lines operating under vacuum. When subjected to a vacuum, a sufficiently heavy wall pipe must be selected to resist the collapsing forces. Basically, the pipe's dimension ratio (DR) governs the amount of vacuum a pipeline can support on a short or long term basis. Selection of thicker wall pipe will allow full vacuum for a long time. The above ground vacuum capabilities given in Chart 1 are the practical,

maximum levels of vacuum that Driscopipe 6400 of a given DR can withstand. The data shown in this chart is based on a maximum of 10% ovality at 73.4°F (23°C) and is applicable to environmental conditions which do not affect polyethylene, such as water. Conditions such as ovality, temperature and the presence of liquid hydrocarbons have a significant effect on external pressure loading caused by vacuum conditions. These factors sharply decrease the pipe's vacuum capability. For example, thicker wall pipe will be required to sustain full vacuum at high temperatures.

If the pipe's vacuum rating is exceeded for any length of time, pipeline collapse may be accelerated. Under excessive vacuum, the mode of failure is not immediate closure or collapse but progressive oval deflection. Unlike other types of pipe, collapse by vacuum is not catastrophic for Driscopipe 6400. It can be compressed to over half its original diameter and then restored to roundness (without damage) by applying internal pressure for a short period of time. However, by properly applying Chart 1, the possibility of collapse is minimized.

Chart 1
Vacuum Plus External Load Resistance
Inches of Mercury at 73.4°F

In any cases, as a general rule of thumb, DR 15.5 or DR pipe can be used safely at 70°F or lower temperatures to carry full vacuum. For vacuum pipeline fittings, lower DR (thicker wall) is selected for working fittings. For example, a buried vacuum pipeline using DR 17 pipe would use fittings made from DR 11 pipe.

In below ground or buried pipelines, soil support will provide greater values for external pressures than those in Chart 1. There are many sources of external pressure on a buried pipe such as the static load, the live load and the effective external pressure due to negative internal operating pressure (vacuum).

A buried pipeline operating under a negative pressure (vacuum) not only has the static and live loads acting on the pipe but, also has a vacuum condition which tries to collapse the pipeline. An internal vacuum generates external pressure, expressed in pounds per square foot (psf or lb/ft²), equal in magnitude to the value of the vacuum in psf. The maximum apparent external pressure due to a vacuum inside the pipe is 14.7 psig or approximately 2100 psf.

Generally speaking, when the primary backfill immediately surrounding the pipe is compacted to 85% or better standard proctor density, the pipe soil system is capable of sustaining all external loads placed on it, including the vacuum condition.

All design parameters must be reviewed to make sure the performance limitations of Driscopipe 6400 are not exceeded. Safety factors can be calculated to ensure short term and long term performance of the buried pipeline. Further evaluation of external loads on a buried pipeline can be found in the Driscopipe "Systems Design" brochure, available from a Driscopipe representative.

Weatherability

Driscopipe 6400 is protected against degradation caused by ultraviolet rays from direct sunlight. The raw material contains 2 1/2% of finely divided carbon black . . . which also accounts for the black color of Driscopipe 6400. Carbon black is the most effective single additive for enhancing the weathering characteristics of plastic materials. The protection that even relatively low levels of carbon black impart to the plastic is so great, that it is not necessary to use other UV absorbers.

Weatherability tests indicate that Driscopipe 6400 can be safely stored outside in most climates for periods of many years without danger of loss of physical properties due to UV exposure.

Applications

Driscopipe 6400 is extruded from a Type III, Class C, Category 5, Grade P34 compound as described in ASTM D 1248. It is classified as cell 345434C according to ASTM D 3350 and has the material designation of PE 3406. The pipe is manufactured to meet the requirements of ASTM D 2513 which is necessary to meet the Pipeline Safety Regulations Part 192, Minimum Federal Safety Standards for the transport of natural gas. Driscopipe 6400 also meets the requirements of API 15LE (American Petroleum Institute's Standard for Plastic Pipe).

By meeting the requirements of these two important specifications, Driscopipe 6400 is well qualified to meet the demanding needs of the energy market in applications such as oil and gas gathering systems, methane recovery from coal seams and landfills, and water supply lines for oil recovery systems.

The properties discussed in the preceding sections, plus the excellent flow characteristics of high density polyethylene piping, enhance the performance of Driscopipe 6400.

A thorough discussion of installation, design and hydraulic parameters is available through a Driscopipe representative.

Fittings

Driscopipe offers a complete line of fittings. Fittings larger than 12" are available as fabricated items made from pipe segments. Molded butt fusion fittings are available up to and including 12". A complete listing of available fittings may be obtained from a Driscopipe representative.

Working Pressure

The working pressure for Driscopipe 6400 applications are determined as follows.

$$P = \frac{2S}{DR-1} \times SF \times EF$$

Where: S = 1600 psig (Hydrostatic Design Basis)
 P = Pressure Rating, psig
 DR = $\frac{\text{Outside Diameter (Inches)}}{\text{Minimum Wall Thickness (Inches)}}$
 SF = Design Safety Factor
 EF = Environmental Service Factor

Design Safety Factor

The Design Safety Factor is a derating factor to compensate for system variables in a thermoplastic piping installation. A factor of 0.5 is recommended for water or for dry natural gas in areas not affected by Federal regulations.

The Design Safety Factor for dry natural gas in areas under the jurisdiction of the Federal Department Of Transportation (DOT), according to Title 49, CFR, Subchapter D, Part 192.123, is 0.32 with a maximum allowable operating pressure of 100 psig. Higher pressure systems may be granted by a waiver from DOT.

Environmental Service Factors

The Environmental Service Factor is an additional derating factor to compensate for high temperatures or other environmental conditions of the installation. The use of this derating factor is recommended in API Spec 15LE.

Using both the Design Safety Factor (.5) and the appropriate derating factor for each temperature (see table), the following operating pressures may be used for Driscopipe 6400 for water, dry natural gas or dry recovered methane.

Working Pressures For PE3408 at Various Temperatures For Water Or Dry Gas (SF = .5 Included) (See Following "CAUTION"):

Temp.	EF	SDR 7	SDR 9	SDR 11	SDR 17

CAUTION: Derating Factor For Wet Gas Or Crude Oil

If polyethylene pipe is to be in continuous contact with crude oil and wet gas (liquid hydrocarbons), the operating pressure selected from these charts should be reduced an additional 50% (EF = 0.5) for 73°F operation.

Example Calculations:

(a) DR 11 pipe (any size) to move dry gas at 100°F.

$$P = \frac{2 \times 1600}{10} \times .5 \times .79 = 126 \text{ psig}$$

(b) DR 7 pipe (any size) for crude oil line service at 70°F.

$$P = \frac{2 \times 1600}{6} \times .5 \times 1.0 \times .5 = 133 \text{ psig}$$

PE 3408 Material Designation

Materials designated as PE 3408 have a hydrostatic design basis of 1600 psig for water at 73°F. After applying the 0.5 design safety factor, the design working stress for 73°F is 800 psig. Thus, a Grade P34 polyethylene material is designated as PE 3408. Driscopipe 6400 qualifies for this material designation.

Life Expectancy

The hydrostatic design basis for Driscopipe 6400 is based on hydrostatic testing data evaluated by standardized industry methods. Life expectancy is estimated conservatively to be in excess of 50 years when proper design and environmental service factors are used to match the pipe design working pressure to the application condition.

Joining

Driscopipe 6400 can be joined by heat fusion, flanging or utilizing mechanical fittings.

Butt heat fusion joining is the recommended method for joining Driscopipe 6400. Phillips has utilized butt heat fusion for over 30 years of Driscopipe's polyethylene piping experience in the oil fields. Butt heat fusion has proven to be fast, economical and highly reliable. The butt heat fusion joints are stronger than the pipe wall as shown in Fig. 1 where the quick burst test shows the ductile break in the wall and not in the fusion joint. This is also shown in Fig. 2 in a tensile pull test.

Figure 1
Quick Burst Test

Figure 2
Tensile Pull Test

Figure 3
Molded Flange Adapter

anged connections, steel to plastic and plastic to plastic, may be made with Driscopipe flange adapters (See Fig. 3).

Iron pipe sized mechanical or compression fittings will also join Driscopipe 6400. Close fitting, properly sized internal stiffeners are recommended. In corrosive applications, the stiffener should be stainless steel or coated steel.

The superior chemical resistance of Driscopipe 6400 will not permit solvent cement joining. Threading of the pipe is not recommended.

A complete line of steel to polyethylene transition fittings are also available.

Heat Fusion

The heat fusion method is a highly efficient, economical method for joining Driscopipe 6400. The heat fusion method of joining high density polyethylene pipe began shortly after the first commercial production of high density polyethylene pipe in the mid-1950s by Phillips Petroleum Company.

The modern day joint is the same as the joint which was made on the first crude fusion equipment in 1956. However, the equipment has evolved to gain efficiency, reliability and convenience. The many principles learned on that early equipment for making a successful joint are still in use today. Phillips Petroleum Company designed, developed and built many new models of heat fusion equipment from 1956 until the early 1970s. Since that time, Phillips Driscopipe personnel have guided this development by others. Phillips pioneered the idea and development of the heat fusion joining system, and has used it exclusively in polyethylene piping systems sold by Phillips since 1956. There are millions of these joints in service today.

Phillips Driscopipe, Inc. does not manufacture fusion equipment but a Driscopipe representative can supply equipment sources.

The heat fusion method is an uncomplicated, visual procedure with straightforward instructions. No "timing cycles" are necessary. The visual procedure allows the operator to concentrate on his work, rather than a clock. Visually, he knows when the pipe ends have melted to the degree required to fuse them together. He controls fusion pressure by observing the amount and configuration of the fusion bead as it is formed.

The principle of heat fusion is to heat two pipe surfaces to the proper temperature, then bring the two surfaces together and allow them to fuse by application of pressure. The pressure causes the melted materials to flow together, effecting mixing and, thus, fusion. On cooling, the original interfaces are gone and the two parts are united. Nothing is added to, or changed chemically, between the two pieces being joined. Fusion demonstrations and training can be arranged through a Driscopipe representative.

Burial

The high possibility of physical damage and environmental concerns are important factors in recommending that Driscopipe 6400 be buried. Engineering details and other burial considerations are discussed in other Driscopipe brochures.

Trenching

The width of the trench is usually determined by the diameter of the pipe. The pipe should have some slack and the trench should be wide enough to provide for good compaction of soil around the pipe. Detector tapes are available from other sources for pipeline detection.

The depth of the trench should be sufficient to provide a minimum of 30 inches of cover. In cultivated areas this should be increased to 36 inches.

Valve locations should be planned so that "bell holes" can be provided which will permit the pipe to lay flat on the trench bottom after being connected and before initial backfill and compaction.

Since gas liquids, including water, will collect in the low spots of any gathering system, it may be desirable to establish "drip pots" at the collecting points to provide for removal of the liquids.

A reasonable distance should be established and maintained from any source of heat.

Where the terrain or topography may dictate, Driscopipe 6400 has been joined in a more practical area, then pulled or pushed into place. This has been done with lengths of 1000 feet or more.

Although fittings are available, the ability to cold bend Driscopipe 6400 in the field to a radius of 20 to 40 times its nominal O.D. eliminates the need for fittings required in other systems.

Backfill

Prior to any backfilling, the system should be pressure tested. Clean backfill, free of stones, debris, etc., should be placed around the haunches of the pipe, in lifts, and over the pipe to a minimum of 4 inches in depth. After compacting this primary bedding, less suitable material may be used to backfill to grade. Compaction utilizing heavy equipment is not advisable unless a minimum of 15 psi pressure is maintained in the pipe and then only after a minimum of 20 inches of cover has been established.

Due to expansion and contraction, inherent in thermoplastics, it is recommended that sufficient time be provided to permit the pipe to attain the lower ground temperatures before the pipe is joined to other sections or the system is terminated.

Special Considerations

Polyethylene pipe will develop very high static electricity charges under certain conditions. One of these conditions occurs during the squeeze-off procedure. Special precautions must be taken to accommodate this phenomenon.

Properly designed tools must be used when squeezing off Driscopipe 6400.

Phillips Driscopipe, Inc. has developed Technical Notes which are available upon request, addressing the above items as well as other topics.

Blind flanges are drilled to 150# bolt pattern to mate with 150# forged steel flanges - ANSI B16.1, 150# plate, steel flanges - AWA C207 and 125# cast iron flanges - ANSI B16.1. Special dimensioned flanges and non-ductile iron flanges quoted upon request.

TECHNICAL CONSIDERATIONS

Pressure Rating

All molded fittings and reducers, flange adapters, stub ends, branch saddles, branch saddle reducing tees, and transition fittings are fully pressure rated to match the pipe SDR pressure rating to which they are made. The shape of fabricated fittings are substantially different than the shape of straight pipe. As a result, stresses imposed on fabricated fittings are higher than those imposed on pipe. Therefore, it is recommended that the pressure rating of fabricated tees, wyes and elbows be re-rated to approximately 75% of the pressure rating of the pipe used to fabricate the fitting. If the full pressure rating of the pipe is required, *Phillips Driscopipe* recommends using a heavier wall fitting (25%) where available. As an alternate measure, when properly designed concrete encasement or other external reinforcement is used on tees, wyes and elbows, the pressure rating can be increased to the working pressure of the pipe from which it is fabricated. Specific recommendations for concrete encasement are shown in the *Driscopipe Systems Installation* brochure.

Installation Precautions

Driscopipe fabricated tees, elbows and wyes are made by butt fusing or sidewall fusing together special cut segments of Driscopipe pipe to obtain the desired fitting. The configuration of these fittings, and the fact that they are fabricated rather than molded, requires that certain precautions be taken when installing them into a piping system.

The installation procedures should provide the least possible amount of lifting and moving of the assembled pipe and fabricated fittings. If it becomes necessary to pull the assembly along side the ditch to properly position it, the fabricated fitting should never be used as the point of attachment for the pulling.

The fusion joining of a fabricated tee and wye into a system becomes complicated because of the third side. It is not too difficult to keep strain off the fitting when fusing pipe to the running side of the tee and lifting and lowering this much of the assembly into position in a ditch. It is when sufficient pipe is added to the third (branch) side to permit the laying of pipe in this direction, that the assembly becomes very difficult to handle. Final handling and positioning of these assemblies requires extra handling equipment and additional precautions to prevent damage to the fabricated fitting.

Recommended Alternate Method: The need for extra equipment and much of the possibility of damage can be eliminated by altering the method of installing the fabricated tee and wye to include the use of a flanged connection on the branch side. This will allow final positioning to take place before the branch side is connected. There will be some instances where it will prove very advantageous from an installation viewpoint to use flanged connections on two sides of a tee or wye and also one side of the elbow. This allows the pipe to be laid from either direction, pushed or pulled into tight locations, rolled into the ditch, and generally handled much easier and faster...before the final connection is made at the tee, wye, or elbow. From the standpoint of economy, speed and ease of installation, and eliminate the occurrence of excessive installation stresses of fabricated fittings, it is recommended that flanged connections always be used on the branch side of tees and wyes and on one end of elbows for larger diameter pipes.

- Driscopipe 1000/6400 Molded fittings are made from the same resin as the Driscopipe 1000[®] & 6400[®] series pipe.
- Driscopipe Fabricated fittings are manufactured from Driscopipe 1000[®] & 6400[®] piping systems. Fabricated tees, wyes and elbows are made by butt fusing together miter cut segments of pipe to obtain the desired shape.
- Fabricated elbows: Due to the nature of polyethylene and the mitered fusion process, the tolerance is generally plus or minus one degree. The broad tolerance typically causes no installation problems due to the flexibility of polyethylene.
- Driscopipe special fittings are custom designed for your specific application through your Driscopipe representative.

Effective date: October 1, 1990

DRASCOPE

1000

PE3408

Butt Fusion Procedure for Pipe and Fittings

1. Clean each pipe with clean cotton cloth.*
2. Square (face) end of each pipe to be fused.
3. Check line-up of pipe ends. Adjust high-low. Check heater plate for proper temperature, and wipe heater surface clean. **Thermometer** reading:
400°F – 425°F . . . coated plates
375°F – 400°F . . . uncoated plates
4. Insert heater plate between aligned ends and bring ends firmly in contact with plate, but **DO NOT APPLY PRESSURE** while achieving melt pattern. Watch for proper melt.
5. Remove heater plate after achieving proper melt bead.
6. Bring melted ends together rapidly. **Do not slam. Apply enough pressure to form a double roll-back bead.**
7. Allow the butt fusion joint to cool properly (until finger can remain comfortably on bead).

Remember

A quality butt-fusion joint has a double bead rolled back to the body of the pipe.

Heater plates should be double checked with a tempilstik or pyrometer for correct **surface** temperature (375°F – 400°F).

Avoid polyester type materials which melt and stick to heater plates

DISCOPIPE

Dual Containment

Pipe and Fittings

Dual Containment Pipe and Fittings

Introduction

Phillips Driscopipe, Inc. manufactures dual containment piping systems for preventive use in application areas where accidental spills could cause possible leaks into the environment. Driscopipe® polyethylene pipe features a range of pipe sizes, pressures (SDR's) and chemical compatibility. The outer polyethylene casing can withstand external corrosion while providing the needed secondary containment of hazardous fluids should the carrier pipe leak. Both leak detection and reporting systems can be installed within Driscopipe dual containment piping. Like other Driscopipe piping, these dual containment systems are engineered and factory fabricated with basic components to assure high quality and reduced field installation time and costs, while maintaining system integrity.

Phillips Driscopipe, Inc. offers a complete line of pipe, fittings, accessories, technical and installation services through qualified and experienced distributors.

Millions of feet of Driscopipe polyethylene pipe are installed each year in hundreds of different applications. This outstanding record of success emphasizes the superior engineering properties of Marlex® polyethylene resins, the quality proprietary production methods of Driscopipe piping systems, and the high integrity and reliability of the butt fusion method for these systems. These features illustrate the successful development of the Phillips family of products.

Driscopipe Piping includes:

- A complete range of pipe and fittings sizes and design pressure ratings.
- Trained, qualified distributors.
- Technical service assistance for system design, installation and on-the-job consultation through qualified distributors.
- Readily available installation equipment.
- Continuing product research, development and testing.
- Economical product availability through strategically located plants throughout the U.S.
- Quality assurance.
- Custom design and fabrication of non-standard and special components.

Piping Material

Driscopipe dual containment piping is a high density, very high molecular weight polyethylene pipe with a PPI listing as a PE 3408 material. Using ASTM D3350, the carrier pipe may be described by the material cell class #355434C or #345434C. The containment pipe is usually designated as a #345434C material.

Driscopipe systems are expected to give many years of trouble-free service when exposed to a broad variety of environments and working conditions. Three Marlex® polyethylene pipes, Driscopipe 1000, Driscopipe 6400 and Driscopipe 8600 were developed for these demanding environments.

Polyethylene pipe is:

- Tough and durable
- Virtually inert
- Strong and "smooth"
- Reliable
- Chemically resistant
- Impact resistant
- Weather resistant
- Abrasion resistant
- Fatigue resistant
- Weldable (heat-fusion)
- Light weight

Tee Design

90° Elbow Design

Driscopipe high density polyethylene piping offers innovative new solutions to old material handling problems. These piping systems give the engineer proven solutions to many traditional problems and new applications.

Piping Components

Driscopipe dual containment piping offers the components necessary to assemble an engineered system. In addition to the standard pipes and fittings shown below, custom machined and/or fabricated parts are available to meet specific project needs through a Driscopipe distributor.

Carrier Pipes: Pipe sizes from 2" to 12" in water rated working pressures of gravity flow to 287 psi are available. When operating at elevated temperatures or when transporting hydrocarbon based fluids, contact your distributor. These conditions will each reduce the standard pressure rating of the carrier pipe.

Carrier Pipe Size	Containment Size*
2"	4"
3"	6"
4"	8"
6"	10"
8"	12"
10"	16"
12"	18"

*Other combinations and sizes quoted upon request.

Fittings: Standard 45° ells, 90° ells, tees, anchors, spacers, manholes, flanged outlets and drain/vents are available to meet project requirements. The containment piping may be completely field fabricated from component pieces. However, pre-fabrication services are offered to allow spool pieces to be shipped to the site for final assembly.

45° Ell Design

Options: Dual containment piping may be equipped with many other desirable options. Distributors should be consulted on availability of those features needed beyond the pipe, fittings and custom project components offered by Phillips Driscopipe.

Design Considerations

- Piping can be engineered for draining or pressure applications.
- The PE pipe is joined by heat-fusion, a proven welding technique that provides leak-free joints.
- The carrier pipe must be rated to carry the flowstream pressure. The containment piping may be equally rated or of thinner wall depending on system need or design.
- The containment piping may be designed into separate leak containment zones, OR
- The containment piping may be engineered to provide continual drainage via the annular space if desirable.
- Pipe is shipped from one of the five plants to provide rapid nationwide delivery.
- Standard fittings and accessories are shop-fabricated near Dallas, Texas to provide rapid service and shipment quoted as per order.
- Design and application assistance is provided by Driscopipe distributor engineering staffs and supported by Driscopipe technical groups.

Summary

When Driscopipe piping systems are chosen and installed, the owner acquires a product whose performance has been proven by long established technology, experience and reliability. A complete team of dedicated personnel are available to help solve sensitive material and piping problems through the Driscopipe national distributor network for these typical applications:

- Leachate Collection and Handling
- Solvent Extract Mining
- Chemical Process Piping/Chemical Wastes
- Hazardous Waste Collection
- Storage Tank Piping

Due to pipe tolerances, "B" dimensions may be slightly larger than the ID of the container pipe.

ADS corrugated polyethylene tubing

02610/ADV
BuyLine 0805

We'll show you dozens of reasons why it's #1 in the land.

ADS
ADVANCED DRAINAGE SYSTEMS INC.

Choose ADS tubing

Corrugated polyethylene tubing from Advanced Drainage Systems, Inc. provides years of trouble-free drainage in a wide variety of applications, at a cost of just pennies per foot. Lightweight ADS tubing is available in continuous coiled lengths, or in straight lengths, and is flexible and easy to install, requiring less labor than traditional drainage materials. ADS tubing is manufactured with high density polyethylene resin, a virtually chemically inert material, so it resists corrosion and abrasion, and won't rot, rust or break down during handling.

ADS grain aeration pipe contains specially designed perforations with a durable, knitted polyester "sock" wrap to maximize air flow and prevent restriction of the perforations.

A full line of accessory fittings and couplings help simplify even the most challenging installations.

Residential and Commercial Construction

Ideal for all homesite and commercial drainage, ADS tubing is lighter, easier to handle, and requires less time and equipment to install than PVC, clay, concrete or corrugated metal. ADS snap-on fittings and couplings keep installation time and labor to a minimum.

Exterior foundation drains are necessary for both residential and industrial buildings, below the level of the lowest floor, where high water tables and rainwater result in wet basements. These drains are placed to collect and channel water away from footers and basement walls to a suitable outlet.

Interior foundation drains where ground water is a problem. These drains intercept water that otherwise would gain entry through the basement walls or floor.

Downspout run-off drains using corrugated plastic pipe are used to channel water collected in the roof gutters to areas away from the building. These can be discharged into storm sewers, into the curb at the edge of the street, or into other suitable outlets.

Low-spot drainage in lawns or yards can be accomplished using surface inlets and corrugated polyethylene tubing to collect and carry the water to a storm sewer or other disposal area.

Basement window well drainage prevents rainwater from seeping down the foundation wall and entering the basement. This is accomplished by running a length of non-perforated tubing from the drain in the bottom of the well to the disposal area.

Driveway and sidewalk underdrainage is used to prevent frost damage or pavement deterioration due to unstable bases. Installation of perforated drainage tubing in a bed of gravel allows the water to drain out of the base course and be channeled away from the pavement.

SB2 gravel-less septic system, a recent innovation, is constructed of 8" and 10" tubing encased in a spun/bonded nylon mesh material, Drain Guard protective wrap and eliminates the need for gravel. Alternately, of the most common methods for home wastewater disposal are septic tank leach fields utilizing 4" ADS tubing, which features virtual immunity to the corrosive environment found in septic tank leach fields.

Highways and Roads

Excess water in the subbase of highway pavements is the leading cause of pavement failures; the adverse effects of inadequate drainage are evident in highways which begin to deteriorate after only two to three years. ADS corrugated polyethylene berm and underdrains collect and remove excess subbase water and reduce pavement damage. Continuous lengths require fewer fittings and connections and less labor to install.

Culverts

Culverts are easily drained with ADS culvert pipe; it is lighter and easier to handle and install than clay, concrete or corrugated metal, resulting in reduced labor costs. ADS culvert pipe has excellent load bearing strength, meeting the toughest requirements. It is approved by most state departments of transportation, and many county and local regulatory agencies. ADS culvert pipe is available in 10", 12", 15", 18" and 24" diameters, in 20' standard lengths.

Parking Lots

The durability of ADS tubing makes it especially suitable for parking lot applications. Excellent deflection qualities enable ADS tubing to resist critical loading conditions without damage.

Airport Runways

Airport runways suffer from the same water-related problems as highways and roads. Whereas corrugated steel, concrete or clay pipe have been widely used in the past, corrugated polyethylene tubing has recently been approved by the Federal Aviation Administration for use as collector systems, culverts and runway underdrains.

Golf Courses

Golf courses are kept lush, green and playable with ADS tubing. ADS tubing resists rot and is flexible, so it follows ground contours and adapts to underground obstacles. It's adaptable to a wide range of soil conditions, including sand traps that collect water or are subject to erosion. Proper installation is an important factor, and ADS provides detailed installation recommendations for every type of soil and topographical condition.

Athletic/Recreational

Strong and durable ADS tubing provides year after year of reliable drainage with minimal maintenance, to keep landscapes as hardy as they are beautiful. Slope drainage is easy with ADS. In sandy or other problem soils, ADS Drain Guard keeps drains flowing. In the case of athletic fields and other places where it is desirable to use the areas as soon as possible after a down-pour, the ADS drainage system provides runoff that keeps up with rainfall.

Utility Companies

Public utilities and manufacturing companies have experienced problems with excess water in coal handling and storage operation. In the winter, freezing of wet coal is a problem, while during the warmer months, coal piles often must be sprayed with water to reduce coal dust and eliminate spontaneous combustion.

The ADS drainage system utilizing corrugated polyethylene tubing under the coal pile is an effective means of removing excess water. Filter protective wrap is required to prevent particles of soil or coal from entering the tubing.

Mining

ADS tubing offers low cost of installation plus excellent performance in corrosive and abrasive environments, solving mine-related water problems. These include drainage of coal piles, hollow-fills, earth dams, dam overflows, air ducts, deep shaft mines, sedimentation ponds, and roads.

Railroads

Poor railbed drainage often results in an unstable subbase and unsafe conditions. ADS tubing is used on new projects as well as to correct problems caused by excess water in existing railbeds. ADS performs under severe loading applications, making it ideal for railroad bed drainage.

Grain/Commodity Aeration

ADS aeration pipe can be easily adapted to all types of grain storage facilities (temporary as well as permanent), including metal buildings, round silos and wooden bins, resulting in uniform air flow.

Technical Notes

ADS corrugated polyethylene tubing is structurally designed to be used as culvert pipe and for other heavy duty drainage applications. This corrugated pipe may also be adapted to other drainage needs.

Applicable Specifications and Installation Guidelines

1. ASTM F 405, Standard Specification for Corrugated Polyethylene Tubing and Fittings.
2. ASTM F 667, Standard Specification for Large Diameter Corrugated Polyethylene Tubing and Fittings.
3. AASHTO M 252, Standard Specification for Polyethylene Corrugated Drainage Tubing.
4. AASHTO M 294, Standard Specification for Corrugated Polyethylene Pipe, 12" to 24" diameter.
5. ADS Installation Guidelines for Culvert and Other Heavy-Duty Drainage Applications.

Advanced Drainage Systems, Inc., is America's leading manufacturer of quality corrugated polyethylene pipe. Manufactured of selected polyethylene resins, ADS pipe meets the strictest product quality standards and industry specifications.

In addition, ADS manufactures a complete line of fittings and couplings, simplifying installations for highway and construction drainage applications.

From coast to coast, ADS tubing is available through the industry's most extensive distribution network. For the name of your local distributor, contact the nearest ADS sales office.

ADS Fittings available in stock and ready to ship to you.

Driscopipe® Engineering Characteristics

Introduction

Driscopipe high density polyethylene piping systems offer the modern engineer the opportunity to take advantage of the unusual characteristics of these materials and use them to solve many old problems and to design systems for applications where traditional materials are either unsuitable or too expensive. When compared to the older traditional piping materials, Driscopipe polyethylene piping systems offer a new freedom in environmental design, extended service life, significant savings for installation labor and equipment costs, and reduced maintenance for pipeline systems where operating conditions are within the pressure and temperature capabilities of the material.

This brochure outlines the Engineering Characteristics of Driscopipe high density polyethylene pipe and fittings and points out many of the advantages and benefits to be realized through the use of these systems. The discussion is directed primarily toward the large diameter (3" through 54") Driscopipe 8600 and Driscopipe 1000 Industrial and Municipal product lines. However, these engineering characteristics are also typical of other Driscopipe polyethylene product lines.

Physical Properties

Driscopipe 8600 is manufactured from Marlex M-8000 very high molecular weight high density PE 3408 resin. Pipe and fittings made from Marlex M-8000 are extremely tough and durable, and possess exceptional long term strength. Marlex M-8000 is a proprietary product and is extruded only by Phillips Driscopipe, Inc.

Driscopipe 1000 is manufactured from Marlex TR-480, a PE 3408 polyethylene pipe resin in a molecular weight range which permits the pipe to be extruded by conventional methods. In this respect, Driscopipe 1000 is comparable to other extra high molecular weight, high density, PE 3408 polyethylene pipes commercially available in North America.

Sheets detailing typical physical properties for Driscopipe 1000 and Driscopipe 8600 are available upon request.

Long Term Hydrostatic Strength

One of the outstanding engineering characteristics of Driscopipe high density polyethylene pipe is its long term hydrostatic strength under various thermal and environmental conditions. Life expectancy is conservatively estimated to be in excess of 50 years using the standard design basis. This strength is determined by standardized methods and procedures which the plastic pipe industry has used for many years to evaluate the long term strength of all types of plastic pipe.

Pipe hoop stress versus time to failure plots of long term hydrostatic pressure data for thermoplastic pipe have been studied and analyzed for many years. The mathematical equations used to evaluate the test data and extrapolate values to longer periods of time were chosen after careful evaluation of more than 1,000 sets of long term test data representing more than 400 plastic pipe compounds. Continued testing on new compounds and extended testing of older compounds have proven the validity of these test methods. Actual data from more than 11½ years (100,000 hours) of continuous testing shows the industry methods to be slightly conservative in that actual values are slightly higher than those calculated by the industry-accepted ASTM method.

The reduction in strength which occurs with time, as indicated by the stress-life curves, does not represent a strength degradation of the material but is more in the nature of a relaxation effect. Plastic pipe samples which have been on test for periods up to 70,000 hours have been de-pressurized and checked for permanent reduction of strength by using the quick-burst test. No loss has been found when compared to samples previously quick-burst from the same test lot.

All evidence confirms that the methods used to predict the long term strength of plastic pipe are sound methods. Through the years, these policies and procedures, used to develop recommended hydrostatic design strengths, have influenced manufacturers to research and develop improved piping products such as Driscopipe 8600 and Driscopipe 1000.

Typical calculated long term strengths are shown below:

Long Term Strength @ 73.4°F(23°C)

Time	Hoop Stress, psi
100,000 hrs. (11.43 yrs.)	1635
438,000 hrs. (50 yrs.)	1604
500,000 hrs. (57 yrs.)	1601
1,000,000 hrs. (114 yrs.)	1586

The 114-year long term strength has been included to show more about the nature of the method used by the industry to evaluate the long term strength of plastic pipe and to illustrate the very slow reduction in strength as time progresses.

Long term hoop stresses for design purposes are normally selected at a level which is much lower than the long term strength of the materials. This ensures that the pipe is operating in a hoop stress range where creep (relaxation) of the materials is nil and assures service life in excess of 50 years. Design stress levels are discussed further in the next section.

The long term hydrostatic tests are conducted by using ASTM standard test procedures which may be applied to all types of plastic pipe (ASTM D 1598 Test for Time-to-Failure of Plastic Pipe Under Constant Internal Pressure). Stress-life tests are conducted by using numerous pipe samples which are filled with water (or other environmental fluids) and subjected to a controlled pressure at a controlled temperature.

Samples are held on test until they fail. The pressure, temperature and time-to-failure data from all samples are used to calculate and plot stress-life curves for the particular type pipe being tested (ASTM D 2837 Obtaining Hydrostatic Design Basis for Thermoplastic Pipe Materials). This data is then used to predict the probable safe life of the pipe at various stress levels (working pressures) and various temperatures. Because it is not practical to test at all temperature levels, these tests are generally conducted at temperatures of 73.4°F and one or more higher temperatures such as 100°F, 120°F and 140°F.

These stress-life curves give a relationship of the expected life span of the pipe when subjected to various internal stress levels (working pressures) at various temperatures. By comparing stress-life curves, one can compare relative long term performance ability of different plastic pipes. Stress-life curves for Driscopipe 8600 and Driscopipe 1000 are shown in Figure 1.

Stress-Life of Driscopipe® 8600 and Driscopipe® 1000

Figure 1

These stress-life curves were obtained using water as the test medium. However, years of laboratory testing and field experience have shown that these same curves may be used to design Driscopipe systems for natural gas, salt water, sewage and hundreds of other industrial and municipal fluids, mixtures and effluents. The long term strength of Driscopipe indicated by these curves must be de-rated in some environmental circumstances, such as in the presence of liquid hydrocarbons or abrasive fluids, although the pipe is very suitable for use in these environments. An outstanding engineering advantage of Driscopipe is its exceptionally long term service life in the presence of internal and external corrosive service conditions.

Design Pressure Ratings

Since plastic pipe was introduced in the late 50s, the safety factor for design of water systems at standard temperature has been 2 to 1. The 2:1 design factor which was officially adopted by the plastic pipe industry in 1963, was based on allowances for many sources of variation. The guiding principle has always been to make the selection on a conservative basis but not to be unreasonably conservative.

The sources of variation for which allowances are made include ... variation in test methods and procedures among laboratories ... variation among lots of the same compound ... variation of lots of pipe from the compound in different plants and from different extruders ... variation in compounds of the same general class ... variations in handling and installation techniques ... variation in operating pressures (water hammer and surge) ... a strength-time allowance to give service life well beyond 50 years.... and, finally, the great unknown. Each of the

factors was judged to reduce the 100,000 hour design strength by 5%-10% or 20% ... for a total of 100% ... or a design factor of 2:1. This is why polyethylene pipe, with a designated 100,000 hour strength of 1600 psi at 73.4°F, has a hydrostatic design strength of 800 psi hoop stress.

The design pressures for Driscopipe are determined by the following equation, adopted internationally by the industry for this purpose:

$$P = \frac{2S}{SDR-1} \times F \quad \text{or} \quad P = 2S \frac{t}{D-t} \times F$$

Where: D = Specified Outside Diameter, Inches
P = Design Pressure, psi
S = Long Term Hydrostatic Strength, psi, at the design temperature
t = Minimum Wall Thickness, Inches
F = Service Design Factor
SDR = Standard Dimension Ratio of D/t

The traditional Service Design Factor for water at standard temperature (73.4°F) is one-half (.5). The Service Design Factor for oil or liquid hydrocarbons is 0.25 @ 73°F. The service design factor may be adjusted by the design engineer to reflect the particular conditions anticipated for the application. The temperature selected for design should consider both internal and external conditions. The design temperature should be based on the temperature of the pipe itself. For practical purposes, it is safer to design to the highest temperature.

The design service factor for water may also be used for solutions of inorganic salts, alkaline fluids, non-oxidizing acids, low concentrations of oxidizing acids and many other solutions. See the discussion on chemical resistance for more information.

All standard design pressure ratings shown in Driscopipe literature are based on water at 73.4°F temperature; ie, a safety factor of 2:1 based on the long term hydrostatic strength of the material. Driscopipe is applicable at pressures from 0 to 265 psi and temperatures from below 32°F up to 180°F. Standard Dimension Ratios (SDR) are available from SDR 32.5 to SDR 7.0

Flow Characteristics

Driscopipe polyethylene has excellent flow characteristics as compared to traditional materials. An extremely smooth interior surface offers low resistance to flow. It maintains these excellent flow properties throughout its service life in most applications due to the inherent chemical and abrasion resistance of the material. Because of smooth walls and the non-wetting characteristic of polyethylene, higher flow capacity and less friction loss is possible with Driscopipe. In many cases this higher flow capacity may permit the use of smaller pipe at a lower cost.

A "C" factor of 155 is commonly used in the Hazen-Williams formula for calculating flow in pressure applications. For gravity flow, an "n" factor of .009 is used in Manning's formula.

Experimental test data regarding pumping and pressure drop through Driscopipe is available upon request. This study compares the flow through 8" Driscopipe with and without internal fusion beads using clear water. It also includes flow data for some clay-water slurries and clay-water-sand slurries. Velocities up to 20 fps are studied. Data includes determination of Hazen-Williams "C" factor, Reynolds number, boundary drag, relative roughness, sand grain roughness and friction loss at various velocities.

Lightweight – Flexible

The inherent light weight and flexibility of Driscopipe provides many cost saving benefits related to handling, storage, hauling, unloading, stringing, joining and installation. Because of its light weight, Driscopipe can be moved, handled and placed in the ditch with smaller and less expensive construction equipment. Usually, manpower requirements are also reduced.

Driscopipe weighs less than water; it has a specific gravity of .955-.957. Because it will float, it can be joined in long strings and easily towed into position on job sites where water is encountered. The combination of light weight and flexibility provides opportunity to fusion join the pipe in a convenient work area and pull it into position in difficult work areas where terrain or other obstacles present installation problems. The pipe can be joined above ground and rolled or lowered into the trench thus allowing the use of smaller trench widths and eliminating the necessity of placing men and equipment inside the trench. Such installation methods can dramatically reduce the time required for installation in many instances.

The flexibility of Driscopipe allows it to be curved over, under and around obstacles and to make elevation and directional changes, thus eliminating fittings and reducing installation costs. The pipe can be cold bent as it is installed to a radius of 20-40 times the pipe diameter. This flexibility and the butt fusion joining method make Driscopipe ideally suited for inserting it inside older piping systems to renew and renovate such systems at a much lower cost than would be possible otherwise.

Pipe flexibility and toughness also allow small diameter Driscopipe to be plowed-in or pulled-in with suitable equipment.

Toughness – “Ductile PE Pipe”

The overall “toughness” of Driscopipe is an important characteristic of the pipe which is derived from many of the chemical and physical properties of the material as well as the extrusion method. The pipe is ductile. It flexes, bends and absorbs impact loads over a wide temperature range of – 180°F up to + 180°F. This inherent resiliency and flexibility allow the pipe to absorb surge pressures, vibration and stresses caused by soil movement. Driscopipe can be deformed without permanent damage and with no adverse effect on long term service life. It is flexible for contouring to installation conditions. The toughness of Driscopipe is one of its outstanding engineering characteristics leading to innovative piping design.

Even though “toughness” has become generally recognized by the industry as a highly desirable characteristic ... there is no standard test which can be used to directly compare the “toughness” among polyethylenes ... as well as among the different plastic materials which are considered suitable for piping.

A “toughness” test has not been devised is simply because it is influenced by so many of the physical and chemical properties of the material. The extreme toughness of Driscopipe has been noted as one of its outstanding features since its introduction to the industry ... yet to explain “toughness”, many properties are discussed and demonstrated. To obtain a complete evaluation of the toughness of a plastic material, it is necessary to see demonstrations

of tests and to conduct some tests in person in order to compare it with materials which are more familiar, such as cast iron, steel, cement, copper, etc.

Toughness is related to ... Environmental Stress Crack Resistance (ESCR) ... Notch sensitivity ... Resistance to secondary stresses from external loading ... Impact strength ... Tear strength ... Flexibility ... Kink resistance ... Abrasion and scratch resistance ... Flexural strength ... Elongation ... Chemical resistance ... Tensile strength ... Ductility ... Creep resistance ... Temperature resistance ... Density ... Molecular weight ... and the thermoplastic nature of the material. Part of the toughness of any polyethylene material can be attributed to its flexibility, flexural strength and impact resistance as compared to the more rigid thermoplastic materials such as PVC. Polyethylene is ductile and will elongate many times more than PVC. Consequently, it will absorb more impact without damage or failure. PE will flex or elongate and stress relieve itself rather than rupture. Generally, impact strength is greater for the higher molecular weight PE resins. Impact resistance is also important from the standpoint of a piping system being able to absorb energy imposed on it by external forces.

The expansive force of water freezing inside Driscopipe will not damage it.

ESCR is one of the properties closely related to “toughness” and has been studied as a possible means to define and measure toughness. The exceptional resistance of Driscopipe 8600 to environmental stress cracking as compared to other PE materials is discussed further in the next section.

Driscopipe 8600 is unique and differs from Driscopipe 1000 and from all other polyethylene pipes. Driscopipe 8600 exhibits a superior toughness which gives the pipe the highest impact strength, highest tear strength and lowest notch sensitivity of any polyethylene pipe currently available. Driscopipe 8600 offers the highest resistance to cuts, scratches and abrasions which occur when handling and installing the pipe.

These properties are maintained throughout its temperature range without a loss of ductility or reduced resistance to notch sensitivity. Driscopipe has been successfully installed in numerous arctic applications. Some of these applications have included direct burial in the unstable arctic permafrost.

To learn more of the relative toughness of Driscopipe 8600, we encourage you to take a piece of pipe with a butt fusion joint and try to tear it up without using sharp tools. Pound it flat with a sledge hammer ... slam it against a corner of angle iron ... run over it with a truck ... then do the same with steel, copper, PVC, cast iron and the less rugged PEs. It's not very scientific ... but we believe you'll be convinced that Driscopipe 8600 has extremely high toughness. We have evaluated Driscopipe many times in laboratory and field test experiments to demonstrate and prove this toughness.

- One excellent indicator of the relative toughness of Driscopipe 8600, as compared to other polyethylene pipe materials, can be observed in the ASTM Standard Test for determination of flow rate of the thermoplastic materials.

When Driscopipe 8600 is heated to 190°C (374°F) to measure the flow rate, it requires 432.5 pounds/sq. in. force, applied for 10 minutes, to flow 1½ grams of 8600 material through the orifice of the test unit! Other commercially available polyethylene pipe materials will flow 10 to 20 times this amount under the same conditions.

- When Driscopipe 8600 is heated to 475-500°F to melt it for fusion joining, it requires 150 pounds pressure per square inch of material to make the melted surfaces flow together. This is another indicator of toughness. Other commercially available polyethylene pipe materials require about one-half that amount of pressure and some competitive pipes require less than 25 psi!
- Driscopipe 8600 has been pressure tested for long periods at temperatures up to 140°F and performance requirements at these high temperatures can be used in purchase specifications to assure that the user is getting the highest performing polyethylene pipe.

Environmental Stress Crack Resistance

The most recent ASTM specification written to identify polyethylene plastic pipe and fittings materials is ASTM D 3350, "Polyethylene Plastics Pipe and Fittings Materials", adopted in 1974. This specification uses six (6) properties to classify PE material ... one of these is ESCR.

ASTM D 3350 lists three cell limits for ESCR classification which use the ESCR test outlined in ASTM D 1693, Test Method for Environmental Stress Cracking of Ethylene Plastics. The cell limits are:

Cell Classification Limit	Test Condition ASTM D 1693	Test Duration Hours	Percent of Failures Allowed	Test Temp. °C
1	A	48	50	50°
2	B	24	50	50°
3	C	192	20	100°

Minimum Notch for A is .020"; for B and C is .012".
 Minimum Thickness for A is .120"; for B and C is .070".
 A and B use a diluted aqueous solution reagent, C uses full strength reagent.

This method of testing for ESCR was first written in 1959 and was developed primarily to evaluate polyethylene as a jacketing material for power and communications cable. Although the method requires the use of laboratory compression molded specimens rather than pipe, it became the generally accepted method for evaluating ESCR of PE materials used for piping. Its wide use was responsible for its inclusion in ASTM D 3550 to describe one of the six primary properties of a PE pipe material.

The test method, ASTM D-1693, is an accelerated test method to determine the resistance of a polyethylene material to environmental stress cracking. It is a measure of the ability of the polyethylene to withstand secondary stress loadings. These loadings are typically thought of as low-level, long-term, external stresses which may act upon the polyethylene pipe in field installations.

Under conditions of the test, high local multiaxial stresses are developed through the introduction of a controlled imperfection (notch). The notched sample is subjected to an elevated temperature bath of a surface active agent. Environmental stress cracking has been found to occur most readily under such conditions.

A note in the test specifications states that, generally, low density (Type I) polyethylenes are tested under Condition A, medium and high density (Type II and Type III) polyethylenes are generally tested under Condition B and high density resins with high melt viscosity, such as pipe grade P34, are tested under Condition C.

As pipe grade polyethylenes have improved, the testing requirements of ASTM D-1693 have become less stringent for P34 pipe grade polyethylenes such as Driscopipe 8600 and Driscopipe 1000. As a result, a more severe stress crack resistance test has been developed to evaluate high density polyethylene pipe. The ASTM F-1248 stress crack resistance test method was developed by a gas distribution company for quality control purposes and is often referred to as Ring ESCR since it tests actual produced pipe ring samples rather than molded specimens.

ASTM F-1248 utilizes rings cut from a pipe sample. The rings are notched on one side and compressed between parallel plates until the distance between the plates is three times the specified pipe minimum wall thickness. The compressed ring samples are subjected to an elevated temperature bath of a surface active agent and visibly inspected for crack formation or propagation.

The Ring ESCR test provides useful information regarding the different polyethylene pipe grade materials. Driscopipe 8600 shows no tendency for sample failures when tested in excess of 10,000 hours. This further reinforces the unique ability of Driscopipe 8600 to provide the highest degree of resistance to the external stresses inherent to a pipeline installation.

Driscopipe 1000, an extra high molecular weight HDPE pipe, will exhibit a ring ESCR of $F_{50} > 1000$ hours. Other lower molecular weight pipes may exhibit lower F_{50} values.

Chemical Corrosion Resistance

The outstanding resistance of Driscopipe to attack by most chemicals makes it suitable to transport these chemicals or to be installed in an environment where these chemicals are present. Factors which determine the suitability and service life of each particular application include the specific chemical and its concentration, pressure, temperature, period of contact and service conditions which may introduce stress concentrations in the pipe or fittings.

Driscopipe is, for all practical purposes, chemically inert within its temperature use range. This advantageous engineering characteristic is one of the primary reasons for the wide use of Driscopipe in industrial applications. It does not rot, rust, pit, corrode or lose wall thickness through chemical or electrical reaction with the surrounding soil, whether acid, alkaline, wet or dry. It neither supports the growth of, nor is affected by, algae, bacteria or fungi and is resistant to marine biological attack. It contains no ingredients which make it attractive to rodents, gophers, etc.

Information relative to the resistance of Driscopipe to a wide range of chemicals is shown in the following tables. This information is based on results of immersion tests (usually 3 months) at various temperatures. Changes in tensile strength and elongation are evaluated at a rapid strain rate to emphasize any strength decay in the material.

Most acids, bases and other chemicals can be transported by Driscopipe using the same design parameters as would apply to water, natural or manufactured gas and water solutions of inorganic salts. Strong oxidizing agents such as fuming sulfuric acid may adversely affect the pipe, depending upon concentration, temperature and period of contact. In many cases, such as gravity flow waste lines, these chemicals can be handled because of dilution and intermittent flow.

Some chemicals, such as all types of liquid hydrocarbons, will mechanically absorb into the wall of the pipe and cause a reduction in hoop stress but this does not degrade the material. This effect is temporary if exposure is intermittent. Where exposure is continuous, it is necessary to derate the pressure capability of the pipe for long term service. This includes such products as gasoline, ethyl alcohol, benzene, carbon tetrachloride, crude and refined oils, etc. Where 5-100% hydrocarbon liquids are continuously present in a pressure system, a service design factor of .25 should be used to calculate design pressures instead of the service design factor of .5 used with water.

$$P = \frac{2S}{SDR-1} \times F \quad \text{or} \quad P = 2S \frac{t}{D-t} \times F$$

Where: D = Outside Diameter, Inches
P = Design Pressure, psi
S = Long Term Hydrostatic Strength, psi, at the design temperature
t = Minimum Wall Thickness, Inches
F = Service Design Factor
SDR = Standard Dimension Ratio of D/t

CHEMICAL RESISTANCE OF DRISCOPIPE

S - Satisfactory
 U - Unsatisfactory
 M - Marginal
 N - Not known

All concentrations are 100% unless noted otherwise.

On reagents marked marginal, chemical attack will be recognized by a loss of physical properties of the pipe which may require a change in design factors.

Temperature Characteristics

Since polyethylene is a thermoplastic material, many of its physical and chemical properties are dependent on temperature and will change as the temperature of the material is increased or decreased. However, the exposure of Driscopipe to temperature variations within the recommended operating range does not result in degradation of the material. As these temperature changes are reversed, the material properties also reverse to their original values.

You will note from the information on physical properties that Driscopipe has a brittleness temperature below -180°F and a softening temperature of $+257^{\circ}\text{F}$. The recommended operating temperature is limited only on the higher temperature side to a range of $140\text{-}180^{\circ}\text{F}$, dependent upon the pressure of the application and other operating and installation considerations. On the lower temperature side, Driscopipe gains strength without becoming brittle and is ideal for use at sub-zero temperatures.

Driscopipe becomes molten at $400\text{-}500^{\circ}\text{F}$ and temperatures in this range are used to fusion join the piping system. Pipe is extruded at about the same temperature. To protect the material against degradation at the higher temperature, it is chemically stabilized. This stabilizer protects the material against thermal degradation which might otherwise occur during manufacture, outside storage and installation.

Driscopipe has been tested for thousands of hours at elevated temperatures of 140°F and 180°F without thermal degradation. These long term pressure tests at the higher temperatures are used to obtain recommended design strengths for the pipe at these temperatures.

Since all thermoplastic piping materials are affected by temperature, it is a general practice to characterize these materials at ambient temperature of 23°C (73.4°F). Nearly all ASTM tests relating to physical, mechanical and chemical properties of thermoplastic materials are conducted at this temperature. If a test is conducted, or a property defined, at other than 73.4°F , it is always noted.

One example of the effect of temperature on Driscopipe is the change in long term strength of the material as shown on the stress-life curves. This type behavior is true for all thermoplastics but there are large differences between the performance of specific materials at the higher temperatures.

Knowledge of the long term strength of Driscopipe at the various temperatures allows selective design of a system. Accurate interpolations can be made for other temperatures between those which are known when data at three or more temperature levels is available.

Other properties of thermoplastic pipe which change with temperature and can affect system design and installation procedures include the following.

Burst strength – Short term (1 minute) burst tests on Driscopipe at various temperatures show these typical hoop stress values:

Temperature, $^{\circ}\text{F}$	Hoop Stress, psi
73.4°	3250
32°	4300
0°	5290
-20°	5670
-40°	6385

Driscopipe will quick-burst at a pressure approximately four times greater than the rated operating pressure.

Chemical Resistance – The ability of most thermoplastics to resist degradation in the presence of corrosive chemicals is reduced as temperature increases. This is also true for Driscopipe but to a lesser extent because of its high density and high molecular weight. The effect of temperature on Driscopipe in the presence of various chemicals is shown in the chemical resistance tables.

Flexibility – As temperature is decreased, the flexibility of Driscopipe is also decreased. This has very little effect on installation except that at the lower winter temperatures, coiled pipe becomes more difficult, mechanically, to uncoil and stretch out in the ditch. Although Driscopipe becomes stiffer at low temperature, it can be bent, uncoiled or plowed in with sufficient mechanical power and no damage will occur to the pipe because of bending it at cold temperatures.

Other Physical Properties – There is a slight change with temperature of impact strength, notch sensitivity, flexural modulus, hardness and elongation ... but none are of such extent as to affect design parameters or installation procedures over the normal range of temperatures.

Modulus of Elasticity – Typical values for the variance in modulus of elasticity with temperature change is shown below.

Temperature °F	Modulus of Elasticity, psi
-20°	300,000
0°	260,000
32°	200,000
75°	130,000
100°	105,000
140°	60,000

Thermal Expansion and Contraction – Polyethylene, like other thermoplastics, has a coefficient of expansion higher than metals. This coefficient is usually determined by a standard test method which employs the use of molded specimens. Measurements are made with a quartz dilatometer while the test specimen is held at elevated temperature. Typical coefficient values by this method range from $.75 \times 10^{-4}$ for Driscopipe 8600 to $.83 \times 10^{-4}$ for Driscopipe 1000.

The coefficient of linear expansion may also be determined by measuring the change in length of unrestrained pipe samples at different temperatures. The calculated coefficient is somewhat higher on extruded pipe than on molded test specimens. This appears to be true for all polyethylene pipe. The average coefficient calculated from measurements made on Driscopipe in the temperature range 0°F to 140°F, is 1.2×10^{-4} in/in/°F.

The circumferential coefficient of expansion and contraction for Driscopipe is approximately $.6 \times 10^{-4}$ in/in/°F in the range of 0° to 140°F ... or about ½ the linear coefficient. This circumferential change with temperature rarely presents any problems in system design. There may be need to consider this factor if compression fittings are used.

The expansion or contraction for Driscopipe can be stated in an easy rule of thumb ... the pipe will expand or contract approximately 1.4" per 100 feet for each 10°F change in temperature. Thus a 1000 foot unrestrained line which undergoes a 20°F increase in temperature change will increase in length 28 inches. The relatively large amount of expansion and contraction of plastic pipe generally presents no real problems in installation. The pipe has a relatively low elastic modulus and consequently there is less stress build-up. These stresses, caused by temperature change, are easily dissipated due to the thermoplastic nature of the material which relaxes and adjusts with time.

Tests have been conducted wherein the temperature of more than 100 feet of unrestrained pipe was changed 130°F in a period of a few minutes. The total force created by contraction was measured and proved to be about (½) one-half the theoretical calculated value. Thermoplastic materials are unique in their ability to stress-relieve themselves. Actual changes in temperature in most applications take place slowly over an extended period of time. The total stresses imposed will vary but are generally much lower than the calculated values.

Direct buried pipe will generally have ample soil friction and interference to restrain movement of the pipe under normal application temperature changes. It is a good idea to make the final tie-ins on a system at a temperature which is as close to operating temperature as possible. This is particularly true for insert liner systems where there is no soil restraint.

Normal good direct burial installation practices which include snaking the pipe in the ditch, proper backfill and compaction, making the tie-in at the proper temperature, etc. should be used at all times and will substantially reduce the possibility of pull out at tie-in connections on such installations. However, planning the transition tie-in becomes more important when Driscopipe is used for insert renewal inside another pipe because there is no restraint from earth loading. Any contraction of the pipe due to reduction in temperature is freely transmitted to the transition connection and may result in pull-out if proper design

precautions are not taken. In those cases, it may be necessary to provide additional anchoring at the terminations of the insert liner. Concrete anchors poured into undisturbed soil and cast around anchor projections in the Driscopipe line will restrict movement at the end of the line. Anchor projections on the Driscopipe liner can be made by fusing a blind tee into the line or by the use of two reducers, to the next larger size of pipe, fused together in the line.

Thermal Conductivity – This property of Driscopipe is lower than that for metals and can sometimes be exploited in the design of the system. It may eliminate or reduce the need for insulating pipe which carries water or other fluids through freezing temperatures. Thermal Conductivity of Driscopipe is 2.7 BTU per hour per sq. ft. per °F per inch of thickness. The slow heat transfer inhibits freezing and, if normal burial precautions are used, accidental freezing is usually eliminated. If the pipe does freeze, it does not fracture but fluid flow will be stopped. It will resume its function upon thawing. Direct application of intense heat should not be used to thaw a line. Antifreeze compounds such as methanol, isopropanol and ethylene glycol can be used without detrimental effect on the pipe.

Ignition Temperatures – The flash point for high density polyethylene using the Cleveland open cup method (ASTM D92) is 430°F. The flash ignition and self ignition temperatures using ASTM D1929 are 645°F and 660°F.

Weatherability

Two principal factors influence the weathering of plastic pipe in outside above ground applications ... temperature changes caused by seasonal variations and solar heating and solar radiation of ultraviolet rays. Effects of temperature variations on Driscopipe were discussed in the preceding section. Expansion and contraction of a line above ground, due to differential heating, will cause the line to move laterally, particularly if it is empty. This movement can easily be controlled within desired limits through the use of restraints.

Driscopipe is also protected against degradation caused by ultraviolet rays when exposed to direct sunlight. The material contains 2½% of finely divided carbon black which also accounts for the black color of Driscopipe. Carbon black is the most effective single additive capable of enhancing the weathering characteristic of plastic materials. The protection even relatively low levels of carbon black impart to the plastic is so great that it is not necessary to use other light stabilizers or UV absorbers.

Weatherability tests indicate that Driscopipe can be safely used outside in most climates for periods of many years without danger of loss of physical properties due to UV exposure. Phillips has done extensive testing of polyethylene compounds containing 2 to 3% carbon black and compared these to other UV stabilizers to determine their effectiveness for protection against UV degradation in outdoor exposure. Samples were aged in outdoor exposure in three geographical locations: Phoenix,

Arizona, Bartlesville, Oklahoma (Phillips 66 headquarters) and Akron, Ohio. From these actual tests, it was determined that one year exposure in Arizona was equivalent to at least two years in Bartlesville and greater than three and one-half years in Akron.

Weather-Ometer tests were run under standard conditions as set out in ASTM D 1499-64 and compared with the actual test samples in the three locations described above. From this test work, it was determined, conservatively, that 5000 hours (approximately 7 months) in the Weather-Ometer compares to greater than 42 months exposure in Arizona. Samples containing 2 to 3% carbon black and thermal stabilizers as used in Driscopipe have been tested for greater than 25,000 hours (2.85 years) in the Weather-Ometer without any brittleness or loss of physical properties. This is equivalent to over 17 years in Arizona and over 60 years in Akron, Ohio.

Permeability

The permeability of gases, vapors or liquids through a plastic membrane is generally considered to be an activated diffusion process. That is, the gas, vapor or liquid dissolves in the membrane and then diffuses to a position of lower concentration. The permeation rate is determined by the functional groups of the permeating molecules and by the density of the plastic ... the higher the density, the lower the permeability. Listed below are typical permeability rates for HDPE.

Gas	Permeability Rate*
Carbon Dioxide	345
Hydrogen	321
Oxygen	111
Helium	247
Ethane	236
Natural Gas	113
Freon 12	95
Nitrogen	53

*Cubic centimeters per day per 100 sq. inches per mil thickness at atmospheric pressure differential.

These permeation rates are considered very low. They result in negligible loss of product and create no hazard. For example, polyethylene piping systems are the predominant material used to construct new gas distribution systems and to renew old deteriorated systems. The permeation rate will vary in direct proportion to the differential pressure applied.

If the internal operating pressure is 60 psi, for example, the permeability rate would be approximately 4 times that shown above but volume losses would still be extremely low. Calculated volume loss in one mile of SDR 11 pipe (any size) in one day, for natural gas, would be ¼ of one cubic foot. At 120 psi, it would be ½ cubic foot per day.

Abrasion Resistance

One of the many outstanding characteristics of Driscopipe polyethylene is its resistance to abrasion. The inherent resilience and toughness of Driscopipe allows the mining industry to use this pipe in numerous surface applications where more conventional materials would be unsatisfactory, either because of the terrain encountered or the abrasiveness of the slurry to be moved. Quite often, a Driscopipe system offers substantial economic advantage as a means of transport over more conventional transportation methods used in the mining industry. Some of the more common applications include tailings lines and the transport of gypsum, limestone, sand, slimes and coal.

Due to its unique toughness, as indicated by low melt flow values, Driscopipe 8600 provides improved abrasion resistance over all other polyethylene piping materials. Controlled pipe loop pumping tests have demonstrated that Driscopipe can outlast steel pipe by as much as 4 to 1. One such test, performed by Williams Brothers Engineering, Tulsa, Oklahoma, compared Driscopipe to steel in pumping a coarse particle size magnetite iron ore slurry. At 13½ ft/sec velocity, Driscopipe was better by a factor of 4:1 and at 17 ft/sec by a factor of 3:1.

Heat Fusion Joining

The heat fusion joining technique has a long history of use for joining polyethylene pipe materials. The heat fusion method of joining PE pipe began shortly after the first commercial production of high density polyethylene in the early 1950s ... both developed by Phillips 66.

The integrity and superiority of heat fusion are now recognized universally. The modern day heat fusion joint is the same joint made in 1956 ... only the fusion equipment has evolved to gain efficiency, reliability and convenience. The principles learned on early equipment for making a successful joint are still in use today. Phillips designed, developed and built many models of heat fusion equipment from 1956 until the early 1970s. Since that time, Phillips has guided this development by others. The extensive line of high quality, efficient fusion equipment offered by McElroy Manufacturing, Inc., Tulsa, Oklahoma is one of the results of this long history of development. Phillips pioneered the idea and development of heat fusion and has used it exclusively in every high density polyethylene piping system sold by Phillips since 1956. There are millions of these joints in service today. In fact, 92% of all natural gas distribution pipe to homes, farms and factories is installed with polyethylene pipe and fittings. Heat fusion joints are industry accepted and field proven.

The heat fusion joining system has been so successful that it is the "standard" joining system for polyethylene. There are many reasons ... here are some.

Heat fusion joining ideally meets the requirements for a fast joining method to facilitate all phases of construction work in a safe and reliable manner.

The heat fusion joint is structurally superior to the socket fusion joint by configuration and, therefore, better meets the requirements of service. The heat joint configuration allows it to better disperse stresses initiated by pipe deflection and external loading. Stress concentration is minimized when the joint is placed in a strain and the joint is more "forgiving" when ground settlement occurs. In a socket joint, there is an extremely high ratio of "joint wall" to "pipe wall", resulting in stress intensification from external loading.

The Driscopipe heat fusion joining system is a simple, visual procedure with straight forward instructions. No "timing cycles" are necessary. The visual procedure allows the operator to concentrate on his work rather than a clock. Visually, he knows when the pipe ends have melted to the degree required to fuse them together. Visually, he observes and controls fusion pressure by observing the amount and configuration of the fusion bead as it is formed.

In the course of this work, the fusion operator is faced with a wide variety of job conditions. Changes in air temperature, material temperature, wind velocity, sun exposure, humidity, as well as condition of the terrain and the equipment all influence the joining requirements. Quality work under field conditions is more consistent with a simple, straight-forward, visual procedure.

One heat fusion operator, with equipment, typically does the whole operation himself, sometimes using a second person as a helper. Pipe tolerances, ovality and curvature are no problem and "melt" is easily controlled by the visual procedure.

Heat fusion joints offer a large advantage over socket coupled joints for plow-in installation and for insert renewal applications. Socket coupled pipe requires larger size plow chutes and bore holes. Heat fused pipe one size larger can usually be handled and installed through bore holes and plow chutes selected for socket coupled pipe. Larger sizes of heat fused pipe can be used inside old mains for insert renewal because it does not require the extra space for the coupling.

Heat fusion joints may easily be cut out and re-done. This fact has a bearing on the quantity and quality of training necessary and favorably affects operator attitude toward quality in the field. These joints can be easily cut out and destructively tested in the field to check joining proficiency and equipment condition and it's inexpensive. There is no coupling to destroy and throw away.

The heat fusion joining system is especially effective with Driscopipe 8600. The melt of this material is very viscous and tough. The operator can apply ample pressure to form the heat fusion joint with little danger of forcing the molten material from between the two ends of the joint, as can be done with the softer, less viscous, high density materials.

Driscopipe 8600 can be fusion joined to other polyethylene piping materials when necessary. Special joining techniques are required to achieve good joints. Phillips Driscopipe technical personnel are available to instruct and demonstrate the fusion joining procedure for joining Driscopipe to other polyethylene materials.

Fatigue Resistance

Driscopipe 8600 very high molecular weight, high density polyethylene has superior resistance to fatigue failure caused by cyclic loading. Independent laboratory tests were conducted to determine the suitability of Driscopipe 8600 for use as the cold water supply pipe and the barge mooring leg of the Mini-OTEC Project (Hawaii, 1979). In that application, 2150' of 24" 60 psi Driscopipe 8600 was deployed vertically in a deep ocean trench just offshore Keahole Point and was subject to cyclic distortion caused by wave action, current, and barge motion.

Cyclic tests showed that Driscopipe 8600 very high molecular weight PE could endure more than 100,000 cycles at a stress of 1800 psi without failure. Copies of this test report are available upon request.

Driscopipe 1000 offers good fatigue service life also, but not equal to 8600. Neither requires de-rating like PVC AWWA C-900 pipe. In fact, per AWWA C-906 for 4" to 63" HDPE pipe, no water hammer or fatigue de-rating factor need be applied to Driscopipe 8600 or Driscopipe 1000 ductile PE pipe.

The Driscopipe performance team offers you innovative solutions to your piping requirements. Contact your nearest Driscopipe Sales Representative. He'll give you personalized technical service, installation assistance and all the cost-saving advantages of a Driscopipe Piping System. Engineered for Performance!

* Pressure Classes are defined as the rated water pressure of the pipe in psi. The thicknesses shown are adequate for the rated water working pressure plus a surge allowance of 100 psi. Calculations are based on a minimum yield strength of 42,000 and a 2.0 safety factor times the sum of the working pressure and 100 psi surge allowance.

** Calculated thicknesses for these sizes and pressure ratings are less than those shown above. Presently these are the lowest nominal thicknesses available in these sizes.

NOTE: Per ANSI/AWWA C150/A21.50 the thicknesses above include the 0.08" service allowance and the casting tolerance listed below by size ranges:

SIZE (Inches)	CASTING TOLERANCES (Inches)
3 - 8	- 0.05
10 - 12	- 0.06
14 - 36	- 0.07

† Ductile-iron pipe is adequate for the rated working pressure indicated for each nominal size plus a surge allowance of 100 psi. Calculations are based on a 2.0 safety factor times the sum of working pressure and 100 psi surge allowance. (See ANSI/AWWA C150/A21.50 for design formulae.) Ductile-iron pipe for working pressures higher than 350 psi is available.

* An allowance for a single H-20 truck with 1.5 impact factor is included for all depths of cover.

‡ Calculated maximum depth of cover exceeds 100 ft.

** Minimum allowable depth of cover exceeds 100 ft.

†† For pipe 14 in. and larger, consideration should be given to the use of laying conditions other than Type 1.

ASSEMBLY INSTRUCTIONS

TYTON AND FASTITE PUSH-ON JOINTS

THE PROCEDURES DESCRIBED BELOW SHOULD BE FOLLOWED TO ASSURE PROPER JOINT ASSEMBLY. SUPPLEMENTAL INFORMATION IS OVER IN THE ATLANTIC STATES INSTRUCTIONS FLYER.

THERE ARE SEVERAL DIFFERENT DESIGNS OF PUSH-ON JOINTS FOR DUCTILE IRON PIPE AND FITTINGS. BE SURE THAT THE CORRECT GASKET IS USED.

IT IS ESPECIALLY IMPORTANT THAT THE GASKET IS INSTALLED IN A CLEAN BELL.

THE GASKET GROOVE IN THE TYTON OR FASTITE BELL SHOULD NOT BE LUBRICATED PRIOR TO GASKET INSERTION.

JOINT ASSEMBLY PROCEDURE

- STEP 1. BELL CLEANING:** Thoroughly clean out the bell. Remove all foreign matter: dirt, sand, mud, ice or excess paint.
- STEP 2. PLAIN END PREPARATION:** Clean off the plain end, removing any dirt, foreign matter or excess paint. Make sure that the plain end is beveled. File smooth any sharp edges which might damage the gasket.
- STEP 3. GASKET INSERTION:** Insert the gasket in its recess in the bell, with the large end of the gasket entering first. Make sure that the gasket faces in the correct direction and is properly seated as illustrated below.
- STEP 4. LUBRICATION:** Apply a thin coating of lubricant to the inside surface of the installed gasket just prior to joint assembly. Make certain the entire inner surface of the gasket is coated. Also apply a thin coating of lubricant to the beveled portion of the plain end.
- STEP 5. JOINING:** Guide the plain end into the bell and compress the gasket by pushing the plain end all the way into the bell socket. Keep the bell and plain end in reasonably straight alignment during assembly. Any deflection should be taken after the joint is assembled.

MECHANICAL JOINT

THE PROCEDURES DESCRIBED SHOULD BE FOLLOWED TO ASSURE PROPER JOINT ASSEMBLY.

THERE ARE SEVERAL DIFFERENT SIZES OF BOLTS. CHECK TO SEE YOU HAVE PROPER SIZE AND NUMBER.

- STEP 1. BELL AND SPIGOT CLEANING AND LUBRICATION:**
Thoroughly clean bell gasket area and spigot of pipe of all foreign material. Lubrication and additional cleaning should be provided by brushing both the gasket and plain end with soapy water or pipe lubricant just prior to slipping gasket into the plain end.
- STEP 2. GLAND AND GASKET:** Place gland with lip extension toward the plain end, and the gasket with the narrow edge toward the plain end of the pipe.
- STEP 3. JOINING:** Insert the pipe into the bell and press the gasket firmly and evenly into the gasket recess. Keep the joint straight during assembly. Make deflection after joint assembly but before tightening bolts. (Lubrication as in Step #1 will help facilitate gasket seating)
- STEP 4. BOLTS:** Push the gland toward the bell and center around the pipe with the gland lip against the gasket. Insert bolts and hand-tighten nuts.
- STEP 5. TIGHTENING:** Tighten bolts to normal range of bolt torque as indicated in table. Maintain approximately the same distance between gland and the face of the bell flange. This is done by partially tightening the bottom bolts first then the top bolts next bolts on either side finally the remaining bolts. This is repeated as many times as required.

ASSEMBLY OF FIELD CUT PIPE

When pipe are cut in the field, the cut end may be readily conditioned so that it can be used to make up the next joint. The outside of the cut end should be beveled about 1/4-inch at an angle of about 30 degrees (Figure 1). This can be quite easily done with a coarse file or a portable grinder. The operation removes any sharp, rough edges which otherwise might injure the gasket.

Figure 1

When ductile iron pipe 14" and larger is to be cut in the field, the material should be ordered as "GAUGED FULL LENGTH". Pipe that is "gauged full length" is specially marked to avoid confusion. The ANSI/AWWA standard for ductile iron pipe requires factory gauging of the spigot end. Accordingly, pipe selected for field cutting should also be field gauged in the location of the cut and found to be within the tolerances shown in Table 1. In the field a mechanical joint gland can be used as a gauging device.

Table 1. Suitable Pipe Diameters for Field Cuts and Restrained Joint Field Fabrication

36	38.24	38.38	120 1/8	120 7/16

Above table based on ANSI/AWWA C151/A21.51 guidelines for push-on joints

THE BACKHOE METHOD OF ASSEMBLY

A backhoe may be used to assemble pipe of intermediate and larger sizes. The plain end of the pipe should be carefully guided by hand into the bell of the previously assembled pipe. The bucket of the backhoe may then be used to push the pipe until fully seated. A timber header should be used between the pipe and backhoe bucket to avoid damage to the pipe.

LAYING CONDITIONS

Consideration of the pipe-zone embedment conditions included in this figure may be influenced by factors other than pipe strength. For additional information on pipe bedding and backfill, see ANSI/AWWA C600.

- * For nominal pipe sizes 14 in. and larger, consideration should be given to the use of laying conditions other than Type 1.
- † Flat bottom is defined as undisturbed earth.
- ** Loose soil or select material is defined as native soil excavated from the trench, free of rocks, foreign materials, and frozen earth.
- § American Association of State Highway and Transportation Officials, 444 N. Capitol St. N.W., Suite 225, Washington, DC 20001.

Re: *Pelham Bay Landfill remediation*
Contract 875-HP

We certify that the pipe and fittings we will supply meet all of the requirements of the following specifications.

FLEXIBLE COUPLING:

Mechanical Joint Solid Sleeve ^{W/} *RETAINER GLANDS*
ANSI A21.10, AWWA C110

FLANGE PIPE:

Ductile iron class 56 thickness with ductile iron 125# flanges domestic.

Pipe: ANSI A21.51, AWWA C151
Fabrication: ANSI A21.15, AWWA C115

FLANGE FITTINGS:

Cast Iron or Ductile Iron class 250 with 125# flange drilling.
ANSI A21.10, AWWA C110, B16.1

COATING:

1 mil Bituminous

LINING:

Double Cement Lined with bituminous seal coat
ANSI A21.4, AWWA C104

Sincerely,

W.C. Krout

FLANGE BOLTS AND
GASKETS

Barbella Enviromental Technology, Inc.
24 Tannery Road
Somerville, NJ 08876

July 13, 1994

Re: *Pelham Bay Landfill remediation*
Contract 875-HP

We certify that the gaskets and bolts we will supply meet all of the requirements of the following specifications.

FLANGE GASKETS: *Clotb inserted rubber ring gasket 1/16" thick*

FLANGE BOLTS: *Carbon steel hex head bolt with heavy hex head nut
Sumberged bolts and nuts will be 304 S/S
ANSI B18.2.1, ANSI B18.2.2, B16.1*

Sincerely,

W.C. Krout
W.C. Krout

Sworn to and subscribed before me this 13th day of July, 1994

The Allowable Stress Values used are as shown in Appendix "A" of ANSI B31.3—1972 for welded pipe in ASTM A-312 having a weld joint factor of .85. Allowable Working Pressures shown for each size reflect the minimum 18% minimum thickness wall tolerance.

See Page 88 for calculation details. All dimensions are in inches.

Compressed Gasketing

BLUE-GARD®

The BLUE-GARD compressed asbestos-free gasketing family eliminates the need for asbestos. It is designed specifically to outperform and seal more effectively than virtually any other nonmetallic gasketing material. BLUE-GARD gasketing provides superior sealability and excellent torque retention. BLUE-GARD gasketing provides superior results because of our unique blends of synthetic fibers, fillers and elastomeric binders developed specifically for this asbestos-free gasketing family.

Features	Benefits
Sealability	<ul style="list-style-type: none"> Provides superior sealability over asbestos gasketing Offers virtually the lowest amount of leakage over any competitive non-metallic gasketing
Creep relaxation	<ul style="list-style-type: none"> Provides improved torque retention resulting in lower leakage than the majority of competitive fibrous type nonmetallic gasketing; both asbestos and asbestos-free
Wide choice of elastomers	<ul style="list-style-type: none"> Handles a wider range of fluids than virtually any other competitive fibrous type of nonmetallic, asbestos-free gasketing

Typical Physical Properties

	Tensile Strength Across Grain psi (N/mm ²):	2500 (17)	2800 (19)	2800 (19)	2500 (17)	2000 (14)	1500 (10)
	Density (1/16" thk. 1.5mm) lbs./ft. ³ :	100 (1.60)	100 (1.60)	100 (1.60)	100 (1.60)	65 (1.04)	85 (1.04)
	(grams/cm ³):						
DIN 3536 Part 4	Gas Permeability cc/min. Nitrogen: Internal pressure: 580 psi (40 bar) Gasket load: 4840 psi (32 N/mm ²)	.05	.03	.08	.04	.001	.001

This is a general guide and should not be the sole means of selecting or rejecting this material. ASTM test results in accordance with ASTM F-104; properties based on 0.8mm (1/32") sheet thickness (except as noted).

Gasketing Products

BLUE-GARD gasketing in command

BLUE-GARD asbestos-free gasketing is monitored and tested from start to finish using the most modern procedures and equipment. This high level of quality assurance continues to produce a full range of compressed asbestos-free gasketing that consistently shows a much better **SEALABILITY** level and a lower level of **CREEP RELAXATION** than the competition.

Style 3000

Color: Blue
Binder: Nitrile (NBR)
Service: Water, aliphatic hydrocarbons, oils, gasoline, mild acids and alkalies*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1000 psi (70 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

A good general purpose gasketing material.

Style 3200/Style 3400

Color: Style 3200 - Off White
 Style 3400 - Grey-black
Binder: SBR
Service: Water, saturated steam, mild acids and alkalies, inert gases*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1200 psi (83 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

For saturated steam and other severe service conditions. Style 3200 meets requirements of MIL-G-24696A.

Style 3300

Color: Black
Binder: Neoprene (CR)
Service: Water, saturated steam, refrigerants, oils, fuels, mild acids and alkalies*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1200 psi (83 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

For use against oils, fuels and refrigerants.

Style 3700

Color: Light Grey
Binder: EPDM
Service: Water, saturated steam, acids and caustics of moderate concentrations*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1200 psi (83 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

The EPDM binder increases serviceability in saturated steam and many alkalies. Also adds exceptional resistance to both weather aging and ozone.

WARNING:

Read the instructions shown throughout this brochure and typical "top specific applications" shown on the product labels. Do not use compressed gaskets in applications where the manufacturer's instructions are not followed. Failure to follow the proper product could result in property damage and/or personal injury.

Performance data obtained in this brochure was developed from field tests. Customer field reports and/or laboratory testing.

While the GANOCK CORP. HAS MADE every effort to provide the most accurate information possible, we assume no responsibility for errors. Specifications are subject to change without notice.

CP-3900/CP-3920

highly compressible gasketing

Styles CP-3900/CP-3920 compressed gasketing materials are designed and manufactured to offer high compressibility characteristics. These premium grade gasketing materials are monitored and tested from start to finish using the most modern procedures and equipment. They exhibit ASTM F36 compressibility test results up to 30%, for high performance in applications involving cast iron or other soft metallic flanges often found in pipe lines, valves, strainers, filters and pump casings. A unique blend of synthetic fibers and high temperature fillers in an elastomeric matrix provide superior sealability and torque retention in a large number of mediums.

Specifications

Style CP-3900

Color: Black
Binder: Nitrile (NBR)
Service: Water, aliphatic hydrocarbons, oils, gasoline, mild acids and alkalies*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1000 psi (70 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

Style CP-3920

Color: Off White
Binder: SBR
Service: Water, saturated steam, mild acids and alkalies, inert gases*
Temperature: max. +700°F (+370°C); min. -40°F (-40°C)
 Continuous oper. temp. +400°F (+205°C)
Pressure, max.: 1000 psi (70 bar)
P x T, max.: 350,000 (12,000)** (1/32" and 1/16" thick)
 250,000 (7,290)** (1/8" thick)

25mm = approx. 1", 1m = approx. 40"

When approaching maximum temperature consult the Ganock Engineering Department
 *Consult General Chemical Resistance of Compressed Gasketing Products catalog
 **P x T max. = psi x °F (bar x °C)

PRESSURE (PSI) - TEMPERATURE (°F) GUIDELINES

The maximum pressure rating of any **TVI** Thermoplastic Valve is 150 PSI @ 72°F - water, nonshock. With temperature increase, the pressure capability of each type valve and size must be derated as charted below.

Ball Valves:
Compact Style,
True Union,
Econo-Pro.

**Ball Check &
Foot Valves,
Gauge Valves.**

IMPROVED PIPING PRODUCTS, INC.

DELTAFLX® BUPP-SS

The high performance, lightweight, stainless steel back-up flange

ANDY IMPROVED PIPING PRODUCTS

We have specialized in flange design since 1979 and furnish our products to a broad cross-section of industrial and municipal users. IPP flanges are made to exacting specifications and conform to the highest standards of customer service and quality assurance.

DELTAFLX BUPP-SS¹ is the most unique and cost effective light weight stainless steel flange connection system in the world... and its available only from IPP².

DELTAFLX, in sizes 2" - 24", is a computer designed flange with a configuration engineered for minimum weight and maximum performance standards.

Investment-cast from the highest grade of ASTM A351 stainless steel, DELTAFLX conforms to a 150 psi drilling template. It's made to be retained by a thermoplastic or steel, stub-end fastened to the pipe by plastic fusion bonding or butt-welding. Ideal for low to medium pressure applications, DELTAFLX BUPP-SS can be considered for virtually any service requiring stainless steel flanges.

¹ Light weight / convoluted flange
² Patent applied for
³ For full class 150 pressure/temperature service see our literature on DELTAFLX LI-SS

- ### FEATURES AND BENEFITS
- Cast stainless steel flange conforms to A351 material specs
 - Designed for use with butt-welded, thermoplastic, or steel stub-ends
 - DELTAFLX is 60% of the weight of a comparable carbon steel flange
 - Rated for 110 psi operating pressure: 150# drilling³
 - Flange is reusable... It is not welded to the pipe
 - Flexible structure is superior where vibration and thermal stresses exist
 - Interchangeable with conventional alloy steel flanges

DELTAFLX eliminates the labor cost and hassle of the two-holing process required during fabrication

Because the flange is free to rotate on the stub-end, it is easy to fit up to mating flanges during assembly and installation. No more trying to match the bolt holes... simply slip the flange over the pipe, weld or bond the stub-end to the pipe, and just turn the DELTAFLX flange until the bolt holes are aligned — install the bolts, nuts, and washers — *one man can do it efficiently.*

IPP — A Strong Customer Connection

SAMPLE SPECIFICATION

- 1.0 The flange shall be of the convoluted design and cast from ASTM A351 CF8M passivated stainless steel. Cast equivalent of 316 SS.
- 2.0 The finish shall be as-cast with flash removed from all edges and bolt holes.
- 3.0 The flange shall be marked with size, bolt hole template, material and type of flange.
- 4.0 The flange shall mate with: ANSI B16.5, B16.1, AWWA C207 and MSS-SP 43
- 5.0 The flange shall be DELTAFLX BUPP-SS as manufactured by Improved Piping Products.

Warranty: If any IPP Ring is believed to be defective, and if on examination IPP finds to its satisfaction that such ring is in fact defective, it will repair or replace such ring at its option without cost. In addition, on IPP Rings, IPP will pay to apply on the cost of installing replacement ring a sum equal to 20% of IPP's published Net Price in effect at the time the defective ring was purchased by the ultimate user or the installing contractor, or the sum of \$3.00, whichever sum is greater. IPP shall not be liable for any consequential damages resulting from any defect in material or workmanship. THIS WARRANTY IS EXPRESSLY IN LIEU OF ANY AND ALL OTHER GUARANTEES AND/OR WARRANTIES.

Hi Seal, the High Performance Butterfly Valve - the economic alternative

Winn Hi-Seal high performance butterfly valves are designed to offer efficient, bi-directional sealing across a wide spectrum of service conditions.

The Hi-Seal range offers easy installation, long service life and minimum maintenance together with a wide choice of designs and materials.

- **POSITIVE SEALING** which is mechanically achieved and does not rely on line pressure assistance.
- **FIRE SAFE** performance proven throughout the range.
- **BI-DIRECTIONAL** performance. Suitable for use on end-of-line service.
- **LONG LIFE** durability due to the double offset operating principle minimising seat wear.
- **COMPACT DESIGN** minimises weight and installation and maintenance costs.
- **ECONOMICAL**, superior performance alternative to other valve types.

BUTTERFLY VALVE FOR GAS
VENTILATION

erfly Valve with built-in reliability ; Ball and other valve types.

The Range:-

Body Types

* Wafer	Clamped between flanges with spanning bolts or studs
Wafer Lugged	Tapped or clearance holes available
Double flanged	Suitable for ANSI and DIN Standards

Design Types

* Soft Seated	for general purpose applications.
Firesafe	for process industry use where superior safety is required.
Metal Seated	for high temperature and/or abrasive services.

Sizes inch mm	2-48 6" 50-1200 10"	2-24 50-600

Body Materials

* Standard	Carbon Steel (ASTM A 216 WCC) Stainless Steel (ASTM A 351 CF8M) Aluminium Bronze (BS 1400 AB2)
Alternatives	Duplex Stainless Steels 6 Mo Inconel Ferralium Hastelloy Titanium Monel Other materials on request

Seat Materials

* Standard (Soft Seat & Firesafe)	PTFE
Alternative Seat Materials	RTFE (Reinforced PTFE) UHMPE (Ultra high Molecular Weight Polyethylene)
Metal Seated Valves	Inconel

Disc Material 316 SS
Shaft Material 17-4 SS

Design Features

Soft Seated

In soft seated models the PTFE seat is mechanically forced onto the disc by means of the seat energiser which acts as a disc spring.

Firesafe

In firesafe models the energising ring is extended so as to form a secondary metal seal in the event of soft seat destruction.

Metal Seated

For high temperature or abrasive applications the soft seat is replaced by a metallic spacer and the metal seat forms the seal.

Benefit: A choice of seating types offers excellent sealing across the whole pressure/temperature range.

Firesafe Design
 Destruction of the soft seat due to elevated temperature will allow the metal seat to spring onto the disc and effect a secondary bi-directional metal to metal seal.

Benefit
 Compliance with International Firesafety specifications.
 (See Page 10.)

Features

Benefits

Bi-Directional Seal

The disc/shaft assembly is doubly offset from centre causing the disc to move into the seat with a camming action. This provides the mechanical principle which ensures a seal in either direction.

As the valve begins to open the disc swings away from the seat eliminating wear points and extending seat life.

Low operating torque.

Positive sealing in either direction.

Long seat life.
Lugged valves ideal for end-of-line service.

One Piece Shaft

Single piece shaft design ensures rigidity and stability of the shaft/disc assembly.

The input drive is a key, designed to fail mechanically should abnormal torques be applied thus protecting the internal disc/shaft assembly.

Long life operation.

To maximise safety.

Gland Adjustment

Gland packing compression is maintained by a bolted gland. Adjusting nuts are always accessible whatever operating method is fitted.

Accessible packing adjustment without operator removal.

Seat replacement

Without removing the disc/shaft assembly, seat rings may be replaced by simply removing the retaining ring.

Fast, easy maintenance.

How do

butterfly valves compare with other valve types?

Butterfly valves are **COMPACT**

Requires less space.
Less weight.
Less raw material.
Less costly than other valve types.

Butterfly valves are **QUARTER TURN** valves

Easy operation by lever, gearbox or actuator.
Superior gland integrity.

Butterfly valves have **FEWER PARTS**

Easier to maintain.

Butterfly valves are **SUITABLE FOR CONTROL PURPOSES**

Linear flow characteristics between 30° and 70° of opening.

Gate valves cannot claim ANY of these advantages.

Pressure/Temperature Ratings

The maximum working capability of any valve is either the body rating or the seat shut-off capability, whichever is the lower.

The seat ratings shown are based on data from API609.

The body ratings shown are from ANSI B16.5/BS 1560 Pt 2.

NOTE: Consult Factory for metal seat applications above 800°F

Operation Methods

Handlever

The Winn lever operator incorporates a lockable spring loaded release arm allowing the valve to be set in intermediate positions for throttling service. A patented, cam adjusted, lever stop plate ensures perfect alignment between lever and disc in the closed position. Levers are fitted as standard on valves up to 6" class 150 and 4" class 300.

Gearbox

On larger valves requiring manual operation, a gearbox is mounted directly onto the valve yoke. The gearbox incorporates position indication and travel adjustment stops.

Powered Operation/Control

Pneumatic, electric or hydraulic actuators with ancillary equipment such as solenoid valves, limit switches, positioners etc. can be supplied.

Adaptions

Extended stem operation, chain wheel operation and other adaptions are available as required.

I.S.O. Mounting Flange.

The operator mounting yoke may be adapted, by the addition of a mounting flange, to provide compatability with I.S.O. 5211. (See drawing on page 5.)

WELD FITTINGS

WELD FITTINGS Are generally manufactured to ASTM A403 with dimensional tolerances in accordance with MSS SP 43 for schedules 5s and 10s and with ANSI B16.9 for schedules heavier than schedule 10s.

As-welded or "paper mill grade" fittings are supplied in the as-welded, pickled and passivated condition.

Flanges conform to ASA B16.3.

* 1/4" raised face is included in thickness O and length through A to Y, YY.

* Unless otherwise specified Welding Neck Flanges in sizes 12" and smaller are based on dimensions as listed to correspond to Schedule 40S pipe. Special bases on application. Sizes 14" and larger—base to be specified by purchaser.

AUTOMATIC FLAP GATES CIRCULAR OPENING

HEAVY DUTY TYPE

These flap gates may be installed on the face of a concrete wall with anchor bolts; attached, by means of studs, to the face of a wall timber embedded in the concrete wall; or bolted to a pipe flange.

The gate has two adjustment features: at the top laterally and at the center for any misalignment. Hinge points have lubrication fittings.

The flap opens on minimum differential head.

Circular heavy duty flap gate, flat frame type with flexible and adjustable hinges and hinges.

SUGGESTED CAST IRON TIDE GATE SPECIFICATIONS

Tide Gates shall be solid, ribbed tide gates, complete with frames, bronze, neoprene, or cast iron seat facing, double adjustable hinges, posts and links, mounted to wall thimbles, or walls, as manufactured by Craft Machine Works, Inc. of Hampton, Virginia.

Materials

Flap & Frame	- Cast Iron ASTM A126 Class B
Hinge Links	- Ductile Iron
Hinges	- Manganese Bronze
Hinge Posts & Pins	- Silicon Bronze
Adjusting Screws	- Silicon Bronze
Anchor Studs & Nuts	- Stainless Steel ASTM A276 Type 316
Wall Thimble (If required)	- Cast Iron ASTM A126 Class B
Seat Face	- Bronze, <u>Neoprene</u> or Cast Iron

Flap

The Tide Gate Flap shall be of Cast Iron ASTM A126 Class B with vertical and horizontal ribs capable of withstanding the design head with a safety factor of 5.

Frame

The Tide Gate Frame shall be Cast Iron ASTM A126 Class B. The flange shall be faced and drilled to match the anchor bolt layout provided. The seat facing of the frame shall be sloped from the vertical with a dovetail groove machined to accept the neoprene or bronze seat which shall be mechanically retained without the use of fasteners. Metal thickness of the frame shall not be less than 1" with flanges not less than 1-1/2" thick.

Seats

Seat facings shall be malleable extruded bronze of a composition which will resist dezincification and will increase in working ability with cold working. The seat facings shall be machined to a 63 micro-inch finish or better, or neoprene seats made from stock of the best grade of neoprene having a tensile strength of 1,500 p.s.i., a minimum elongation of 400 percent and a durometer hardness number 60 \pm 5 on the shore "A" scale.

The installed seat facing will be made of a special shape to fill and permanently lock into the machined dovetail grooves when installed.

Seats shall be cast iron machined to a 125 micro-inch finish or better.

CRAFT MACHINE WORKS, INC.

2102 45th Street, Hampton, Virginia 23661

Tele: (804) 380-8815 Fax: (804) 380-9120

SUGGESTED CIRCULAR FLAP VALVES SPECIFICATIONS

Circular Flap Valves where shown in the valve schedule and contract drawings, shall be as manufactured by the Craft Machine Works, Inc., Hampton, Virginia.

Valves shall have a cast iron flanged frame, cast iron flap, with iron to iron, bronze, or neoprene seating. The hinge arms and flap shall be cast in one piece, and shall be attached to the frame by means of a bronze pivot pin.

Flap valves less than Six inch in diameter with bronze or neoprene seating shall have a cast bronze flap, otherwise the flap is of cast iron.

SUGGESTED CAST IRON TIDE GATE SPECIFICATIONS

HINGE LINKS

Hinge Links shall be of ductile iron, bronze bushed and provided with noncorrosive grease fittings. Adjustable hinges shall be of manganese bronze. Hinge posts, hinge pins, and adjusting studs shall be of silicon bronze.

CASTINGS

Casting shall be true to pattern, sound, smooth, and without injurious cold shuts, swells, lump scabs, scoria, sand holes and other defects and imperfections.

Plugging and filling will not be allowed where the physical strength of the casting will be impaired. All castings shall be thoroughly cleaned, inside and outside, of sand and dirt. Sandblasting, wire brushes, scrapers or other approved mechanical appliances shall be used for this purpose. Acid or other corrosive liquids shall not be used in the cleaning of castings.

WALL THIMBLES

Wall Thimbles shall be of the section ("F") and depth as indicated on the plans and listed in the gate schedule. They shall be Cast Iron, one piece construction, of adequate strength to withstand all operational and reasonable installation stresses. Wall thimbles shall be internally braced during concrete placement. A center ring or waterstop will be cast around the periphery of the thimble. The front flange will be machined and have tapped holes for the Tide Gate attaching studs. Large rectangular wall thimbles will be provided with holes in the invert to allow satisfactory concrete placement beneath the thimble.

WORKING DRAWINGS

Detailed working drawings and descriptions shall be furnished in conformity with the General Conditions of the Contract Documents.

MODEL 10C FLAP GATE

- For seating heads to 10 feet
- Round opening
- Spigot back
- Cast Iron seating surfaces

The Model 10C flap gate consists of the simplest possible design with double hinge action for heads to 10 feet. Pivot points are stationary. Ring and flap are of cast iron with galvanized steel hinge arms and assembly bolts and bronze bushings. Extension of the cast iron bosses of the flap over the top of the pivot arms limits the double hinge action, and prevents the bottom of the flap from folding inside the ring and wedging the gate in the open position.

The gate is made in spigot

back for attaching to corrugated steel pipe. Most sizes are now available in flat back for attaching to a concrete wall. Anchor bolts are placed in the original pour of concrete. After the gate is in place on the anchors and properly aligned using the double nuts, grout is packed between the gate seat and the wall.

This gate opens under a minimum head differential, yet is possible closing under a few inches of water on the face of the gate. A lifting eye is cast integrally with the flap to permit manual operation.

(All Dimensions in Inches)

SIZE				PIVOT RADIUS
6	8.75	3.75	4.75	7.50
8	10.75	5.00	6.50	10.25

* Maximum width of gate may occur at top or on horizontal center line. "A" dimension is shown for maximum horizontal width of gate.

* FLAT BACK ATTACHED TO CONCRETE

Revised 8-63

SPECIFICATIONS FOR MODEL 10C FLAP GATE

General

Flap gates shall be ^{FRESNO} ~~Armed~~ Model 10C or approved equal. Similar installations shall have operated successfully for five years or more. All component parts shall be of the type material shown in the Materials section of this specification.

Seat

The spigot back seat shall be one-piece cast iron with a raised section around the perimeter of the waterway to provide the seating face. The seat shall be shaped to provide two pivot bosses extended above the top of the waterway opening.

Cover

The cover shall be one-piece cast iron with pivot point bosses, a lifting eye and a reinforced section around the perimeter of the waterway opening. Pivot bosses shall be designed to limit the double hinge action, preventing the cover from rotating sufficiently to become wedged in the open position.

Seating Faces

The cast iron seating faces of the seat and cover shall be machined to a plane with a minimum 63 micro-inch finish.

Links

The links connecting the cover and the upper pivot bosses shall be one-piece galvanized steel and of sufficient section to safely withstand the normal forces encountered during gate operation. Each link shall be provided with a commercial grade bronze bushing at the pivot points.

Fasteners

All anchor bolts, assembly bolts and nuts shall be galvanized steel and of ample section to safely withstand forces created by operation of the gate under the heads

shown in the Gate Schedule. Quantity and size of the fasteners shall be as recommended by the manufacturer. Anchor bolts shall be furnished with two nuts each to install gates attached to concrete.

Painting

Exposed machined or bearing surfaces shall be coated with a water-resistant rust preventive compound. All assembled units shall be shop painted in accordance

with the manufacturer's standard practice.

Installation

Installation of the flap gates shall be done by the contractor in a workmanlike manner in accordance with the manufacturer's instructions.

Materials

Materials shall conform to the requirements of the following ASTM Standards.

CAST IRON	A 126, Class B
GALVANIZED STEEL (Fasteners)	A 307 (Bolts) A 164 (Galvanized Coating)
GALVANIZED STEEL	A 36 or A 306 (Carbon Steel) A 123 (Galvanized Coating)

*Steel, Concrete, and Ductile Iron pipe O.D.s vary. It is important to for proper sizing.

**Height may vary slightly due to customized construction.

TIDEFLEX™ PE

E.P.A. Tests Call Tideflex™ an "Excellent Solution."

The Environmental Protection Agency's (E.P.A.) recent test results proved Red Valve's patented Tideflex™ Check Valve to be an excellent solution to eliminate maintenance costs and operational failures with traditional flap gate valves.

According to the report:

"Problems with malfunctioning flap gates, like frozen hinge pins, accumulation of debris, worn seats, misalignment, warpage and corroded parts and costs of maintenance crews are eliminated with the Tideflex™ Valve."

Today, thousands of patented Tideflex™ Valves and diffuser valve systems are operating maintenance-free worldwide. These valves have successfully withstood severe winter freezes, typhoons, hurricanes and flooding, minimizing damage to wetlands, beaches and residential areas, eliminating hydraulic surges to waste water treatment plants and saving municipalities millions of dollars in maintenance and treatment costs.

PROBLEM

These traditional flap gate valves were held open by telephone poles to eliminate loud clanging noises and allow for better outflow. Unfortunately, they no longer prevented backflow into the city's water treatment plant.

SOLUTION

Tideflex™ all rubber check valves were installed, and eliminated the noise as well as completely preventing the backflow problem. Simply Revolutionary!

Function

The Tideflex™ Valve is manufactured of flexible elastomer material reinforced with synthetic fabric much like an automobile tire. Neoprene construction with a special EPDM cover for ozone protection is furnished as a standard. Pure Gum Rubber, Hypalon, Butyl, Buna-N, EPDM and Viton are also available, and come with standard EPDM covers.

Forward hydraulic pressure opens the valve automatically without any additional energy source and reverse hydraulic pressure seals the valve automatically. The Tideflex™ Valve is simple to install. Two metal bands easily connect it to the O.D. of a pipeline.

By engineering the elastomer fabric matrix in varying degrees of flexibility, each Tideflex™ Valve is customized to your exact application to open with minimum specified head pressure and withstand maximum specified back pressure.

This versatile design of the Tideflex™ Valve also allows it to be used as a vacuum breaker on pipelines and pressure vessels to prevent closing.

The inherent cushioning action of the Tideflex™ Valve's elastomer design completely eliminates noise. The valve's heavy-duty construction makes it vandal-proof and reduces the likelihood of children entering a pipeline.

A number of other custom-designed check valves like Red Valve's Series 33 are available for in-line service.

Use of Wheatland Rigid Steel Conduit in Conformance to the 1984 National Electrical Code

Though the National Electrical Code deals primarily with proper field application, it presumes that the conduit meets the standards necessary to perform properly under approved conditions. Wheatland rigid steel conduit is made to provide all the qualities required for proper installation as specified in the Code.

For your convenience in designing and specifying raceway systems of rigid steel conduit, the applicable articles from the National Electrical Code are enumerated below.

ARTICLE 346—RIGID METAL CONDUIT

Use (346-1)—The use of rigid metal conduit shall be permitted under all atmospheric conditions and occupancies subject to the following.

(a) **Protected by Enamel.** Ferrous raceways and fittings protected from corrosion solely by enamel shall be permitted only indoors and in occupancies not subject to severe corrosive influences.

(b) **Dissimilar Metals.** Where practicable, dissimilar metals in contact anywhere in the system shall be avoided to eliminate the possibility of galvanic action. *Exception:* Aluminum fittings and enclosures shall be permitted to be used with steel rigid metal conduit, and also, steel fittings and enclosures shall be permitted to be used with aluminum rigid metal conduit.

(c) **Corrosion Protection.** Ferrous or nonferrous metal conduit, elbows, couplings and fittings shall be permitted to be installed in concrete, in di-

rect contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection and judged suitable for the condition.

Cinder Fill (346-3)—Conduit shall not be used in or under cinder fill where subject to permanent moisture.

Exception No. 1: Where of corrosion-resistant material suitable for the purpose. *Exception No. 2:* Where protected on all sides by a layer of non-cinder concrete at least 2 inches thick. *Exception No. 3:* Where the conduit is at least 18 inches under the fill.

Wet Locations (346-4)—All supports, bolts, straps, etc. shall be of corrosion-resistant materials or protected against corrosion by corrosion-resistant materials.

Minimum Size (346-5)—Conduit smaller than 1/2 inch electrical trade size shall not be used. *Exception No. 1:* For underplaster extensions as permitted in Section 344-2. *Exception No. 2:* For enclosing the leads of motors as permitted in Section 430-145 (b)

Number of Conductors in Conduit (346-6)—The number of conductors permitted in a single conduit shall not exceed the percentage fill specified in the N.E.C. (See pages 6 and 7 for number of conductors permitted in each conduit trade size.)

Reaming and Threading (346-7)—

(a) **Reamed.** All cut ends of conduits shall be reamed or otherwise finished to remove rough edges.

(b) **Threaded.** Where conduit is threaded in the field, a standard conduit cutting die with a 3/4-inch (19-mm) taper per foot (305 mm) shall be used.

Bushings (346-8)—Where a conduit enters a box or other fitting, a bushing shall be provided to protect the wire from abrasion unless the design of the box or fitting is such as to afford equivalent protection.

Couplings and Connectors (346-9)—

(a) **Threadless.** Threadless couplings and connectors used with conduit shall be made tight. Where buried in masonry or concrete, they shall be of the concrete-tight type. Where installed in wet locations, they shall be of the rain-tight type.

(b) **Running Threads.** Running threads shall not be used on conduit for connection at couplings.

Bends—How Made (346-10)—Bends of rigid metal conduit shall be so made that the conduit will not be injured and that the internal diameter of the conduit will not be effectively reduced. The radius of the curve of the inner edge of any field bend shall not be less than shown in Table 346-10.

Table 346-10
Radius of Conduit Bends (Inches)

Size of Conduit (In.)	Conductors Without Lead Sheath (In.)	Conductors With Lead Sheath (In.)
½	4	6
¾	5	8
1	6	11
1¼	8	14
1½	10	16
2	12	21
2½	15	25
3	18	31
3½	21	36
4	24	40
5	30	50
6	36	61

For SI units: (Radius) one inch = 25.4 millimeters.

Exception: For field bends for conductors without lead sheath and made with a single operation (one shot) bending machine designed for the purpose, the minimum radius shall not be less than indicated in Table 346-10 Exception.

Table 346-10 Exception
Radius of Conduit Bends (Inches)

Size of Conduit (In.)	Radius to Center of Conduit (In.)
½	4
¾	4½
1	5¼
1¼	7¼
1½	8¼
2	9½
2½	10½
3	13
3½	15
4	16
5	24
6	30

For SI units: (Radius) one inch = 25.4 millimeters.

Bends—Number in One Run (346-11)

A run of conduit between outlet and outlet, fitting and fitting, or outlet and fitting shall not contain more than the equivalent of four quarter bends (360 degrees, total) including those bends located immediately at the outlet or fitting.

Supports (346-12)—Rigid metal conduit shall be installed as a complete system as provided in Article 300 and shall be securely fastened in place. Conduit shall be firmly fastened within 3 feet of each outlet box, junction box, cabinet or fitting. Conduit shall be supported at least every 10 feet.

Exception No. 1: If made up with threaded couplings, it shall be permissible to support straight runs of rigid metal conduit in accordance with Table 346-12, provided such supports prevent transmission of stresses to termination where conduit is deflected between supports. **Exception No. 2:** The distance between supports may be increased to 20 feet for exposed vertical risers from machine tools and the like, provided the conduit is made up with threaded couplings, is firmly supported at the top and bottom of the riser, and no other means of intermediate support is readily available.

Table 346-12
Supports for Rigid Metal Conduit

Conduit Size (Inches)	Maximum Distance Between Rigid Metal Conduit Supports (Feet)
½-¾	10
1	12
1¼-1½	14
2-2½	16
3 and larger	20

For SI units: (Supports) one foot = 0.3048 meter.

Boxes and Fittings (346-13)—Boxes and fittings shall comply with the applicable provisions of Article 370.

Splices and taps (346-14)—Splices and taps shall be made only in junction boxes, outlet boxes or conduit bodies. See Article 370.

CONSTRUCTION SPECIFICATIONS General (346-15)—Rigid metal conduit shall comply with (a) through (c) below.

(a) **Standard Lengths.** Rigid metal conduit as shipped shall be in standard lengths of 10 feet (3.05 m) including coupling, one coupling to be furnished with each length. Each length shall be reamed and threaded on each end. For specific applications or uses, it shall be permissible to ship lengths shorter or longer than 10 feet (3.05 m), with or without couplings and with or without threads.

(b) **Corrosion-Resistant Material.** Nonferrous conduit of corrosion-resistant material shall have suitable markings.

(c) **Durably Identified.** Each length shall be clearly and durably identified in every 10 feet (3.05 m) as required in the first sentence of Section 110-21.

Percent of Cross Section of Conduit and Tubing for Conductors

Number of Conductors	1	2	3	4	Over 4
All conductor types except lead-covered (new or rewiring)	53	31	40	40	40
Lead-covered conductors	55	30	40	38	35

Notes to Tables

- Each of the tables apply only to complete conduit or tubing systems and are not intended to apply to short sections of conduit or tubing used to protect exposed wiring from physical damage.
- Equipment grounding conductors, when installed, shall be included when calculating conduit or tubing fill. The actual dimensions of the equipment grounding conductor (insulated or bare) shall be used in the calculation.
- When conduit nipples having a maximum length not to exceed 24 inches are installed between boxes, cabinets, and similar enclosures, the nipple shall be permitted to be filled to 60 percent of its total cross-sectional area.
- See table on left, for allowable percentage of conduit or tubing fill.

Rigid Steel Conduit Specifications

Wheatland Hot-dipped Galvanized Rigid Steel Conduit is manufactured in conformance to standards established by the American National Standard Institute, the Underwriter's Laboratories and the Federal Specification. In preparing bids, it may be stated that Wheatland Rigid Steel Conduit conforms to:

- American National Standard Institute C80.1-1983
- Federal Specification WW-C-581e
- Underwriter's Laboratories Specification No. 6
- National Electrical Code—Article 348

UNDERWRITER'S LABORATORIES SPECIFICATION NO. 6

The specifications for rigid steel conduit established by the Underwriter's Laboratories cover both the manufacture and testing of the conduit in detail. The sections referring to the qualifications of the conduit are condensed and summarized below. Be assured that Wheatland Hot-dipped Galvanized Rigid Steel Conduit meets the UL specifications in every way.

The Tube

Each tube used in the manufacture of rigid metal conduit shall be steel (or other suitable metal) and shall have a circular cross-section sufficiently accurate to permit the cutting of clean, true threads. The wall thickness shall be uniform through the length of the tube. The welding of all seams shall be thoroughly well done. The welded seam shall be free from metal trimmings, sharp edges and sharp projections.

Both the inside and outside surfaces of the tube shall be thoroughly cleaned so that the protective coating will have a smooth finish. Before the

protective coating is applied, the interior surface of the tube shall be examined to be sure it is free from scale.

Each tube used for rigid metal conduit shall be capable of being bent cold into a quarter circle around a mandrel, the radius of which is four times the trade size of the tube, without developing cracks or opening a weld.

The Protective Coating

Both the inside and outside of ferrous metal rigid conduit shall be protected against corrosion by a coating of zinc (or enamel or equivalent corrosion-resistant coating). The coating shall be sufficiently elastic to prevent its cracking or flaking off when a finished sample of 1/2-inch conduit is tested up to a year after manufacture by bending it into a semi-circle, the inner edge of which has a radius of 3 1/2 inches.

A protective coating of zinc shall be such that a sample of finished rigid ferrous-metal conduit will not show a fixed deposit of copper after four one-minute immersions in a standard copper sulfate solution.

The Threads

Each length of conduit is to be threaded on both ends and chamfered to remove burrs and sharp edges on the interior surface. All threads are to be clean and full cut. If threads are cut after the protective coatings are applied, they shall be treated to prevent corrosion before the conduit is installed.

The Finished Conduit

Every piece of conduit is to be inspected prior to shipment to be sure it is free from poor coating, scale, burrs or fins, embossing on interior surfaces or other defects.

Each length of conduit shall be marked "rigid metal conduit" and indicate the type of material. In addition, it shall be marked with manufacturer's name or trade mark.

FEDERAL SPECIFICATION WW-C-581e

This specification covers zinc-coated rigid steel conduit in all common trade sizes. Its general requirements are that products furnished under this specification conform as applicable to ANSI C80.1 and UL 6 for rigid steel conduit.

Other provisions of WW-C-581e which should be noted when preparing bids are summarized here. For details on packaging and quality assurance, refer to the full specification.

Standard Commercial Product

The conduit shall, as a minimum, be the manufacturer's standard commercial product with any added features needed to comply with the requirements.

Identical Items

Conduit, couplings, elbows and nipples of the same classification furnished under any specific contract shall be physically and mechanically identical. No deviation will be acceptable without prior written approval of the contracting officer.

Material

All material shall be new and unused. Material not specified shall be of the same quality used for the intended purpose in commercial practice. Materials used shall be free from defects which would adversely affect the performance or maintainability of individual component or the overall assembly.

Fire and Casualty Hazards

Each contractor shall submit proof that the conduit proposed under this specification conforms to UL6. The UL listing mark may be accepted as evidence that the conduit conforms to this requirement.

Marking

Conduit shall be permanently marked in accordance with ANSI C80.1 and UL6.

Workmanship

All threaded portions of conduit shall be clean and undamaged. Plastic thread protectors shall be furnished on all exposed conduit threads. The exterior zinc coating, and all other protective coatings, including the interior coating and thread coating, shall completely and uniformly cover the metal substrate.

AMERICAN NATIONAL STANDARD INSTITUTE SPECIFICATION FOR ZINC-COATED RIGID STEEL CONDUIT

The ANSI Specification C80.1 is very precise and explicit in setting standards for rigid steel conduit. Wheatland's rigid steel conduit matches these standards in every way. It meets the general requirements of having an accurate circular cross-section, a uniform wall thickness, a defect-free interior surface and continuously welded seams. It is thoroughly cleaned before coating so the protective coating adheres well and is smooth. The exterior surface is thoroughly and evenly coated with metallic zinc applied directly to the steel so that metal-to-metal contact and galvanic protection against corrosion are provided. The interior sur-

face is protected by zinc for corrosion resistance

DETAILED REQUIREMENTS

Some of the pertinent detailed requirements of Specification C80.1 are interpreted and summarized below for your reference and assurance that Wheatland Rigid Steel Conduit is produced to precise standards

Zinc Coating

The zinc content of the coating on the outside surface shall be equivalent to a minimum thickness of 0.0008 inches.

Threading and Chamfering

Each length of conduit shall be threaded on both ends, and each end shall be chamfered or otherwise treated to remove burrs and sharp edges. If threads are cut after the zinc

coating has been applied, the threads shall be treated with a protective coating to prevent corrosion before installation. This treatment shall not impair electrical continuity through couplings or fittings after installation.

Identification

Each length of conduit shall be identified with the manufacturer's name and trade mark and the words "Rigid Steel Conduit"

Threads

The number of threads per inch and the length of the threaded portion at each end of each length conduit shall be as shown in the accompanying table and shall conform to American Standard Pipe Threads. The perfect thread shall be tapered for its entire length, and the taper shall be 3/4 in/ft.

Dimensions of Threads for Rigid Steel Conduit, Zinc Coated

Nominal or Trade Size of Conduit (inches)	Threads per Inch	Pitch Diameter at End of Thread E_o	Length of Thread (inches)

Rigid non-metallic conduit is normally supplied in standard 10' lengths with one belled end per length. For specific requirements, it may be produced in lengths shorter or longer than 10', with or without belled ends.

See Section 16010, Part 2.1
CARLON PLUS 80® RIGID NON-METALLIC CONDUIT (Extra Heavy Wall EPC-80) *PLEASE CORROSION R Pa 3 OF 3*

For use in aboveground and below ground applications that are subject to severe physical abuse.

- U.L. Listed
- Sunlight resistant
- Rated for use with 90°C conductors

16010 - 2.1A

PVC GALVANIZED CONDUIT

G.C. MONACO ELECTRIC & DAUGHTER, INC.
 281 W. LINCOLN AVE.
 MT. VERNON, NY 10550

SUPPORT OF CARLON RIGID NON-METALLIC CONDUIT IN ABOVEGROUND INSTALLATIONS

Distances between supports should be based on temperatures and the specific application. Because non-metallic conduit is lighter in weight, it does not require as strong a support system. The following chart illustrates the support requirements as outlined in the National Electric Code based on 50°C (122°F) air temperature and 90°C conductor temperature

Conduit Size (in.)	Maximum Spacing Between Supports (feet)
1/2 - 1	3
1 1/4 - 2	5
2 1/2 - 3	6
3 1/2 - 5	7
6	8

Plastic conduit should always be installed away from steam lines, etc. Support straps should be tightened only enough to allow for lineal movement caused by expansion and contraction.

Corrosion Resistance Data

CORROSION RESISTANCE OF CARLON PLUS 40® AND PLUS 80® CONDUIT

Carlton Plus 40 and Plus 80 are generally acceptable for use in environments containing the chemicals below. These environmental resistance ratings are based upon tests where

See Section 16010, part 1 the specimens were placed in complete submergence in reagent listed. In many applications the Plus 40 and Plus 80 can be used in process areas where these chemicals are manufactured or used because worker safety requirements dictate that any air presence or splashing be at a very low level.

If there are any questions for specific suitability in a given environment, prototype samples should be tested under actual conditions.

OCAL-BLUE CONDUIT

16010 - 2.1A

OCAL-BLUE CONDUIT

- 1) The conduit is hot dipped galvanized after fabrication.
- 2) The threads are hot dipped galvanized.
- 3) A coating of 1/2 mil acrylic epoxy over the entire pipe inside & out including the threads
- 4) A clear urethane coating over threads
- 5) A minimum 40 mil PVC coating on the outside
- 6) A nominal 2 mil blue urethane on the inside

OCAL-BLUE

PVC Coated Conduit with Blue Urethane Interior Coating is the answer to internal corrosion, and is necessary because of the large quantities of corrosive atmosphere that are breathed into the conduit system.

We start by manufacturing the rigid conduit and do our special Hot Dipped Galvanizing after fabrication. The galvanizing is done after the threading, producing Hot Dipped Galvanized threads and providing extra protection against corrosion.

The PVC compounds are made from primary materials without the addition of fillers or secondary materials. The end result is sealing characteristics that outperform any other corrosion prevention system.

Occidental Coating Company also offers fittings, elbows, wireways, light fixtures, panel boards and other electrical accessories coated with the OCAL-BLUE process.

For custom orders, special colors or large quantities Occidental's manufacturing capabilities guarantee delivery time unmatched in the industry.

Finally, our reputation for dependability and customer service has made Occidental Coating Company the most trusted name in corrosion protection for the electrical industry.

OCAL coatings have been tested against more than 120 chemical solutions and have been proven the most effective, long-lasting corrosion protection systems available.

~~Aluminum OCAL-BLUE PVC Coated Aluminum Conduit has the same corrosion protection qualities as regular OCAL-BLUE except that it combines the protection of OCAL-BLUE with lightweight copper-free aluminum conduit.~~

Occidental Coating company protects each shipment of OCAL-BLUE products with protective packaging for damage-free distribution.

Figure 8 Cable

Used to support integrated messenger telephone cable — commonly referred to as Figure 8 Cable. Hanger is in two parts, hook and clamp both galvanized steel. Installed with a 1/2" machine bolt and two square nuts. One nut is placed between hook and clamp for spacing. The other is used to tighten the clamp member. Order nuts and bolts separately. Accommodates .109 or .134 solid messenger wire.

Catalog No.	Description	Approx. Ship. Wt., Lbs. Per 100 Pcs.
9015	Hook and Clamp	54

No. 7911

HANGERS, MESSENGER

Universal Type

Used on corners and straight runs. Messenger is securely clamped by two 1/2" carbon-steel guy clamp bolts. Mounted with a 3/8" thru-bolt and a 1/2" lag screw, neither of which is included. Hot dip galvanized.

HOOKS, GUY

Keeps guy wire from creeping downward when pole is guyed sharply. Nos. 5001, and 5004 are used for storm guying. Hooks should be used under bolt heads for maximum shear strength. For Guy hooks mounted on strain plates, see page 5-37.

No. C203-0166

HOOKS, GUY, DUCTILE IRON

Ductile Iron — Hot Dip Galvanized — Less corrosive than malleable iron — No hydrogen or galvanizing embrittlement — Characteristically superior in withstanding shock loads.

Will accommodate a maximum guy strand of 7/16" diameter at a 90° angle to the pole. May be used for down guy attachment with excellent load holding capabilities. The guy strand loop may be made up on the ground to simplify installation.

Catalog No.	Type	Wgt. Per 100 Pcs.

PELHAM BAY LANDFILL

L-142

**Everene® Insulation - 600 Volts
(Cross-Linked Polyethylene)****EVERENE®
BUILDING WIRE
TYPE XHHW****specifications**

specifications:	Underwriters' Laboratories Standard No. 44 Type XHHW, Federal Specifications JC-30 and JC103E, IPCEA Pub. No. S-66-524 and NEMA Pub. No. WC-7.
conductor:	Copper or Aluminum.
insulation:	Everene (Cross-Linked Polyethylene)
cover:	none
voltage:	600
temperature:	75°C (Wet or Dry) Type XHHW 90°C (Dry Locations) Type XHHW 90°C (Wet or Dry Locations) Per IPCEA-NEMA Specifications

Conductors:**Copper:**

Solid or concentric stranded soft copper is used, conforming with ASTM Specifications B3 or B8, and Underwriters' Laboratories Standard UL44 for Rubber insulated wires.

Aluminum:

Aluminum conductors No. 8 AWG solid and smaller shall be of three-quarter hard aluminum. Stranded conductors 8 AWG and larger shall be either three-quarter hard or hard aluminum in accordance with underwriters' laboratories standard UL44.

insulation:

Conductors are insulated with Everene (Cross-Linked Polyethylene) conforming to Underwriters' Laboratories requirements for types XHHW insulation, with a conductor operating temperature of 90°C in dry locations and 75°C in wet locations.

Everene also conforms to the requirements of IPCEA Pub. No. S-66-524 and NEMA Pub. No. WC-7 for cross-linked Polyethylene insulation suitable for use on power cables in wet or dry locations and conductor operating temperatures not exceeding 90°C.

outer covering:

No outer covering is required on Everene cables.

"TRIANGLE EVERENE TYPE XHHW 600 VOLTS"

application

Everene Insulated Type XHHW building wire is approved for circuits not exceeding 600 volts where the maximum operating temperature does not exceed 75°C in wet locations and 90°C in dry locations.

The National Electrical Code permits the use of Type XHHW wire in duct or conduit installed underground, in concrete slabs or other masonry in direct contact with earth, in wet locations, and where condensation and moisture accumulations within the raceway may occur. Also suitable for direct burial on non-code installations per IPCEA Pub. No. S-66-524, NEMA Pub. No. WC-7.

description

Everene Type XHHW building wire is lighter and smaller in diameter than rubber insulated wire which requires an additional covering of braid or a protective jacket.

Everene insulated building wire is highly resistant to abrasion, chemicals, ozone and crushing. In addition Everene has excellent resistance to sunlight, moisture and flame, and combines the superior electrical properties which borderline high molecular weight polyethylene with the thermal properties of rubber.

COPPER CONDUCTORS

(T) — The ampacities for type XHHW conductors for sizes 14, 12 & 10 AWG are the same as designated for 75°C conductors, per N.E.C. table 310-16.

ALUMINUM CONDUCTORS

* — The ampacities for type XHHW conductors for sizes 12 & 10 AWG are the same as designated for 75°C conductors, per N.E.C. Table 310-18.

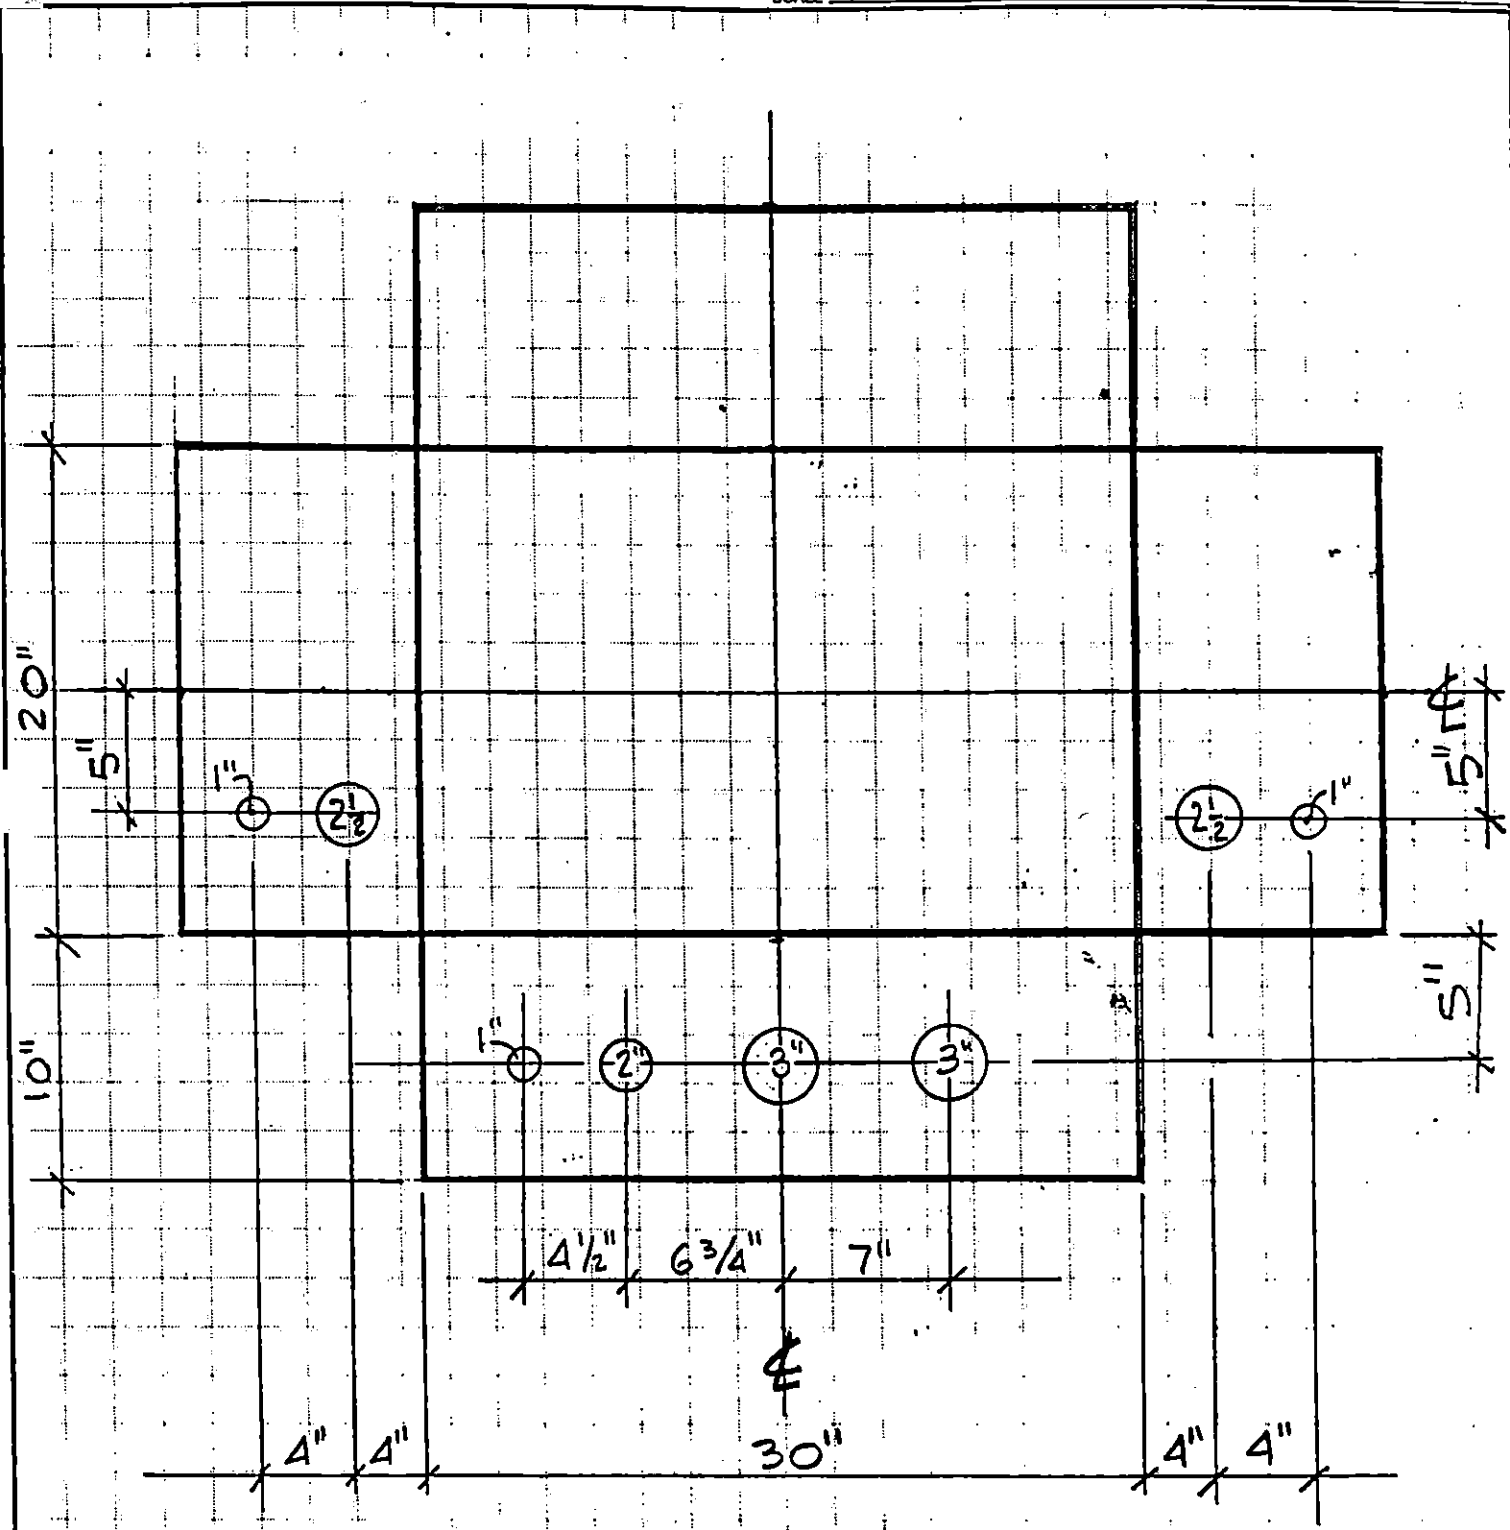

All ampacities are based on three (3) single conductor cables in conduit at a 30°C maximum ambient air temperature and 75°C or 90°C maximum conductor operating temperature.

ORDERING INSTRUCTIONS - BOXES

L-127-16030

16030-2.18

Catalog Number and Inside Dimensions (L x W x D) Should be specified.

Conduit Entrances - Sizes and Locations Should be furnished on a drilling template (or comparable sketch) similar to the Drilling Template shown on page 27. These templates, in pad form, are available upon request with small supply in pocket at back of binder.

Conduit Entrances - Types Should be specified as follows:

1. Slip Hole (drilled only - for conduit clearance).
2. Drilled and Tapped Hole (D&T). If Thread Chart in next column shows that the box wall thickness does not permit required number of threads, specify bosses.
3. Bossed, Drilled and Tapped hole to provide a minimum of five full threads (Boss-D&T).
4. Boss only, for drilling and tapping in field - specify conduit size.

Conduit Spacings Minimum spacing between conduit centers and their distance from corner and back of box are given in tables on page 27. When not specified, spacings will be selected at our discretion.

Mounting Lugs Standard on Types HF, HC-T, HC-S, RB, EX and DH boxes, optional on other types. Unless locations are otherwise specified, lugs will be placed on each long side of box and will be spaced and drilled to our standards. See additional mounting lug data in the tables on page 26.

Mounting Buttons For mounting equipment in back of box - location should be indicated on sketch or drilling template. Buttons are usually 3/8" high and 3/4" diameter with larger sizes available at the same price, and buttons are normally blind tapped for 1/4"-20 screws.

THREAD CHART

CONDUIT SIZE	NUMBER OF THREADS PER INCH	WALL THICKNESS REQUIRED INCHES		
		5 THREADS	3 1/2 THREADS	3 THREADS
3/8"	16			
1/2" to 3/4"	13	9/32	7/32	3/16
1" to 2"	11-1/2	3/8	1/4	7/32
2-1/2" to 6"	8	7/16	5/16	9/32
		5/8	7/16	3/8

UL requirements: 1/4" minimum wall thickness, EX boxes - 5 threads, DH & DH-A boxes - 3-1/2 threads, other box styles - 3 threads.

SPRING CITY ELECTRICAL MFG. CO., SPRING CITY, PA. 19475

EXPLOSION-PROOF JUNCTION BOXES

TYPE EX - for surface mounting

T-TIGHT AND EXPLOSION-PROOF
(NEMA 7, CLASS I, GROUP D)
(NEMA 9, CLASS II, GROUPS E, F & G)

Type EX boxes are explosion-proof as well as dust-tight. All joints are the metal-against-metal type with no gasket. The wide flanges are ground to very close tolerances and with the larger number of cap screws used in assembling provide an explosion-proof enclosure in hazardous concentrations of atmospheres containing gasoline, hexane, naphtha, benzene, butane, propane, alcohol, acetone, benzol, laquer solvent vapors or methane (NEMA 7). The generous radii where box walls meet back of box reduces usable inside depth.

Standard Construction:

1. Extra heavy cast iron box and cover
2. Hot-dip galvanized finish
3. Stainless steel cover screws
4. Mounting lugs

At Additional Cost:

- (See page 74)
1. Drilled and tapped holes
 2. Bosses to provide five full threads
 3. Interior mounting buttons, blind tapped
 4. Mounting plate
 5. Hinges for covers - located on long side and right side unless otherwise specified

For ordering instructions, see pages 24 & 27

Conduit

Galvanized Rigid Steel Conduit

1/2" thru 6" Diameters

SPECIFICATIONS

INDUSTRY STANDARDS

UL 6 - Rigid Metal Electrical Conduit

Federal Spec. WWC-581-E - Conduit, Metal, Rigid,
and Intermediate

ANSI Standard C80-1 - Rigid Steel Conduit, Zinc Coated

APPLICATIONS:

Galvanized Rigid Metal Conduit shall be installed in accordance with the National Electrical Code's Article 346 - "Rigid Metal Conduit."

- Under all atmospheric conditions and occupancies
- In concrete, in direct contact with earth or in areas subject to severe corrosive influences.
- In or under cinder fill where subject to permanent moisture when protected on all sides by a layer of non-cinder concrete not less than 2 inches thick; when the conduit is not less than 18 inches under the fill.

CONSTRUCTION:

Triangle PWC hot-dipped galvanized rigid steel conduit is produced from high grade raw steel pipe which has been thoroughly cleaned prior to final coating to insure permanent adhesion. It is completely protected from any corrosion by a special protection process:

1. The interior as well as the exterior are coated with a solid, unbroken layer of zinc. The tenacious bond between the zinc and steel layers is formed by the co-mingling of steel and zinc into a transitional steel/zinc alloy layer, providing the superior protective bonding of an alloyed interface.
2. The threads on the conduit are zinc coated after cutting by Triangle's exclusive Galv-Coat process.
3. The conduit is coated with a durable bichromate finish or other suitable treatments which prevent oxidation and white rust.

Threaded Rigid and IMC Conduit Hubs

Appleton's Uni-Seal Rigid Conduit Hubs eliminate the need for welded hubs. Efficiency of installation is built into the superior design; single wrench installation. Patented hex-hub wedge adaptor fits nearly flush against inside walls of enclosures; provides maximum wiring room. Simple two-piece construction. Protective insulated throats, positive grounding and water-tight sealing action. Flame resistant insulated throat eliminates need for end bushings. Locking edge of body bites into enclosure wall, makes hub self-locking; eliminates the need for locknuts, provides continuous 360° pressure on both sides of enclosure wall, forms positive grounding and vibration-resistant connection. Built-in recessed neoprene gasket.

Unilet® Conduit Outlet Bodies: Form 35®, Form 85, Mogul and LBD. Conduit Outlet Boxes: JB, GS, and SEH. For Use with Rigid Steel, Rigid Aluminum, IMC, and EMT Conduit.

Applications

- Serve as pulling fittings.
- Make bends in conduit system.
- Provide openings for splicing.
- Connect and change direction of conduit runs.
- Allow connections for branch runs.
- Permit access to conductors for maintenance.
- Form 35, Form 85, JB, and GS when used with cover and gasket provide enclosed and gasketed raintight fit.
- Mogul Unilets have larger wiring chambers for heavy or numerous conductors.
- LBD Unilets have larger wiring chambers with specially designed covers to facilitate pulling stiff, heavy conductors.

Features: All Unilet conduit outlet boxes and bodies

- Malleable iron Unilets: high tensile strength and ductility. High corrosion-resistance; high impact and shock resistance.

Aluminum Unilets: copper-free aluminum (max. 4/10ths of 1% copper content). Light weight, high corrosion resistance. Self-oxidizing, self-renewing.

- Roomy interiors: more wiring space.
- Smooth, rounded integral bushing in each hub protects conductor insulation.
- Accurately tapped, tapered threads for tight, rigid joints and ground continuity.

Features: Form 35

① Exclusive built-in easy-pulling rollers in type C (1-1/4" thru 4") and type LB (1-1/4" thru 4")—eliminate damage when cable is pulled through hubs.

- Sizes with flat-back design ideal where fitting is mounted flat against surface.
- Complete line of conduit bodies, covers and receptacles.

• All covers have captive stainless steel screws to speed installation, prevent "freezing" of screws.

• Blank covers domed for extra wiring space.

Features: Form 85

② Exclusive built-in easy-pulling rollers in type C (2-1/2" thru 4") and type LB (2-1/2" thru 4")—eliminate damage when cable is pulled through hubs.

Not to be used in Handhole or below grade

① Form 35, malleable, 2" Type LB with rollers shown

② Form 85, aluminum, 2" Type C shown.

③ Mogul Unilet, malleable iron, 2" Type C shown.

④ LBD malleable iron pulling Unilet, 2" shown.

⑤ JB conduit outlet box. Choice of three depths. JBX shown.

⑥ GS conduit outlet box. Four tapped conduit entrances.

⑦ SEH conduit outlet box. Takes wiring devices for 4" octagonal outlet boxes.

1701 W. Wellington Ave.
Chicago, Illinois 60657

Unilet® Conduit Outlet Boxes: Form 35®, Form 85, Mogul and LBD. Conduit Outlet Boxes of, GS, and SEH. For Use with Rigid Steel, Rigid Aluminum, IMC, and EMT Conduit.

- Light weight aluminum facilitates shipping, handling and installing.
- Sizes with flat-back design ideal where fitting is mounted flat against surface.
- Complete line of conduit bodies, covers and receptacles.
- All covers have captive stainless steel screws to speed installation, prevent "freezing" of screws.
- Blank covers domed for extra wiring space.

Features: Mogul Unilets

① For installations requiring extra wiring space—excellent for heavy, stiff conductors.

• Raised cast covers for additional wiring area.

• Covers have captive stainless steel screws to speed installation, prevent "freezing" of screws.

Features: LBD Unilets

② Serve as pulling fittings—ideal for heavy, difficult-to-bend conductors.

• Make 90° bends in conduit—straight pull through hubs in either direction.

• Excellent for use as conductor entrance to buildings, motors.

• Complete with gasketed covers.

Features: JB Series

③ Enclosed and gasketed boxes when used with hub or blank covers provide raintight fit.

• Suitable for exposed or concealed installations.

• Blind cover screw holes prevent conductor damage during installation, provide water tightness.

• Available in three inside depths—1-5/16", 2-1/16", and 3-1/8".

• Available with or without mounting lugs.

• Furnished with four tapped holes and two close-up plugs.

• Available in malleable iron or aluminum.

• Cushion fixture hangers enclosed and gasketed (vaportight).

Features: GS Series

④ Enclosed and gasketed boxes when used with hub or blank covers provide raintight fit.

• Extra wide mating surfaces of GS box and cover provide greater gasket con-

tact for more positive seal.

• Suitable for exposed or concealed installations.

• GSU-20 can be fitted with connection block.

• Universal design—furnished with four threaded universal 3/4" hubs, four 3/4" to 1/2" reducers, and three close-up plugs.

• Furnished with mounting lugs.

• Cushion fixture hangers enclosed and gasketed (vaportight).

Features: SEH Series

⑤ Economy cast conduit outlet box.

• Take wiring devices designed for 4" octagonal outlet boxes.

• Two 8-32 screw holes tapped on 3-1/2" centers.

Standard Materials

• Form 35 Unilet conduit outlet bodies: malleable iron.

• Form 85 Unilet conduit outlet bodies: aluminum—copper-free (max. 4/10th of 1%), 1/2" thru 2"—pressure cast. 2-1/2" thru 4" sand cast.

• Mogul Unilets and covers: malleable iron.

• LBD Unilets and covers: malleable iron (some sizes also in aluminum).

• Covers for Form 35 and 85: blank—malleable iron, steel and aluminum. Duplex grounding receptacle—phenolic. Lamp receptacle—porcelain. Wiring device and switch covers—aluminum.

• JB, GS, and SEH conduit outlet boxes and covers plus JB and GS fixture hangers: malleable iron.

• JB-A boxes and covers: copper-free aluminum.

• Gaskets: Neoprene or composition fiber.

Standard Finishes

• Form 35, Mogul and LBD malleable iron bodies: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

• Form 85 and LBD aluminum bodies: aluminum polymer enamel.

• Form 35 Covers: steel: zinc electroplate. Malleable iron, 1/2" thru 1-1/2": zinc electroplate and clear chromate. Malleable iron, 2" thru 4": triple-coat—(1)

zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

• Mogul and LBD malleable iron covers: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

• Form 85 stamped aluminum covers: natural finish.

• Form 85 and LBD cast aluminum covers: aluminum polymer enamel.

• Malleable iron conduit outlet boxes, GS fixture hangers, 3/4" JB and GS hub covers, and SEH hub covers: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

• JB fixture hangers, JB and GS 1/2" hub and blank covers and SEH blank cast cover: zinc electroplate and clear chromate.

• SEH blank steel cover: zinc electroplate.

• Aluminum JB conduit outlet boxes: aluminum polymer enamel.

• UL Standard 514.

• Federal Spec. W-C-586B.

• Suitable for classified location use in Class I, Division 2 areas, if installed in compliance with NEC 501-4(b).

• Appleton malleable iron products conform to ASTM A47-77, Grade 32510, which has the following properties: tensile strength, 50,000 psi; yield, 32,000 psi; and elongation, 10%.

• Appleton aluminum products are produced from a high strength copper-free (4/10 of 1% max.) alloy.

Other Useful Information

• For explosion-proof conduit outlet bodies and boxes, see Catalog Section J.

Patented rollers make cable-pulling easier, eliminate insulation damage.

Unions, Sealing Fittings, Flexible Couplings, Elbows, Drain/Breather, Close-Up Plugs: Explosion-Proof.

UNILETS® for Use with Threaded Metal Conduit.

Features: Non-Expansion Unions

① Concentric ring interlocked design of 1/2", 3/4" and 1" sizes makes possible smaller diameter, allowing use in tighter spaces; 1-1/4" and larger UNY sizes have removable male nipple.

● Choice of malleable iron or aluminum.

Features: Expansion Unions

② One-piece design eliminates need for disassembly during installation.

● Telescoping cylinder within cylinder design permits expansion or contraction.

● Standard or long types available.

● Small external diameters—excellent in restricted areas in wiring of pumps, motors, and other equipment.

● Internal phosphor bronze "bonding jumper" ring assures positive ground between telescoping cylinders.

Features: Sealing Fittings

③ Raintight construction.

● Removable nipple in male sealing fitting may be used interchangeably in top or bottom hub.

● EYSF/EYSM—for sealing vertical conduit. Large opening for damming and filling.

● ESUF/ESUM for sealing vertical or horizontal conduit. Pouring spout rotates 90°. Removable cover provides full access for damming. 2-1/2" thru 4" sizes have threaded cover openings for damming.

● EYF/EYM—close radius type for sealing vertical or horizontal conduit runs.

● EYDM Drain Sealing Fittings—close radius type for sealing vertical conduit runs. Access cover has drain valve for automatic draining of water accumulation above the seal.

● ESF/SFM Drain Sealing Fittings—for sealing vertical conduit runs. Provide continuous, automatic draining of water accumulation above the seal.

● APELGO sealing cement is a specially formulated water soluble powder. Mixed to the proper proportions, it is poured in sealing fittings and hardens to contain and restrict the passage of gases and explosions in classified areas.

● Fiber Filler—makes dams around and between all conductors to prevent sealing compound from leaking while being poured in its liquid state.

Features: Flexible Couplings

④ Heavy duty design resists mechanical abuse. Watertight.

● Electrical conductivity equal to rigid conduit on a similar length basis—no bonding jumper required.

● Interior insulating liner protects conductors from abrasion under vibrating conditions.

● EXGJH—both end fittings are female, each furnished with a removable male nipple.

● EXLK—female end fitting with union at one end plus a female end fitting with a removable male nipple at the other end.

Standard Materials

● UNY and UNF (Non-Expansion) Unions, 1/2" thru 1": steel or aluminum.

● UNY and UNF (Non-Expansion) Unions, 1-1/4" thru 6": malleable iron or aluminum.

● UNY and UNF Expansion Unions: steel.

● UNL Unions: malleable iron and steel.

● EYSF/EYSM, EYF/EYM and EYDM Seals: malleable iron or aluminum.

● ESUF/ESUM and SF/SFM Seals: malleable iron.

● EXGJH and EXLK Couplings, 1/2" thru 2": outer bronze braid, inner brass core with insulating liner. End Fittings: 1/2" thru 1-1/4"—steel; 1-1/2" thru 2"—brass.

● EXGJH Couplings, 2-1/2" thru 4": outer stainless steel braid, inner stainless steel core with insulating liner and stainless steel end fittings.

● PLG Close-Up Plugs: malleable iron, steel, or aluminum.

● BR Reducers: malleable iron or aluminum.

● EL and UNA Elbows: malleable or cast iron.

● ECDB Combination Drain/Breather: stainless steel.

Standard Finishes

● Unions, Malleable Iron—UNY and UNF (Non-Expansion), and UNL: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

● Unions, Steel—UNY and UNF (Non-Expansion), and UNY and UNF (Expan-

sion): zinc electroplate.

● Unions, Aluminum—UNY and UNF (Non-Expansion), 1/2" thru 2"—natural finish; 2-1/2" thru 4"—aluminum polymer enamel.

● Sealing Fittings, Malleable Iron—EYSF/EYSM, ESUF/ESUM, EYF/EYM, EYDM and SF/SFM: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

● Sealing Fittings, Aluminum—EYSF/EYSM, EYF/EYM and EYDM: aluminum polymer enamel.

● Flexible Couplings—EXGJH and EXLK: steel end fittings—zinc electroplate and clear chromate; braid—natural finish.

● Close-up Plugs—PLG: malleable iron—zinc electroplate and clear chromate; steel—zinc electroplate; aluminum—natural finish.

● Bell Reducers—BR: malleable iron—zinc electroplate and clear chromate; aluminum—natural finish.

● Elbows, Malleable Iron—EL and UN: triple-coat—(1) zinc electroplate, (2) dichromate, and (3) aluminum polymer enamel.

● Combination Drain/Breathers, stainless steel—ECDB: natural finish.

Options

● For EXGJH or EXLK Flexible Couplings, a special protective coating can be applied for use in severe corrosive atmospheres. Consult factory for details and pricing.

Compliances

● UL Standard 886

● Appleton malleable iron products conform to ASTM A47-77, Grade 32510, which has the following properties: tensile strength, 50,000 psi; yield, 32,000 psi; and elongation, 10%.

● Appleton aluminum products are produced from a high strength copper-free (4/10 of 1% max.) alloy.

● Class I, Div. 1 & 2, and Class II, Div. 1 & 2, if installed as follows: Unions, Elbows, Plugs, Flex. Couplings—NEC 501-4 (a)(b); Seals—NEC 501-5 (a)(b)(c)(d)(e) and NEC 502-5; Drains—NEC 501-5(f).

† 90°C Ampacity based on not more than three type THHN single conductors in a raceway in free air at ambient temperature of 30°C.

Building Wire

N-A[®] Type THHN OR THWN 90° C—600 Volts

SPECIFICATIONS

INDUSTRY STANDARDS

UL 83 - Thermoplastic insulated wire and cable
Fed. Spec. JC 30B - cable and wire, electrical

APPLICATION

Trioseal[®] (Polyvinyl Chloride) insulated, nylon jacketed Type THHN-THWN smallest diameter wire is an all purpose construction suitable for new construction or rewiring and is approved for 600 volt applications where the maximum operating temperature does not exceed 75°C for wet locations and 90°C for dry locations in accordance with the National Electrical Code's Article 310 - "Conductors for General Wiring" and Article 210 - "Branch Circuits."

Suitable for lighting and power in residential and industrial installations, machine tool, and appliance wire applications.

Type THHN or THWN Trioseal insulated-nylon jacketed wire permits greater utilization of existing space in raceways or conduit. The overall nylon jacket is abrasion resistant for easy pulling through conduit and is highly resistant to flame, acids, alkalis, chemicals, oil, gasoline and grease. The insulation is free stripping, bright and smooth.

CONSTRUCTION

Conductor:

Bare, annealed, solid per ASTM B-3 or stranded copper per UL-83.

Insulation:

High quality proprietary VW-1 rated polyvinyl chloride (Trioseal) compound rated at 90°C and listed by Underwriters' Laboratories.

Insulation Covering:

Tough, heat and light stabilized, low moisture absorption nylon (N-A[®], Nylon Armored) conforming to Underwriters' Laboratories requirements for Types THHN or THWN.

UL LISTINGS:

THHN - 90°C dry building wire

THWN - 75°C wet and dry building wire

MTW-90°C Machine tool wire

AWM-105°C appliance wire

Gasoline and Oil Resistant

VW-1 Rated

For use - 1/0 AWG & larger, when identified

Sunlight Resistant - 1/0 AWG & larger, when identified

VOLTAGE:

600 volts

Note: Sizes 18 and 16 AWG listed as TFFN

CUTLER-HAMMER SAFETY SWITCHES

Heavy-Duty Single Throw

DRY TYPE TRANSFORMER

WHEN ORDERING SPECIFY

- Catalog Number
- UL listed, File E5239.
- Meets UL 98 for enclosed switches and NEMA Std. KS-1.
- Suitable as service entrance equipment, except 1200A on grounded Wye systems, per NEC-230-95, and 4-pole switches.

① UL Type 4X stainless steel enclosures through 200A, Type 4 painted steel for 30-600A. For stainless steel enclosure on 400-800A, add suffix -SS and consult factory for availability.
 c rating for 400-800A switches is 250V.
 ② Use outside poles or 3 pole switch, for ac rating only.
 ③ For four pole applications use three pole switch and control pole, Cat. No. DS16CP, listed on Page DD-13. Consult factory for application data.

DS16CP

CONTROL POLE DESCRIPTION

Operation — The K-Series Control Pole provides one Normally Open contact, late-make, early-break operation. It mounts in the same position and pre-drilled holes as a Neutral Block, directly connected to the power pole operating shaft. Direct connection and visible blades provide more secure electrical interlocking than handle linkage operation of a snap switch type of interlock. This reliability meets the requirements of many specifications for 4-pole switches when the fourth pole is required for secure electrical interlocking.

Wire Size Range — #16 to #12 AWG, copper conductors.

Ratings — 10A continuous; Ac or Dc.

Ac Code Rating A600			Dc Code Rating N600	
Volts Ac	Make	Break	Volts Dc	Make & Break
120V	60A	6A	125V	2.2A
240V	30A	3A	250V	1.1A
480V	15A	1.5A	600V	0.4A
600V	12A	1.2A

*Availability to be announced.

- To be discontinued.
- The ROP, RCAN and RGCN NEMA 3R enclosures have top hinged front covers with a padlock hasp/fetch. The cover must be raised to operate the breaker handle. All other NEMA 3R enclosures have an external side-operated handle mechanism.

ENCLOSED CIRCUIT BREAKERS

WESTINGHOUSE TRANSFORMERS

Dry-Type Distribution, Energy Efficient

3 Phase, 60 Hz - Type DT-3

DESCRIPTION

Features • Specifications

- U.L. listed.
- Low operating costs when operated at 115°C or 80°C rise.
- 220°C insulating system provides extended life when operated at 115°C or 80°C rise.
- Manufactured in accordance with NEMA/ANSI, UL and IEEE standards.
- Overload capability of 15% for 115°C rise units operated at 150°C rise and 30% for 80°C rise units operated at 150°C rise.

- Drip proof enclosure.
- Core constructed from stacked laminations that are braced and dipped in resin to assure quiet operation.
- Furnished with primary and secondary terminal pads.
- Front and rear panels provide for easy installation and maintenance.
- All units 100% tested prior to being shipped.

- Not for construction. Refer to TCS47-720 by frame number for certification.
- For wiring diagram, refer to TCS47-730 by diagram number.

- ⊙ Refer to Cutler-Hammer.
- ⊙ Normally stock. Any style not normally stocked is available on a QWIK ENTRY (Q) suffix.

NOTE: Refer to Cutler-Hammer for availability of custom designs.

WHEN ORDERING SPECIFY

• Catalog Number

• UL listed. File E5239.

• Meets UL 98 for enclosed switches and NEMA Std. KS-1.

• Suitable as service entrance equipment, except 1200A on grounded Wye systems, per NEC-230-95, and 4-pole switches.

K-series 63A, Type 3R

¹ UL Type 4X stainless steel enclosures through 200A. Type 4X painted steel for 400-600A. Use stainless steel for corrosive atmospheres. Add suffix -SS and consult factory for availability.

² Dc rating for 400-600A switches is 250V.

³ Use outside poles on 3-pole switch for dc rating only.

⁴ For four pole applications use three pole switch and one pole. Cat. No. DS16CP, listed on Page 53. Consult factory for application data.

TRANSFORMERS

Dry-Type Distribution, General Purpose

3 Phase, 60 Hz - Types EPT and DT-3

DESCRIPTION

Type EPT 3-15 kVA

Type EPT 30 kVA

Type DT-3 30-1500 kVA

Type DT-3 With Optional Weathershields

Type EPT Resin Encapsulated

Features • Specifications

- U.L. listed for indoor/outdoor mounting (600 volt class)
- Can be mounted in any position indoors. Outdoors mounts upright only
- All units 100% tested prior to being shipped.
- Constructed in accordance with NEMA, ANSI, ASA, and IEEE standards
- Totally enclosed-non-ventilated design permits installation in areas that contain dust, moisture or corrosive fumes
- As much as 40% smaller in cubic volume than equal Kva ratings in other dry-type designs
- Low sound levels permit installation in hospitals, hotels, schools and libraries.

- Large terminal compartment permits easier cable connections
- Immersion of core and coil in sand and resin provides rigid construction which attenuates sound and will withstand short circuit stresses up to 25 times normal load current for two seconds.
- 15 Kva and below has terminal compartment on the bottom.
- 30 Kva has terminal compartment at top. No knockouts.
- Lifting holes are provided.
- Flexible leads built into the unit for ease of making connections.

Type DT-3 Ventilated

Features • Specifications

- UL listed (600 volt class) 30 Kva thru 1000 Kva
- 150°C rise - 220°C total insulation system
- Drip proof enclosure
- Core is constructed from stacked laminations that are braced and dipped in resin to assure quiet operation
- All ratings are constructed in accordance with NEMA, ANSI, ASA and IEEE standards
- 100% tested to meet ANSI and NEMA sound levels
- The ventilated designs are furnished with terminal straps only.
- Front and rear panels are provided for easy installation and maintenance.

- Ⓢ Not for construction. Refer to TCS47-720 by frame number for certification.
- Ⓢ For wiring diagram, refer to TCS47-730 by diagram number.
- Ⓢ NEMA 3R outdoor enclosure is standard for Westinghouse Type EPT.

Ⓢ Lighting tap capacity limited to 5% of rated kVA. Note: Refer to Westinghouse for availability of special designs.

Ⓢ Normally stock. Any style not stocked is on a OWIK ENTRY (O) suffix.

Note: Contact Westinghouse for availability of special designs for hazardous locations - Type EPT only.

Note: Stainless steel enclosures are available for Westinghouse Type EPT.

Ⓞ 22,000 AIC Ratings are maintained when BRH branch breakers are used. 22,000 AIC Rating maintained when BR, BD, BOC are used as branch breakers only in conjunction with a main BRH or WFPH Main Breaker.
Ⓞ Ground bus kits priced separately. See page 18.

Ⓞ Refer to page 19 for Box Style Number and Dimensions.
Ⓞ Raintight panels are provided with hub closer plates.
Ⓞ May be field converted to main breaker unit. Interior adjustability is standard.
Ⓞ To be discontinued.

MUM UNIT HEATERS

MUM units mount either horizontally or vertically. Rotary version. For factories, warehouses, garages, stores, shipping rooms, power stations, aircraft hangars. Can be used for primary, supplementary, spot, or dual-system heating.

• Wide range of optional control kits are field installable, increasing the MUM adaptability to the specification market.

• Formed air unit heater with 10 power ratings; 3 Kw to 50 Kw heating output; 208, 240, 277 and 480V, 10,230 to 170,500 BTU/hr.

• 32 compatible models (no need to try to assemble a heating system from 70 or 80 models)

• Heavy gauge die-formed steel housing. Two-toned, smartly styled.

• Advanced pull-through air flow design draws air across heating element for more even air distribution and cooler element operation.

• Specially designed venturi outlet to meet that added throw as required in vertical position.

• Branch circuit fusing (when required).

• Completely enclosed fan motor.

• 1- or 3-phase wiring on 5 through 10 Kw 208/240V and 15 Kw 208V units (field interconnectable).

• Aluminum-finned, copper clad steel sheath heating element has longer useful life, because of cooler sheath temperature and faster heat dissipation.

• 24V control transformer standard on most models, providing a safer and more accurate means of temperature control. 3 Kw and 5 Kw, 208-277V, have line voltage controls as standard. (24V control available on made-to-order basis.)

• Automatic reset linear thermal cut-out, capillary type, provides protection over entire length of element area. (Manual reset protection available on made-to-order basis.)

• 2-speed fan selector switch (25 to 50 Kw models).

• Fan delay feature eliminates cold drafts. Element heats up before fan cuts in, then fan continues to distribute heat after element shuts off.

• Ruggedly built, yet lighter weight for easier installation. No piping flues, valves, or traps.

• Individually adjustable discharge louvers to control air flow.

• Choice of optional diffusers for variety of air patterns, maximizing heat concentration and coverage in the vertical position.

• Meets all UL, NEC, and OSHA requirements. UL File No. E21609.

NOTE:
 1. All standard units are supplied with a low voltage control transformer and contactor (24V) except MUM-03 & 05, 208, 240, & 277 volt models. Low voltage control on these units is available on made to order. All units are available on special order for 120 volt control; internal with transformer or external without transformer.
 2. On dual phase units, maximum amp draw is listed for respective voltage.
 3. 25 thru 50 Kw models have two speed motors and dual CFM ratings.
 4. SA Standard
 5R Optional - made to order - amp load enhanced on 3 Phase
 6R Optional - made to order - amp load enhanced on 3 Phase

PANELBOARDS

**B7L/B7P SERIES
FOR HAZARDOUS AND
HOSTILE LOCATIONS**

**LIGHTING AND POWER
APPLICATIONS**

MURBELL

KILLARK

Circuit breaker panelboards from Killark fill a wide range of explosion-proof and weather-proof installation requirements for circuit protection and equipment control.

B7L/B7P SERIES
 CLASS I, DIV 1&2 GROUPS B,C,D
 CLASS II, DIV 1&2 GROUPS E,F,G
 CLASS III, DIV 1&2
 NEMA 3, 4, 4X, 7BCD, 9EFG
 EXPLOSION-PROOF
 DUST-TIGHT
 WEATHERPROOF

APPLICATIONS

PRISM Panelboards are for use in:

- Hazardous locations due to the presence of flammable gasses or vapors, combustible dust, or easily ignitable fibers and flyings, and areas which are subject to corrosion, weather and dampness.
- Petroleum Refineries, Chemical and Petrochemical plants with indoor and outdoor processes.
- Applications requiring overcurrent and short circuit protection of lighting, appliances, heating and motor circuits.

PANELBOARD ORDERING INFORMATION

- 1 - Select basic panelboard with the following criteria in mind:
 - a) Number of poles (spaces) required.
 - b) Type of breaker desired.
 - c) Type wiring system needed.
 Main Breaker is desired.
- 2 - Select branch breakers from page 6 based on frame, number of poles, amperage and type. Make sure breakers selected are compatible with panelboard selected.
- 3 - Refer to page 6 for additional options!
- 4 - See page 7 for detailed ordering instructions and example.

Panelboard Series	Type	Circuit Breaker Frame Type	Maximum Voltage
B7L	Lighting	Westinghouse Quicklag	240 Volt
B7P	Power	Westinghouse Series C	600 Volt

STANDARD MATERIALS

- Enclosure - Copper Free Aluminum (less than 4/10 of 1% copper).
- Main Breaker Handle - Copper Free Aluminum.
- Cover bolts - 316 Grade Stainless Steel.
- Flange Gasket "O" Ring - Buna-N Nitrile.
- Branch Breaker Operators - Valox Thermoplastic Polyester handle molded onto 316 stainless steel shaft with neoprene "O" ring.
- Hinges are Copper Free Aluminum with stainless steel pin and hardware.
- Mounting Lugs 1/4" thick 6061-T651 Aluminum.

STANDARD FINISH

- Grey Silver Lacquer Paint.

THIRD PARTY CLASSIFICATIONS

Classified Certified (CSA Cert. Est.9/93)

**B7L/B7P SERIES
 QUALITY FEATURES**

Take a closer look . . .

Recessed Notches in Flange

- Open cover easier with prying instrument without flange damage.

Gasketed Flange

- Nitrile (Buna-N) Gasket located inside cover bolts to prevent water from seeping into enclosure.

Quick Release, Captivated Cover Bolts of 316 Grade Stainless Steel

- Triple-lead bolts require only 3 1/2 turns to disengage. Stainless steel (316) for maximum protection from corrosion.

Wiring Room
To meet latest NEC
wire bend
requirements.

Top Feed Panel
Standard.
With bottom feed
optional.

NEMA 3- Protection from falling rain.
NEMA 4-4x - Protection from hose directed water
and corrosion.

Standard Electrical Components

B7L - Westinghouse Quicklag Breakers
B7P - Westinghouse Series C Breakers

Buss Bars

- B7L - Main buss is tinned aluminum. Copper available as option.
- B7P - Copper standard.

Main Lugs

Mechanical solderless type, approved for CU or AL conductors.

Ductile Mounting Lugs

High strength yet ductile aluminum alloy.
Can adjust to irregular surface.
Slotted for easier mounting.

Copper-Free Aluminum Construction

High strength, light weight, corrosion resistant.

Conduit Openings Supplied Standard

Sufficient quantity and size for incoming power and branch circuits.
Optional sizes and locations available.
Suitable for field installation of drain and breather.

Solid Neutral Standard

Single phase 3 wire.
Three phase 4 wire.

Hinged Cover
Installed as standard
providing an extra
measure of safety
and convenience

MAIN BREAKER HANDLE

- Provisions for lock "on" or "off" positions.
- Minimum number of parts for trouble free operation.
- Spring-loaded to prevent breakage of breaker toggle.
- "O" ring on shaft.

BRANCH BREAKER HANDLE

- Provisions to lock all branch breakers in "on" or "off" positions.
- "O" ring gasket on all shafts.
- Spring-loaded so that cover can be closed regardless of breaker/handle position.
- Lifts and rotates into place.
- Identification of On-Trip-Reset-Off is positive.
- B7L lighting panel predrilled and factory plugged for maximum number of branch circuits. Permits addition of breaker handles and spaces plus changing of 1-2-3 pole breakers in field.

Westinghouse type BA circuit breaker 1,2 or 3 pole.

Catalog numbers on this page are for the basic panelboard enclosure only with a

panel interior chassis containing main lugs or main breaker as illustrated. Internal branch breakers and external handles are NOT included in basic enclosure catalog number and must be ordered as separate items. Refer to pages 6 & 7 for part numbers of branch breakers and detailed ordering instructions.

BRANCH CIRCUIT LOADS

The interior panel chassis supplied in B7L panel is limited to a maximum of 140 amperes at any one connection point. Breakers of 50 thru 100 amps must be installed opposite breakers of smaller

amperage so as not to exceed the 140 ampere limitation.

Notes:

- 1) B7L panels are factory drilled for maximum number of single pole branch breaker handles and B7P for maximum number of 3 pole branch breaker handles as standard.
- 2) Part numbers illustrated above include external handle, trip mechanism, locking tab and internal breaker. Refer to page 7 for complete ordering information and examples.
- 3) Space = External handle, shaft and trip mechanism installed to allow for future installation of breaker.
- 4) Ground Fault & Equipment protection breakers include external pushbutton for each breaker to test ground fault sensing circuit and the mechanical operation of breaker.
- 5) Switch Neutral Breaker note. A two pole breaker has one pole for breaking from main buss and one pole that breaks neutral. Three pole breaker consists of two poles for breaking from main buss and one pole that breaks neutral.

ACCESSORIES / OPTIONS

To be ordered as separate item with notation on order for assembly into enclosure.

Description	Quantity
Drain & Breather ¹ NEMA 3, 7CD, 9 EFG	SU-3
Drain & Breather ¹ NEMA 3, 7BCD, 9EFG (not CSA)	SU-3B
Grounding Kit 100 AMP	KIT-251 G-1
225 AMP	KIT-252 G
Special Baked Epoxy Finish	B7SF
Copper Buss and lugs for B7L series	B7CU
Eye bolts for ease of installation ²	B7EB
Change 100 Amp Buss to 225 amp B7P series	B7ML225
Change 225 Amp Buss to 400 amp B7P series	B7ML400
Separate Grounded Neutral Terminal (24ckt)	B7GNT24
Separate Grounded Neutral Terminal (42ckt)	B7GNT42
Main lugs at bottom	B7MLBTN
Change standard conduit size and location	B7SPNPT

1. Installation of drain and breather will void the NEMA 4-4X Rating of panelboard. Drain and breather will be installed into a standard conduit opening provided in box.
2. Lifting eyebolts are installed in two conduit openings located in top of box and are to be removed after installation.

B7L/B7P SERIES PANELBOARDS

SPECIFICATION AND ORDERING INFORMATION

PANEL SELECTION FACTORS

Basic information required when specifying panelboards is as follows:

- Environment
- Service (Voltage/Frequency/Phase)
- Interrupting Capacity
- AMP Rating of Main (Lugs Only or Breaker)
- Branch Breaker (Type/Number of Poles/Amperage)

ORDERING INFORMATION

Specifying and ordering a complete panelboard assembly requires the selection of three components. (1) Basic Panel, (2) Branch Breaker and (3) Options (if required). This method of cataloging permits a wide variety and maximizes circuit flexibility in our panelboard offering. Components supplied in each of these selections include:

- 1) Basic Panelboard Enclosures (pages 4-5)
 - Explosion-proof enclosure consisting of box and cover.
 - Cover predrilled and plugged for maximum number of branch breaker handles. (handles not supplied)
 - Box supplied with conduit openings.
 - Main circuit breaker and external handle. (when specified)
 - Panelboard internal chassis with buss bars but less branch circuit breakers.

- 2) Branch Circuit Breakers (page 6)
 - Internal circuit breaker
 - External handle mechanism with internal tripping mechanism.
 - Test pushbutton for GFI (when ordered)
 - Lockout shield with on-off-trip-reset identification.

- 3) Options - Accessories (page 6)
 - As required

ORDERING EXAMPLE

Specification is for a 3 phase 120/208 volt panel with 100 Amp main lugs complete with (4) single pole 20 Amp, (2) double pole 20 Amp and (1) three pole 30 Amp branch breakers with a separate grounded neutral terminal.

Branch Breaker Total = (4) 1Pole = 4 Poles Total
 (2) 2Pole = 4 Poles Total
 (1) 3Pole = 3 Poles Total
 Total 11 Branch Poles

Zenith Product Bulletin

A Product Bulletin Dedicated to Informing the Electrical Community

December, 1992

Some emergency power installations require multiple automatic transfer switches, each feeding a specific load. In many such installations, where non-critical loads are being served, specifications may call for manual or non-automatic transfer switches that are manually operated because operating personnel are present and the loads are not of a critical nature requiring unattended automatic operation.

Because of the less critical function of these non-automatic transfer switches there have been no specific requirements set forth and, as a result, devices such as double throw disconnect switches have been used. Since the non-automatic transfer switches are part of the emergency power supply system they should have the same electrical ratings as the automatic transfer switches feeding the more critical loads. In the event of a short circuit the non-automatic transfer switches must have the same withstand current ratings as the automatic transfer switches and they must be as rugged and dependable.

To meet this need, Zenith has developed the ZTSM series electrically operated, mechanically held non-automatic transfer switches. These units feature the same rugged construction as the ZTS series of automatic transfer switches and are supplied with the same electrical ratings and mechanical features. The ZTSM series is electrically operated by means of push buttons or double throw switches mounted on the switch enclosure or at a remote location. Unlike the disconnect switches mentioned above, the ZTSM series offers additional protection by incorporating normal and alternate source voltage sensing relays that will not permit the switch to be manually transferred unless the source to which it is being transferred is at 90% of its rated voltage. In addition, the ZTSM series is tested and listed per UL-1008 standards. Double throw disconnect switches are not.

ZTSM160F 1600 AMP 4 Pole
Non-Automatic Transfer Switch

ZTSM Series Non-Automatic Transfer Switch Features:

- U.L. & C.S.A. Listed
- Amperage sizes, 40, 80, 100, 150, 200, 260, 400, 600, 800, 1000, 1200, 1600, 2000, 3000
- Poles: 2, 3, or 4
- Available for operation on all standard voltage systems
- Withstand Current Ratings: Same as ZTS series automatic transfer switches
- Available in standard and delayed transition versions
- Bypass/Isolation units (ZBTS Series) also available

*MULTI-VOLT LUMINAIRES: All multi-volt luminaires are pre-wired for 120 volt operation, but are easily field-reconnectable for 208, 240, or 277 volt operation.

NOTES

1. STANDARD DISTRIBUTION IS TYPE 3. For IES TYPE 5 DISTRIBUTION change the 3 in the lamp housing catalog number to 5. (Example: LMSXXXXX3MFSX to LMSXXXXX5MFSX.)
2. STANDARD FINISH is dard bronze. Other colors available, contact factory if required.
4. LAMPS are not included, order separately.
5. 50 HERTZ BALLAST is available for all luminaires. Contact factory for information.
6. For more information, contact your local American Electric representative.

NOTES

- STANDARD DISTRIBUTION IS TYPE 3. For IES TYPE 5 DISTRIBUTION- change the 3 in the lamp housing catalog number to 5. (Example: LMHXXXXX3MFSX to LMHXXXXX5MFSX.)
- STANDARD FINISH is dark bronze. Other colors available, contact factory if required.
- LAMPS are not included, order separately.
- 50 HERTZ BALLAST is available for all luminaires. Contact factory for information.
- For more information, contact your local American Electric representative.

Options / Accessories

Pole mount, secured with solid steel plate, attaches luminaire directly to round or square pole. Full-length mounting screws secure luminaire, arm and pole.

Catalog Number -LMPX

Wall mount arm secures luminaire to wall plate with full length mount screws. Full length mounting screws secure luminaire to arm and wall plate.

Catalog Number -LMWX

Adjustable knuckle for pole attachment of luminaire. Makes a smooth transition from pole to luminaire.

Catalog Number -LMKX

Square/round tenon adaptor mounts on top of round or square pole for luminaire attachment. Makes a smooth transition from pole to luminaire. Available mounting arrangements listed below.

Catalog Number	Description
LMTX	Square Tenon with 1 Arm
LM1X	Square Tenon with 2 Arms at 90°
LM2X	Square Tenon with 2 Arms at 180°
LM3X	Square Tenon with 3 Arms
LM4X	Square Tenon with 4 Arms
LM5X	Round Tenon with 1 Arm
LM6X	Round Tenon with 2 Arms at 90°
LM7X	Round Tenon with 2 Arms at 180°
LM8X	Round Tenon with 3 Arms at 90°
LM9X	Round Tenon with 3 Arms at 120°
LM0X	Round Tenon with 4 Arms at 90°

Mast arm mount—Luminaire is attached to curved mast arm for mounting to pole or structure.

Catalog Number -LMMX

Field installed photoelectric control available, contact factory for more information.

SQUARE STRAIGHT STEEL POLES

For use with floodlight luminaires such as MINILITER®, MAGNULITER®, SPORTSLITER®, as well as Magnu-Series architectural luminaires.

STEEL SSP SERIES

Square Straight Shaft — One-piece construction, steel tubing.

Pole Top — All poles available with 2 3/4" O.D. tenons or machined to accept side mounted Magnu-Series luminaires.

Handhole — Group I and II poles only have 3" x 4" reinforced frame. Group III poles have 4" x 6" frame. Both include cover. Ground lug standard.

Base — Steel plate type base with two-piece base cover.

Anchor Bolts — Four "L" shaped bolts per set with two nuts and two washers each. Bolt template included.

Standard Finish — Rust preventive primer.

PELTONITE® BENTONITE PELLETS

SEALING AGENT

DESCRIPTION:

PELTONITE is a sealing agent manufactured by ROCTEST offering great possibilities in the treatment of water problems in civil engineering works.

PELTONITE is the commercial name given to pre-formed bentonite balls, the bentonite used being of the high sodium mineral type.

APPLICATIONS:

PELTONITE can certainly find a wide range of applications and its usage is only limited by the ingenuity of those involved with water problems.

Typical applications are:

- sealing of all types of piezometer holes.
- sealing of large size dewatering wells and of wellpoints.
- sealing the bottom of open end caissons.
- sealing of detrimental infiltration through rock discontinuities.

WHY SHOULD YOU USE PELTONITE?

PELTONITE has many advantages:

- scientific proof has been made of the high quality seals obtained with bentonite pellets and this without the need of any special tamping tool.
- the probability of obtaining a satisfactory seal over the old method of using hand-rolled bentonite balls is highly increased.
- the bentonite balls are of uniform size and shape.
- their small size, spherical shape and high density improve their settling characteristics in water.
- jamming problems as they settle are almost eliminated.
- they are easy to handle.
- they considerably cut down the time usually needed to perform a good quality seal and consequently, reduce equipment and labor costs involved in an installation.
- they come in conveniently packed rigid 50 lb. drums which are re-sealable, thus minimizing waste.
- storage of PELTONITE is independent of temperature conditions.

PELTONITE balls are small spheres $\frac{3}{8}$ " in diameter.

Useful information:

The following table gives the weight of PELTONITE needed to perform a 1 foot seal for different borehole diameters.

BORE DIA. (in.)	2	3	4	5	6	7	8
WEIGHT OF PELTONITE (lb)	3	4	7	11	15	20	27

Specifications:

SIZE:	$\frac{3}{8}$ " dia. (10 mm.)
DENSITY:	1.8
DRY BULK DENSITY:	75 lb/ft ³ (1260 kg/m ³)
SWELL FACTOR:	greater than 10 when unconfined and fully saturated.
STANDARD PACKAGE:	50 lb (22.7 kg) per barrel

Pneumatic Bladder Sampling Pumps

Well Wizard pumps come in an unmatched range of sizes and materials—plus a 10-year warranty.

THE BEST PUMPS FOR YOUR PROJECT-GUARANTEED!

No matter how demanding your application, we've got the pump. Need samples from over 600 feet? Testing in the ppb range? What about other tough sample collection problems—aggressive/corrosive environments, non-standard well casings, difficult site conditions? No matter what the challenge, QED makes a pump that will do the job better.

So much better, we guarantee it. Dedicated Well Wizard bladder pumps with protective intake screens are guaranteed for ten years against pump failure. They'll keep on working or QED will repair or replace them free. Nobody else in the business offers this level of protection.

PURGE AND SAMPLE WITH THE SAME PUMP

In many situations, a Well Wizard bladder pump can be used for both purging and sampling. For low purge volumes, a standard model (1100, 1200, or 1300-series) may be the choice. Model T1200 is most commonly used. For greater volumes, a high-rate 1500-series Power Pump will cut purging times (and labor costs) by approximately 50%.

The advantages are obvious. A single-pump system is simple to specify and install; extremely economical; and delivers unmatched bladder-pump sample quality. Large purge volumes may require the use of an accessory, such as a Purge Mizer™ inflatable packer or a purge pump; see pp. 18-19 for details.

* T1300 requires Clamp Tool No. 35104 for field attachment of tubing. Clamps are provided w/ pump.

† This model cannot be retrofitted with screen. If screen is desired, order P1101S.

FLOW PERFORMANCE CURVE:

1500 Series Pumps

Note: Flow rates are based on pump submergence of 25 feet and operating gas pressure of 100 psi from 311HR Air Source/Controller. Call for flow rates under other conditions.

WELL WIZARD

TO BUILD THE BEST, START WITH THE BEST MATERIALS

Bladder pump design allows construction of the highest quality materials, with consistent usage throughout the pump. All parts and fittings that contact the sample are matched for compatibility and better performance. You will achieve accurate sampling with the greatest cost-efficiency by choosing the proper pump material.

Lab-Certified Cleaning

All Well Wizard pumps pass through a rigorous cleaning procedure, and are laboratory-certified to be free of all EPA 601, 602, base neutral, and acid extractable contaminants.

Production parts are batch-treated in laboratory cleaning solution at 130°F and are rinsed with 130°F tap water. Parts are then washed with purified water (filtered, treated with activated carbon and a series of ion exchange columns). Assembly and testing steps also use purified water.

A special 24-hour water extraction test is then run, and the water analyzed; pumps that don't test clean are run through the procedure again until they do. Preassembled pumps are issued a reference number when they have been certified clean and are sealed in polyethylene bags for protection until they are installed.

The "Secret" Of Bladder Durability

It's no secret. We start with the most inert polymers available...go through all the process variables to find the toughest formulations...test each batch of bladder material for the equivalent of decades of service to assure reliable performance... and protect bladders with easy-to-replace Inlet screen cartridges to reduce abrasion and wear.

If a bladder does malfunction, QED supplies a quick change kit so you can easily replace just the bladder sleeve—in the field, with no waiting.

Teflon®/PTFE

For maximum sample accuracy at low contaminant levels, and longest pump life in harsh chemical environments, QED uses only the finest duPont Teflon® and other PTFE resins available.

Stainless Steel

All stainless steel is not the same. Electropolishing stainless steel has been proven to give the most inert finish for preserving water quality, with lower porosity to help it resist corrosion. That's what we use in all QED stainless parts, rather than inferior alloys with little or no protective finish. (Stainless steel pumps are not recommended for low metal sampling levels, high acid, high dissolved solids, or reducing conditions.)

PVC

Polyvinyl chloride is an economical alternative when monitoring doesn't require stainless steel. We use only NSF-grade PVC, extruded specifically for QED with no markings or lubricants to contaminate the sample.

FLOW PERFORMANCE CURVES:

1100 Series Pumps

1200 Series Pumps

1300 Series Pumps

Note: Flow rates are based on pump submergence of 25 feet and operating gas pressure of 100 psi from 3111HR Air Source/Controller. Call for flow rates under other conditions.

35200	Optional S.S. Screen for 1200 & 1500 Series Pumps

Note: Intake screens must be used to qualify for 10-year warranty.

WELL WIZARD ON VIDEO Well Wizard Operation & Maintenance

A user's manual on video, this 17-minute tape is packed with valuable, easy-to-follow instructions. Sections on installation, operation, and troubleshooting are color-coded for quick reference. Learn from the experts about sample pumps, purge pumps, inflatable packers, and pneumatic controllers, included with every Well Wizard System.

DEEP WELL FLOW CURVE:

1100 Series Pumps

Note: Flow rates based on pump submergence of 25 feet. Depths to 320 feet based on operating gas pressure of 155 psi from 3111HPE Air Source/Controller. *Even greater depths (to 1000 feet) are possible; consult QED for details.

WELL WIZARD

Sample and Purge Tubing

A critical component of any monitoring system, tubing assemblies in a variety of materials fulfill every need.

PROTECT YOUR SAMPLES WITH THE BEST TUBING

QED has always recognized that ground water monitoring demands the highest material standards. This applies to tubing; a sample is only as good as the tubing it runs through. QED tubing enhancements ensure the ultimate accuracy of ground water samples for monitoring programs.

Twin-line bonded tubing makes handling, installation, and portable water level probe use easier. Economical Teflon-lined polyethylene bonded tubing is our most popular choice, with Teflon on the inside of the sample discharge tubing where it's really needed. Model PT5100 is used most often. Other tubing set choices include all-Teflon bonded, polyethylene bonded, and polypropylene bonded (for deep wells).

All tubing is controlled-quality, virgin-grade material, without printing. Standard tubing assemblies are cut to exact length and pre-assembled to well cap and pump per customer specifications at no extra cost. Bulk tubing is also available; inquire for details.

Teflon is a duPont trademark; material may be an equivalent PTFE.

Controllers/Air Sources

Workhorse controller/compressor carts provide self-contained portable performance.

3111LR Controlled/Compressor Cart

RUGGEDLY CONSTRUCTED, EASILY PORTABLE

Most of our customers choose the 3111 series controller/compressor carts. They combine field-proven pneumatic controllers with performance-engineered compressors, powered by reliable, fast-starting 4 HP Honda gasoline engines. Model 3111LR is the most popular choice.

The most durable, portable, all-in-one pump-driving system around, the 3111 series operates every sampling and purging system we make. It's simple and self-contained, optimized for maximum performance, reliability, and ease of use. Finishing touches include oilless compressors for maximum contamination protection.

3013 Pneumatic Controller

SPECIFICATIONS:

MODEL NO.	DESCRIPTION
3111LR	Standard controller/compressor cart drives pumps to 200 ft. lift; 4 HP Honda engine, high output compressor (4.3 SCFM at 100 psi), with model 3013 controller mounted on the anti-vibration braced cart, with easy wheel/handle breakdown; 89 lbs.
3111LH	High pressure model controller/compressor cart provides lifts to 320 ft. with high pressure compressor (2.1 SCFM at 165 psig) and model 3013H high pressure controller, otherwise similar to model 3111LR above; 93 lbs.

Note: Economy models available with Briggs & Stratton engines: 3111HR standard lift 3111HP high pressure.

THE MOST RELIABLE CONTROLLERS IN THE INDUSTRY

Versatile Well Wizard 3013 series controllers are fully adjustable, can operate high-rate purge pumps at full capacity and still be throttled down to 0 psi for EPA-recommended low flow rates for sampling.

One-person portability, fast set-up, and unattended cycling greatly reduce labor costs, and QED systems come complete—no extra charges for hoses, batteries, chargers or other necessary equipment.

All standard and high pressure models are compatible with a wide range of gas sources. Optional Pump Manifold lets one controller run three sampling pumps within a 20-foot radius. High pressure models allow lifts to 1000 feet. Pneumatic design provides sophisticated control with no batteries or electrical supply. And it's tough: Well Wizard controllers have been left out in the rain, dropped from trucks, even had their lids ripped off—and still kept on working.

SPECIFICATIONS:

MODEL NO.	LOGIC	MAXIMUM SUPPLY PRESSURE (PSI)	MAXIMUM PUMP DEPTH (feet)	WEIGHT (lbs)	LENGTH (Dimensions in inches)	WIDTH	HEIGHT
3013	Pneumatic	125	250	22	18	14.50	6.75
3013H	Pneumatic	300	600	26	18	14.50	6.75
3013UH	Pneumatic	500	1000	32	18	14.50	6.75

EXTRA CONTROLLER PERFORMANCE BUILT IN Pneumatic Power

3013 series controllers have all-pneumatic design for maximum reliability. No battery to drain, no long waits for recharging or replacement batteries—if you've got pressure, you've got power. Third-generation pneumatic controls provide inherent shock and moisture resistance for real ruggedness.

Electronic Efficiency

Model 350 has uniquely efficient circuits that work for 100 hours on one set of inexpensive, readily available AA batteries. Its MIL-SPEC circuit board delivers continued performance in all conditions. Warning light shows a full day's power remaining, so you won't get left out in the field.

3017	Low Submergence Adaptor

SAMPLE PRO

Portable Water Level Meter

Get accurate, repeatable measurements quickly and easily at all depths.

CONVENIENT, RELIABLE PERFORMANCE

Static water level measurement is faster, easier, and more precise than ever with Sample Pro® 6000 Series flat tape water level meters.

The compact electronic probe, standard in stainless steel, is specially designed to eliminate false readings caused by cascading water, and fits easily in wells, boreholes, and standpipes. Kink-resistant flat tape is permanently marked in 1/50th ft. increments, allowing repeatable depth measurements accurate to 1/100th ft.

Kevlar strands reinforce the tape for improved stretch resistance; the Kevlar connects to bolted metal for a stronger probe/tape connection and better water-tight seal, protecting against probe failure.

SIMPLE OPERATION AND DECONTAMINATION

The probe and cable are lowered from the easy-to-carry, free-standing reel. Visual and audio alarms indicate contact with static water; depth measurement is taken directly from the tape. A built-in sensitivity control allows adjustment to fit varying water conductivity conditions. The unit operates for up to a year on a single, easily-replaceable 9 volt battery.

Decontamination is easier than ever. The meter electronics can be removed by disconnecting a single plug; the whole reel/tape/probe assembly can then be simply washed down or even totally immersed for thorough cleaning between wells.

OPTIONS AND ACCESSORIES

Seven standard models are available with inch or metric markings in a range of cable lengths from 100' to 650' and 50 to 150 meters. Lengths up to 1500' can be special ordered; please inquire.

Accessories include a padded protective carrying bag and a tape guide which keeps the cable from rubbing on the edge of the well casing, for reduced tape wear, easier lowering and raising, and more precise, repeatable measurements.

SPECIFICATIONS:

Probes:	Stainless steel (w/ strain relief), 5/8" diameter x 5" long			
Tape:	Flat tape, PVC with Kevlar and tinned copper conductors, markings at 1/50' intervals or 1 centimeter intervals for metric			
Power:	One standard 9V battery			
Reel:	Small, free-standing with carrying handle and winding knob, brake, probe holder, battery test, on-off switch, sensitivity adjustment (Model 6000QSS uses larger reel)			
Depth Options:	MODEL NO.	TAPE LENGTH	METRIC MODELS	TAPE LENGTH

AMERICAN**

BUCKET DRILL RIGS

EXTRACTION WELL DRILLING
EQUIPMENT

BUCKET DRILL

A heavy duty model with 7000-pound double drum hoist. The 52-inch ring gear takes buckets to 48 inches in diameter. With a triple telescoping Kelly and 39-foot derrick, depths to 85 feet can be reached. By use of a stem, depths to 105 feet are possible.

Moretrench American uses the Bucket Drill to predrill excavations for the installation of Moretrench dewatering wells.

Revert or bentonite is used as a drilling fluid to support the sides of the excavation.

Moretrench American wellscreens and select sand or gravel filters are installed upon completion of the drilling operation.

Submersible pumps are used as the pumping tool for deep wells.

24" - 72"
DIAMETER

**GLOVER
ROCK-GRAB**

SPADE TOOTH STEP AUGER

This auger incorporates a step-tooth design minimizing "walking" tendencies. It uses spade type teeth mounted in discrete positions both radially and in elevation. Full contact with the surface being drilled results in stability and continuous penetration in materials such as soft limestone, clay, shale, compacted sand and gravel. Worn teeth are easily removed and replaced. This auger performs well in a wide range of drillable materials that otherwise requires more than one tool for efficient drilling production.

SINGLE FLIGHT, DOUBLE CUTTING EDGE AUGERS

These augers incorporate features of both the single flight, and double flight augers. The auger has two cutting edges for which a full line of cutting edge configurations is offered. The first leading edge of the flights cuts and conveys material up the auger. The opposing cutting edge is on a partial flight and serves to balance cutting forces when starting a shaft. This auger offers the advantage of double flight augers without reducing efficient conveyance of materials. Less tool weight and lower cost are also advantages to this design when compared to a double flight auger.

MUDDING AUGERS

The principle purpose of a mudding auger is to drill and mix cuttings into a slurry. The openings placed in the auger's flights allow circulation of materials through the tool and complement mixing effects as the auger is rotated while alternately raised and lowered. The openings also provide a vacuum/pressure relief that results in increased speed and ease in which the auger may be raised and lowered in the shaft. Flight holes also serve to eliminate problems which result from pulling a partial vacuum in unstable materials that may result in wall collapse and shaft deformation. Mudding augers may also be used for typical drilling production. They are available in single or double flight configurations and may be equipped with a variety of cutting edges.

PROCEDURE

I. Piston Tube Sampling

To retrieve samples of the slurry wall backfill, we propose to proceed as outlined below:

- Minimum 8" O.D. hollowstem augers will be advanced to the prescribed depth. The diameter of the hollowstem will be minimum 4 1/4".
- Upon reaching the target depth, a nominal 3" I.D. piston tube sampler measuring 24" in length will be pressed to its full depth.
- The tube will be withdrawn and the sample turned over to BET.
- The augered hole will be backfilled with a cement-bentonite grout in the proportion of 1 bag of portland cement, 4 to 6 pounds of dry bentonite to 7 gallons of water.

II. Piezometer Installation

- Minimum 8" O.D. hollowstem augers will be advanced to depth. The hollowstem will be minimum 4 1/4" I.D. A wooden plug will be placed in the lead auger prior to drilling.
- Upon reaching completion depth, the hollowstem will be flushed with clear water to remove any fines and to stabilize the hole for piezometer construction.
- Minimum 1 1/4" I.D. PVC piezometer assemblies will be inserted in the hollowstem conforming to the depth requirement of the specifications.
- Filter gravel will be placed by tremie as the augers are withdrawn to a point 6" above the screen as specified.
- Above the filter-gravel, ^{*} cement-bentonite grout will be placed via a grout pump and tremie pipe.
- The piezometer will be completed with cap, protective casing and lean concrete as specified.

* 7 GAL. H₂O
1 BAG (94#) PORTLAND CEMENT
5# BENTONITE POWDER

PVC Vee-Wire® Screens

- Only continuous slot, wire-wrapped non-metallic screens available without a restricting pipe base.
- More open area per foot than any other non-metallic screen available. Allows more water to enter at lower velocities, which reduces turbidity and enables a more representative sample to be collected.
- Exceptionally strong due to sonically welded PVC wire and rods.
- Thermally-attached fittings (through 6PS), eliminate solvent welding in the field, which can endanger sampling accuracy.

PVC Slotted Pipe

- Use Johnson screens™ slotted PVC pipe when monitoring applications do not require the performance of Vee-Wire® screen.
- Meets Wheelabrator Engineered Systems Inc.'s high standards of quality.
- Slots are cleaned to remove stringers and hurrs.

WELL AND PIEZOMETER ABANDONMENT PROCEDURES

Per Section 02677 of the Specifications, the following describes the proposed method of abandoning the existing wells.

1. The wells will be located in the field. The outer protective casing will be removed.
2. A mixture of cement, bentonite and water will be used as a grout mixture for grouting the existing wells. The grout mix design will be as follows:

Portland Cement	94 Lbs.
Powdered Bentonite	4-6 Lbs.
Water	8-10 Gals.

3. The cement-bentonite grout will be mixed and pumped through a tremie pipe 3 feet from the bottom of the well to the top of the well.
4. A well abandonment report will be kept in accordance with Paragraph 1.3.B and Paragraph 1.7 of Section 02677. The report form that will be used is attached.
5. After 24 hours the well will be inspected for settlement of the grout previously placed. If any settlement occurred, additional grout will be placed in the well.
6. After the wells have been grouted, the inner casing shall be removed to 4 to 5 feet below ground surface. The remaining portion of the hole will be backfilled.

Groundwater Monitoring Products

AMERICAN COLLOID COMPANY
Water/Mineral Division

American Colloid Company's PureGold® Product Line

American Colloid Company has specifically engineered the PureGold® product line to meet the strict regulatory requirements of the groundwater monitoring industry. PureGold® products are produced from the highest quality bentonite clays. Each product consists of a blend of pure, dried bentonite clays without polymers or organic additives. PureGold® products are formulated under strict quality control standards. The products have been analyzed for inorganics using the EP Toxicity Test Method, and for organic priority pollutants using U.S. EPA CLP procedures. The analytical results were below EP Toxicity maximum concentration limits for inorganics and below CLP detection limits for organics.

PRODUCT NAME

USE

PureGold® Gel

A 90 bbl. yield, polymer free drilling fluid. Used for maintaining borehole integrity in unstable geologic formations.

PureGold® Grout

A high solids bentonite grout. A safe substitute for cement. Used for sealing the annulus of groundwater monitoring wells and abandoning boreholes.

PureGold® Tablets

Bentonite tablets available in 1/2", 3/8" and 1/4" diameters. Used for sealing the annulus of groundwater monitoring wells.

PureGold® Doughnut

A bentonite cylinder. Used for sealing the annulus of groundwater monitoring wells.

PureGold® Chips

Bentonite chips available in two sizes: 1/4" to 3/8" and 3/8" to 3/4". Used for abandoning shallow boreholes. (< 100')

PureGold® Lube

A bentonite based tool joint lubricant. For use in environmental drilling where petroleum based lubricants are not allowed.

PureGold® Grouter

A grout mixer available in two models. Used for mixing and pumping high solids bentonite grouts.

Marsh Funnel & Cup Mud Balance

Test equipment for measurement of drilling fluids and grout.

TECHNICAL DATA SHEET**PureGold® Chips**

Description: PureGold® Chips are natural sodium bentonite screened to 1/4" to 3/8" in size.

Recommended Use: For sealing shallow boreholes, decommissioning wells, providing an interface between bentonite grouts and cement, and as a backfill for ground rod installations.

Characteristics:

- Chemically stable, results from TCLP Metals Analysis are below RCRA limits for hazardous constituents.
- Provides a high solids clay seal.
- Prevents infiltration of surface contamination.
- Provides a permanent flexible seal.
- Can be used to seal abandoned holes, conductor pipe and seismic shot holes.
- Forms a low resistivity contact to grounding rods.

Mixing and Application: Bagged material should be screened of fines before placing in hole. Material should be poured slowly down hole to prevent bridging or binding. If installed in the unsaturated zone, water should be added at two foot intervals to assure adequate hydration.

Bulk Density: 69.25 lbs./ft³

Packaging: PureGold® Chips are packaged in 50 lb. Multi-wall weather resistant bags, 48 bags per pallet, and shrinkwrapped.

MH WALL

**CROSS SECTION
OF A-LOK BEFORE
INSTALLATION**

**CROSS SECTION
OF A-LOK AFTER
INSTALLATION**

Drawings: # D-8-A

DESCRIPTION:

The A-LOK is a high performance flexible connector designed to produce a positive watertight connection for pipes entering precast manholes and other concrete structures. The rubber connector is compounded from a polyisoprene blend whose performance has been proven to be excellent for use in sanitary systems.

Integral placement of the connector in the concrete wall is achieved by use of a two part precision mandrel with a positive securing system to "lock in" connectors on the correct line and grade.

ADVANTAGES:

- 1.) A-LOK functions on pure compression, making field installation quick and easy. Clean and lubricate both connector and pipe; center pipe in connector and insert.
- 2.) The A-LOK connector assures a positive watertight connection, providing 10 degrees of omnidirectional deflection to eliminate infiltration and shear due to settlement or ground movement. This flexibility permits immediate backfill enhancing project safety, and overcoming the problems normally encountered with water, running sand and other unstable trench conditions.
- 3.) On larger diameter pipe when size prohibits it being installed in a flat plane the physical configuration of the A-LOK allows it to be cast in a curve with a radial progression of rotation. This design has resulted from years of extensive research and development and causes no loss in compression or deflection.

SPECIFICATIONS & TESTING:

- 1.) Available for pipes from 4" through 60" inside diameter.
- 2.) The A-LOK meets all material and performance requirements of A.S.T.M. Standard C-923 titled "Resilient Connectors Between Reinforced Concrete Manhole Structures and Pipes." Some of the requirements are given in the attached tables.

PLAN VIEW of MH

MANHOLE DIA.	MAX. PIPE SIZE O.D.

Water absorption	increase in weight	D 1171 D 746 D 624, Method B
Ozone resistance	rating 0	
Low-temperature brittle point	no fracture at -40 F.	
Tear resistance	200 lb/in. or 34 kN/m	

A-LOK INSTALLATION INSTRUCTIONS

A-LOK is a compression gasket sized to fit pipe barrel. Entry pipe should have a smooth outside surface and the correct diameter. Clean and lubricate A-LOK and pipe end which will be inserted into A-LOK. Care should be taken to lube the entire portion of pipe which will slide through A-LOK. When pipe barrel is lubricated, pipe can be reversed or deflected without twisting A-LOK rubber. Pipe can be installed in either direction from inside or outside of manhole. If pipe is cut, care should be taken to allow no sharp edges. A slight bevel is preferred as a lead and this should also be lubricated. Entry adapters are available if necessary to enhance centering and coupling of pipe to manhole. Pipe bedding on outside of manhole is critical as non-rigid pipe may grate if not bedded correctly. Moulding gravel should be run between pipe and A-LOK after installing to remove any mud, stone, or excess lubricant.

WARNING

Because of the A-LOK connector's ability to insure a flexible, watertight joint, it is our strong recommendation that no mortar be placed around the connector at all on the outside of the structure and that no mortar be placed around the top half of the connector on the inside when completing the invert work. The use of mortar in either of these areas would eliminate the flexibility for which the connector is designed, and cause problems of shear.

EPOLON 22 BLACK MASTIC

PRODUCT DESCRIPTION:

A heavy duty, interior/exterior, multi-mil, two component, coal tar epoxy compound. Specifically designed for the protection of steel and concrete in immersion service or where unusual resistance to severe humidity, corrosion, fresh or salt water immersion, abrasion, impact or general chemical attack is required.

RECOMMENDED USES:

For use on: properly prepared steel and concrete surfaces such as concrete pipes, plant equipment, sewerage plants, cooling towers, underground tanks, barges, bulkheads, bridges, conveyors or sludge vessels and various chemical plants. Do not use for potable water service.

PERFORMANCE STANDARDS:

APPLICABLE STANDARDS: Meets performance requirements of Steel Structures Painting Council SSPC-16-68T and Corps of Engineers Specification C200a.

CHEMICAL RESISTANCE:

Immersion	Frequent Contact	Occasional Contact
Salt Solutions	Solvents	Organic Acids
Fresh Water	Alcohols	Mineral Acids
Crude Oil	Vegetable Oils	Oxidizing Agents
Alkalies.	Petroleum Products	

GENERIC TYPE: Coal Tar Epoxy-Polyamide

COLOR: Black

FINISH: Semi-gloss

NUMBER OF COATS RECOMMENDED: Two

RECOMMENDED FILM THICKNESS:

Wet: 11 - 14 Mills
Dry: 8 - 10 Mills

TOTAL SOLIDS:

Volume: 71 - 73%
Weight: 81 - 83%

THEORETICAL COVERAGE:

115 - 145 Sq. Ft./Gallon at
8 - 10 Mills Dry Film Thickness

NUMBER OF COMPONENTS: Two

INDUCTION TIME @ 75°F: 30 Minutes

DRYING TIME @ 75°F HUMIDITY 50%:

To Touch: 4 Hours
To Handle: 8 Hours
To Recoat: 18 Hours and within
72 Hours Maximum

POT LIFE @ 75°F (Mixed): Up to 8 Hours

FLASH POINT (Mixed): 80°F (TCC)

VOLATILE ORGANIC COMPOUND:
Less than 2.0 Pounds Per Gallon

MIXING RATIO: 4:1 By Volume

WEIGHT PER GALLON (Mixed): 10.6 lbs average

VISCOSITY @ 77°F (Mixed): 100 - 110 Krebs Units

DRY HEAT RESISTANCE:

Continuous: 200°F
Intermittent: 250°F

SHELF LIFE: Up to 24 Months at Recommended Storage Conditions

REDUCER: EPOLON 145 REDUCER

STORAGE CONDITIONS: Indoors at 45° - 100°F

APPLY BY: Airless Spray Recommended
Brush or Roller for small areas.

PACKAGED: One and Five Gallon Kits
One Gallon Kit: 1 Gallon Container Component A
part filled @ .8 Gallon
1 Quart Container Reactor B
part filled @ .2 Gallon
Five Gallon Kit: 5 Gallon Container Component A
part filled @ 4 Gallons
1 Gallon Container Reactor B

APPLICATION CONDITIONS:

Relative Humidity: Up to 85%
Temperature: 50° - 100°F
Surface Temp.: 5°F above Dew Point

"ENGINEERED PRODUCTS FOR HEAVY-DUTY INDUSTRIAL & COMMERCIAL PROTECTION"

EPOLON 22 BLACK MASTIC

MIXING

Mix contents of each component thoroughly to obtain a uniform consistency and insure no pigment remains bottom of can. Pour the contents of the container marked "Reactor B" into the slack filled container marked "Component A" or in the ratio of 4 parts "Component A" to 1 part "Reactor B" by volume while under agitation. Continue agitation until the two components are thoroughly mixed. Allow to stand 30 minutes prior to application. Re-stir before using. Do not use mixed material beyond recommended pot life. Temperatures above 75°F will shorten pot life.

SURFACE PREPARATION

Prepare surface by method suitable for service and exposure. All surfaces must be dry, clean and free of all paint, rust and other foreign matter. Do not paint in dampness or temperatures below 50°F.

STEEL: All surface contamination including rust, mill scale, loose paint, old coatings, and all other foreign matter must be removed by dry abrasive blasting and coated within 8 hours or before visible rusting occurs. Surface profile of blast not to exceed 2 mils. Prior to blast cleaning, remove all visible deposits of oil and grease in accordance with Solvent Clean SP-1. Round off all rough welds and sharp edges and remove weld spatter. Minimum surface preparation: Immersion service - Near White Blast SP-10. Non-immersion service - Commercial Blast SP-6.

CONCRETE: New concrete must age at least 60 days before coating. Form release agents, curing compounds, salts, all previous coatings, hardeners, and other foreign matter will interfere with adhesion and must be removed and surface properly prepared by mechanical abrasion, abrasive blast, or acid etching. Surface must be swept or vacuumed to remove all spent abrasives, dust and other foreign matter. Minimum surface preparation is acid etch with a 15% muriatic acid solution creating a grainy surface texture. Flush and rinse completely and allow to dry thoroughly.

SPECIFICATION

STEEL, IMMERSION, (Near-White Blast SP-10):

2 coats: EPOLON 22 BLACK MASTIC. Total dry film thickness: 16 mils minimum.

STEEL, NON-IMMERSION, (Commercial Blast SP-6):

1st coat: EPOLON RUST INHIBITOR 15 RED.

Finish with: 1 coat: EPOLON 22 BLACK MASTIC.

GALVANIZED METAL OR NON FERROUS METALS, RUST FREE (Solvent Clean SP-1):

1st coat: METAL BOND 47 PRIMER.

Finish with: 2 coats: EPOLON 22 BLACK MASTIC.

CONCRETE, NEW OR UNPAINTED WOOD:

1st coat: EPOLON 22 BLACK MASTIC (reduced 1 quart per gallon with EPOLON 146 REDUCER).

Finish with: 1 coat: EPOLON 22 BLACK MASTIC. Total dry film thickness: 16 mils minimum.

Allow 5 days curing time at recommended temperature and humidity before putting tank in service. Do not apply over previously painted surfaces.

REDUCER

If thinning is required:

Up to one pint per gallon of EPOLON 143 REDUCER.

RECOMMENDED EQUIPMENT (or Equivalent)

AIRLESS SPRAY:

Standard airless equipment such as the Graco President or Bulldog 30:1 pump ratio. Inbound pressure 80 - 100 psi and .019" to .023" fluid tip.

Use a 50% overlap with each pass of gun. Airless spray recommended for best film build and to minimize spray dust. EPOLON 22 BLACK MASTIC may be applied, if required, to small areas only by brush and roller. Film build obtained will depend primarily upon the skill and technique of the applicator. In most cases when using brush or roller, a second coat will be necessary to achieve recommended film thickness. Use a short bristle brush or medium nap roller (do not use long nap lambs wool cover). Keep roller saturated with material, working coating into all irregularities. Be sure proper film thickness is obtained. Special attention should be given to sharp edges, boltheads, flanges, rivets, corners, welds and other irregular surfaces to insure they receive proper film thickness equivalent to that recommended for all other adjacent areas.

When applying two coats, be sure first coat is properly cured. Excessive film thickness or conditions of poor ventilation require longer dry times. Excessive humidity or condensation on the surface during curing may result in a surface haze or blush. This should be removed by water washing before recoating. When recoating after 72 hours of application of initial first coat, surface coating must be brush blasted or abraded prior to application.

NOTE: Curing time is extended at temperatures below 70°F and shortened above 70°F. At low temperatures (50°F) curing speed is greatly retarded.

WARNING: FLAMMABLE. Contains xylene, glycol ethers and epoxy resin. Keep away from heat, sparks and open flame. Do not take internally. Explosion proof and non-sparking equipment should be used. May irritate eyes and skin. Prolonged breathing of vapors may irritate respiratory tract causing headache, nausea and dizziness. Use only with adequate ventilation. Avoid contact with skin and breathing of vapors of spray mist. Close container tightly and wash hands properly after each use. Keep out of reach of children. Refer to Material Safety Data Sheet prior to use.

VOICLAY®

WATERSTOP-RX®

Fast, effective, permanent sealing
for concrete joints.

70" SEWER ROOF SLAB

ACC
American Colloid Company

Waterstop-RX[®] helps save time, money... and concrete structures.

Installing conventional waterstops in concrete joints is an important (but normally time-consuming) part of concrete construction. It can also be very labor-intensive, reducing the profitability of the job. Most important, conventional waterstops offer only a partial solution to water infiltration, leaving architects, engineers, and contractors open to liability problems.

Clay[®] Waterstop-RX[®] solves water infiltration problems. It's easy to apply even by a single, inexperienced laborer, cutting installation time in half. It eliminates split-forming and splicing. And, its self-healing properties ensure that concrete joints remain protected permanently.

How Waterstop-RX works
The key to Waterstop-RX is its western medium bentonite base. Specified for more than 20 years for foundation waterproofing, bentonite swells in contact with water, forming an impenetrable gel. This property also allows bentonite products to fill in small cracks in concrete.

Waterstop-RX comes in a coil. It is applied by adhering the material to the butt end of the concrete with RX Primer or concrete cut nails—an operation that requires a single laborer. Then pour or place the next section of concrete to complete the joint. No split-forming, splicing, or bonding is required as with conventional waterstops.

Upon hydration, Waterstop-RX swells to form a self-healing compression seal that completely locks out water. This action also prevents water migration along the waterstop and in keyways as an extra protection against penetration.

All-weather application
Waterstop-RX has been engineered for use under virtually all temperature conditions. Unlike other popular joint sealants, Waterstop-RX does not become stiff and brittle in cold weather nor spongy and difficult to work with in hot weather. As a result, Waterstop-RX does not have to be heated in cold weather, saving time and money. It also remains totally flexible without shrinking, hardening, or oxidizing regardless of the length of time it is exposed to the elements.

Safe to use
Because Waterstop-RX is non-toxic, no special handling equipment is required. It is clean to the touch, and does not contain any material which can discolor or irritate the skin, helping eliminate lost man-hours.

Waterstop comparison
Upon contact with water, Waterstop-RX swells to form a compression seal that repels water completely. No migration along the waterstop or keyway is allowed.

Water is stopped by a damming effect of hydrostatic pressure, but is allowed to remain inside the joint. This allows lateral movement along the waterstop or in the keyway. If a weak point is found, water can then enter away from the point of original contact, making repair difficult and costly.

Installation procedures

Surface preparation

Joint surfaces should be clean and dry. For best results, Waterstop-RX Primer should be applied to the joint surface prior to adhering Waterstop-RX, especially on vertical joints. The primer creates a tacky surface which allows for excellent adhesion to the concrete.

Positioning

Waterstop-RX is adhered to the butt end of the previous concrete pour and should be positioned a minimum of 2" from the exterior joint surface. Concrete cut nails, Waterstop-RX Primer, or both must be used to secure Waterstop-RX in place to prevent displacement of the material during the pour.

Waterstop-RX may also be installed in a cast in place recess at the exterior side of the joint. In this situation, precautions must be taken to protect Waterstop-RX from hydration prior to backfilling and backfill must be compacted to 85% modified proctor minimum, adjacent to the joint. The recess at the exterior of the joint should match the dimension of Waterstop-RX.

The ends of individual Waterstop-RX coils should be butted together—never overlapped.

Applications

Waterstop-RX is ideal for use on many types of poured in place and below grade precast concrete applications. There should be a minimum of 2" of concrete cover separating the exterior face of the Waterstop-RX from the exterior side of the joint.

NOTE: In cases of lightweight concrete or insufficient coverage, consult the manufacturer.

Use On:

- Precast concrete wall panel systems
- Septic tanks and sewage treatment plants
- Sanitary and storm sewer manholes
- Pipe (round, oval, flatbase, elliptical, and arch types)
- Cold joints in foundation slabs or walls below grade
- Burial vaults Utility vaults Box culverts
- Wet wells

CLOSED JOINT

When a double coil of Waterstop-RX is used, apply one coil on the rear sliding surface of the tongue and another coil on the rear sliding surface of the groove or bell as illustrated.

Typical Details

Waterstop-RX[®] Technical Information

Waterstop-RX[®] is a flexible strip of bentonite waterproofing compound, coiled in two sizes. Dimensions and other specifications are as follows:

Dimensions	1" x 3/4" x 16'6"	3/4" x 3/4" x 25'0"
Weight	.50 lbs./ft. minimum	.165 lbs./ft. minimum
Carton Contents	100 L/F	150 L/F
Carton Weight	50 lbs.	25 lbs.
Carton Size	14" x 14" x 10"	14" x 14" x 10"
Pallet Size	4' x 4'	4' x 4'

Chemical Composition

Material	Test Method	Waterstop-RX Results
Butyl Rubber-Hydrocarbon (% by weight)	ASTM D-297	24.9%
Bentonite	SS-S-210-A	75.0%
Volatile matter	ASTM D-6	Below 1%

NOTE: Contains no asbestos fibers or asphaltics.

Physical Properties

Property	Test Method	Waterstop-RX Results
Specific gravity at 77°F	ASTM D-71	1.57
Softening point	ASTM D-30	N/A
Penetration	ASTM D-217 150 GTL 300 GTL	58 85
Flash point	ASTM D93-97	365
Min. head pressure	Hydrostatic pressure test	231 ft. (100 psi)
Accelerated aging	(Mechanical oven 4 hrs. @ 212°F)	Maintained 99% solids
Flow resistance	(3/4" overhead joint exposed to 135°F for 7 days)	No flow
Storage life		Indefinite
Adhesion to clean, dry concrete		Excellent
Application temperature range		5° to 125°F
Service temperature range		-40° to 212°F

Seal concrete joints quickly and permanently with the waterstop that heals itself—Waterstop-RX. For more information, contact your American Colloid Company distributor, or contact us direct.

Distributed by:

Limitations

In conditions where severe ground water contamination is expected, please consult the manufacturer for compatibility information. Waterstop-RX should be confined within a concrete joint with a minimum 2" concrete cover to the exterior of the joint surface. Waterstop-RX may also be installed in a cast-in-place recess at the exterior side of the joint. In this situation, precautions must be taken to protect Waterstop-RX from hydration prior to backfilling and backfill must be compacted to 85% of modified proctor minimum adjacent to the joint. The cast in place recess should match the dimension of the Waterstop-RX being used.

An exposed length of coil should not be submerged for extended periods of time. If Waterstop-RX exhibits considerable swelling prior to confinement in the joint, it must be replaced with new material. To avoid displacement of Waterstop-RX during or prior to concrete placement, cut nails and/or Waterstop-RX Primer must be used to hold the material in place. Proper care should be taken during concrete placement to avoid displacing the Waterstop-RX strip. Waterstop-RX is not an expansion joint product and should not be used as such.

NOTE: In cases of lightweight concrete or insufficient coverage, consult the manufacturer.

Warranty

American Colloid Company warrants its materials to be of good quality and will replace material proved to be defective. In no instance will American Colloid Company be liable for labor costs or incidental damage associated with the use of this product, unless stated in a warranty for a specific project.

Document

This brochure contains information to supplement information service available from American Colloid Company's Building Materials Division and from local distributors.

Application Assistance

Local distributors of Waterstop-RX are qualified to aid in solving problems related to use of this product. In the event that your needs are special or you have an unusual situation, your local Waterstop-RX distributor will arrange to have a factory representative contact you for personal assistance.

Neoprene Rubber

High-Grade Neoprene Rubber Sheetting

• Color: Black • Durometer Hardness, Shore A: Soft, 35-45; Medium, 45-55; Firm, 55-65; Hard, 65-75
 • Tensile Strength: 1500 psi • Temperature Range: -20° to +170° F

The high tensile strength of 1500 psi makes this premium grade rubber a great choice for the most demanding applications. It takes rough handling with minimal abrasion and maintains its resiliency after extended compression. This neoprene has better resistance to oil, heat, ozone, oxidation, and

flame than natural rubber. Applications include belting, mountings, seals, diaphragms, and insulation. Neoprene has all the resistance to general chemicals, except concentrated acids, as natural rubber. Meets ASTM D-2000-86E, Type BC and military specifications MIL-R-3065.

Commercial-Grade Neoprene Rubber Sheetting

• Color: Black • Temperature Range: -20° to +220° F
 • Tensile Strength: 1000 psi • Durometer Hardness, Shore A: 45-55

Tensile strength of 1000 psi gives this commercial-grade neoprene the ability to handle most general purpose applications. It is great for gaskets, pump and tank flanges, diaphragms,

shock absorbers, and insulation. This rubber stands up well to oil, abrasion, and weather. The rubber conforms to irregular flange joints, and it seals under minimum bolt loads.

Industrial-Grade Cloth-Inserted Neoprene Rubber Sheetting

• Color: Black • Temperature Range: -20° to +220° F
 • Tensile Strength: 1000 psi • Durometer Hardness, Shore A: 45-55

Fabric reinforcement provides the strength needed for stress applications such as gasketing, diaphragm packing. A 6.7-oz. nylon ply is inserted per 1/8" of thickness. Sheets resist abrasion, oil, and weather. Meets ASTM D-2000-75E, Type BC.

Premium-Grade Nylon-Inserted Neoprene Rubber Sheetting

• Color: Black • Temperature Range: -40° to +220° F
 • Tensile Strength: 1500 psi • Durometer Hardness, Shore A: 65-75

Nylon inserts give rubber greater tensile strength and durability than cloth ply, making it better for diaphragm packing. A 6.7-oz. nylon ply is inserted for every 1/8" of thickness. Resistant to abrasion, oil, and weather. Meets ASTM D-2000-28E715.

Hose Accessories

Designed to prevent hose stress due to twisting during assembly, these easy-to-assemble adapters are excellent for confined areas.

Adapters are made of steel with a corrosion-resistant finish. To minimize piping leaks, the swivel ends of each adapter have dry seal pipe threads.

Adapters are available in straight or angle styles, male pipe x female pipe swivel, or female pipe x female pipe swivel.

Pneumatic In-Line Hose Swivels

Full 360° hose swivel helps eliminate the nagging problem of hose twisting and kinking... especially at critical connection points in air lines. Choose from brass or steel construction.

BRASS CONSTRUCTION—Include threaded male on one end and female on the other end. Pressure rating is 300 psi.

NPT	M x F	No.	NET EACH
1/2" x 1/2"		4480K11	\$2.59
3/8" x 3/8"		4480K12	3.29

STEEL CONSTRUCTION—Have threaded 1/2" male NPT on one end, female hose end or swivel barb on the other end. Black oxide finish.

Description	No.	NET EACH
Male 1/2" NPT x Swivel Barb for 1/2" ID Hose	5302K63	\$4.79
Male 1/2" NPT x Swivel Barb for 3/4" ID Hose	5302K64	4.79
Male 1/2" NPT x 1/2" NPT		

360° Hydraulic Hose Swivel Joints

Designed for a 90° angle connection with a full 360° swivel, these joints eliminate annoying hose twisting and kinking. Joints prevent excessive flexing which means no more long radius bends. Ideal for use in most applications where hose moves, bends, and twists.

Plated steel construction. Threaded male on one end and female on the other end. May be used for hydraulic applications up to 3000 psi.

NPT Thread	M x F	No.	NET EACH

Flexible Braided Sleeving

Protect hose, wire bundles, and cable from abrasion with this flexible, sturdy braided sleeving. Cut sleeving with scissors... no heat, chemicals, or other tools are needed for installation.

TINNED COPPER—Furnished in an expanded form, the sleeving does not have to inch its way over the material to be protected... the material can easily be fed through the enlarged sleeve. The sleeve's diameter is reduced when it is pulled lengthwise over the material for a neat, smooth fit.

NYLON—Provides 100% shielding over the nominal diameter is provided.

POLYESTER—Material is impervious to salt water, fuels, most oil-based solvents, hydraulic fluids, lubricating oils, and antifreeze. Sleeving is also fungus-resistant. Supplied in a nonexpanded form. Maximum recommended service temperature is 257° F.

Bi-Directional 360° Pneumatic Hose Swivels

Improve tool maneuverability and extend hose life. Units swivel 360° at two locations to allow air hose to drop straight to the floor... no matter how the tool is held. The male pipe thread screws directly into most air tools and accepts male pipe thread hose fittings and standard quick-change adapters. Maximum psi: 150.

NOTE: Do NOT use these swivels on percussion tools or in areas of high mechanical abuse.

Size	No.	NET EACH

316 Stainless Steel Unperforated Worm Drive Hose Clamps

Extra-wide band threads are stamped, leaving the unperforated clamps smooth on the inside—the risk of damage to your hose is eliminated.

Made of 316 stainless steel, these clamps are ideal for use in environments with an aggressive atmosphere

and high risk of corrosion. The joining of the band to the housing is arranged so that the least possible deviation from a circular shape arises while the clamps are being tightened. The bands and screw threads are properly pitched—virtually immune to vibration back-off. Band width is 3/16". Slotted hex head screws are 1/4".

Clamps are sold in packages of 10.

DOWEL-IN

INTRODUCTION:

Richmond published the first dowel bar substitution brochure in 1974. Since that time Richmond has continued to study, develop and manufacture anchorages and splice devices to meet the ever increasing demands from the construction industry. This brochure is the fruition of that effort, a second generation dowel bar substitution system with improved design, strength and economics.

DEVELOPMENT:

As good as the initial dowel bar substitution system is, the continuing study revealed unexpected barriers and hesitations among engineers against a system based on wire insert splice mechanisms. To remove these objections a system was needed that would be readily identified, familiar to handle, easy to use and compatible to standard codes and practices. From this reasoning came the Dowel Bar Splicer, manufactured from standard deformed rebar. . . a simple, yet unique, splice connection.

DESIGN:

The Dowel Bar Splicer and Dowel-In are fabricated from standard rebar material and are designed to achieve full rebar loads, threading does not reduce bar area. Dowel-Ins are furnished with rolled UNC threads in nominal diameters of 5/8", 3/4", 7/8", 1" and rolled UN threads in nominal diameters of 1-1/8", 1-1/4", 1-7/16" and 1-9/16". Splicers are furnished in corresponding sizes and threads. These sizes are suitable for splicing # 4 through # 11 bars and/or substituting for # 4 through # 11 protruding dowels. The Splicer is available in straight or hooked configurations with single or double receivers. Dowel-Ins are available straight or hooked. Both the Splicer and Dowel-In are available cut to required length.

HOW TO USE THE CHARTS:

The Splicer data and Dowel Bar Substitution information is presented in Tables 1, 2, 3, 4 and 5. Table 1 is a quick comparison of dowel diameters to appropriate dowel substitution options. For example, specification documents might require No.4 dowels. To find the proper substitution, enter Table 1 at No. 4 and proceed across the Table noting that the substitution will be composed of a No. 5 bar Splicer with 5/8" diameter internal thread and a No. 4 bar Dowel-In with 5/8" diameter external rolled thread. This simple procedure can be repeated for any given dowel size.

To determine proper lap splice lengths, use Tables 2 and 3. When hooked bars are specified, use Table 4 for load requirements. Tension splices may be achieved by adhering to Table 5 or Table 1.

NOTE: All illustrated applications lend themselves to any continuous splice requirement.

TABLE 3: Required Development and Lap Lengths - Grade 60

Table 1 is a direct comparison of dowel diameters and appropriate substitution options.

Tables 2 and 3 summarize required development and lap lengths for concrete strengths of 3,000 and 5,000 psi per ACI Standard 318-77.

Tension: $\ell_d = .04A_b \frac{f_y}{\sqrt{f_c}}$; min. $.0004f_y d_b$ or 12 inches.

Compression Development Length: $\ell_d = .02f_y \frac{d_b}{\sqrt{f_c}}$; min. $.0003f_y d_b$ or 8 inches.

Compression Splice: Compression ℓ_d ; min. $.0005f_y d_b$ or 12 inches.

Consult ACI Standard 318-77, Chapter 12, for multipliers and limitations.

Table 4 identifies the maximum tensile force for hooked rebar as a function of concrete compressive strength. These values were generated by applying the equations and information found in Chapter 12 of ACI Standard 318-77.

Table 5 is arranged to address tension splices such as depicted in Detail F. The other details show but a few examples of the many splice configurations possible.

GRADE 40 REBAR SIZE	CONCRETE STRENGTH

TABLE 6: Reinforcing Steel Data

TYPICAL SETTING METHODS:

Setting methods for the Dowel Bar Splicer are simple and straight forward. The unit can easily be nailed directly to the form face utilizing the nail holes in the integral flange. See sketch below.

To incorporate a keyway it is again easily accomplished - no holes to drill, no dowels to drive in. Simply gang the DB-SAE Splicers to the keyway and nail the keyway to the form. See sketch below.

On metal faced modular forms small screws are often used to firmly set and position the splicer units.

REBAR SPLICE SPECIFICATIONS:

In order to facilitate ease of construction and to provide continuity of reinforcing steels through construction joints and routine splices, the appropriate authority may at their option utilize the Dowel Bar Substitution and Splice System as manufactured by Richmond Screw Anchor Co., Inc. or and approved equal.

For dowel bar substitution and rebar splice systems, other than Richmond Screw Anchor Co., Inc.'s DB-SAE Splicer, the contractor shall submit manufacturer's literature, product samples and certified test reports to the appropriate authority.

Test reports shall show yield and ultimate tensile load capacities. All male threads shall be rolled (UN or UNC), cut threads are not permitted.

Tension failure must occur in the nominal bar diameter of the Dowel-In.

HOW TO ORDER:

Reference Table 1 on page 3 for correct Dowel-In/DB-SAE sizes.

DOWEL-IN (DI)

Give desired bar size (should be equivalent to rebar being substituted for on the structural drawings), length, symbol and name. If a hooked configuration is required also give A and B dimensions shown below.

Example 1
Straight Dowel-In

Example 2
Hooked Dowel-In

Example 1 : #6 bar, 24" DI Dowel-In

Example 2: #6 bar, 12" x 9", DI Hooked Dowel-In

DOWEL BAR SPLICER (DB-SAE)

Give bar size of DB-SAE required (normally one size larger than the Dowel-In, check Table 1 for correct size), length, symbol, name and size of Dowel-In to be used in conjunction with the splicer. If a hooked configuration is required also give dimensions A and B shown below.

Example 1
Straight DB-SAE

Example 2
Hooked DB-SAE

Example 1: # 7 x 24" DB-SAE Dowel Bar Splicer for a # 6 Dowel-In.

Example 2: # 7 x 12" x 9" hooked DB-SAE Dowel Bar Splicer for #6 Dowel-In.

NOTE:

All tolerances per CRSI Design Manual criteria. All bends assumed 90° unless otherwise stated.

ADVANTAGES:

Richmond's Dowel Bar Splicer has been engineered, tested and proven to meet, or exceed, field standards and design/engineering practices. It achieves excellent compatibility with normal procedures and has the rewarding benefits of improved costs and time saving.

The unit is strong, easy to use and readily identified as rebar material. The application requires no special tools, the easy installation accomplishes forming simplicity. No extra elements, such as mechanical wedges, nuts, collars, couplers or thermite material, are required. Routine cutting, threading, bending, etc., can easily be handled in the field.

The "bottom line" — the Dowel Bar Splicer assures strong, safe and fast dowel bar substitutions. Broken-off and/or bent dowel bars are eliminated and bruised shins, gouged backs and scraped scalps will be less likely. Best of all, though, you will improve forming costs and reduce forming and form stripping hassles.

Call or write for additional information, Richmond provides engineered layouts and details for dowel bar substitution requirements.

SPEC DATA

This Spec-Data sheet conforms to editorial style prescribed by The Construction Specifications Institute. The manufacturer is responsible for technical accuracy.

1. PRODUCT NAME

Richmond Screw Anchor Company Rebar Splicing Systems: DB-SAE—Dowel Bar Splicer System* Coupler Splice System** Half Coupler (for welding) Splice System**

2. MANUFACTURER

Richmond Screw Anchor Company
7214 Burns Street
Fort Worth, Texas 76118
Phone: (817) 284-4981
FAX: (817) 284-4504

3. PRODUCT DESCRIPTION

Mechanical connection devices for splicing reinforcement bars in concrete structures. The DB-SAE Dowel Bar Splicer System is a two-piece, standard splicing technique (splicing bars of equal size) that eliminates protruding dowels. The Coupler Splice System and Half Coupler Splice System are a means to achieve standard splicing (equal bar sizes) and/or transition splicing (bars of different sizes).

Richmond Rebar Splice Systems are manufactured in the USA from domestic rebar material and are composed of a Splicer (DB-SAE or Coupler) and a Dowel-In (DI).

Basic Use: Richmond mechanical connections are suitable for joining reinforcement bars end to end. The mechanical connections accommodate bar sizes #4 through #14. Mechanical connections are a convenient alternative to lap splicing and/or butt welding. Typical applications include the splicing of reinforcement bars in monolithic structures, rebar anchorage, future expansion and dowel bar substitution at construction joints.

Composition and Materials: Richmond mechanical connections are manufactured from deformed or smooth bar meeting ASTM A615 material specifications; other grades are available upon request. Mechanical connections and reinforcement bars

may be epoxy coated to meet applicable corrosion resistant criteria.

Limitations: Usage of mechanical connections may be controlled by governing building codes.

4. TECHNICAL DATA

Applicable Standards/Guides/Codes: (ACI 318 Building Code Requirements for Reinforced Concrete) American Concrete Institute; (ICBO) International Conference of Building Officials; City of Los Angeles Department of Building and Safety; New York Board of Standards and Appeals; (AASHTO) American Association of State Highway and Transportation Officials; (ASTM A615) American Society for Testing and Materials; Corp of Engineers CW-03210 Civil Works Construction Guide for Steel Bars; (CRSI) Concrete Reinforcing Steel Institute.

Load Test Data: Richmond Screw Anchor Company provides test data and appropriate test reports. Static, dynamic, fatigue and seismic test data is available. Such data is derived from tests performed in accordance with ACI, ICBO, AASHTO, ASTM and CRSI.

Safety Factors: The ACI building code establishes the minimum splice capacity as follows: "A full mechanical connection shall develop in tension or compression, as required, at least 125 percent of specified yield strength (fy) of the bar." For mechanical anchorage, the ACI code establishes the following safety criteria: "Any mechanical device capable of developing the strength of the reinforcement without damage to concrete may be used as anchorage." Splicing or anchorage, Richmond Screw Anchor Company mechanical connections achieve full strength of the bars connected. For ASTM A615 grade 60 material the full capacity is at least 150 percent of the specified yield (fy).

5. INSTALLATION

Monolithic: Rebar mats/cages may be placed or prefabricated; individual reinforcement bars may be mechanically spliced, incorporating various Richmond splice devices. The mechanical connection is achieved by screw-

ing the male (Dowel-In) into the female (Splicer or Coupler). Pre-torque is not necessary; however, all elements must be fully engaged and secure.

Dowel Bar Substitution and Anchoring: The female (Splicer) will be positioned and secured to the formwork, rebar or bulkheads prior to placing concrete. After concrete has cured, the formwork is removed. Prior to a secondary pour, the Dowel-In (DI) will be threaded into the Splicer. Wrench-tightening is not required; however, all elements must be fully engaged and appropriately aligned.

6. AVAILABILITY AND COST

Availability: Richmond Screw Anchor Company splice devices are available worldwide. See page 6 for the nearest plant and/or sales office.

Cost: Prices are available at the branch office locations.

7. WARRANTY

Richmond Screw Anchor Company splice devices are manufactured according to strict quality assurance specifications. They are warranted to be free from manufacturing defects and to perform as represented in writing (provided that the product is installed and used in accordance with the manufacturer's instructions).

8. MAINTENANCE

No special requirements.

9. TECHNICAL SERVICES

Additional product information or technical information is available by contacting Richmond.

Dowel Bar Splicer (DB-SAE)

DB-SAE Dowel Bar Splicer

The DB-SAE Splicer is a one-piece unit integrally forged from grade 60 rebar material. It is available in #4 through #11 sizes and is designed to achieve 150 percent of specified yield (full mechanical ultimate). DB-SAEs are available straight (cut to length), hooked, double-ended, thread-ended or bolt-headed in plain or epoxy coated. It is also possible to order the Splicer with a reduced washer and/or a clipped washer.

Dowel-In (DI)

DI Dowel-In - #4, #5 and #6 configuration with chamfered nose.

DI Dowel-In - #7 through #11 configuration with pilot nose.

The Dowel-In (DI) is manufactured from grade 60 rebar material and is available in sizes corresponding to the DB-SAE Splicer. The end of the Dowel-In is enlarged by forging before threading so that the cross-sectional area of the bar is not reduced during threading operations, thus assuring a strength capacity of 150 percent of the specified yield. Dowel-Ins are configured to facilitate easy installation of the splice. They can be easily assembled by hand. On large projects, such as highway paving, a centrifugal chuck on an electric or air powered drill motor will speed installation.

Dowel-Ins are available straight or hooked, plain or epoxy coated.

Completed Splice

Both pieces of the completed splice are manufactured from equal size bar stock.

Typical Applications

#11	#11	6/6	6/6	6/6	6/6	135,100

TABLE 10: DB-SAE/Dowel-In Dynamic Test Summary

The purpose of the progressive cyclic tests was to demonstrate the seismic resistance capacities of the Richmond Splice System. Cyclic testing began at 55 percent of the specified yield (60,000 psi) for 25,000 cycles, stepping to 75 percent (fy) for an additional 12,500 cycles, stepping again to 90 percent (fy) for another 4,000 cycles, finally stepping to 100 percent

(fy) for 1,000 cycles. As a result of this test series, each splice reached a stress range of 90-100 percent of the specified yield (60,000 psi) and the total number of cycles of each splice exceeded 41,500 cycles. Units exceeding 42,500 cycles were further tested to evaluate the reserve static tensile load.

Splice Size Stress Level	#5	#6	#8	#11

TABLES 11 AND 12: DB-SAE/Dowel-In Fatigue Test Summary

The fatigue test programs were performed to illustrate the merits of the Richmond Splice System design philosophy of upset and upsized threads relative to the nominal rebar area. All specimens exceeded 2,000,000 cycles at 15,000 psi, 25 percent of the specified yield (60,000 psi). Upon completing 2,000,000 cycles, the tests were stopped and the specimens were statically tensiled to failure to evaluate the reserve strength capacity. A second test series was initiated to develop S-N behavior characteristics of the splice system.

Position Connector

The Position Connector is a left and right hand threaded stud with a free fit hex nut keyed to the hex bar stock of the stud. Right hand and left hand DB-SAE Splicers may be connected and drawn together, using this method, when hooked bar alignment is critical.

Clipped Flange

The Splicer's flange may be supplied clipped as needed to insure adequate concrete cover or to avoid interferences with other objects. Flange may be clipped in more than one direction as required.

Coupler Splice System

The Coupler Splice System employs the attributes of the Dowel-In's (D) upset and upsized threads. Dowel-Ins are threaded into a heavy-duty coupler body. The Coupler Splice System matches the strength performance criteria of the DB-SAE Splice

System in all aspects. A unique advantage of the Coupler is that it also behaves as a position connector. The Coupler can be advanced beyond the thread region of the Dowel-In and then returned to final position, joining a second Dowel-In to the first.

#14	1-7/8" - 8 UN	2-7/8" x 3-7/8"	158750	202500

TABLE 8: Half Coupler Selection Guide

The Half Coupler Splice is simply a shorter version of the Coupler Splice, suitable for welding to steel components such as soldier piles, weld plates, steel frame structure and special bulkheads. A Half Coupler accommodates only one Dowel-In. The capacity of the Half Coupler may be limited by field welding conditions.

Hooked Splicer and Hooked Dowel-In

Hooked dowels may be substituted with a hooked DB-SAE or hooked Dowel-In. Hooked DB-SAEs and DIs will meet or exceed those requirements as defined in ACI 318. All bars are bent using the appropriate pin diameter. (See the table for dimensions). The "B" dimension can be any length necessary to meet building requirements.

Bar Size	#4	#5	#6	#7	#8	#9	#10	#11
Min. "A" Dimension	5"	5"	6"	7"	9"	12"	14"	15"
Bar Diameter	6d				8d			

TABLE 2: Hooked Rebar Bend Dimensions

The "A" dimension may be reduced, using bending pin diameters less than ASTM and code requirements.

Headed Splicer

SYSTEM THREAD SIZE	DB-SAE-3 BAR SIZE	EMBED LENGTH (125)	LOAD CAPACITY	DOWEL-IN BAR SIZE	DOWEL-IN LOAD CAPACITY	
					1.25P _y	1.5P _y
5/8" 11UNC	#4	5"	18,000	#4	15,000	18,000
3/4" 10UNC	#5	7.5"	27,000	#5	22,500	27,000
7/8" 8UNC	#6	9"	33,000	#6	33,000	39,000
1" 6UNC	#7	10.5"	34,000	#7	45,000	64,000
1 1/4" 5UNC	#8	12"	71,100	#8	89,250	71,100

TABLE 3: Recommended DB-SAE-3 Headed Splicer and Dowel-In Sizes

The Headed Splicer is a convenience connector. It is designed to eliminate hooked bar congestion. It

also provides excellent end anchorage and may be used for common structural anchorage provisions for light standards, signs, posts, fixtures, etc. The anchor may be modified to support greater loads than shown.

Double-Ended Splicer

The Double-Ended Splicer is a device for establishing a direct load path through a concrete section, thus avoiding multiple hooked bars or protruding dowels. It also helps to eliminate bar congestion. Oftentimes it is configured in a "U" shape for special applications. See miscellaneous components.

DB-SAE-4 Double-Ended Splicer

Typical Specification

The Richmond Dowel Bar Splicer System, consisting of the Dowel Bar Splicer (DB-SAE) and Dowel-In (DI), shall be used in splicing of rebar. The Dowel Bar Splicer (DB-SAE) shall be forged from ASTM A615 Grade 60 deformed rebar material, free of external welding or machining. It shall be furnished with an Integral nailing flange and threaded with UNC or UN thread to a depth equal to 1.0 times the nominal thread diameter plus 1/4". The Dowel-In (DI) shall be fabricated from ASTM A615 grade 60 deformed rebar material with thread corresponding to the DB-SAE Splicer. The completed splice, utilizing the Dowel Bar Splicer and Dowel-In shall meet 150 percent of the specified bar yield strength (fy) exceeding tensile requirements of American Concrete Institute (ACI) Specification 318, "Building Code Requirements for Reinforced Concrete" and the Corp of Engineers Specification CW-03210, "Civil Works Construction Guide Specification for Steel Bars, Welded Steel Wire Fabric and Accessories for Concrete Reinforcement."

Compliance

Richmond Dowel Bar Splicer System complies with the following standards, guides, codes and/or specifications:

- American Concrete Institute ACI 318
- International Conference of Building Officials (ICBO) Report #4028
- City of Los Angeles Research Report RR24518
- State Departments of Transportation
- Corp of Engineers Specification CW03210
- Concrete Reinforcing Steel Institute

# 7	10.5"	4.375"	14.0"
# 8	12.0"	5.000"	16.0"

† Shear and tension refers to the loading condition. If the Dowel-In is subjected to both shear and tension loading, the edge distance for shear will govern.

TABLE 6: DB-SAE-3 Headed Splicer Setting

Miscellaneous Components

Hooked Double-Ended Splicer

Hooked Double-Ended Splicer is used to alleviate restrictive concrete space envelopes, such as narrow beams and columns, etc. Other applications may be performed, i.e., insert or anchor cages for attaching sign posts, light poles or other structural fittings. These units may be laced together to provide patterns for 2, 4 or more bolts.

Thread-Ended Splicer

The Thread-Ended Splicer is used to provide a continuous mechanical splice connector to insure reinforcement continuity. The mechanical connector suitable for attaching to the thread end is shown in Table 7, Coupler Selection Guide.

HORN

HORNBOARD

Asphalt Impregnated Fiber Expansion Joint Filler

DESCRIPTION

HORNBOARD Asphalt impregnated Fiber Expansion Filler is composed of tough, resilient, cellulose fibers securely bonded together with a uniform impregnation of bituminous binder and performed into strips or sheets. The material is strong but lightweight; cuts and handles easily; resists breakage. It will not extrude from the joint under normal compression and service temperatures, and does not embrittle in cold weather.

Installation is easy: HORNBOARD will not twist, break or deform with ordinary handling. It cuts cleanly, places readily, stays strong and sound through many years of repeated expansion/contraction cycles.

USE

HORNBOARD is a general, multi-purpose filler for expansion joints in all types of heavy concrete construction. It is specifically engineered for commercial, industrial and public works applications.

LIMITATIONS

HORNBOARD should not be used in conjunction with polysulfide, acrylic or other polymer-base joint sealants.

SPECIFICATIONS

Designed to comply with:

11/4/93.tpcp.23

1. The first part of the document
describes the general situation
of the country and the
state of the economy.
It also mentions the
main problems that
the government is facing.

2. The second part of the document
describes the measures that
the government has taken
to solve these problems.
It also mentions the
results of these measures.

3. The third part of the document
describes the future plans
of the government.
It also mentions the
challenges that the
country will face in the
future.

4. The fourth part of the document
describes the role of the
private sector in the
economy. It also mentions
the measures that the
government has taken to
encourage the private
sector to invest in the
country.
