EXECUTIVE SUMMARY

The Site Characterization Report (SCR) provides sufficient information to establish remedial action objectives, evaluate remedial action alternatives, and select a remedy pursuant to 6 NYCRR Part 375 1.6(d)(3) and DER-10. The Site Characterization (SC) and Supplemental Site Characterization (SSC) described in this document are consistent with applicable guidance.

Site Location and Current Usage

The Site is located at 3547 Webster Avenue in the Norwood section of Bronx, New York, and is identified as Block 3356 and Lots 196 and 200 on the New York City Tax Map. The Site is 18,663 square feet and is bounded by Woodlawn Cemetery (4199 Webster Avenue) to the north, a two-story commercial building (3525 Webster Avenue) to the south, Webster Avenue to the east, and a six-story residential building (3540 Decatur Avenue) and vacant land to the west. Currently, both lots are vacant, and on-site structures are demolished. Prior to the demolition, Lot 200 (15,000 square feet) was improved with a two-story building with a partial basement approximately 8.5 feet in depth and 435 square feet in area in the southern portion of the warehouse. The two-story structure occupied the entire footprint of the tax parcel. Lot 196 (3,663 square feet) was most recently utilized as an automotive center and improved with a one-story building with no cellar in the western portion and asphalt-paved parking in the eastern portion of the lot along Webster Avenue.

Summary of Proposed Redevelopment Plan

The proposed future use of the Site consists of a new eight-story mixed-use building. The new building will utilize the existing partial cellar on Lot 200 for utilities. The new building will occupy approximately 57 percent of the Site in the eastern portion. The western portion will be utilized as open parking, and access to the parking will be provided through the northern portion of the Site. The first floor will be utilized for parking, residential lobby, community facility space, and commercial use; the second through eighth floors will be utilized for residential apartments.

Excavation depths are expected to be approximately 2.5 to 3.5 for footings and 9 feet for an elevator pit. The existing partial cellar will be excavated approximately 2 to 3 feet below its existing elevation to install a new mat slab. The western portion of the Site (i.e., future parking area) will not be disturbed under this plan. The average depth to groundwater is approximately

7.01 feet bgs and groundwater beneath the Site flows east towards the Bronx River, located 0.1 miles to the east of the Site.

Summary of Past Uses of Site and Areas of Concern

Based on a Phase I Environmental Site Assessment prepared by Partner Assessment Corporation, Inc. (Partner) for Lot 200 in May 2019, a site history was established. According to a review of the historical sources, the Site was developed with the current structure in 1927. The Site was occupied by numerous commercial tenants, including garage, auto repair, and manufacturing operations (metal products/electrical panels/surgical supplies) from at least the 1940s to the 1980s.

Additionally, a Phase I Environmental Site Assessment (ESA) performed by Progea, Inc. for Lot 200 on August 28, 2019, further established a more extensive site history. Historical Sanborn fire insurance maps indicate the subject building had two 550-gallon buried tanks containing gasoline. There were no available records indicating whether the tanks were removed and there was no soil testing data available at the time of the Phase I ESA. The historical presence of two USTs containing gasoline, without documentation of assessment and removal, was considered a REC, which warranted further investigation. Progea then conducted a Phase II ESA to evaluate the potential impact to the Site from the aforementioned environmental concern(s) identified in Progea's (August 28, 2019) Phase I ESA Report.

The AOC identified for this site include:

1. Presence of elevated concentrations of VOCs in groundwater beneath the Site.
2. Presence of elevated concentrations of chlorinated solvents and petroleum-related VOCs in the soil vapor beneath the Site.

Summary of the Work Performed under the Site Characterization

Vektor performed the following scope of work on behalf of the Responsible Party on September 30, 2022 on Lot 200 of the Site:

1. Conducted a Site inspection to identify AOCs and physical obstructions (i.e. structures, buildings, etc.);
2. Performed a geophysical survey to locate utilities in the vicinity of the proposed boring locations, and identify any unidentified underground storage tanks (USTs);

3. Installed eleven soil borings across the entire project Site, and collected twenty-two soil samples for chemical analysis from the soil borings to evaluate soil quality;

4. Installed nine soil vapor probes around Site perimeter and collected nine soil vapor samples for chemical analysis.

Vektor performed a Supplemental Site Characterization in February 2024 to further investigate the groundwater conditions beneath Lots 196 and 200 of the Site. The scope of the Supplemental Site Characterization included:

1. Performed a geophysical survey to locate utilities in the vicinity of the proposed boring locations, and identify any unidentified underground storage tanks (USTs);

2. Installation and sampling of eight permanent bedrock monitoring wells (MW-6 through MW-13);

3. Performance of a geophysical bedrock survey; and

4. Survey of the monitoring wells by a licensed surveyor.

Summary of Environmental Findings

1. Elevation of the property is approximately 109 feet above mean sea level (MSL).

2. The average depth to groundwater is approximately 7.01 feet bgs and groundwater beneath the Site flows east towards the Bronx River, located 0.1 miles to the east of the Site. The groundwater range in depth is el. 92.38 feet in MW-8 (NAVD88) to el. 99.71 feet in MW-9 (NAVD88).

3. Depth to bedrock ranges between approximately 1-5 feet at the Site.

4. The stratigraphy of the site, from the surface down, consists of approximately 5 feet of brown to grey sand and varying degrees of silt and crushed rock.

5. Soil/fill samples collected during the SC were compared to NYSDEC Unrestricted Use Soil Cleanup Objectives (SCOs) and Restricted Use Restricted Residential as presented in 6NYCRR Part 375-6.8.

    - No SVOCs, Pesticides, PCBs, or PFAS compounds were detected in any of the soil samples above their respective Unrestricted Use SCOs.

- One VOC, methylene chloride (max. of 0.088 mg/kg), was detected above its respective Unrestricted Use SCO in three soil samples but below its respective Restricted Residential Use SCO. It should be noted that methylene chloride is a common laboratory contaminant.

- Eight metals; barium (max. of 469 mg/kg), copper (max. of 125 mg/kg), lead (max. of 264 mg/kg), nickel (max. of 65.1 mg/kg), zinc (max. of 303 mg/kg), mercury (max. of 0.476 mg/kg), hexavalent chromium (max. of 3.35 mg/kg) and trivalent chromium (max. of 110 mg/kg) were detected above their respective Unrestricted Use SCOs in thirteen soil samples. Of these metals, only barium was detected above its respective Restricted Residential Use SCO in three soil samples SB-1 (0-1'), SB-7 (3'-5'), and SB-8 (0-2').

6. Soil vapor samples collected during the SC showed elevated concentrations of petroleum-related VOCs and high concentrations of chlorinated solvents in the soil vapor beneath the Site.

    - Total concentrations of petroleum-related VOCs (BTEX) ranged from 33 $\mu g/m^3$ in SV-3 to 636 $\mu g/m^3$ in SV-4.

    - Chlorinated solvents 1,1,1-trichloroethane (max. of 750 $\mu g/m^3$ in SV-4), 1,1-dichloroethylene (max. of 17 $\mu g/m^3$ in SV-4), and cis-1,2-dichloroethylene (max. of 170 $\mu g/m^3$ in SV-4), and tetrachloroethylene (max. of 1,700 $\mu g/m^3$ in SV-4) were detected in six soil vapor samples. Carbon tetrachloride (max. of 6.4 $\mu g/m^3$ in SV-3) was detected in two soil vapor samples. Methylene chloride (at 1.1 $\mu g/m^3$ in SV-9) was detected at a trace concentration in one soil vapor sample. Trichloroethylene (max. of 13,000 $\mu g/m^3$ in SV-4) was detected in all nine soil vapor samples. Vinyl chloride (max. of 1 $\mu g/m^3$ in SV-8) was detected in two soil vapor samples.

    - Chlorinated solvents 1,1,1-trichloroethane, carbon tetrachloride, tetrachloroethylene, and trichloroethylene were detected above the monitoring/mitigation range established by the NYSDOH soil vapor guidance matrix.

7. The geophysical bedrock survey revealed that the boreholes at MW-6 through MW-13 have little or no vertical flow. Fractures were identified in five of the monitoring wells:

MW-7 (9.8 feet to 11.6 feet), MW-8 (9.8 feet to 12.8 feet), MW-9 (10.4 feet to 10.9 feet), MW-12 (8.7 feet to 9.1 feet), and MW-13 (9.4 feet to 13.6 feet). Flow values of 0.03 gal/min or less are considered as no flow.

- Up flow values over 0.03 gal/min were observed at the following intervals and borehole locations;
    - MW-7 at 13-16.75 feet
    - MW-13 at 14-17 feet
- Down flow values over 0.03 gal/min were observed at the following intervals and borehole locations;
    - MW-7 at 16.75-20 feet
    - MW-8 at 13.5-18 feet

8. Groundwater samples collected during the Supplemental Site Characterization performed between February 2024 were compared to the NYSDEC Division of Water Technical and Operational Guidance Series (TOGS 1.1.1) Ambient Water Quality Standards (AWQS) and NYDEC Part 375 PFAS Remedial Program.

SITE CHARACTERIZATION REPORT

1.0 SITE BACKGROUND

Bedford Realty c/o 3547 Webster Tower LLC originally enrolled in the New York City Voluntary Cleanup Program (NYC VCP) to investigate and remediate an 18,663-square foot site located at 3547 Webster Avenue in Norwood section of Bronx, New York. However, based on the results of investigations conducted at the Site, the Site was referred to the NYSDEC. 3547 Webster Tower LLC then executed an Order on Consent with the NYSDEC on November 10, 2023 to characterize the contamination at the Site and implement any interim remedial measures.

A Site Characterization was performed on September 30, 2023 and a Supplemental Site Characterization was performed between February 5, 2024 and February 28, 2024 at the Site. This SCR summarizes the nature and extent of contamination and provides sufficient information for establishment of remedial action objectives, evaluation of remedial action alternatives, and selection of a remedy that is protective of human health and the environment consistent with the use of the property pursuant to 6 NYCRR Part 375 1.6(d)(3) and DER-10.

1.1 Site Location and Current Usage

The Site is located at 3547 Webster Avenue in the Norwood section in Bronx, New York and is identified as Block 3356 and Lot 196 and 200 on the New York City Tax Map. Figure 1 shows the Site location. The Site is 18,663 square feet and is bounded by Woodlawn Cemetery (4199 Webster Avenue) to the north, a two-story commercial building (3525 Webster Avenue) to the south, Webster Avenue to the east, and a six-story residential building (3540 Decatur Avenue) and vacant land to the west. A map of the site boundary is shown in Figure 2. Prior to the demolition, Lot 200 (15,000 square feet) was improved with a two-story building with a partial basement approximately 8.5 feet in depth and 435 square feet in area in the southern portion of the warehouse. The two-story structure occupied the entire footprint of the tax parcel. Lot 196 (3,663 square feet) was most recently utilized as an automotive center and improved with a one-story building with no cellar in the western portion and asphalt-paved parking in the eastern portion of the lot along Webster Avenue.

1.2 Proposed Redevelopment Plan

The proposed future use of the Site consists of a new eight-story mixed-use building. The new building will utilize the existing partial cellar on Lot 200 for utilities. The new building will

occupy approximately 57 percent of the Site in the eastern portion. The western portion will be utilized as open parking, and access to the parking will be provided through the northern portion of the Site. The first floor will be utilized for parking, residential lobby, community facility space, and commercial use; the second through eighth floors will be utilized for residential apartments.

Excavation depths are expected to be approximately 2.5 to 3.5 for footings and 9 feet for an elevator pit. The existing partial cellar will be excavated approximately 2 to 3 feet below its existing elevation to install a new mat slab. The western portion of the Site (i.e., future parking area) will not be disturbed under this plan. The average depth to groundwater is approximately 7.01 feet bgs, and groundwater beneath the Site flows east towards the Bronx River, located 0.1 miles to the east of the Site.

1.3 Description of Surrounding Property

The Site is located within a primarily a mixed residential, commercial, and industrial area of the Bronx. The Site is bounded directly by Woodlawn Cemetery, residential and commercial buildings, and across Webster Avenue by residential and commercial buildings.

According to the NYCOER's Searchable Environmental E-Database (SPEED), a pre-school, Rose Hill Pre-K Center, is located 306 feet northeast of the Site. Mis Pequenos Angelitos daycare center, with the address 3540 Decatur Avenue, is located immediately west adjacent to the Site. Figure 2 shows the surrounding land usage.

The nearest ecological receptor is the Bronx River located approximately 0.1-miles east of the Site.

2.0 SITE HISTORY

2.1 Past Uses and Ownership

Based on a Phase I Environmental Site Assessment (ESA) performed by Progea, Inc. on August 28, 2019, a site history was established. Historical Sanborn fire insurance maps indicate the subject building had two 550-gallon buried tanks containing gasoline. There were no available records indicating whether the tanks were removed or closed in place at the site, and there was no soil testing data available at the time of the Phase I ESA. The historical presence of two USTs containing gasoline, without documentation of assessment and removal, was considered a REC which warranted further investigation. Progea then conducted a Phase II ESA to evaluate the potential impact to the Site from the aforementioned environmental concern(s) identified in Progea's (August 28, 2019) Phase I ESA Report.

Additionally, a Phase I Environmental Site Assessment prepared by Partner Assessment Corporation, Inc. (Partner) in May 2019, further established a more extensive site history. According to a review of the historical sources, the Site was developed with the current structure in 1927. The Site was occupied by numerous commercial tenants that included garage, auto repair, and manufacturing operations (metal products/electrical panels/surgical supplies) from at least the 1940s to the 1980s.

2.2 Previous Investigations

Phase I ESA for Lot 200 by Partner dated May 2019

Partner identified the following recognized environmental conditions (RECs):

- According to a review of the historical sources, the Site was developed with the current structure in 1927. The Site was occupied by numerous commercial tenants, including garage, auto repair, and manufacturing operations (metal products/electrical panels/surgical supplies) from at least the 1940s to the 1980s. These types of operations utilize various petroleum products as well as chlorinated solvents for metal cleaning operations. Chlorinated solvents are highly mobile and have the potential to impact the property through subsurface conduits, such as cracks in the floor or floor drains. Based on the duration of operations and absence of prior subsurface investigation reports, the historical use of the Site for garage, auto repair, and manufacturing operations is considered to represent a REC.

- Partner's research and onsite observations identified the presence of an active and historic aboveground and underground storage tanks (ASTs/USTs). The t property is registered (Facility ID 2-293466) with one 5,000-gallon #2 Fuel Oil AST that was installed in 1986, which was noted to be present during Partner's site reconnaissance. In addition, a vent pipe and fill ports characteristic of USTs were observed. Four fill ports and one vent pipe were observed at the Site; three fill ports along the sidewalk located southeast of the building along with a fill port in this vicinity; and one fill port along the northeastern interior (area of dock). Partner traced the aforementioned registered/active AST pipe to the fill port located along the northeastern interior. In addition, Partner noted two petrometer gauges to be present; one on the exterior of onsite active/registered tested AST vault and one within the partial basement. Due to flooding within the basement, Partner was unable to trace the possible petrometer fill line to a potential tank. However, according to a review of the Sanborn Maps, the property was depicted with two 550-gallon gasoline buried tanks as early as 1945 to at least 2007. No additional information regarding the fill ports or former USTs was provided during the course of this assessment. Therefore, it is unknown if oil was stored within ASTs or USTs located at the property or if USTs were properly closed and/or removed. Based on the lack of information regarding UST removal, it is possible that a release from the USTs has resulted in an impact to the subsurface of the Sitr. Based on this information, the former presence of USTs and fill ports/vent pipes on the Site is considered to represent a REC.

- Lot 200, Tax Block 3356 at 3547 Webster Avenue is listed as an E Designation site in the regulatory database report. The E Designation listing is identified as E-249 and was issued March 23, 2011 for "Hazardous Materials Phase I and Phase II Testing Protocol" and "Window Wall Attenuation & Alternate Ventilation." An E-Designation is a zoning map designation in the City of New York that indicates the presence of an environmental requirement pertaining to potential Hazardous Materials Contamination, Window/Wall Noise Attenuation or Air Quality impacts on a particular tax lot. These designations are assigned to properties during rezoning events. A property can continue to be used as before, with no additional requirements. However, if a property is to be redeveloped with new construction or change of use, the environmental requirements of the E-Designation need to be satisfied prior to the

issuance of building permits and Certificates of Occupancy. Partner contacted the New York City Department Office of Environmental Remediation to obtain the current status of the E-Designation. According to Myrna (OER Project Manager), as of May 8, 2019 no documents have been submitted to the OER to satisfy the E Designation requirements. Based on the abovementioned details, the E Designation listing is considered to represent a REC.

Subsurface Investigation Report for Lot 200 by Progea dated October 2019

Progea identified the following recognized environmental conditions (RECs) during Phase I ESA for Lot 200 dated August. 2019:

- The historical presence of two USTs containing gasoline, without documentation of assessment and removal., Based on the available review of available Fire Insurance Maps Historical Sanborn fire insurance maps indicate the subject building had two 550-gallon buried tanks containing gasoline. However, there were no available records indicating whether the tanks were removed or closed in place at the site, and there was no soil testing data available at the time of the Phase I ESA. The historical presence of two USTs containing gasoline, without documentation of assessment and removal, was considered a REC which warranted further investigation.

Progea concluded the following subsurface investigation results:

- Results of the GPR Survey indicated there were no subsurface anomalies with reflections or signatures consistent with USTs.
- A potential vapor intrusion risk was established as TCE and PCE were detected at concentrations above the applicable action levels in sub slab soil gas. When applied the NYSDOH Decision Matrices indicate mitigation as the recommended action prior to future permanent occupancy of the building.
- There does not appear to be a current indoor vapor intrusion risk related to subsurface contamination. No immediate actions are required.
- No subsurface soil contamination related to petroleum hydrocarbons or chlorinated solvents was identified. No detectable VOCs were identified in the soil samples.

- As part of future renovations for the site, Progea recommended vapor mitigation be incorporated into the future renovation/redevelopment plans. They've concluded that since there were no current exposure hazards and no immediate actions were required.

Groundwater Investigation on Lot 200 by Vektor dated March 2023

The following scope of work was conducted by Vektor as part of the Groundwater Investigation conducted between February 27, 2023 and March 21, 2023:

- Performed a geophysical bedrock survey to investigate lithology, fracture location and orientation, flow in the borehole, and overall physical condition of the borehole;
- Installed five bedrock monitoring wells and collected five groundwater samples for chemical analysis from the groundwater wells to evaluate groundwater quality.

The NYSDEC deemed the data collected from the Groundwater Investigation invalid, and the results of this investigation should not be considered for Site evaluation.

2.3 Site Inspection

David Klein of Vektor Consultants performed a site inspection on February 5, 2024, prior to the supplemental site characterization activities. The site reconnaissance consisted of visual inspection of the accessible areas of the Site and its vicinity. The former two-story one-story buildings that occupied most of the tax parcels are currently demolished. The entire site is covered by the former buildings' concrete slabs. The Site is currently vacant with no ongoing business operations. No landscaping or additional site amenities are provided on Site. City sidewalk bounds the Site to the east along Webster Avenue.

2.4 Areas of Concern

The AOC identified for this site include:

1. Presence of elevated concentrations of VOCs in groundwater beneath the Site.
2. Presence of elevated concentrations of chlorinated solvents and petroleum-related VOCs in the soil vapor beneath the Site.

SIR-3000 cart-mounted Ground Penetrating Radar (GPR) unit with a 400 Mhz antenna, a radio detection RD7000 precision utility locator, a Fisher M-Scope TW-6 pipe, and cable locator. The Geophysical Surveys did not identify any anomalies indicative of underground storage tanks (USTs).

4.2 Bedrock Geophysical Investigation

A geophysical survey was conducted by American Geophysics (American) of Butler, New Jersey from February 14 to February 20, 2024. Boreholes at monitoring well locations MW-6 through MW-13 were the subject of this geophysical survey from February 14 to February 20, 2024. The purpose of the geophysical bedrock surveys was to investigate lithology, fracture location and orientation, flow in the borehole, and overall physical condition of the borehole. Geophysical borehole logging was conducted using a Mount Sopris MXA winch with a Matrix console and Mount Sopris 2FA -1000 fluid probe, Mount Sopris 2PCA-1000 caliper probe, Mount Sopris 2PGA-1000 gamma, SP and SPR probe, Mount Sopris HFP- 2293 heat-pulse flowmeter, ALT QL40-2G acoustic televiewer, and an ALT QL40-OBI- 2G optical televiewer.

The borehole logs consist of caliper, fluid resistivity/ conductivity, fluid temperature, natural gamma, self-potential (SP), single point resistivity (SPR), optical televiewer, acoustic televiewer, and heat-pulse flowmeter. A copy of the geophysical bedrock report is provided in Appendix B.

4.3 Borings and Bedrock Monitoring Wells

4.3.1 Drilling and Soil Logging

Coastal Environmental Services was retained to install borings across the Site on September 30, 2022. Due to the site conditions (i.e., shallow bedrock), soil borings were installed to five feet below grade surface(bgs) across the site. SB-1 through SB-8 and SB-11 were installed in the vacant building on Lot 200. Soil boring SB-9 was installed in the automotive center and SB-10 was installed in the paved parking portion of Lot 196. Continuous soil samples collected from each boring were field screened for presence of volatile organic compounds (VOCs) with a photoionization detector (PID) and visually inspected for evidence of contamination. No elevated PID readings or olfactory odors were identified during this SC.

Enviroprobe Service Inc. was retained to install monitoring wells across the Site between February 5 and February 21, 2024. Eight groundwater bedrock monitoring wells designated as

MW-6 through MW-13 were installed utilizing a Geoprobe® Model 8140 Sonic drill rig to depths between 18.17 and 23.51 feet bgs.

Boring logs are included in Appendix C. Monitoring well construction logs are provided in Appendix E. A map showing the location of soil borings and monitoring wells is shown in Figure 3.

4.3.2 Bedrock Monitoring Well Construction

Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to advance bedrock wells into bedrock at the MW-6 through MW-13 locations. The bedrock wells were installed by advancing steel casing 5 feet into bedrock and grouting the annulus within the borehole at each well location. The depth of the steel casing of each respective well was installed as follows:

- MW-6 steel casing set from 0 to 8.5 feet as bedrock begins at 3.5 feet
- MW-7 steel casing set from 0 to 9 feet as bedrock begins at 4 feet
- MW-8 steel casing set from 0 to 8.5 feet as bedrock begins at 3.5 feet
- MW-9 steel casing set from 0 to 8.5 feet as bedrock begins at 3.5 feet
- MW-10 steel casing set from 0 to 8 feet as bedrock begins at 3 feet
- MW-11 steel casing set from 0 to 8 feet as bedrock begins at 3 feet
- MW-12 steel casing set from 0 to 8 feet as bedrock begins at 3 feet
- MW-13 steel casing set from 0 to 9 feet as bedrock begins at 4 feet

Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to drill into bedrock within the steel casing to install each well. Final well depths and well screened intervals at each well location are as follows:

- MW-6: Installed to 19.47 feet. Well screen PVC installed from 5-19.47 feet interval
- MW-7: Installed to 20.47 feet. Well screen PVC installed from 3-20.47 feet interval
- MW-8: Installed to 19.78 feet. Well screen PVC installed from 5-19.78 feet interval
- MW-9: Installed to 20.12 feet. Well screen PVC installed from 5-20.12 feet interval
- MW-10: Installed to 23.51 feet. Well screen PVC installed from 5-23.51 feet interval

- MW-11: Installed to 19.39 feet. Well screen PVC installed from 5-19.39 feet interval
- MW-12: Installed to 20.35 feet. Well screen PVC installed from 5-20.35 feet interval
- MW-13: Installed to 18.17 feet. Well screen PVC installed from 5-18.17 feet interval

All monitoring wells were finished as stick-up PVC risers and sealed at the slab level. All monitoring wells were developed by using a submersible pump until the water was clear and turbidity was less than 50 Nephelometric Turbidity Units (NTU). Monitoring wells were surveyed by Montrose Surveying Co. LLP and gauged by Vektor Consultants, Inc. on the same day. The average depth to groundwater is 7.01 feet bgs and the range in depth is el. 92.38 feet in MW-8 (NAVD88) to el. 99.71 feet in MW-9 (NAVD88).

All groundwater monitoring wells were gauged on February 27, 2024. A groundwater contour map showing groundwater flow direction is provided on Figure 4. Groundwater sampling logs and monitoring well survey are provided in Appendix F.

Survey

The locations of soil borings, groundwater monitoring wells, and soil vapor points were field measured in reference to the nearest foundation walls. Monitoring wells were surveyed by Montrose Surveying Co. LLP on February 27, 2024.

4.4 Sample Collection and Chemical Analysis

Sampling performed as part of the field investigation was conducted for all Areas of Concern and also considered other means for bias of sampling based on professional judgment, area history, discolored soil, stressed vegetation, drainage patterns, field instrument measurements, odor, or other field indicators. All media, including soil, groundwater, and soil vapor, have been sampled and evaluated in the SCR. Discrete (grab) samples have been used for the final delineation of the nature and extent of contamination and to determine the impact of contaminants on public health and the environment. The sampling performed and presented in this SCR provides a sufficient basis for the evaluation of remedial action alternatives, the establishment of a qualitative human health exposure assessment, and the selection of a final remedy.

Soil Sampling

Twenty-two (22) soil samples were collected for chemical analysis during this SC. All soil samples were collected using a dedicated, disposable sampling scoop to prevent cross-contamination. VOC samples were collected via individual one time use 5g terra-core sampler tool provided by the laboratory for each sample. Soil samples were immediately containerized in pre-cleaned, laboratory-supplied glassware, stored in a chilled cooler (4ºC), and submitted to York Analytical Laboratories (York) of Stratford, CT, under proper chain of custody procedures. The soil sampling event included collection of shallow soil samples from 0 to 2 feet and deeper samples from 3 to 5 feet. No olfactory impacts or elevated PID readings were observed during the RI. Soil samples were analyzed at a New York State Department of Health ELAP-certified laboratory for the presence of volatile organic compounds (VOCs) by EPA Method 8260, semi-volatile organic compounds (SVOCs) by EPA Method 8270, pesticides/PCBs by EPA Methods 8081/8082, chromium hexavalent and chromium trivalent, target analyte list (TAL) metals by EPA Methods 6010. In addition, one soil sample collected from SB-4 from 3 to 5 feet bgs was also analyzed for Per- and Polyfluoroalkyl Substances (PFAS) by Modified EPA Method 537.1 and 1,4-dioxane by EPA Method 8270 SIM. It should be noted that these samples were collected prior to the implementation of the EPA Method 1633 for PFAS sampling.

Data on soil sample collection for chemical analyses, including dates of collection and sample depths, is reported in Table 1. Soil sample collection data is reported in Tables 3 through 7. Figure 3 shows the location of samples collected in this investigation.

Groundwater Sampling (Supplemental Site Characterization)

One groundwater sample (total of eight) was collected from each monitoring well, plus one duplicate groundwater sample from MW-13 and one MS/MSD sample from MW-7, utilizing USEPA low-flow groundwater sampling techniques one week after well development. The groundwater monitoring wells were purged approximately three well volumes prior to sampling utilizing a peristaltic pump. Groundwater field parameters, including pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, temperature, and turbidity, were measured during purging. The tubing was changed between each monitoring well to prevent cross-contamination, and the low-flow equipment was cleaned with Alconox and distilled water. Samples were collected with a peristaltic pump with dedicated polyethylene tubing. Groundwater

samples were placed into laboratory-supplied glassware and stored in a chilled cooler (4ºC), and submitted to York of Stratford, CT, under proper chain of custody procedures.

Groundwater samples plus the duplicate and MS/MSD groundwater samples collected at groundwater interface were submitted to York Analytical Laboratories, an ELAP-certified laboratory, for analysis for Target Compound List (TCL) volatile organic compounds (VOCs) via Environmental Protection Agency (EPA) Method 8260C, TCL semi-volatile organic compounds (SVOCs) via EPA Method 8270D, target analyte list (TAL) metals (filtered and unfiltered) via EPA Method 6010D/7471, total cyanide, Polychlorinated biphenyls (PCBs) via EPA Method 8082A, TLC pesticides via EPA Method 8081B, NYSDEC list per and polyfluoroalkyl substances (PFAS) (40 compounds) via EPA Method 1633; and 1,4-dioxane via EPA Method 8270D SIM. All groundwater monitoring wells were gauged on February 27, 2024.

A groundwater contour map showing groundwater flow direction is provided on Figure 4. Groundwater sample collection data is reported in Tables 8 through 12. Groundwater sampling logs and monitoring well survey are provided in Appendix F.

Soil Vapor Sampling

Nine (9) soil vapor probes were installed, and nine (9) soil vapor samples were collected for chemical analysis during this SC. The soil vapor implants were installed with a direct push drill rig to a depth of 5 feet beneath the existing cellar slab in building areas and 5 feet below grade surface (bgs) in outdoor areas. The soil vapor samples were collected for the duration of two hours.

The construction of the vapor points followed the design of the NYSDOH Guidance document. Sample points were backfilled using glass beads followed by environmental grade silica sand and topped with a bentonite layer to seal the tubing in the hole. The soil vapor points were connected to ¼-inch outer diameter inert polyethylene, Teflon lined tubing, which extended above ground surface to allow for purging and sampling. Prior to testing, the integrity of the seal was tested by placing a plastic shroud over the vapor points to isolate them from ambient air. Then, a helium tracer gas was applied into the shroud and was screened utilizing a helium detector for presence of helium. No helium was detected in any of the vapor points; therefore, the sampling points were confirmed to be sealed properly prior to sampling.

After purging approximately three volumes of air from each vapor point at a flow rate less than 200 milliliters per minute, representative samples were collected for laboratory analysis utilizing

6-liter SUMMA canisters fitted with 2-hour flow controllers set not to exceed 0.2 liters per minute, as established by the NYSDOH Guidance document. Upon completion of the vapor sampling, all canisters were labeled properly with the sample ID numbers, and vacuum pressure readings in the canisters before and after the sample collection. The vapor samples were submitted to York of Stratford, CT, under proper chain of custody procedures

Soil vapor sampling locations are shown in Figure 3. Soil vapor sampling logs are included in Table 2. Soil vapor sample collection data is reported in Table 13. Methodologies used for soil vapor assessment conform to the *NYS DOH Final Guidance on Soil Vapor Intrusion, October 2006.*

4.5 Reporting

Daily reports were provided to NYSDEC including a summary of Site activities, investigation progress updates, and photographs of fieldwork. Copies of the submitted daily reports are included in Appendix G.

4.6 Community Air Monitoring Program

Air monitoring was conducted to characterize any personnel exposures and fugitive emissions generated from the performance of the investigation activities. Air monitoring was performed in accordance with the CAMP/HASP prepared for this investigation.

Calibrated air monitoring instruments were used to monitor for potential releases of volatile organic vapors and soil particulates from the Site. Upwind and downwind air monitoring stations were established relative to each drilling location. An upwind and downwind Photo Ionization Detectors and particulate meters were utilized during all invasive activities. The air monitoring instruments were calibrated on a daily basis prior to the start of fieldwork. Monitoring was performed from February 5, 2024, to February 20, 2024, in compliance with the Community Air Monitoring Plan in the approved SSC Work Plan. No elevated PID readings were identified during the implementation of the SSC Work Plan. There was one dust exceedance that occurred on February 19, 2024, from 10:29 to 10:44 am (max. of 0.155 mg/m^3) due to a construction vehicle (bobcat) idling in the proximity of the air monitoring equipment. Readings returned to normal once the bobcat was repositioned away from the air monitoring equipment. Copies of the submitted air monitoring data are included in Appendix G.

4.7 Investigation Derived Waste

Investigation-derived wastes (IDW) generated during the Supplemental Site Characterization were containerized as necessary. Thirty (30) 55-gallon drums were generated and will be disposed of off-site properly in accordance with applicable laws and regulations. - No pesticides were detected in any of the groundwater samples.
- No PCBs were detected in any of the groundwater samples.
- Naturally occurring metals, including magnesium, manganese, and sodium, were detected in total and dissolved groundwater samples across the Site. It should be noted that naturally occurring metal contaminants in groundwater are not site-specific contaminants of concern and will not be addressed by the remedy.
- Mercury was detected in dissolved groundwater in the duplicate sample (DUP-1) from MW-13 at a concentration slightly above its respective AWQS. Mercury was not detected above its respective AWQS in the MW-13 parent sample.
- Two PFAS compounds, PFOS and PFOA, were detected above the regulatory limits in all groundwater samples across the Site.

A summary table of data for chemical analyses performed on groundwater samples is included in Tables 8 through 12. Figure 6 shows the location and posts the values for groundwater that exceed the NYSDEC TOGS 1.1.1 AWQS.

More specifically, the highest concentrations of CVOCs detected were Trichloroethylene (max. of 13,000 µg/m^3) and tetrachloroethylene (max. of 1,700 µg/m^3) in soil vapor sample SV-4, which was installed on the western portion of the Site.

Data collected during the SC is sufficient to delineate the distribution of contaminants in soil vapor at the Site. A summary table of data for chemical analyses performed on soil vapor samples is included in Table 13. Figure 7 shows the location and posts the values for soil vapor samples with detected concentrations.

There are no known impediments to remedial action at this property.

5.7 Data Usability Summary

Analytical Services Protocols (ASP) Category B laboratory reports for the soil, groundwater, and soil vapor samples were provided by York Analytical Laboratories and reviewed by Alpha Geoscience, a third-party data validator. Data qualifiers were updated following the completion

of the Data Usability Summary Reports (DUSRs). The DUSRs are included in Appendix H, I, and J for each respective media.

All data that are not qualified rejected (R) are considered usable with estimated (J-, J, J+, or UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the data validation reviews. Validated data, provided in ASP Category B Packages are submitted to the NYSDEC EQUIS database in an Electronic Data Deliverable (EDD) format. The data were determined to be mostly usable.

Soil:

The data are mostly usable and acceptable.

The following were rejected:

- The “not detected” PFAS results for PFBA and N-EtFOSE were qualified as “rejected, unusable” (R) for sample FB-2.

Please note that the data for 1,4-dioxane was rejected only under the VOCs list when analyzed via EPA Method 8260. All data for 1,4-dioxane were deemed acceptable under the SVOCs list when analyzed with the correct EPA Method 8270SIM. Reporting limits (RLs) via EPA Method 8260 are higher, and QC recoveries are always poor and therefore, qualified/rejected data for this one compound via EPA Method 8260 is common. RLs for 8270SIM are lower and, as a result, have much better QC recoveries.

Soil Vapor:

The data is acceptable, and no soil vapor data was rejected.

6.0 CONCEPTUAL SITE MODEL

Investigation results were compared to the following applicable standards and guidance values and areas of concern were identified:

- NYSDEC Part 375 Unrestricted Use and Restricted Residential Use SCOs,
- NYSDEC TOGS 1.1.1 AWQS and NYSDEC Guidance Values

6.1 Site Contaminants

The following contaminants of concern were identified at the Site:

- VOCs Impacts in Groundwater and Soil Vapor

6.1.2 VOCS IMPACTS IN GROUNDWATER AND SOIL VAPOR

VOC impacts to soil vapor and groundwater that are likely attributed to the historical site uses (i.e., manufacturing operations including metal products/electrical panels/surgical supplies) were identified during the investigations.

Groundwater:

VOCs generally consisting of chlorinated VOCs (CVOCs) (1,1,1-trichloroethane, 1,1,2-trichloroethane, 1,1-dichloroethane, 1,1-dichloroethylene, 1,2-dichloroethane, cis-1,2-dichloroethylene, trans-1,2-dichloroethylene, trichloroethylene, vinyl chloride) were identified in groundwater across the Site.

Six petroleum-related VOCs (1,2,4-trimethylbenzene, ethyl benzene, n-butylbenzene, n-propylbenzene, toluene, and total xylenes) were identified in groundwater in the northern and western portions of the Site.

Soil Vapor:

Results showed low to moderate concentrations of petroleum-related VOCs and high concentrations of chlorinated VOCs (CVOCs) in all soil vapor samples. More specifically, the highest concentrations of CVOCs detected were trichloroethylene (max. of 13,000 $\mu g/m^3$) and tetrachloroethylene (max. of 1,700 $\mu g/m^3$) in soil vapor sample SV-4, located in the western portion of the Site.

Conclusions:

The impacts identified at the Site could be attributed to releases associated with the historical use of chlorinated solvents at the Site. Based on the concentrations identified, mitigation is required as set forth in NYSDOH Guidance to address soil vapor contamination. Although fractures were identified in some wells, due to the little or no vertical flow in wells, in-situ groundwater treatment may not be feasible.

7.0 QUALITATIVE EXPOSURE ASSESSMENT

The objective of the qualitative exposure assessment is to identify potential receptors and pathways for human exposure to the contaminants of concern (COC) that are present at, or migrating from, the Site. Human health exposure risk was evaluated in accordance with Appendix 3B NYSDOH Qualitative Human Health Exposure Assessment and Section 3.3(c)4 of the NYSDEC DER-10. The five elements of an exposure pathway are the (1) source of contamination; (2) environmental media and transport mechanisms; (3) point of exposure; (4) route of exposure; (5) receptor population based on past, present or future events. The potentially exposed receptors and how any unacceptable exposures may be eliminated are determined from an assessment of the primary use of the area, actual and potential use of ground and surface waters that are impacted or threatened, and how any potential routes of exposure may be eliminated.

7.1 Contaminant Sources

Based on the results of the previous investigations and this SC, on-site contaminants to be evaluated for human health exposure risk include contaminants of concern at the Site include groundwater and soil vapor with VOCs.

The soil vapor results showed low to moderate concentrations of petroleum-related VOCs and high concentrations of chlorinated VOCs in all soil vapor samples. More specifically, the highest concentrations of CVOCs detected were Trichloroethylene (max. of 13,000 µg/m^3) and tetrachloroethylene (max. of 1,700 µg/m^3) in soil vapor sample SV-4, which was installed on the western portion of the Site. CVOC concentrations were detected in groundwater samples throughout the Site with the highest concentrations identified in the upgradient well MW-9, which is also located in the western portion. These contaminants are likely attributed to the historical use(s) of the Site.

7.2 Current Conditions

The Site is located in a densely developed part of Bronx, New York. The Site is currently vacant, and on-site structures were demolished. The ground surfaces are currently covered by the former concrete building slabs and demolition debris. Therefore, human exposure to contaminated soil through dermal absorption, inhalation, and ingestion is limited and unlikely.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

As the Site is covered with the former buildings' concrete slabs and demolition debris, a potential exposure pathway for soil vapor is unlikely.

7.3 Exposure Route

An exposure route is the mechanism by which a receptor comes into contact with a chemical. Three potential primary routes exist by which chemicals can enter the body:

- Ingestion of water, fill, and/or soil;
- Inhalation of vapors and/or particulates; and
- Dermal contact with water, fill, soil, and/or building materials.

7.4 Potential Sensitive Receptors

On-Site Receptors: The site is currently vacant and capped with the former building's concrete slab. Limited demolition debris is currently atop the concrete slabs on grade and open areas at the Site. The Site is also secured with a NYCDOB-approved construction fence. Onsite receptors are limited to workers, trespassers, site representatives, and visitors granted access to the property. Under proposed future conditions, potential on-site receptors include workers, residents, and visitors.

Off-Site Receptors: Potential off-site receptors within a 500-foot radius of the Site include adult and child residents; commercial and construction workers; pedestrians; and trespassers based on the following land uses within 500 feet of the Site:

1. Commercial Businesses – existing and future
2. Residential Buildings – existing and future
3. Building Construction/ Renovation – existing and future
4. Pedestrians, Trespassers, Cyclists – existing and future
5. Schools – existing and future

Community Air Monitoring Program (CAMP) will be implemented at the Site during intrusive activities to monitor air quality the public.

7.5 Potential Exposure Pathways

On-Site: The site is currently capped with the former buildings concrete slabs and demolition debris. Human exposure to contaminated soil through dermal absorption, inhalation, and ingestion is unlikely due to the current site cover.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

As the site is capped with former building's concrete slabs and demolition debris, potential exposure pathway for soil vapor is unlikely. Once construction activities begin, a potential exposure pathway may exist for construction workers and inspectors to come into direct contact with soil. Any future site remediation activities would be conducted under a HASP, which would control and limit human exposure to on-site contaminants.

Off-Site: There is an existing potential exposure pathway from soil gas emanating from on-site CVOCs entering neighboring properties as a result of any floor or wall openings/cracks. The potential receptors from such a migration pathway into the building would be to: off-site construction and commercial workers, adult and child residents, and visitors. The primary route of exposure would be inhalation.

During the redevelopment (excavation activities), the potential exists for off-site vapor intrusion risk to off-site receptors. In the absence of a CAMP and HASP, during ground intrusive activities, off-site receptors could be exposed to particulates and vapors. The implementation of a CAMP and HASP during intrusive work will monitor and limit off-site receptor's exposure to particulates and vapors.

As groundwater in this area of New York City is not used as a potable water source, a complete exposure pathway to groundwater under current site conditions is unlikely.

Once the redevelopment is completed, it is unlikely that a new foundation with the addition of a vapor barrier would allow for vapor migration into the building. Based on the findings, the evaluation during the remedy will include a provision for implementing actions such as installation and operation of engineering controls to address exposures related to soil vapor intrusion.

7.6 Exposure Assessment Conclusions and Recommendations

Based upon this analysis, exposure to contaminants in soil and groundwater is not expected under current conditions as the site is capped with a concrete slab and groundwater in this area of New York City is not used as a potable water source. There is an existing potential exposure pathway from soil gas emanating from VOCs entering neighboring properties as a result of any possible floor or wall openings/cracks. Once remediation/construction activities start, any potential exposure pathway will be monitored and controlled by the implementation of a CAMP and HASP.

Based on the results of the QHHEA, it is possible that a complete exposure pathway exists for the migration of site contaminants to off-site human receptors during future conditions. During redevelopment (excavation activities), the potential exists for off-site vapor intrusion risk to off-site receptors through inhalation. In the absence of a CAMP and HASP, during ground intrusive activities, off-site receptors could be exposed to particulates and vapors. Monitoring and control measures have been and will continue to be used during any investigation and any future planned remediation to prevent completion of this pathway. Under future conditions, the Site will be remediated, and engineering and institutional controls will be implemented to prevent completion of this pathway.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the SC and SSC, the following conclusions were made:

- The stratigraphy of the site, from the surface down, consists of approximately 1-5 feet of brown to grey sand and varying degrees of silt and crushed rock. Shallow bedrock was encountered from 1 to 5 feet across the Site.
- The average depth to groundwater is approximately 7.01 feet bgs and groundwater beneath the Site flows east towards the Bronx River.
- The groundwater range in depth is 92.38 feet in MW-8 (NAVD88) to el. 99.71 feet in MW-9 (NAVD88).
- Geophysical surveys did not identify any areas of concern indicative of anomalies consistent with USTs.
- The geophysical bedrock survey revealed that the boreholes at MW-6 through MW-13 have little or no vertical flow. Fractures were identified in five of the monitoring wells: MW-7 (9.8 feet to 11.6 feet), MW-8 (9.8 feet to 12.8 feet), MW-9 (10.4 feet to 10.9 feet), MW-12 (8.7 feet to 9.1 feet), and MW-13 (9.4 feet to 13.6 feet).
- One metal, barium was identified at concentrations exceeding its respective Restricted Residential Use SCO is present in soil beneath the western and central portions of the Site at 0 to 1 feet bgs in the area of SB-1, at 0 to 2 feet bgs in the area of SB- 8, and at 3 to 5 feet bgs in the area of SB-7. Overall, the soil quality is consistent with the contaminants identified in urban fill across New York City.
- Elevated concentrations of VOCs and naturally occurring metals are present in groundwater beneath the entire Site. The highest concentrations of CVOCs are present in the areas of MW-7 and MW-9 located in the northern and western portions of the Site, respectively.
- Elevated concentrations of chlorinated-related VOCs that would require mitigation are present in the soil vapor beneath the Site. The highest concentrations of CVOCs were detected in SV-4, which is located in the western portion of the Site.
- PFAS compounds were detected in groundwater collected from onsite monitoring wells; however, no PFAS compounds were detected in any of the soil samples, and no on-site source was identified. The presence of PFOA and PFOS in groundwater is likely the

result of regional groundwater conditions in the vicinity of the Site due to historical industrial uses.

Based on the results of the SC and SSC, remedial action will be necessary to address the AOCs. Applicable strategies and technologies may include but are not limited to, source removal in accordance with all applicable laws and regulations and installation of engineering controls.

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and shaded values are detected concentrations above Part 375 Unrestricted Use SCOs

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
D=result is from an analysis that required a dilution
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
D=result is from an analysis that required a dilution
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

NOTES:
Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations
Bold and highlighted values are concentrations above TOGS 1.1.1.

Q is the Qualifier Column with definitions as follows:
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

Any Regulatory Exceedences are color coded by Regulation
Bold values are detected concentrations

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
~=this indicates that no regulatory limit has been established for this analyte

GEOPHYSICAL BEDROCK REPORT

1. INTRODUCTION AND PURPOSE

Monitoring wells MW6, MW7, MW8, MW9, MW10, MW 11, MW12, and MW13, located at 3547 Webster Avenue in Bronx, NJ were the subject of this geophysical survey.

The purpose of the geophysical borehole logging was to investigate lithology, fracture location and orientation, flow in the borehole, and overall physical condition of the borehole.

2. GEOPHYSICAL METHODOLOGY

Geophysical borehole logging was conducted using a Mount Sopris MXA winch with a Matrix console and Mount Sopris 2FA -1000 fluid probe, Mount Sopris 2PCA-1000 caliper probe, Mount Sopris 2PGA-1000 gamma, SP and SPR probe, Mount Sopris HFP-2293 heat-pulse flowmeter, ALT QL40-2G acoustic televiewer, and an ALT QL40-OBI-2G optical televiewer.

The borehole logs consist of caliper, fluid resistivity/ conductivity, fluid temperature, natural gamma, self potential (SP), single point resistivity (SPR), optical televiewer, acoustic televiewer, and heat-pulse flowmeter.

3. Interpretation

Fractures are classified in the structure logs and tadpole plots as three groups; open fractures, partial open fractures, and closed fractures.

Open fractures are fractures in the rock that appear to be open based on caliper data. Partial open fractures are fractures that appear not to be fully open in the borehole. Closed fractures show as fractures and have no significant caliper enlargement. Possible banding are also identified. All orientations are based on magnetic north.

Flow values of 0.03 gals./min. or less are considered as no flow and approach the limit of the flowmeter. However, data below this limits may be useful in determining a trend within the borehole.

Interpretations are on the comments section of the log.

Appendix A has all the geophysical logs. Appendix B has the fracture data and Appendix C the heat pulse flowmeter data.

MW 6

The well was approximately 19.3 feet in depth. No water was encountered in the well. Bottom of casing was at 8.9 feet. All depths are based on ground surface at the time of the logging.

The geophysical logging of this borehole detected fractures and caliper enlargements based on the caliper log. No significant fractures and enlargements were detected at this well. Some small enlargements were also detected by the caliper.

No fluid data, heat pulse flow meter data, SP, and SPR data were collected due to lack of water in the well

See Appendix A for the logs of this borehole.

WHERE FLOOR AREA IN A BUILDING IS SHARED BY MULTIPLE USES, THE FLOOR AREA FOR SUCH SHARED PORTION SHALL BE ATTRIBUTED TO EACH USE PROPORTIONATELY, BASED ON THE PERCENTAGE EACH USE OCCUPIES OF THE TOTAL FLOOR AREA OF THE ZONING LOT, LESS ANY SHARED FLOOR AREA.

AIR LEAKAGE TESTING

FOR NEW BUILDINGS AND ADDITIONS 50,000 SQUARE FEET (4 645.2 M2) AND GREATER SHALL TEST OR INSPECT EACH TYPE OF UNIQUE AIR BARRIER JOINT OR SEAM IN THE BUILDING ENVELOPE FOR CONTINUITY AND DEFECTS, AS PER AN AIR BARRIER CONTINUITY PLAN DEVELOPED BY A REGISTERED DESIGN PROFESSIONAL. ALTERNATIVELY, SUCH BUILDINGS AND ADDITIONS MAY SHOW COMPLIANCE THROUGH TESTING IN ACCORDANCE WITH ITEM I OF THIS SECTION.

IIA6 AIR SEALING AND INSULATION – VISUAL INSPECTION:
OPENINGS AND PENETRATIONS IN THE BUILDING ENVELOPE, INCLUDING SITE-BUILT FENESTRATION AND DOORS, SHALL BE VISUALLY INSPECTED TO VERIFY THAT A CONTINUOUS AIR BARRIER AROUND THE ENVELOPE FORMS AN AIR-TIGHT ENCLOSURE. THE PROGRESS INSPECTOR SHALL VISUALLY INSPECT TO VERIFY THAT MATERIALS AND/OR ASSEMBLIES HAVE BEEN TESTED AND MEET THE REQUIREMENTS OF THE RESPECTIVE STANDARDS, OR THAT THE BUILDING IS TESTED AND MEETS THE REQUIREMENTS OF THE STANDARD, IN ACCORDANCE WITH THE STANDARD(S) CITED IN THE APPROVED PLANS.

WEATHER	Snow		Rain		Overcast		Partly Cloudy		Bright Sun	X
TEMP.	< 32		32-50	X	50-70		70-85		>85	

Project Name:	3547 Webster Avenue	**Date:**	2/5/2024

Consultant:	**Personnel On-Site:**
Vektor Consultants	Environmental Consultant – Vektor Consultants Driller- Enviroprobe Service Inc. Geophysical Surveyor- American Geophysics Inc NYSDEC- Erick Bower

Work Activities Performed:

- Vektor inspected the Site with American Geophysics Inc., the geophysical surveyor, to target areas of sample locations, and other potential indicators of underground anomalies and subsurface impacts.
- American Geophysics Inc. performed a geophysical survey to investigate for subsurface structures and to bedrock well locations and utilities throughout the site.
    - American Geophysics Inc. precleared all bedrock well locations. The precleared locations were marked with spray paint on the concrete slab to ensure that utilities were not encountered during well installation.
- Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to advance one bedrock well into bedrock at MW-12. The bedrock well was installed by advancing steel casing 5 feet into bedrock and grouting the annulus within the borehole at the well location. The depth of the steel casing at the well was installed as follows:
    - MW-12- steel casing set from 0 to 8 feet as bedrock begins at 3 feet.
- Wells will be drilled another 5 feet into rock from the bottom of casing once the grout sets overnight.

Samples Collected

- No samples were collected

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work. The upwind CAMP station spent most of the time in the northern portion of the Site and the downwind CAMP station spent most of the time in the southern portion of the Site as the wind was consistently coming from the south.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.007 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.017 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530193001, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-913472
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530144407, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-602264
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Planned Activities for the Next Day

Continue installation of bedrock wells.

WEATHER	Snow		Rain		Overcast		Partly Cloudy		Bright Sun	X
TEMP.	< 32		32-50	X	50-70		70-85		>85	

Project Name:	3547 Webster Avenue	**Date:**	2/6/2024

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Enviroprobe Service Inc.

Work Activities Performed:

- Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to advance two bedrock wells into bedrock at MW-9 and partially at MW-13. The bedrock wells were installed by advancing steel casing 5 feet into bedrock and grouting the annulus within the borehole at the well locations. The depth of the steel casing at the well was installed as follows:
  - MW-9 steel casing set from 0 to 8.5 feet as bedrock begins at 3.5 feet.
  - MW-13 steel casing partially set at 5 feet. Bedrock was observed at 4.5 feet bgs. The steel casing will continued to be installed on 2/7/2024 to a depth of 9.5 feet bgs.
- Wells will be drilled another 5 feet into rock from the bottom of casing once the grout sets overnight.

Samples Collected

- No samples were collected

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work. The upwind CAMP station spent most of the time in the northern portion of the Site and the downwind CAMP station spent most of the time in the southern portion of the Site as the wind was consistently coming from the south.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.009 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.040 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530193001, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-913472
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530144407, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-602264
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Problems Encountered

N/A

Planned Activities for the Next Day

Continue installation of bedrock wells.

Project Name:	3547 Webster Avenue	**Date:**	2/9/2024

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Enviroprobe Service Inc.

Work Activities Performed:

- Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to advance three bedrock wells into bedrock at MW-7, MW-8, and partially at MW-6. The bedrock wells were installed by advancing steel casing 5 feet into bedrock and grouting the annulus within the borehole at the well locations. The depth of the steel casing at each well location was installed as follows:
  - MW-7 steel casing set from 0 to 9 feet as bedrock begins at 4 feet.
  - MW-8 steel casing set from 0 to 8.5 feet as bedrock begins at 3.5 feet.
  - MW-6 steel casing was set at 6 feet. Bedrock was observed at 3.5 feet bgs. The steel casing will continue to be installed on 2/12/2024 as it needs to be grouted.
- Wells will be drilled another 5 feet into rock from the bottom of casing once the grout sets overnight.

Samples Collected

- No samples were collected

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work. The upwind CAMP station spent most of the time in the southern portion of the Site and the downwind CAMP station spent most of the time in the northern portion of the Site as the wind was consistently coming from the south.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.30 mg/m^3

Highest Levels:
PID: 0.1ppm Dust: 0.071 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530193001, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-913472
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530144407, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-602264
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Problems Encountered

None

Planned Activities for the Next Day

Continue installation of bedrock wells.

Consultant: Vektor Consultants	**Personnel On-Site:** Environmental Consultant – Vektor Consultants Driller- Enviroprobe Service Inc.

Work Activities Performed:

- Enviroprobe Service Inc. utilized a Geoprobe® Model 8140 Sonic drill rig to advance borings into bedrock at MW-9, MW-13 and partially at MW-12. Depth of the borings at each well location were installed as follows:
  - MW-9 was drilled down to 15 feet.
  - MW-13 was drilled down to 20 feet.
  - MW-12 was partially drilled down to 12 feet. The boring will continue to be installed to 20 feet on 2/16/2024.
- Wells will be drilled another 10 feet into rock from the bottom of groundwater level.

Samples Collected

- No samples were collected

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work. The upwind CAMP station spent most of the time in the northwestern portion of the Site and the downwind CAMP station spent most of the time in the southeastern portion of the Site as the wind was consistently coming from the northwest.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.007 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.070 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530193001, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-913472
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530144407, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-602264
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Problems Encountered

None

Planned Activities for the Next Day

Continue installation of bedrock wells.
Continue geophysical logging of bedrock wells.

- Vektor developed monitoring wells MW-8, 9, 11, and 12. Monitoring well MW-6 had a 1 foot water column with a low recharge rate and could not be developed.
- The following are the final well depths and their screened intervals:
  - **MW-6:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.
  - **MW-7:** Installed to 22.5 feet. Screened PVC installed from 3-22.5 feet interval.
  - **MW-8:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.
  - **MW-9:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.
  - **MW-10:** Installed to 25 feet. Screened PVC installed from 5-25 feet interval.
  - **MW-11:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.
  - **MW-12:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.
  - **MW-13:** Installed to 20 feet. Screened PVC installed from 5-20 feet interval.

Community Air Monitoring Program (CAMP)

An upwind and downwind CAMP stations were placed in the near the perimeters of Site during intrusive work. The upwind CAMP station spent most of the time in the northeastern portion of the Site and the downwind CAMP station spent most of the time in the southwestern portion of the Site as the wind was consistently coming from the northeast.

Background Levels (Initial Readings at Start of Day):
PID: 0.0 ppm Dust: 0.011 mg/m^3

Highest Levels:
PID: 0.0ppm Dust: 0.077 mg/m^3

- Upwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530193001, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-913472
- Downwind CAMP was implemented during drilling and sampling activities. CAMP equipment consisted of a DustTrack II Model 8530; S/N: 8530144407, AND MiniRAE 3000, Model PGM-7320 photoionization detector (PID); S/N: 592-602264
- No VOC or dust concentrations were detected in exceedance of the daily short-term exposure limit (STEL) at the work area CAMP station.

Sample and Data Qualifiers Relating to This Work Order

S-08	The recovery of this surrogate was outside of QC limits.
S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
QM-07	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-BLK	The target analyte was detected above the RL in the batch method blank. All samples showed >10x the concentration in the blank for this analyte. Data are reported.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
B	Analyte is found in the associated analysis batch blank. For volatiles, methylene chloride and acetone are common lab contaminants.

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Sample and Data Qualifiers Relating to This Work Order

PFSu-H	The isotopically labeled surrogate recovered above lab control limits due to a matrix effect. Isotope Dilution was applied.
PF-CCV-H	The CCV recovery was slightly above acceptable limits for the qualified compound. However, sample results are not biased high because results are corrected for isotope recovery.
PFAS-MSH	The recovery for this matrix spike compound was above control limits possibly due to matrix effects or non-homogenieity of the sample verses the native sample

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Soil and Ground Water Sampling Events

Dear Mr. Klein,

The Data Usability Summary Reports are attached to this letter for the 3547 Webster Avenue site, September 2022 soil and March 2023 ground water sampling events. The data for York Analytical Laboratories, Inc. SDG numbers 22I1653, 22I1655, 23C0961, and 23C1185 are mostly acceptable, with issues that are identified in the QA/QV review summaries. There are data that are rejected, unusable (R) in data pack 22I1653. The DUSR and QA/QC reviews outlines the reasons for rejecting the data. The data are rejected based solely on the validation guidance criteria. The rejected data may be determined to be acceptable to the user based on additional information that is not contained in the data validation criteria.

A list of data validation acronyms and qualifiers is attached to assist you in interpreting the data validation reviews. If you have any questions concerning the work performed, please contact me at (518) 348-6995. Thank you for providing us an opportunity with vEKtor consultants.

Sincerely,

Data Usability Summary Report for

22 Soil Samples
Collected September 30, 2022

Prepared by: Donald Anné
February 14, 2024

The data package contains the documentation required by NYSDEC ASP. The proper chain of custody procedures were followed by the samplers. All information appears legible and complete. The data pack contains the results of 22 soil samples analyzed for volatiles semi-volatiles, 1,4-dioxane by SIM, pesticides, PCBs, TAL metals, and hexavalent chromium, and 1 soil samples analyzed for 1,4-dioxane by 8270D SIM.

The overall performances of the analyses are acceptable. York Analytical Laboratories, Inc. did fulfill the requirements of the analytical methods except for ICP metals analyses.

The data are mostly acceptable with some issues that are identified in the accompanying data validation reviews. The following data were qualified:

- The "not detected" volatile results for tetrachloroethylene were qualified as "estimated" (UJ) for the following samples because 2 of 2 percent recoveries for tetrachloroethylene were below QC limits, but not below 10% in the associated soil LCS/LCSD.
