- If an oncoming vehicle does not lower beams from high to low, avoid glare by watching the right edge of the road and using it as a steering guide.
- Make frequent stops for light snacks and exercise. If you are too tired to drive, stop in a safe area and get some rest.
- Observe driving safety as soon as the sun goes down. Twilight is one of the most difficult times to drive, because your eyes are constantly changing to adapt to the growing darkness.

1.6.2 Snow/Freezing Conditions

When snow and ice are present, be prepared by following these winter driving safety tips.

1.6.2.1 Prepare the Vehicle Before a Snowstorm

- Check under the hood and take a look at the vehicles cooling system. Make sure the vehicle contains adequate antifreeze and the hoses are in good condition.
- Test heaters and defrosters ahead of time to make sure they are in good working condition.
- Test your windshield wipers and check the condition of your wiper blades. If wipers leave streaks on your windshields, replace the blades.
- It is recommended that a windshield washer/antifreeze solution is used during winter conditions.
- Check your lights and periodically clear them of snow and dirt.
- Car batteries need extra power in cold conditions. Make sure the battery's terminals are clean and cables are secure.

- Keep your gas tank at least half full in the winter to help avoid gas line freeze up.

1.6.2.2 Driving During and After a Snowstorm

- Wear sunglasses to aid in limiting reflection from snow.
- Be aware of blind spots created by snow banks.
- Be extra cautious of pedestrians and other vehicles in intersections.
- Allow extra time for braking and increase the distance between you and the car ahead of you.
- Reduce your speed and do not exceed the posted limit.
- If you start to lose traction take your foot off the gas and gradually reduce your speed. Accelerate slowly once you feel traction is regained.
- If you start to skid, steer in the direction of the skid. Remember, steering can be more important than braking on slippery roads.

1.6.3 Driving In the Rain

To prevent losing control of your car on wet pavement, take these preventive measures.

- Prevent skids by driving slowly and carefully, especially on curves.
- Steer and brake with a light touch.
- When you need to stop or slow, do not brake hard or lock the wheels.
- Maintain mild pressure on the brake pedal.

If you skid, ease your foot off the gas, and carefully steer in the direction you want the front of the car to go. For cars without anti-lock brakes, avoid using your brakes. This procedure, known as "steering into the skid," will bring the back end of the car in line with the front. If your car has anti-lock brake systems (ABS), brake firmly as you "steer into the skid."

Hydroplaning happens when the water in front of your tires builds up faster than your car's weight can push it out of the way. The water pressure causes your car to lose contact with the road surface and slide on a thin layer of water between your tires and the road. At this point, your car can be completely out of contact with the road, and you are in danger of skidding or drifting out of your lane, or even off the road.

To avoid hydroplaning, keep the tires properly inflated and maintain good tread on the tires. If tires need to be replaced on a company vehicle, notify the branch manager or their designee. Slow down when roads are wet, and stay away from puddles. Try to drive in the tire tracks left by the cars in front of you. If you begin to hydroplane, do not brake or turn suddenly. This could throw your car into a skid. Ease your foot off the gas until the car slows and you can feel the road again. If you need to brake, do it gently with light pumping actions. If your car has ABS, then brake normally; the car's computer will mimic a pumping action, when necessary.

If weather conditions worsen to the point where the driver is not comfortable driving, pull the vehicle over to a safe location until conditions improve. Do not drive during severe weather conditions. Do not attempt to drive on roads with standing water or that have been flooded. Find an alternate route if these conditions exist.

1.6.4 Off Road

If operation of a vehicle is required off publicly or privately maintained roads or in situations where four-wheel-drive vehicles are required, the appropriate vehicle for the situation will be used.

1.7 Driver Training

GEI employees are required to complete driver safety training every 3 years. Employees will complete the examination at the end of each module and forward the training certificate to Human Resources.

1.8 Limitations

Follow safety procedures as defined in the site-specific HASP.

STANDARD OPERATING PROCEDURES

SOP No. HS-006 Excavations and Trenches

1.1 Objective

GEI employees may be involved with projects that include some type of excavation and trenching as part of the work activities. The following guidelines will be followed when excavations or trenches are present on GEI projects.

1.2 General

This standard operating procedure (SOP) is intended for use by employees engaged in work on project sites that include trenching and/or excavation operations. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for trenching and excavation hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

Hazards associated with excavations and trenches can include collapse, falls, falling objects, hazardous atmospheres, and incidents involving mobile equipment.

GEI employees will not enter trenches or excavations that do not comply with OSHA 29 CFR 1926.650. If a project requires GEI employees to enter a trench or excavation, the trench or excavation should meet the following requirements:

- The excavation must be inspected daily by a competent person to identify potential hazards associated with the excavation. GEI generally does not act as the competent person.
- A protective system should be in place for trenches or excavations greater than 5- feet in depth.
- Employees will be protected from vehicular traffic by the use of barricades, cones and tape or other physical barriers.
- The protective system should be designed based on soil type, depth of excavation, water level, loads adjacent to the excavation, changes in weather conditions, or other operations in the area. Protective systems can include sloping or benching of the sidewalls, shoring the sidewalls using an approved support system, or shielding workers with a trench box or other similar type of support.
- If the excavation is greater than 20-feet in depth, the protection system requires a design by a registered professional engineer or based on tabulated data prepared and/or approved by a registered professional engineer.

- Excavations and trenches greater than four feet in depth require a safe access and egress including ladders, steps, or ramps. These points of access and egress are to be no greater than 25 feet of lateral travel in any direction.

- Where oxygen deficiency (atmospheres containing less than 20.7 percent oxygen) or a hazardous atmosphere exists or could reasonably be expected to exist, such as in excavations in landfill areas or excavations in areas where hazardous substances are stored nearby, the atmospheres in the excavation shall be tested before employees enter excavations greater than four feet in depth.

When GEI is subcontracting the excavation activities:

- Care should be taken not to create new hazards like narrow walkways along edges of an excavation.
- Heavy equipment should not be parked or working at the edge of the excavation.
- Spoils should not be stockpiled within 2 feet of the trench edges.
- Confirm with subcontractor that underground utilities have been located before any excavation or trenching activities begin (refer to SOP HS-014 Utility Mark-out).
- When required guardrails will be installed for crossings and walkways to provide fall protection.
- Confirm with the subcontractor that the excavation or trench has been tested for hazardous atmospheres before entering.
- Confirm with the subcontractor that the excavation or trench has been inspected by a competent person before each work shift and after any type of precipitation. Water should be directed away from the excavation or trench whenever possible. If hazards are identified during this inspection, verify that the hazards are controlled prior to entering the trench or excavation.
- GEI employees will not work under raised or suspended loads.

In circumstances where GEI employees are working on sites where a contractual agreement with the excavation contractor does not exist and we cannot confirm the above stated conditions, entry into trenches or excavations should not be conducted.

1.3 Soil Classifications

The soil classification system means a method of categorizing soil and rock deposits in a hierarchy of Stable Rock, Type A, Type B, and Type C, in decreasing order of stability.

1) Stable rock means natural solid mineral matter that can be excavated with vertical sides and remain intact while exposed.

2. Type A means cohesive soils with an unconfined, compressive strength of 1.5 ton per square foot (tsf) (144 kPa) or greater. Examples of cohesive soils are: clay, silty clay, sandy clay, clay loam and, in some cases, silty clay loam and sandy clay loam. Cemented soils such as caliche and hardpan are also considered Type A. However, no soil is Type A if:

a) The soil is fissured; or
b) The soil is subject to vibration from heavy traffic, pile driving, or similar effects; or
c) The soil has been previously disturbed; or
d) The soil is part of a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical (4H:1V) or greater; or
e) The material is subject to other factors that would require it to be classified as a less stable material.

3) Type B means:

a) Cohesive soil with an unconfined compressive strength greater than 0.5 tsf (48 kPa) but less than 1.5 tsf (144 kPa); or
b) Granular cohesionless soils including: angular gravel (similar to crushed rock), silt, silt loam, sandy loam and, in some cases, silty clay loam and sandy clay loam.
c) Previously disturbed soils except those which would otherwise be classed as Type C soil.
d) Soil that meets the unconfined compressive strength or cementation requirements for Type A, but is fissured or subject to vibration; or
e) Dry rock that is not stable; or
f) Material that is part of a sloped, layered system where the layers dip into the excavation on a slope less steep than four horizontal to one vertical (4H:1V), but only if the material would otherwise be classified as Type B.

4) Type C means:

a) Cohesive soil with an unconfined compressive strength of 0.5 tsf (48 kPa) or less; or
b) Granular soils including gravel, sand, and loamy sand; or
c) Submerged soil or soil from which water is freely seeping; or
d) Submerged rock that is not stable, or
e) Material in a sloped, layered system where the layers dip into the excavation or a slope of four horizontal to one vertical (4H:1V) or steeper.

Where soils are configured in layers, i.e., where a layered geologic structure exists, the soil must be classified on the basis of the soil classification of the weakest soil layer. Each layer may be classified individually if a more stable layer lies below a less stable layer, i.e., where a Type C soil rests on top of stable rock.

1.4 GEI Requirements for the Excavation/Trenches Competent Person

Although GEI does not normally act as the competent person for excavations and trenches this person should have and be able to demonstrate the following:

- Training, experience, and knowledge of:
  - soil analysis;
  - use of protective systems; and
  - requirements of 29 CFR Part 1926 Subpart P.
- Ability to detect:
  - conditions that could result in cave-ins;
  - failures in protective systems;
  - hazardous atmospheres; and
  - other hazards including those associated with confined spaces.
- Authority to take prompt corrective measures to eliminate existing and predictable hazards and to stop work when required.

1.5 Test Equipment And Methods For Evaluating Soil Type

Many kinds of equipment and methods are used to determine the type of soil prevailing in an area, as described below.

A. Pocket Penetrometer. Penetrometers are direct-reading, spring-operated instruments used to determine the unconfined compressive strength of saturated cohesive soils. Once pushed into the soil, an indicator sleeve displays the reading. The instrument is calibrated in either tons per square foot (tsf) or kilograms per square centimeter (kPa). However, Penetrometers have error rates in the range of ± 20-40%.

   1. Shearvane (Torvane). To determine the unconfined compressive strength of the soil with a shearvane, the blades of the vane are pressed into a level section of undisturbed soil, and the torsional knob is slowly turned until soil failure occurs. The direct instrument reading must be multiplied by 2 to provide results in tons per square foot (tsf) or kilograms per square centimeter (kPa).

2. Thumb Penetration Test. The thumb penetration procedure involves an attempt to press the thumb firmly into the soil in question. If the thumb makes an indentation in the soil only with great difficulty, the soil is probably Type A. If the thumb penetrates no further than the length of the thumb nail, it is probably Type B soil, and if the thumb penetrates the full length of the thumb, it is Type C soil. The thumb test is subjective and is therefore the least accurate of the three methods.
3. Dry Strength Test. Dry soil that crumbles freely or with moderate pressure into individual grains is granular. Dry soil that falls into clumps that subsequently break into smaller clumps (and the smaller clumps can be broken only with difficulty) is probably clay in combination with gravel, sand, or silt. If the soil breaks into clumps that do not break into smaller clumps (and the soil can be broken only with difficulty), the soil is considered unfissured unless there is visual indication of fissuring.

B. Plasticity or Wet Thread Test. This test is conducted by molding a moist sample of the soil into a ball and attempting to roll it into a thin thread approximately 1/8 inch (3 mm) in diameter (thick) by 2 inches (50 mm) in length. The soil sample is held by one end. If the sample does not break or tear, the soil is considered cohesive.

C. Visual Test. A visual test is a qualitative evaluation of conditions around the site. In a visual test, the entire excavation site is observed, including the soil adjacent to the site and the soil being excavated. If the soil remains in clumps, it is cohesive; if it appears to be coarse-grained sand or gravel, it is considered granular. The evaluator also checks for any signs of vibration.

During a visual test, the evaluator should check for crack-line openings along the failure zone that would indicate tension cracks, look for existing utilities that indicate that the soil has previously been disturbed, and observe the open side of the excavation for indications of layered geologic structuring.

The evaluator should also look for signs of bulging, boiling, or sluffing, as well as for signs of surface water seeping from the sides of the excavation or from the water table. If there is standing water in the cut, the evaluator should check for "quick" conditions. In addition, the area adjacent to the excavation should be checked for signs of foundations or other intrusions into the failure zone, and the evaluator should check for surcharging and the spoil distance from the edge of the excavation.

1.6 Shoring Types

Shoring is the provision of a support system for trench faces used to prevent movement of soil, underground utilities, roadways, and foundations. Shoring or shielding is used when the location or depth of the cut makes sloping back to the maximum allowable slope impractical. Shoring systems consist of posts, wales, struts, and sheeting. There are two basic types of shoring, timber and aluminum hydraulic.

Hydraulic shoring can be a prefabricated strut and/or wale system manufactured of aluminum or steel. Hydraulic shoring provides a critical safety advantage over timber shoring because workers do not have to enter the trench to install or remove hydraulic shoring. Other advantages of most hydraulic systems are that they:

- Are light enough to be installed by one worker;
- Are gauge-regulated to ensure even distribution of pressure along the trench line;
- Can have their trench faces "preloaded" to use the soil's natural cohesion to prevent movement; and
- Can be adapted easily to various trench depths and widths.

All shoring should be installed from the top down and removed from the bottom up. Hydraulic shoring should be checked at least once per shift for leaking hoses and/or cylinders, broken connections, cracked nipples, bent bases, and any other damaged or defective parts.

Pneumatic Shoring works in a manner similar to hydraulic shoring. The primary difference is that pneumatic shoring uses air pressure in place of hydraulic pressure. A disadvantage to the use of pneumatic shoring is that an air compressor must be on site.

- Screw jack systems differ from hydraulic and pneumatic systems in that the struts of a screw jack system must be adjusted manually. This creates a hazard because the worker is required to be in the trench in order to adjust the strut. In addition, uniform "preloading" cannot be achieved with screw jacks, and their weight creates handling difficulties.
- Single-Cylinder Hydraulic Shores. Shores of this type are generally used in a water system, as an assist to timber shoring systems, and in shallow trenches where face stability is required.
- Underpinning. This process involves stabilizing adjacent structures, foundations, and other intrusions that may have an impact on the excavation. As the term indicates, underpinning is a procedure in which the foundation is physically reinforced. Underpinning should be conducted only under the direction and with the approval of a registered professional engineer.

1.7 Shielding Types

Trench Boxes are different from shoring because, instead of shoring up or otherwise supporting the trench face, they are intended primarily to protect workers from cave-ins and similar incidents. The excavated area between the outside of the trench box and the face of the trench should be as small as possible. The space between the trench boxes and the excavation side are backfilled to prevent lateral movement of the box. Shields may not be subjected to loads exceeding those which the system was designed to withstand.

Trench boxes are generally used in open areas, but they also may be used in combination with sloping and benching. The box should extend at least 18 in (0.45 m) above the surrounding area if there is sloping toward excavation. This can be accomplished by providing a benched area adjacent to the box.

Earth excavation to a depth of 2 ft (0.61 m) below the shield is permitted, but only if the shield is designed to resist the forces calculated for the full depth of the trench and there are no indications while the trench is open of possible loss of soil from behind or below the bottom of the support system. Conditions of this type require observation on the effects of bulging, heaving, and boiling as well as surcharging, vibration, adjacent structures, etc., on excavating below the bottom of a shield. Careful visual inspection of the conditions mentioned above is the primary and most prudent approach to hazard identification and control.

1.8 Sloping And Benching

Maximum allowable slopes for excavations less than 20 ft (6.09 m) based on soil type and angle to the horizontal are as follows:

Soil type	height / Depth ratio	Slope angle
Stable Rock	Vertical	90°
Type A	¾:1	53°
Type B	1:1	45°
Type C	1½:1	34°
Type A (short-term)	½:1	63°
(For a maximum excavation depth of 12 ft)		

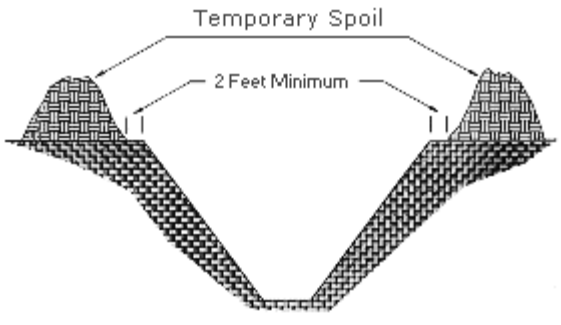
There are two basic types of benching, simple and multiple. The type of soil determines the horizontal to vertical ratio of the benched side.

As a general rule, the bottom vertical height of the trench must not exceed 4 ft (1.2 m) for the first bench. Subsequent benches may be up to a maximum of 5 ft (1.5 m) vertical in Type A soil and 4 ft (1.2 m) in Type B soil to a total trench depth of 20 ft (6.0 m). All subsequent benches must be below the maximum allowable slope for that soil type. For Type B soil the trench excavation is permitted in cohesive soil only.

1.9 Spoil

Temporary spoil must be placed no closer than 2 ft (0.61 m) from the surface edge of the excavation, measured from the nearest base of the spoil to the cut. This distance should not be measured from the crown of the spoil deposit. This distance requirement ensures that loose rock or soil from the temporary spoil will not fall on employees in the trench.

Spoil should be placed so that it channels rainwater and other run-off water away from the excavation. Spoil should be placed so that it cannot accidentally run, slide, or fall back into the excavation.



Permanent spoil should be placed at some distance from the excavation. Permanent spoil is often created where underpasses are built or utilities are buried. The improper placement of permanent spoil, i.e. insufficient distance from the working excavation, can cause an excavation to be out of compliance with the horizontal-to-vertical ratio requirement for a particular excavation. This can usually be determined through visual observation. Permanent spoil can change undisturbed soil to disturbed soil and dramatically alter slope requirements.

1.10 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

Do not enter a trench or excavation without consulting with the project manager, Corporate Health and Safety Officer (CHSO), or Regional Health and Safety Officer (RHSO).

Some states, including Massachusetts, require a trench permit prior to trenching or excavation activities. Verification of local requirements will be evaluated in the planning stage.

STANDARD OPERATING PROCEDURES

HS-007 General Safety Requirements

1.1 Objective

GEI is committed to providing its employees with a safe and healthy work environment. To maintain a safe work environment, GEI has established general safety requirements to promote safe work practices.

1.2 General Health and Safety Training

GEI requires employees to complete Health and Safety Training on an annual basis. Project employees must have completed, at a minimum, GEI's General 4-Hour Health and Safety Training or when required, HAZWOPER training before beginning on-site work activities. In addition, field staff must be current in First Aid and CPR Training. Site-specific safety training will also be completed before beginning work on each project site. Further Health and Safety training requirements can be found in Section 2 of the GEI Health and Safety Manual.

1.3 Tailgate Meetings

Health and Safety tailgate meetings will be conducted by the GEI Project Manager or Site Safety Officer (SSO), and be recorded in the GEI field book or on the GEI daily safety briefing log. Employees on-site will sign the daily safety briefing log to indicate attendance.

1.4 Health and Safety Plans

GEI projects must have a health and safety plan (HASP) before beginning site work. GEI HASP templates are located on the Health and Safety page on the GEI intranet. Specific requirements for HASPs are located in Section 7 of GEI's Health and Safety Manual. After the HASP has been completed, it must be sent to the Corporate Health and Safety Officer (CHSO) and the Regional Health and Safety Officer (RHSO) for review. Project employees must read the HASP and sign the signature page to document that they have read, understood, and will comply with the requirements of the HASP. The site-specific HASP must be kept on-site at all times.

1.5 Personal Protective Equipment

Project-specific personal protective equipment (PPE) will be identified in the HASP based on the hazards present during work tasks. Required PPE must be worn on the project site. More information regarding PPE is located in Section 6 of GEI's Health and Safety Manual.

1.6 Fire Protection and Prevention

The work site should be kept clear of flammable materials and debris. GEI field personnel should know where fire extinguishers are located, and be familiar in the use of the extinguisher. Information on the correct use of a fire extinguisher is included in GEI's general health and safety training. Call 911(or other number identified in the project HASP) in the event of a fire.

1.7 Accident/Incident Reporting

The following accident reporting procedures must be followed:

- Seek medical attention.
- Notify your supervisor.
- Notify CHSO and Human Resources (HR) within two hours of the accident/incident.
- Complete Accident Reporting Form (found on the Health and Safety page of the GEI Intranet or on the GEI App) within **24 hours** and send to the CHSO and Human Resources. Refer to Section 8 of the GEI Health and Safety Manual for more information.

1.8 Near Miss Reporting

GEI employees will complete a near-miss reporting form if a hazardous or unsafe condition or near miss is observed. The near-miss reporting form is located on the Health and Safety page of the GEI Intranet. Refer to Section 8 of the GEI Health and Safety Manual for more information.

1.9 Housekeeping

Work areas, passages, and stairs will be kept clear of debris. Debris will be removed from the project site at regular intervals.

1.10 Illumination

Project sites will be illuminated either with natural or artificial illumination, in compliance with OSHA regulations.

1.11 Sanitation

Hand-washing is an essential form of protection from chemical and biological exposures and illness. GEI employees should wash their hands after performing work tasks and

regularly throughout the day. If soap and water are not available, hand sanitizers and/or wipes should be used.

1.12 Machinery, Tools, Material, and Equipment

Machinery, tools, material, and equipment will be kept in good working condition and will be inspected by a competent person. Unsafe equipment will be identified as unsafe by tagging or locking the controls to render them inoperable. Arrangements will be made to repair or dispose of damaged or unsafe equipment.

1.13 Vehicles

GEI's motor vehicles will be maintained in accordance with the GEI fleet maintenance program. Each GEI-owned vehicle will have a fire extinguisher and first aid kit. Additional fire extinguishers and first aid kits are kept in each GEI office for use in personal or rental vehicles.

1.14 Heavy Equipment

GEI employees will keep a line of sight between them and heavy equipment operators. If a GEI employee needs to communicate with heavy equipment operators, they will use hand signals or direct communication with the operator. GEI employees should not:

- Operate or climb on heavy equipment
- Approach heavy equipment while it is in operation.
- Use cellular telephones when working near operating equipment.

For more information regarding heavy equipment, refer to GEI's SOP HS-018 Heavy Equipment.

1.15 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

1.16 Attachments

None

1.17 Contact

GEI Corporate Health & Safety Officer
GEI East – North Regional Health & Safety Officer
GEI East – South Regional Health & Safety Officer

GEI Central Regional Health & Safety Officer
GEI West Regional Region Health & Safety Officer

STANDARD OPERATING PROCEDURES

SOP NO. HS-009 Hazardous Substances Management

1.1 Objective

This Standard Operating Procedure (SOP) is intended to outline the steps GEI employees will take to identify potential hazards associated with exposure to hazardous substances, the risks associated with these hazards, and the proper controls to use to minimize exposure. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for encounters with biological hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

1.2 Hazard Identification

An initial identification of hazards should be done based on a review of available documents including lists of chemicals used on site, analytical data from soil, surface water, groundwater, air, spill history, site history, equipment on site, maps, photos, and a preliminary survey.

1.3 Risk Identification

Once the presence and concentrations of specific hazardous substances and health hazards have been established, the risks associated with these substances will be identified. GEI employees and GEI subcontractors who will be working on the site will be informed of risks that have been identified.

Risks to consider include, but are not limited to:

- Potential exposures exceeding the permissible exposure limits and published exposure levels.
- Potential Immediately to Life and Health (IDLH) Concentrations.
- Potential Skin Absorption and Irritation Sources.
- Potential Eye Irritation Sources.
- Potential hazardous atmospheres, including oxygen deficiency and fire and explosion hazards.

1.4 Engineering Controls, Work Practices, and Personal Protective Equipment for Employee Protection

Engineering controls, work practices, and personnel protective equipment (PPE) for substances regulated in OSHA Subpart Z (Toxic and Hazardous Substances) will be implemented in accordance with this section to protect employees from exposure to hazardous substances and safety and health hazards.

1.4.1 Engineering Controls, Work Practices, and Personal Protective Equipment for Substances Regulated in Subparts G (Occupational Health and Environment Control) and Subpart Z (Toxic and Hazardous Substances)

Engineering controls and work practices will be instituted to reduce and maintain employee exposure at or below the permissible exposure limits for substances regulated by 29 CFR Part 1910.

Engineering controls that may be feasible include the use of pressurized cabs or control booths on equipment, and/or the use of remotely operated material handling equipment. Work practices may include removing non-essential employees from potential exposure during opening of drums, wetting down dusty operations, and positioning employees upwind of potential hazards.

If engineering controls and work practices are not feasible, or not required, a reasonable combination of engineering controls, work practices, and PPE will be used to reduce and maintain at or below the permissible exposure limits or dose limits for substances regulated by 29 CFR Part 1910, Subpart Z.

GEI will not implement a schedule of employee rotation as a means of compliance with permissible exposure limits or dose limits except when there is no other feasible way of complying with the airborne or dermal dose limits for ionizing radiation.

The provisions of 29 CFR, subpart G, Occupational Health and Environment control, will be followed.

1.4.2 Engineering Controls, Work Practices, and Personal Protective Equipment for Substances <u>Not</u> Regulated in Subparts G and Subparts Z

An appropriate combination of engineering controls, work practices, and personal protective equipment will be used to reduce and maintain employee exposure to or below published exposure levels for hazardous substances and health hazards not regulated by 29 CFR Part 1910, Subparts G and Subparts Z. GEI will use published literature and Safety Data Sheet (SDS) as a guide in making the determination of what level of protection is appropriate for hazardous substances and health hazards for which there is no permissible exposure limit or published exposure limit.

1.4.3 Decontamination Procedure

Decontamination procedure(s) will be developed, communicated to employees, and implemented before employees or equipment enter areas on site where potential for exposure to hazardous substances exists. Procedures will be developed to minimize employee contact with hazardous substances or with equipment that has contacted hazardous substances.

GEI employees leaving a contaminated area will be properly decontaminated; contaminated clothing and equipment leaving a contaminated area will be properly disposed of or decontaminated.

Decontamination procedures will be monitored by the site safety officer (SSO) to determine their effectiveness. When such procedures are found to be ineffective, the site safety officer will contact the CHSO and appropriate steps will be taken to correct deficiencies.

1.4.3.1 Location

Decontamination will be performed in areas that will minimize the exposure to employees, equipment, and the environment.

1.4.3.2 Equipment and Solvents

Equipment and solvents used for decontamination will be decontaminated or disposed of properly.

1.4.3.3 Personal Protective Clothing and Equipment

Protective clothing and equipment will be decontaminated, cleaned, laundered, maintained or replaced as needed to maintain their effectiveness.

Employees whose clothing comes in contact with hazardous substances will immediately remove that clothing and rinse the exposed area with water. The clothing will be disposed of or decontaminated before it is removed from the work zone.

1.4.3.4 Commercial Laundries or Cleaning Establishments

Commercial laundries or cleaning establishments that decontaminate protective clothing or equipment will be informed of the potentially harmful effects of exposures to hazardous substances.

1.4.3.5 Showers and Changing Rooms

Where the decontamination procedure indicates a need for regular showers and change rooms outside of a contaminated area, they will be provided and meet the requirements of

29 CFR 1910.141 (Sanitation). If temperature conditions prevent the effective use of water, then other effective means for cleansing will be provided and used.

STANDARD OPERATING PROCEDURES

SOP No. HS-010 Inclement Weather

1.1 Objective

Inclement weather can affect work activities and pose safety hazards to employees working in these conditions. The following guidelines will be followed when weather conditions become a safety concern.

1.2 General

This standard operating procedure (SOP) is intended for use by employees engaged in work with the potential to be affected by inclement weather. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for encounters with biological hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

Employees should be aware of local weather conditions and monitor advisories issued by the National Weather Service and other local reporting services. Depending on location and season, storms are capable of producing heavy rain, floods, extreme temperatures, high wind conditions, lighting, tornados, and/or snowfall.

1.2.1 Heavy Rain

If working or driving in a storm use extreme caution. When driving, turn your lights on when the rainfall becomes heavy. Employees should be aware of the following:

- Heavy rain decreases visibility, especially when driving.
- Surfaces and tools become slippery.
- If you are working in the rain and your clothes become wet there is a risk of hypothermia when exposed to winds, even in warm temperatures.
- If the storms are going to produce thunder and/or lightning, leave the work area immediately and move to a safe area.
- Use your best judgment to determine if the rainfall becomes too heavy to continue working safely.

1.2.2 Lightning

Lightning can strike as far as 10 miles from the area where it is raining. That's about the distance you can hear thunder. **If you can hear thunder, you are within striking distance. Seek safe shelter immediately.** This can be within a building or vehicle. Wait 30 minutes after the last clap of thunder or flash of lightning before going outside again.

1.2.3 Flooding

Flooding may occur as a result of heavy rain in a short period of time. Flooding can be particularly acute in canyon areas where dry creek beds can turn into raging rivers from rainfall in distant or higher elevation areas. Be aware of this and your surroundings and move to a safe place if you begin to see signs that flooding may occur. Do not attempt to drive through areas or streets that are flooded. Seek alternate routes. Be particularly cautious at night when flooded areas are difficult to see. Urban flooding can stop traffic and increase the potential for traffic accidents and becoming trapped in vehicles.

1.2.4 Extreme Temperatures

Work activities may take place in extreme heat or cold. Be prepared if these conditions are anticipated. Have the appropriate personal protective equipment (PPE) available, exercise proper fluid intake, and take breaks to prevent heat and cold stress. For more information about these conditions see the heat stress and cold stress programs found in GEI's Health and Safety Manual.

1.2.5 High Wind and Tornados

Tropical storms are described as storms with sustained winds ranging from 39 to 73 miles per hour (mph) and hurricanes produce sustained winds that exceed 74 mph. When winds approach 40 mph (gale force winds) twigs begin to break off of trees and vehicles will veer off of the road. When winds approach **40 mph** or the GEI employee feels unsafe based on the activities being performed, stop work and seek shelter as soon as possible. Blowing or falling debris and overhanging limbs/signs can be a significant hazard. If possible, avoid driving in these conditions; 70 percent of injuries during hurricanes are a result of vehicle accidents. Note that tall or elevated equipment will have manufacturer's safe operating wind speeds defined that could be less than 40 mph. The operator's manual should be consulted prior to operation of the equipment.

A tornado is a violent, dangerous, rotating column of air that is in contact with both the surface of the earth and a cumulonimbus cloud or, in rare cases, the base of a cumulus cloud. The Fujita Scale is used to rate the intensity of a tornado by examining the damage caused by the tornado after it has passed over a man-made structure. Based on the Fujita Scale or F-Scale Numbers begin at F0: 40-72 mph and go to F6: 319-379 mph (F6 is generally theoretical). Nearly three-fourths of tornados are on the weak F0-F1 scale with just over two-thirds of deaths resulting from the violent F4-F5 tornados. If tornado wind

speeds exceed the 40 mph, stop work and seek shelter immediately if a tornado is seen. If a tornado siren is sounded move immediately to safety indoors and then move to a windowless interior space, basement, stair well, or designated fall-out shelter. Windows should not be opened before an oncoming tornado. If there is no shelter available, seat belt yourself into your stationary vehicle or seek a depression or low spot on the land surface.

1.2.6 Snowfall and Ice Conditions

Working in the winter months will result in activities taking place during periods of snowfall or icy conditions. If you are working during or after snow has fallen, dress appropriately for the conditions. Snow and ice can cause working surfaces to become slippery. Clear snow and ice from work areas to prevent slip hazards. Use caution when performing snow or ice removal activities to prevent injuries. Driving in snowy and icy conditions is also hazardous. Reduce speed and use caution if you must drive in these conditions.

If the weather conditions deteriorate and you do not feel safe working in these conditions, stop work, move to a safe indoor location, and contact your Project Manager to let them know the weather, work conditions, and your location.

1.3 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection. Protection extreme weather conditions can best be accomplished if the conditions are anticipated. Monitor local weather conditions prior to starting work.

STANDARD OPERATING PROCEDURES

SOP No. HS-012 Noise Exposures

1.1 Objective

Working in loud environments can cause hearing damage and loss if the proper protection is not in place. The following procedures describe methods to mitigate unhealthy noise levels and protect hearing.

1.2 General

This SOP is intended for use by employees engaged in work within loud environments. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for work in loud environments and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

Prior to working on a project, an Activity Analysis or Job Hazard Analysis will be performed by the Project Manager or their designee to evaluate the potential hazards and identify steps to be taken to protect workers from hazards. If projects involve high levels of noise from such sources as heavy equipment, power tools, pumps, generators, or other noise source employees should take steps to remove the noise exposure. GEI has an established Hearing Conservation Program located in the GEI Health and Safety Manual.

Hearing protection is required if noise levels in a work area are known to be above 85 decibels (dB), which can be measured with a noise meter. When decibel levels are not known, hearing protection is required if you need to raise your voice to talk to someone standing within a normal speaking distance from you.

The first option for employee protection from hazardous noise levels is to remove the hazard by taking away the source of the noise or using engineering controls to reduce the level. If this cannot be accomplished, the next control measure to be used is to remove the employee from the source. This can be done by moving the work area to a quieter location or distancing the employee from the noise source. For example, GEI employees do not need to be standing next to an operating drill rig or other heavy equipment, by distancing themselves from heavy equipment or other noise sources the need for hearing protection can be eliminated. The final option for employee protection is personal protective equipment (PPE). Disposable ear plugs are made available to GEI employees

and are to be used when required. Additional means of hearing protection will be provided, such as ear muffs, if the disposable ear plugs are not adequate.

Employees should be aware of surroundings such as moving equipment, traffic, and other site hazards when wearing hearing protection.

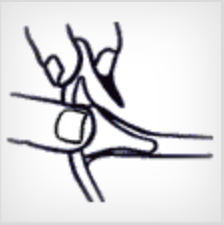
1.3 Proper Use of Hearing Protection

DISPOSABLE EAR PLUG FITTING INSTRUCTIONS

Before fitting any ear plugs, make sure your hands are clean.
Foam ear plugs are disposable and not intended for reuse.

Hold the ear plug between your thumb and forefinger. Roll and compress the entire ear plug to a small, crease-free cylinder. While still rolling, use your other hand to reach over your head and pull up and back on your outer ear. This straightens the ear canal, making way for a snug fit.

Insert the ear plug and hold for 20 to 30 seconds. This allows the ear plug to expand and fill your ear canal.



Test the fit. In a noisy environment, and with earplugs inserted, cup both hands over your ears and release. You should not notice a significant difference in the noise level. If the noise seems to lessen when your hands are cupped over your ears, your ear plugs are not fitted properly. Remove and refit following instructions.

Always remove ear plugs slowly, twisting them to break the seal. If you remove them too quickly, you could damage your ear drum.

REUSABLE EAR PLUG FITTING INSTRUCTIONS

Before fitting any ear plugs, make sure your hands are clean. Reach around your head and pull up and back on your outer ear. This straightens out the ear canal, making way for a snug fit.

Reusable ear plugs should be inspected and cleaned often in soapy water. If they become hard, torn, or deformed they should be replaced.

Hold the stem end of the ear plug and insert it well inside your ear canal until you feel it sealing and the fit is comfortable.

Test the fit. In a noisy environment, and with ear plugs inserted, cup both hands over your ears and release. You should not notice a significant difference in the noise level. If the noise seems to lessen when your hands are cupped over your ears, your ear plugs are not fitted properly. Remove and refit following instructions.

Always remove ear plugs slowly, twisting them to break the seal. If you remove them too quickly, you could damage your ear drum.

1.4 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURE

SOP HS-014 Utility Mark-out

1.1 Objective

This standard operating procedure (SOP) provides guidance for utility mark-out procedures related to drilling, excavation, or other sub-surface or intrusive activities to avoid injury to GEI employees or property damage. This SOP is applicable when GEI is responsible for its operation or our subcontractor's operation for utility mark-out.

Clients or local agencies may have additional requirements or procedures for the marking of utilities. If local utility mark-out procedures differ from those described within this SOP, applicable state or municipal regulations should be followed.

1.2 General

- This SOP is intended for use by employees engaged in work with sub-surface or intrusive activities. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for subsurface hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.
- The contractor or GEI employee visits the site and marks out each exploration area with white paint, flags, or stakes. Mark-outs will be performed wearing required PPE, including eye protection when using spray paint to perform the mark-out.
- Exploration locations should be marked out with sample identification number(s) and type of sample (e.g., boring, test-pit, or monitoring well).
- The contractor compiles information about the work areas on a request form specified by the state utility mark-out program and provides this information to the mark-out program call center with a phone call or electronic submittal. Work area location maps can be sent to the utility mark-out program to clarify locations.
- The mark-out program customer service representative will provide a mark-out ticket number and a list of utilities notified upon receipt of the request information. This information will be recorded on the GEI documentation form or in other project documents.

- If known, the contractor will also notify non-member utility operators (such as apartment complexes, commercial complexes, railroads with communication cables, etc.).
- Utility companies or their sub-contractors will only mark-out, or clear, utilities under their responsibility. Generally, this means that they will only mark-out utilities within the public right-of-way up to private property boundaries. Information needed to determine the location of utilities on private properties will be requested from the property owner. This may include available property drawings or as-built figures. If this information is not available, additional non-intrusive surveys of the property may be required by a private utility locator to find underground utilities by using techniques, including ground penetrating radar (GPR).
- American Public Works Association (APWA) Uniform Color Code For Marking Underground Utility Lines are:

    1. **White** – Proposed Excavation
    2. **Pink** – Temporary Survey Markings
    3. **Red** – Electric Power Lines, Cables, Conduit and Lighting Cables
    4. **Yellow** – Gas, Oil, Steam, Petroleum, and Gaseous Material
    5. **Orange** – Communications, Alarm, Signal Lines, Cables or Conduit
    6. **Blue** – Water
    7. **Purple** – Radioactive Materials
    8. **Green** – Sanitary and Storm Sewers and Drain Lines

- Before the intrusive work activities begin, the contractor will verify that each utility company has completed a utility location for the work area or the location has been cleared by a private locator and record this on the mark-out request information sheet.
- A visual survey of the project area will be done prior to the start of intrusive activities. This visual inspection will be done to identify signs, manholes, utility boxes, or other evidence of an underground utility is present and has been considered.
- The contractor can begin work on the scheduled work date and time if the utility operators have responded, taking care to find and preserve markings that have been made.
- Completed clearance documentation will be located on the excavation site during excavation activities and kept in project files.
- When excavating near a buried utility, observe the approximate location around that utility.

- If exposing a utility, proper support and protection must be provided so that the utility will not be damaged.
- If the excavation work requires significant spans of the utility to be exposed, it is the contractor's responsibility to support them (to prevent sagging or collapse) as needed. Contact the utility operator for support, guidance, or assistance.
- When the excavation is complete, provide proper backfill for utilities that have been exposed.

- Take care not to damage the conduit or protective coating of a utility. If the contractor damages this, leave the damaged utility exposed and immediately call the utility owner.
- If a gas line is contacted, the contractor must notify police, fire, and emergency personnel, and evacuate employees according to the site evacuation procedures. No attempt should be made to tamper with or correct the damaged utility.
- If the contractor/consultant needs to dig within the approximate location of a combustible, hazardous fluid, or gas line (natural gas, propane or gasoline), soft digging is required (hand digging, vacuum extraction) to a maximum depth of five feet. The approximate location is defined as 24 inches on either side of the designated center line of the utility if the diameter is not provided or 24 inches from each outside edge if the diameter is provided.

1.3 Limitations

- Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.
- Mark-out notification time usually does not include holidays. Make sure holidays are considered and mark-out time is scheduled accordingly. Under no circumstances are intrusive activities allowed to be performed prior to the required mark-out.
- Do not use white paint if precipitation is eminent. Consider using stakes if snow is predicted.

STANDARD OPERATING PROCEDURES

SOP No. HS-016 Traffic Hazard Management

1.1 Objective

The objective of this standard operating procedure (SOP) is to prevent or limit the potential for GEI personnel to encounter traffic hazards during field activities.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for traffic hazards. The site-specific health and safety plan (HASP) should include a hazard assessment for the project that identifies the potential for exposure to traffic hazards and the control methods to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

1.3 Traffic Hazard Management

Traffic Hazard Management is the process of identifying and managing the potential risks associated with the movement of traffic through, around, or past a work area. This Traffic Hazard Management SOP is designed to assist employees in identifying and managing these hazards. Work areas should be as safe as possible. It is the responsibility of GEI employees to follow the Traffic Hazard Management plan and adhere to these safety standards. Safety is not negotiable.

Under no circumstances are GEI employees permitted to commence work in a situation that they feel puts their health and safety, or the health and safety of others, at risk.

Major risk factors for work site Traffic Hazard Management include:

- The speed of traffic past or through a work site.
- The clearance between moving traffic, workers, vehicles and equipment, and over-head power lines.
- Traffic volume and vehicle composition.
- Nature and conditions at the work site and approaches to the work site.
- Other factors such as the time of day, sight distance, weather, presence of pedestrians, or cyclists, and the type of work being carried out.

- Other hazards in proximity to the work site (e.g., power lines, open excavations) that may have conflicting measures needing to be considered when developing the plan.

1.4 Site Preparation

The following management measures will be considered whenever working in traffic areas. In addition, remain aware of the amount of traffic around the working area. The work space should be large enough for the job to be completed safely. Check permit, traffic control plans, and flagger/police detail requirements for the local jurisdiction. Perform routine checks of the work zone to make sure there are adequate levels of protection.

1.4.1 Warning Cones and Warning Signs

GEI employees will comply with the Department of Transportation's (DOT) Manual on Uniformed Traffic Control Devices (MUTCD) and/or state regulations for temporary traffic barriers (cones, barriers) and sign placement when required for working in traffic areas. Clearly define the work site by placing traffic barriers around the work space to indicate the space that is needed to safely perform the work. The traffic barrier will help make the work site more visible to other workers and moving vehicles. Place traffic barriers to give yourself adequate space to work, so equipment is not outside the space. OSHA suggests placing the first warning sign at a distance calculated to be 4 to 8 times (in feet) the speed limit (in MPH).

1.4.2 Adequate Light

Requirements for night conditions and work areas with poor visibility are similar to day requirements; however there are a number of additional things to consider, such as visibility of the work site to advancing traffic and sufficient lighting. OSHA requires lighting for workers on foot and equipment operators to be at least 5 foot-candles or greater.

Visibility of the work area can be increased by employing the following measures:

- Using parked vehicles hazard and flashing lights.
- Wearing reflective safety vest that is in good condition.
- Providing adequate lighting to illuminate the work area. This lighting should be positioned so that there is no glare to approaching drivers.
- Placing advance warning signs and cones with retro reflective stripes so that they are visible to road users.

1.4.3 Distance from the Nearest Traffic Lane

Work areas located along roadsides will have a minimum clearance as defined by DOT's MUTCD and/or state or local DOT regulations for cone and sign placement.

1.4.4 PPE

The proper personal protective equipment (PPE), as outlined in the project HASP, will be worn when appropriate. The color/type of safety vest will comply with site regulations.

1.5 Equipment Operation

Vehicles and heavy equipment operators should use a spotter when possible if it is necessary to drive in reverse to reduce risk of collision with oncoming traffic. If it is necessary to drive against the flow of traffic make sure this area is within the work zone and properly blocked off from oncoming traffic.

1.6 Pedestrian Safety

When working near pedestrian traffic, a safe walkway will be established. Refer to local regulations when establishing pedestrian walkways.

1.7 Limitations

Follow safety procedures as defined in the site-specific HASP, federal DOT, and local jurisdictions. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURES

SOP No. HS-018 Working Around Heavy Equipment

1.1 Objective

The objective of this standard operating procedure (SOP) is to prevent or limit the physical hazards when working around heavy equipment for GEI personnel.

1.2 General

This SOP is intended for use by employees engaged in work with the potential for working near heavy equipment. The site-specific health and safety plan (HASP) should include a hazard assessment for the project for working near heavy equipment to be implemented by GEI employees. These hazards should be reviewed in the project safety briefing and documented on the Project Safety Briefing form, found on the Health and Safety page of the GEI intranet.

1.3 Heavy Equipment

Heavy equipment (excavators, backhoes, drill rigs, etc.), can present many physical hazards that can result in serious injury or death if the proper safety precautions are not followed. The following is a list of precautions to be aware of when working around heavy equipment:

- Wear appropriate personal protective equipment (PPE), including a reflective, high-visibility safety vest.
- Always keep your distance from moving vehicles.
- Do not assume the vehicle operator knows where you are or where you are going. Make sure to make eye contact and receive acknowledgement of your presence with the operator. Avoid working near heavy equipment, but if unavoidable, communicate your location with the heavy equipment operators. If using hand signals, discuss the signals with the equipment operator prior to starting work.
- Watch for moving equipment. Construction sites can have a lot of activity and vehicles may be moving closer than you may think.
- Do not rely on back-up or other alarms. They may not be working or you may not hear them with the noise of other activities taking place in the area.
- Stay out of the swing radius of cranes, excavators, or other equipment that swings or rotates.
- Do not walk beside a moving vehicle, the vehicle may turn, slip, or the load may shift causing the vehicle to go off course.

- Do not ride on the outside of a moving vehicle.
- Always stay out from under a suspended load on cranes or hoists, even if it means taking the long way around.
- Do not walk behind a piece of equipment that is backing up. The operator may not see you.
- If working next to heavy equipment is unavoidable, be aware of the hazards including pinch points and moving parts. Use a spotter to watch the work area for moving equipment.
- If necessary, ask the operator to stop equipment operation to perform your work tasks.
- Verify the location and operation of emergency shut-off devices on the equipment.
- Be aware of the fuels and chemicals associated with the equipment. Have a spill prevention and response plan in place that includes the appropriate containment materials (i.e., spill kit).
- Do not wear loose fitting clothing when working around moving equipment (i.e., drill rig augers).
- Do not operate heavy equipment.
- Do not use cellular telephones near operating equipment.

1.4 Limitations

Follow safety procedures as defined in the site-specific HASP. Appropriate PPE must be worn correctly to provide the intended level of protection.

STANDARD OPERATING PROCEDURES

SOP No. HS-025 Manual Lifting

1.1 Objective

The purpose of the GEI Consultants, Inc. (GEI) Manual Lifting SOP is to identify and reduce potential work-related musculoskeletal disorder (WMSD) hazards. The SOP is intended to comply with state regulations and safe work practices developed by the Occupational Safety and Health Administration (OSHA). Modifications to meet these requirements will be made to this program as changing laws or regulations dictate.

1.2 General

The following Safe Lifting guidelines will be followed by GEI employees involved in manual lifting activities:

- Before manual lifting is performed, a hazard assessment must be completed. The assessment must consider size, bulk, and weight of the object(s), if mechanical lifting equipment is required, if two-man lift is required, whether vision is obscured while carrying and the walking surface and path where the object is to be carried.
- Get a co-worker to help if equipment or other item is too heavy to lift.
- If possible, use powered equipment instead of manually lifting heavy materials. Lifting equipment such as dollies, hand trucks, lift-assist devices, jacks, or carts can be provided for employees.
- Reduce lifts from shoulder height and from floor height by repositioning the shelf or bin.
- Make sure walkways are clear of tripping hazards before moving materials.
- Use your legs and keep your back in a natural position while lifting. Keep the load close to your torso.

- Test the load to be lifted to estimate its weight, size, and bulk and to determine the proper lifting method.

- Do not twist while carrying a load. Instead, shift your feet and take small steps in the direction you want to turn.
- Make sure there are appropriately marked and sufficiently safe clearances for aisles and at loading docks or passageways where mechanical-handling equipment is used.
- Properly stack loose or unboxed materials which might fall from a pile by blocking, interlocking, or limiting the height of the pile to prevent falling hazards.
- Bags, containers, bundles, etc. should be stored in tiers that are stacked, blocked, interlocked, and limited in height so that they are stable and secure to prevent sliding or collapse.
- Storage areas should be kept free from accumulation of materials that could lead to tripping, fire, or explosion.
- Work methods and stations should be designed to minimize the distance between the person and the object being handled.

Supervision must periodically evaluate work areas and employees' work techniques to assess the potential for and prevention of injuries. New operations should be evaluated to engineer out hazards before work processes are implemented.

1.3 Injury Reporting

Injuries experienced during manual lifting activities should receive prompt medical attention. If a GEI employee suffers an injury on the job, he/she is to report the injury to their immediate supervisor within 2 hours of the incident. The supervisor will immediately notify the CSHO and Director of Human Resources.

After verbal notification has been made, an Incident and Accident Report Form is to be completed by the employee and/or Project Manager and submitted to Human Resources and the CHSO within 24 hours of its occurrence. This form is available on the Health and Safety site on the GEI Intranet.

Upon notification from a Branch or Office Manager, Human Resources, and/or the receipt of the Incident and Accident Report Form, the CHSO and/or the RHSO will conduct an investigation and evaluation of the incident and the incident response. Information received will be analyzed for the hazards and risk factors associated with the incident. The CHSO will then recommend (as necessary) engineering controls, PPE, training or other appropriate measures to minimize the potential for future musculoskeletal injuries. The CHSO/RHSO will develop educational information based on lessons learned for distribution to GEI employees.

1.4 Training

Training will include general principles of ergonomics, correct maul lifting training to avoid musculoskeletal injuries, recognition of hazards and injuries, procedures for reporting hazardous conditions, and methods and procedures for early reporting of injuries.

1.5 Ergonomic Evaluation Process

1.5.1 Requesting an Evaluation

An evaluation can be requested by the employee if they have concerns about their workstation, tasks, or are experiencing discomfort while working. The employee can request an evaluation by directly contacting their supervisor, Branch Manager, RHSO, HR or the CHSO via email. The Branch Manager will be notified of the requested evaluation. The Coordinator will send the Worksheet to the employee, who will complete it and return it to the Coordinator. The Coordinator will review the Worksheet and suggest modifications to the employee. If these modifications do not resolve the issue, the Coordinator will then schedule an in-person evaluation with the employee. If an employee is experiencing discomfort at their workstation and a request for an evaluation has been made, the evaluation will occur as soon as possible to assist the employee. If the Coordinator is not available another Coordinator will be assigned the evaluation.

Coordinators will be trained to treat the information obtained during the evaluation as confidential. If there are concerns the employee does not wish to discuss with the Coordinator due to their personal nature, a representative from HR will be designated to assist with the evaluation.

1.5.2 Job Hazard Analysis

Once the evaluation has been scheduled, the Coordinator will meet with the employee at their workstation and conduct the interview and review their work area. The Ergonomic Evaluation Checklist will help guide the Coordinator through a series of questions to help evaluate the potential ergonomic safety concerns. The evaluation is designed to be a conversation between the employee and Coordinator to help develop an open dialog. During the evaluation the Coordinator will identify ergonomic risk factors and implement immediate corrective actions, if possible. In many cases, simple adjustments can be made to the work station using existing equipment. Ergonomic work practices including “ergo breaks” and stretching can also be recommended.

1.5.3 Corrective Actions

During the evaluation the Coordinator may suggest adjustments that can be made to the existing work station. The employee will be encouraged to adopt the suggestions but ultimately has the choice to accept and implement them. Once the evaluation has been completed, the Coordinator will review the evaluation and if there are concerns, they will evaluate them with the HSC. Once the HSC has discussed the evaluation and developed corrective actions, they will be documented on the Checklist. The corrective actions will be shared with the employee and the Branch Manager. Prior to equipment purchases, approval will be authorized by the local branch manager.

Broken equipment will be taken out of service, properly disposed of and replaced. If improper equipment is being used, the proper equipment will be obtained or purchased with approval. If the employee's workspace presents a hazardous condition (fire hazards, trip hazards, noise exposure, etc.) the hazard will be corrected, if possible, or the employee will be moved to a safe workspace. If the equipment being used is not an appropriate fit for the employee, a suggestion will be made in the evaluation report to obtain or purchase the equipment that fits the employee properly.

If a repetitive task is identified, options will be discussed with the Branch Manager, the HSC and/or other appropriate personnel to evaluate whether the task can be altered to facilitate a safer condition. Many times accelerated deadlines, apprehension, or lack of options cause an employee to believe they don't have a choice and will just push through to complete the task potentially causing an ergonomic injury. These types of situations need to be recognized and corrected. A proactive approach by both the Branch Manager and employee should be instituted to prevent or anticipate these situations so that the correct equipment, additional employees or better planning can be incorporated while still meeting the deadline.

The organization of the workspace is also an important ergonomic factor. Items should be placed so that frequently used equipment is within arm's reach and located on the correct side of the body for which that equipment is used to prevent unnecessary twisting or reaching. Having adequate space to complete tasks is necessary but may not be achieved if piles and unnecessary items occupy the space. The Coordinator can suggest how to take advantage of tools and organizational skills to free up space.

Other areas of concern may be outside factors that occur away from the office. If the employee conducts field work, the tasks should be completed with ergonomics in mind.

A separate evaluation of these tasks may be conducted to determine if a different process or equipment may be used to reduce any unnecessary pressure or fatigue to the employee's body. At times when employees have permission to work from home or use their GEI computers at home, in hotels while traveling, in an environment that is not ergonomically correct, employees will be encouraged to adopt the ergonomic recommendations they learn at work.

Employee's hobbies can also pose ergonomic risks. Hobbies that involve repetitive motions, prolonged postures, vibration, excessive force/overexertion and adverse environmental factors may cause ergonomic injuries that can be aggravated at work.

During the interview process, the Coordinator will try to identify these risks and discuss techniques to help alleviate discomfort and minimize additional injury. It will be up to the employee to modify anon-related work risks.

If an employee is experiencing discomfort, efforts will be made to alleviate the discomfort while at work. For example, if an employee has a physical injury that occurred outside of work that requires them to keep their leg elevated, the employee can work with their Coordinator to determine a solution. This may involve temporarily modifying their workstation or transferring to another workstation. Healthy work practices and generally good health are keys to staying comfortable at work too. Regular stretch breaks, good posture, vision check-ups, good sleep habits and maintaining a healthy weight are factors in creating a comfortable work environment. If a physical non-work related problem persists and impedes the employee from being effective at work, suggestions may be made to see a personal physician for further advice.

1.5.4 Reporting and Follow-up

Once the evaluation has been completed and the Coordinator's suggestions have been implemented, the Coordinator will document the findings on the Checklist and an evaluation report will be completed and submitted to the employee, the evaluated employee's Branch Manager, and the CHSO. Then a follow-up will be conducted by the Coordinator to evaluate whether the adjustments were successful. The timeline for follow-up will be based on the adjustments suggested and employed. If new equipment is installed, the Coordinator will follow-up after the equipment has been installed and the employee has had time to adjust to it. If an injury has been identified, the Coordinator will notify the Branch Manager and CHSO immediately following the evaluation. This will confirm on-going management of the injury.

During the follow-up evaluation the Coordinator will make visits to the employee's workstation and assess visually and through interviews determine how the changes have been received. Each of these follow-ups will be documented on the Checklist. If during the follow-up a re-adjustment or different equipment is needed, the reevaluation process will continue until the employee is comfortable.

1.6 Limitations

Follow safety procedures for manual lifting.

National Grid Contractor Safety Requirements

FOREWORD

National Grid's vision is to be a world-class safety organization with zero injuries every day. This includes working to help ensure the safety of our employees, contractors and the community. National Grid is committed to delivering operational excellence, including excellent levels of safety internally and in cooperation with the external contractors we rely on.

The Executive Safety Committee provides review and input for Safety Policies and Procedures through the Safety Policies and Procedures Subcommittee.

The Safety department is the owner of this procedure and is responsible for maintaining and implementing this procedure, soliciting comments from stakeholders and revising as necessary.

This document, "Contractor Safety Requirements", represents the current contractor safety requirements that are unique to operations and various functional groups at National Grid. This document does not specifically reference actions that are required by OSHA, other laws, rules, or regulations. These are requirements that should be understood by the contractor and contractor compliance with all applicable federal, state and local laws, rules, and regulations is expected by National Grid as a contractual condition.

Questions regarding this procedure should be referred to the National Grid Safety Department.

This document will be updated as necessary to communicate all aspects of National Grid's contractor safety to bidders, current contractors and to reflect changes in National Grid's Safety Policies and Procedures.

1.0 CONTRACTOR SAFETY AT NATIONAL GRID

1.1 Definitions

Adverse Public Impact
Incident that disrupts service to the public or results in adverse public reaction.

Bulk Commodity Transportation
Activities involved in the movement of bulk commodities via truck, rail, plane or water vessel onsite and offsite on behalf of National Grid that if released could have safety and / or environmental consequences. Examples include but are not limited to: gasoline, oil, boiler chemicals, LNG, Nitrogen.

Compliance Assessments (CAs)
An act of observing and engaging in discussion with employees at a job site or work area locations. Compliance Assessments are documented using the Compliance Assessment checklist for each segment of operation and are not considered anonymous. Compliance Assessments are utilized to comply with internal policy and external regulatory requirements.

Contracted Services
Contracted Services refers to any activity that is conducted by an organization or individual under the terms of a purchase order. Contracted services may include all types of construction and maintenance services, tree trimming, building maintenance and demolition, electrical structure dismantling, site restoration, engineering design, recycling and waste disposal, drilling, rigging, electrical, and utility pole/structure maintenance.

Contractor
An independent person or company that undertakes a contract to provide materials or labor to perform a service or do a job and are responsible for the safety of his/her employees and subcontractors.

Contractor Orientation
Contractor orientation is intended to serve as a resource in order to provide the contractor with the tools necessary to educate their employees and subcontractors. The session is not intended to train the contractor management, their employees or subcontractors. The extent and content of the orientation session shall be commensurate with the scope and type of the contractor's activities.

Hazardous Conditions
A condition that can and is rectified immediately by the person who identified the hazard.

Incident
An unplanned event that has a human component and results in or could potentially result in harm to people, damage to property and/or adverse public impact.

Incident Management System (IMS)
National Grid's online incident management tool that allows the company to report safety, environmental and asset-related incidents, perform incident analysis, generate safety reports and monitor the organization's safety performance.

ISNetworld, Inc. (ISN or ISN System)
Third party contractor that is a global resource for connecting Hiring Clients with safe and reliable contractors and is a contractor information management system currently contracted with National Grid.

Job Brief
A planned interactive discussion with all contractor employees, sub-contractors and team members working on a job that occurs just prior to a job, task, project, prior to a change in planned work or when a new person arrives on site.

Major Hazard Asset (MHA)
A class of assets at National Grid, including Compressed Natural Gas (CNG), Gas Transmission (≥ 125 psig), Power Generation sites, Liquefied Natural Gas (LNG) plants, and LNG Trucking, in which any condition, or set of conditions, presents potential for a major accident to occur. Also referred to as process safety assets.

Major Accident
An event involving the release of potentially dangerous materials, the sudden and uncontrolled release of large amounts of energy (such as fires and explosions), or both. These can have catastrophic effects and can result in multiple injuries and fatalities, as well as substantial reputational, economic, property, and environmental damage

Operator Qualification (OQ)
As defined in the Code of Federal Regulations, Transportation, 49 Subpart 192.801 through 192.809 and/or DOT pipeline qualified for gas contractors doing work at National Grid. Additional state requirements pursuant to the state the contractor is working may be required.

Process Safety Management
Method of focusing and mitigating concerns of major hazards impacting safety, environmental damage and business losses. It is an organized effort to identify

and analyze the significance of hazardous situations associated with a process or activity to aid management in making critical safety decisions

Project Representative
National Grid Owner's Representative or designee who is assigned to certain contracted projects and communicates regularly with the contractor during the course of the contracted service. This person also ensures the work is being performed in accordance with the contract, including the safety requirements.

Purchase Order (P.O.)
An agreement/contract between National Grid and a contractor to provide services and/or materials. The P.O. is set up by Procurement. The term "Contract" and "P.O." are similar and may be used interchangeably. A "Blanket P.O." is set up for contractors whose work is on-going. A "one-time P.O." is set up for project work.

Qualified Electrical Worker
Those who are knowledgeable in the construction and operation of the electric power generation, transmission and/or distribution equipment involved, along with the associated hazards.

Qualified Gas Worker
Any contractor who performs covered tasks in accordance with National Grid's Operator Qualification Program and the Northeast Gas Association are required to be knowledgeable and meet all regulatory standards.

Risk Assessment
A risk assessment is the process of identifying hazards and calculating or ranking the associated risks according to: the likelihood of occurrence, the severity of the harm from the hazard, and the amount of time of exposure to the hazard.

Safe/Unsafe Act (SUSA)
The act of observing and engaging in discussion with employees at a job site or work area location. SUSA Visits focus on observation of behaviors and result in obtaining a commitment to working safely. SUSA Visits are conducted by members of management and safety personnel on a routine basis and are a vital part of managing the company and developing a safety culture. SUSA Visits are not announced and they are anonymous. For trending purposes, SUSA Visits will be documented by the observer after the discussion is complete and the observer has left the job site. SUSA Visits should focus on prevention of soft tissue injury as well as other at-risk behaviors.

Safety Observer

A person who is responsible for alerting the work team to any potential unsafe conditions or lack of compliance with approved work practices, procedures or guidelines.

Transportation Advisor
Third party agency specializing in federal and company mandated drug and alcohol testing programs.

1.2 Introduction

Safety performance is a prime consideration in the selection of contractors. National Grid will stipulate safety performance requirements and responsibilities in our contracts, purchase orders (POs) and will hold the contractor accountable for meeting the contractual requirements.

National Grid's goal is to establish a long-term working relationship with contractors who share the same safety values and demonstrate those values through their work performance.

Contractor safety at National Grid involves three broad areas:

1. **The Contractor Procurement (Selection) Process**
   Contractor safety begins with the selection of contractors who have demonstrated a strong safety record. National Grid will complete a review during the procurement process that involves determining a contractors' risk and the scope(s) of work involved. National Grid currently uses ISNetworld, Inc. as a third (3rd) party assessment process for assisting with contractor procurement. The 3rd party entity will vet and continually monitor individual contractors' compliance with applicable safety and/or risk and insurance program requirements.

2. **Safety Communication**
   Safety communication covers all the avenues and forums in which National Grid and the contractor communicates safety. Communication begins early in the bidding phase and is on-going as an integral part of the contractor-customer relationship. The goal is to ensure clarity, transparency and to limit misunderstandings.

3. **Safety Compliance**
   Safety compliance is the process of ensuring that the necessary technical provisions of the contract are being followed. National Grid will assign a project representative or other designee to provide guidance and oversight. The Contractor is responsible for their employees and subcontractors and shall be held accountable for ensuring compliance

with all applicable safety rules while working on National Grid property, rights of way (ROWs) and our assets.

1.3 Risk Ranking of Work

1. National Grid characterizes and ranks risk by the scopes of work performed. The categories are classified as high, medium or low risk. Prior to being considered for work at National Grid, contractors who perform High or Medium Risk work must be pre-qualified in ISN. See Appendix A for more information regarding the National Grid Contractor Risk Matrix.

2. Activities that are designated as “high risk” means that catastrophic event can result if safety measures are not followed. Activities designated as “medium” risk present certain opportunities for moderate to significant injuries, property or reputational damage, and/or loss of service and/or possibly business continuity. Activities designated as “low” risk may still require safety compliance and control measures, although the contractor performing the work does not necessarily need to be enrolled in ISN, if that is the only classification of work that contractor performs for National Grid.

3. The designation High Risk, Medium Risk, or Low Risk, refers only to the inherent risk associated with the work activity and is not an opinion on the ability of a contractor to work safely.

4. The Procurement Agent will notify the bidder/contractor at the beginning of the procurement process if their contracted service has been ranked as high or medium risk.

1.4 Bidder Information Request – High and Medium Risk Work

1. Any contractor bidding on high or medium risk work shall be required to complete a questionnaire regarding the Contractor’s safety program, compliance and history of occupational illnesses and injuries (ISNetworld New Vendor Onboarding application form, located on the ISNetworld website). Contractors will also be required to demonstrate that all employees, including subcontractors, are qualified.

2. ISNetworld then thoroughly reviews contractors’ qualifications against a prerequisite list of National Grid criteria. National Grid has established that contractors performing high or medium risk work MUST HAVE and MAINTAIN a grade of “C” or better in the ISN system to perform work and services for National Grid. ISN will track and manage the National Grid pre-qualified contractor bidder lists. This bidder list is the first step for a contractor in establishing a working relationship with National Grid. For

active ISN contractors, ISN will request updated information monthly. Contractors who do not have a current PO, contract, or authorized scope of work with National Grid will be considered as a Prospective bidder and will be asked to submit information quarterly. It is understood that insurance may not be maintained within National Grid standards, however, once a contractor is awarded a contract, proper and adequate insurance must be provided to ISNetworld to achieve a passing grade. Lack of insurance or inadequate insurance is an immediate "F" grade in the ISN system per National Grid criteria.

3. Project representatives may request an exemption or variance from requiring a contractor to be placed in ISNetworld for various reasons. A Supplier Exemption Request form (located in the forms section of the SHE Infonet) shall be completed, documented and signed by the business unit VP and Corporate Safety Director prior to contract award.

4. The information that the Bidder provides National Grid via ISN serves as the basis for assessing safety qualification. For this reason, it is important for contractors to maintain transparency throughout the process. National Grid and ISN will review all submitted information. Any effort in avoiding complete disclosure will disqualify the Bidder from bidding work at National Grid.

1.5 Safety Compliance

1. National Grid representatives evaluate contractor compliance by conducting routine site visits, Compliance Assessments (CA's) Safe/Unsafe Acts (SUSA) visits and attending periodic contractor safety meetings. Contractors should also perform and document safety self-assessments to ensure compliance to federal, state, local and National Grid regulations. This combined effort enhances, solidifies safety compliance and has the added benefit of quality control / quality assurance of the work performed.

2. Contractors bidding on new work shall provide worker qualifications to the National Grid procurement representative via the "Bidder Information Request" form and/or ISN National Grid On-boarding form.

3. If a safety violation is observed by a National Grid representative, the violation will be discussed with the contractor at the time of discovery.

4. Contractor employees enrolled in ISNetworld that are involved in any accident, incident or significant near-miss event, will be required to lead an investigation and root cause determination process. In addition, the contractor must implement corrective actions and establish measures to

prevent a recurrence through an incident investigation process and document the details within ISN.

5. Individual contractor personnel who habitually violate any safety rules should be identified, and the contractor should remove the individual(s) from the project. National Grid reserves the right to remove any contractor employee(s) who violate safety rules or procedures; pose a safety risk to themselves, other contractors; our employees; or the general public.

6. If a contractor is observed to be operating in a manner that creates an imminent danger to persons or property, it is the responsibility of all individuals observing the hazard to cease the hazardous operation impacted until the issue has been resolved to the satisfaction of National Grid, the Owners Representative or Safety Representative.

7. Contracts/POs shall require the contractor to immediately forward any citations, notices, or OSHA reportable cases per 29 CFR 1904.39 from a National Grid project, upon receipt to the appropriate project representative and/or ISN. The project representative shall distribute copies of the citation or notice to senior management, Safety, Procurement, and the Legal Department.

8. Willful and/or repeat violations of safety requirements by the contractor may be considered a breach of the contract and reason for contract termination.

9. If the contractor's overall safety performance is viewed as being unsatisfactory or noncompliant with contract provisions, and if the contractor is unwilling to demonstrate satisfactory program improvement, the result may be considered a breach of the contract and reason for contract termination.

10. National Grid project managers and/or construction supervisors shall document safety compliance by completing a "Contractor Performance Evaluation" for each project. This documents both positive and negative safety performance or behaviors and this feedback will be used in the decision process for awarding future contracts.

2.0 GENERAL SAFETY REQUIREMENTS

2.1 Introduction

1. All contractors are required, and expected to comply with all applicable requirements of the Occupational Safety and Health Administration (OSHA), and all other applicable federal, state and local laws, ordinances, regulations,

and other project and site-specific permits unless superseded by identified National Grid procedures.

2. This document represents policies and safety-related work methods unique to National Grid and they may be more stringent than OSHA regulations. Contractors must follow these requirements as well as their own rules or regulations that meet or exceed OSHA and other regulatory requirements.

3. National Grid will provide more detailed information and guidance regarding specific procedures prior to commencement of work.

2.2 Applicability

Applies to: All contractors, as needed

1. In any contracted task, where a safety observer is required, it is the responsibility of the contractor to provide that person and ensure that he/she is qualified to perform the role when needed.

2. A 4:1 pitch shall be maintained when using an extension ladder or the ladder shall be tied off and/or secured and 3 points of contact shall be maintained by the climber. If both hands are needed to perform work, then fall protection is required.

3. Although not preferred, if hard hats are worn backwards, the suspension adjuster must always face the rear. Class E hard hats are required for all electrical work.

4. 20KV EH overshoes are required when:
    - Workers on the ground are working within 50’ of the master ground connection point to earth.
    - Operating a wire trailer and pulling/tensioning machine.
    - Operating a winch truck or reel trailer with its payout in an energized area that may result in inadvertent contact.
    - Hand digging in close proximity to energized cables within the tolerance zone.
    - Making repairs in a trench to a faulted primary cable without de-energizing any adjacent energized primary cables within close proximity.
    - Using approved live line tools to move energized primary cables in a trench.
    - If removing underground cable rubber covering or arc suppression blankets from an energized cable.

- Working within minimum approach distance (MAD) of downed electrical wires or foot patrolling for such wires.
- If setting poles in proximity to energized lines or equipment and using truck controls from the ground.

5. National Grid expects that all cargo will be secured in accordance with U.S. DOT requirements.

    - As of January 2004, the Federal Motor Carrier Safety Administration (FMCSA) within the U.S. DOT published Cargo Securement Rules 393.100-136 Subpart I – Protection Against Shifting and Falling Cargo.

6. Chaps are required to be worn by ANY person using a chainsaw to make a cut on the ground or assisting in that cut and within striking distance. Other situations where cut off machines are used, chaps designed for the purpose of providing durable protection from abrasion, spatter and sparks from cutting ferrous metals shall be required; however, a hazard assessment should be completed to determine the need. Always use proper cutting techniques and push blades away from the body when using tools that may slip or inadvertently make contact with the leg. Never leave any equipment running while not in use.

7. All applicable contractors must meet the requirements of drug and alcohol testing in accordance with FMCSA DOT 49 CFR Part 40 and Pipeline and Hazardous Materials Safety Administration (PHMSA) DOT 49 CFR Part 199. National Grid shall monitor contractor compliance to the drug and alcohol regulatory requirements through Transportation Advisor or ISNetworld as needed.

8. Contractors who drive regularly in delivery of service for National Grid shall:

    a. Have a safe motor vehicle operations policy which must be communicated to their employees before they begin driving for company business. The contractor is expected to follow National Grid's *Safe Motor Vehicle Operations* policy to include the following:
        - Prior to moving any vehicle, the driver shall perform a "circle of safety" inspection. This is to confirm not any person, animal, equipment, or property will be injured or damaged when the vehicle is moved.

        - Drivers should back into or pull through a parking space so that when you re-enter the vehicle, the first move is forward.

- No driver shall use a hand-held mobile telephone while driving a vehicle for National Grid business.

- The driver shall eliminate or minimize sources of potential driving distractions to include, eating, smoking, reading, writing, grooming, use of any electronic devices, mirror or seat adjustment. These shall be done when the vehicle is not in motion.

b. Comply with all requirements of all federal, state and local regulations regarding safe motor vehicle operations.

c. Ensure that new and existing employees have a valid Driver's License in accordance with requirements of specific job duties and classification/type of the vehicle they are operating. Contractors must have an acceptable driving record. If their driving record is unacceptable, the driver shall not be permitted to operate a vehicle on behalf of National Grid.

d. Provide vehicles in safe operating condition, in accordance with federal state and local regulations. The vehicle should be equipped with proper safety equipment as appropriate for the vehicle type and its intended use.

e. Track and evaluate any vehicular accidents or incidents experienced by their employees. Corrective actions, such as driver coaching, corrective action driver training and medical/vision tests should be recommended and acted upon where appropriate. All accidents or near misses while performing work for National Grid shall be communicated to the National Grid project representative or designee and documented in the ISN system.

f. For more information, contact a National Grid representative for a copy of the National Grid Safety Policy *Safe Motor Vehicle Operations*

9. All contractors that require the use of heavy equipment shall ensure that competent, appropriately licensed, skilled and qualified personnel are in control of this equipment at all times. In addition, contractors shall ensure the following:

    - Equipment is inspected for safety and use at the beginning of the work period of shift. All failing or defective equipment and components shall be removed from service.

- Equipment is under the control of trained operators who are always aware of their location and the locations/presence of persons working near the equipment, its swing zones and blind spots.

- Operators shall ensure that no loose clothing or jewelry is present that could inadvertently get caught equipment controls.

- Equipment is kept free of debris, water, oil, grease, mud or anything that could create a slip/fall hazard inside the cab.

- Keep hands, feet, and clothing away from power-driven and moving parts.

- Equipment cab windows should be kept clean and free of mud, ice, snow and/or fog for maximum visibility.

- Never carry passengers on heavy equipment or any equipment unless it is equipped to do so.

- Ensure that stabilizers are extended prior to starting a task.

- Before making a swing, operators shall always look out the windows and mirrors for confirmation that the area is clear. If visual confirmation is impaired or the operator is unsure due to weather, lighting or other interferences, the operator shall cease operation until an independent spotter can check the swing area and confirm it is clear.

- All excavations shall have signs posted, demarcation and controlled to prevent unauthorized persons from entering and falling inadvertently into the excavation. Excavations shall only be opened under the supervision of a competent person for excavation.

- All pot holing/test holing and exploratory excavations shall utilize vacuum excavation whenever near known or the possibility of unknown hazards such as live electrical or gas conveyances. When using vacuum excavation in combination with air blowing/air knife tools, all persons in the immediate area shall be wearing safety glasses in addition to a full face shield.

- No one is to work under a suspended load.
- Never use a bucket to lift personnel.
- Ensure stabilizers are in the upright and stored position before moving equipment.
- Operators shall not leave heavy equipment running unless the following requirements are met:
    - Parking break is engaged and wheels are chocked (if applicable)
    - Surroundings create no hazard of unqualified personnel entering unattended equipment
    - Vehicles and equipment idling limited to that designated state and local environmental regulations (generally, 3 to 5 minutes maximum). See table below for additional information

Region	Vehicles	Idling Limit	Exemptions Include
New York	Diesel trucks	5 minutes	• Traffic conditions • Temperatures < 25°F and motionless for two hrs • Hybrid electric engine charging battery vehicles • To provide power to auxiliary sources
NYC	All Motor vehicles	3 minutes	• Emergency vehicles • Loading/unloading • Temperatures <40°F
New Hampshire	Diesel/ Gas vehicles	5 minutes >32°F 15 minutes -10°F to 32°F No Limit <-10°F and no nuisance created	• Traffic conditions • Emergency vehicles takeoff power for auxiliary uses • Vehicles being serviced or repaired • Operated solely to defrost windshield
Massachusetts	All Motor Vehicles	5 minutes	• Vehicles being serviced or repaired • Vehicles in operation for which associated power is needed • Delivery vehicle in which engine power is needed
Rhode Island	Diesel Motor Vehicles	5 minutes	• Traffic conditions • Operate defrosting, heating, or cooling equipment to ensure health and safety of the driver or passenger. • Temperatures between 0 & 32°F - 15 minutes per hour. If < 0°F idling as needed for heat • To provide power to auxiliary sources • Vehicles being serviced or repaired
Vermont	All Motor Vehicles	5 minutes within any 60-minute period	• Emergency/public safety vehicles while engaged in "official operations" • Idling necessary to operate safety equipment • Vehicles in operation for which associated power is needed • Vehicles being serviced or repaired

- All lifts that occur on National Grid properties, ROWs or near critical assets require formal lifting plans developed by the contractor and reviewed with the National Grid project representative. Some lifts will also require formal critical lifting plans and this may include PE or geotechnical assessments to ensure a stable lifting base for the crane or other apparatus.

10. All temporary, metal fencing installed or located under transmission lines shall be grounded and have signage according to National Grid grounding standards. Contact a National Grid representative for a copy of the Engineering Documents ST 03.05.001ST 03.06.001 and SP 08.00.001.

3.0 ADMINISTRATIVE SAFETY REQUIREMENTS

3.1 Worker Qualification Assurance

1. In order to meet National Grid safety requirements, the contractor must describe how workers, including subcontractors, are qualified. The contractor must supply information concerning the type of skills assessment performed, training programs and how they ensure that employees demonstrate competencies. National Grid reserves the right to review this information and request additional training requirements. All documents shall be uploaded and maintained in the ISN system. For work on process safety assets, the contractor shall ensure all workers and sub-contractors are trained and receive appropriate refresher training to maintain their appropriate level of certification and qualifications needed to perform work safely.

2. The contractor shall provide management personnel qualifications through resumes or other documents. National Grid may interview and/or approve management personnel if considered necessary.

3. For work on Process Safety assets (Gas Transmission, Generation, LNG, LNG Transportation and CNG), contractors shall provide a description of their experience in the business asset and specific tasks including similar projects, lists of licenses/certifications, and references from previous similar projects. Contractors shall be made knowledgeable of National Grid process safety requirements that are relevant to their specific work activities by the business hiring them.

3.2 Meetings

Applies to: All contractors; as needed

1. The pre-bid meeting is coordinated by National Grid Procurement to provide bidders with an opportunity to become acquainted with contractual requirements and specific safety issues concerning the project, including company-specific safety rules and known site conditions.
   a. For contractors working on Major Hazard Assets, contractual language including designation of site medical facilities, locker rooms, bathrooms, etc. should be discussed by the project team with the contractor at this time.

2. At this time, Procurement will notify the prospective bidders of the following:

   a. If they are required to submit a project safety plan (HASP) prior to the pre-construction meeting

   b. The cost of specific safety equipment, practices and personal protective equipment shall be factored into their bid/proposal.

3.3 Project Health & Safety Plan (HASP)

Applies to: Contractors performing high or medium risk work

1. Contractors who perform high or medium risk-ranked services shall submit a project-specific HASP plan prior to the start of the project and/or at pre-construction meeting. Your National Grid project representative will provide you with specific requirements of the format and/or forms to be completed.

2. For typical work that can be completed in 1-2 days, a documented job brief is sufficient to address the hazards and proper mitigations. Ask your National Grid project representative for details.

3. The *Short Version* plan shall be used for work that generally last 3-5 days. This plan shall include a completed safety hazards checklist and the Emergency Contact Sheet. Proper mitigation shall be documented in the safety hazards checklist for any applicable hazards. For examples of the Safety Hazards Checklist and the Emergency Contact Sheet, a National Grid representative can provide related forms under the *Contractor Safety* website in the Infonet.

4. The *Long Version* plan shall be used for work that will take at least 6 days or complicated projects. At a minimum, the *Long Version* safety plan shall include the following elements:

a. Roles and Responsibilities

b. Scope of Work

c. For contractors working on Major Hazard Assets - List of all equipment contractor is expected to use in work activities and indication that it meets regulatory and National Grid requirements

d. For contractors working on Major Hazard Assets - List of contractor materials to be brought onto work site for review and approval by National Grid

e. Task and hazard identification and risk assessment of the hazards

f. Hazard mitigation/control procedures and work methods

g. Incident investigation and reporting

h. Compliance and monitoring

The HASP shall be submitted to the National Grid project representative for review and approval before work commences. The National Grid project representative shall ensure the HASP meets National Grid criteria and includes all aspects of the project prior to a review by Safety. For an example of a Long Version HASP, a National Grid representative can provide related policies and procedures under the *Contractor Safety* website in the Infonet.

For contractors performing bulk commodity transportation activities, a risk assessment including the potential consequences, frequency and safeguards to be used shall be performed and included in the HASP. If a preexisting National Grid requirement is in place for managing bulk commodity transportation activities, one shall follow those requirements, with no additional risk assessment being required.

Every contracted and subcontracted employee performing work on the project shall review the HASP to ensure steps in the plan are adhered to mitigate hazards during the pre-job orientation. These mitigation steps shall be incorporated into daily job briefs.

In addition, all workers shall sign an attendance sheet during the pre-job orientation that they have reviewed the plan, will adhere to the mitigation steps and they fully understand the plan. This document will be kept at the job site and available for review as needed and if requested by any National Grid representative, or any other parties.

A. Roles and Responsibilities

The HASP shall identify who is providing project oversight and how they are qualified. For example, if the work requires excavation, there must be someone on-site who is qualified as an excavation competent person.

For multi-employer work-sites, the general contractor is responsible for all their employees and subcontractors. The safety plan shall clearly state this responsibility.

If requested to do so, Contractors shall designate a competent person to participate in or conduct a process hazard analysis (PHA) regarding a portion or the entirety of the project. National Grid will not be responsible for training the contractor on the PHA methodology.

B. Scope of Work

The Contractor shall clearly and briefly state the scope of work as provided by National Grid. The plan must specifically address the project or services requested by National Grid.

C. Task and Hazard Identification and Risk Assessment

The contractor shall perform a risk assessment by identifying all significant tasks, the anticipated hazards and hazard mitigation procedures.

The contractor's cost to provide adequate safety measures and to comply with National Grid requirements must be considered and budgeted in the bid/proposal.

D. Hazard Mitigation Procedures and Work Methods

For each hazard, the contractor shall specify measures that will be taken to eliminate, control or mitigate these hazards.

A table below is an example of a method to simply and clearly organize and present the task, hazard, and mitigation steps:

Location: Substation Yard		
Task	**Hazard**	**Mitigation Steps**
Material Handling	Contact with overhead energized lines/equipment	Off load in the clear and have a safety observer present

E. Incident Investigation and Reporting

All work related incidents involving injury or illness to employees, the public or property damage (including contractor vehicle accidents) shall be reported to the National Grid project representative and documented in the ISN system.

F. Compliance Monitoring

To ensure that both contractor employees and subcontractors will achieve safety compliance, jobs with over 100 workers at any point in time or in excess of $1 million will require a full time safety professional hired by the contractor. This safety professional must be qualified, competent and be on site anytime work is performed. Qualifications of this safety representative must be acceptable to National Grid prior to hire by the contractor and may be documented in the ISN system.

G. Environmental Compliance

Unless otherwise specified and based on the scope of work, any potential environmental risks shall be determined and addressed by the contractor following all applicable National Grid procedures. For more information, contact a National Grid representative regarding Environmental Procedure No.6 *Contracted Services* and Environmental Procedure No.25 Appendix A, *Environmental Screening Checklist.*

3.4 Contractor Orientation/Pre-Construction Meeting

Applies to: All contractors, as needed

1. A National Grid project representative, construction supervisor, or other designated National Grid representative may hold a contractor orientation or pre-construction meeting prior to the start of a project/service. Other attendees may include; the Safety department, Environmental representatives, as well as contractor management as needed.

2. It is intended to serve as a method to provide the contractor with the tools necessary to educate their employees and subcontractors on National Grid's procedures and requirements. The session is not intended to train the contractor management, their employees or subcontractors.

3. All contractors are required to attend a National Grid orientation program specific to the type of work they will be performing. Contractor management representation shall also be present meeting and all documentation of attendance shall be kept at the job site and available to any National Grid representative. For visitors and contractors working on Major Hazard Assets, site orientation shall at a minimum include the following:

   - General site hazards
   - Specific hazards involved in each task the employee may perform
   - Safety policies and work rules, including Process Safety policies
   - Location of emergency equipment like fire extinguishers, eyewash stations, and first-aid supplies
   - Smoking regulations and designated smoking areas if applicable
   - Steps to take following an accident or injury
   - Proper reporting of emergencies, accidents, and near misses
   - Selection, use, and care of personal protective equipment
   - Emergency evacuation procedures, routes, and security systems
   - Safe housekeeping rules
   - Safe use of tools and equipment
   - Hazardous materials in use and location of safety data sheets

   Site access shall not be granted to contract employees working on process safety assets until orientation is conducted.

4. The contractor's Project Health & Safety Plan will be discussed at this meeting including a final review of the safety hazards checklist to ensure proper hazard identification and mitigation plan has been implemented.

5. These hazard mitigation measures shall be reviewed and work shall not commence until these hazards have been adequately addressed. The National Grid project representative will discuss the methods by which compliance will be achieved to National Grid safety requirements with the contractor.

6. An Emergency Call List shall be exchanged with the National Grid project representative for high or medium risk projects or as applicable. This list must contain 24-hour contact information for key contractor and project

personnel, including the project representative and Safety representatives. This list should be distributed to all concerned, as determined by the project team, prior to the start of work. For contractors working on process safety assets who have an emergency response role, the emergency response plan shall be updated to clarify the contractor's role in the event of an emergency on site.

7. For routine maintenance services, a review of associated safety issues and specific facility issues, restrictions or practices, such as evacuation procedures, shall be discussed with the contractor upon initial hiring. Any changes in the facility that may affect the safety of contractor or National Grid employees or third parties must be communicated immediately.

8. Upon completion of the contractor orientation or preconstruction meeting, the contractor management official shall certify in writing that: (1) the contractor has been informed of National Grid safety requirements; (2) that employees and subcontractors have the appropriate qualifications to perform the work, and; (3) the contractor agrees to comply with all applicable safety requirements. The certification shall be completed annually in ISNetworld as an acknowledgement of the above requirements.

3.5 Job Safety Briefs

Applies to: All contractors; as needed

1. Job safety briefs shall be documented in writing. Written job safety briefs, permits, and/or plans shall be available at the job site for inspection and retained for 30 days after the job is completed.

2. National Grid reserves the right to perform a safety stand-down with any contractor for purposes including, but not limited to: recent injuries, incidents or near misses; identified hazards at job site or equivalent, and for other reasons to communicate with the contractor crew.

3. Each crew shall conduct these job safety briefs prior to each day's work at the job location, when there are changes to the day's work order or plan, and when a new worker or company joins the crew additional briefs are required.

4. Each worker must have the opportunity to voice concern. The work cannot begin until each worker signs off on the job safety brief stating that they have discussed the work, raised any questions, and agree with the plan.

5. Visitors to the work site shall be asked to read and sign the job brief acknowledging they understand contents. Contractors shall review the job brief and discuss the elements of the hazards and mitigation steps with each visitor prior to entering the job site. If a visitor refuses to sign, the general foreman will note it on the brief and will not allow the visitor to enter.

6. SITE SIGNAGE: An assessment of the work site should be conducted by the National Grid project representative overseeing the work with the contractor to determine if site signage will be needed to protect site visitors, the public or any other persons entering the work site. If Site Signage is required at the site, the signage shall be posted at the main entrance to the work site. The sign shall direct all visitors to check in with the Person in Charge (PIC), be escorted to the designated safe area and advised of all work currently in progress. The visitor is expected to comply with all related safety requirements and sign off on the Job Brief before entering the work site.

3.6 Safety Meetings

1. In addition to job safety briefs, the contractor shall have regular safety meetings with their employees and subcontractors. Contractors performing high or medium risk work shall have weekly safety meetings, while low risk contractors, at a minimum, shall have safety meetings monthly and attendance must be documented.

2. The safety meetings shall include the following topics: statistics, incidents, near misses, updates on old business and new business raised. It will include the round table discussion by the workers and the action items discussed. Meeting minutes must be documented and shall include specific action items, their due dates, persons responsible and a completion date. This documentation shall be available for inspection during the project period, and for 30 days after the project is completed. For contractors working on Process Safety assets, meeting minutes from contractor shall be shared and discussed with National Grid site management.

3. Routine Safety meetings/calls between National Grid and the Contractor shall be coordinated on a regular basis. Safety meetings may include but are not limited to SUSA/Compliance Assessments, Safety Briefs, Safety Day discussions and regularly scheduled calls to promote safety and best safety practices. Contractors working on Process Safety assets for more than 6 months shall schedule leadership visits to discuss process safety topics.

4. Contractors working on process safety assets for greater than three (3) months, or as needed, shall hold project planning meetings to discuss short term and long term work items. Project planning meetings shall include safety performance monitoring against project targets and should include a National Grid SHE representative for jobs on Major Hazard Assets in addition to a National Grid site representative.

3.7 Incident Investigation

Applies to: All contractors (regardless of risk ranking)

1. All contractors are required to report any work-related incidents involving injury or illness to employees, the public or property damage to the National Grid project representative. The first priority is to ensure that anyone injured receives medical treatment. Examples of incidents may include, but is not limited to: injury, property damage, adverse public impact, near miss, a hazardous condition and road traffic collisions (RTC).

2. Contractors will then be responsible to perform an incident investigation immediately following the incident and document root cause/corrective actions in the ISN system and to National Grid.

Incident Response Steps

In the event of an incident, the contractor shall provide details of the incident to National Grid that follows the steps below.

1. Contractor supervisor collects basic information about the incident from the employee or witnesses:
    - What happened?
    - Who and how many people were injured?
    - What treatment was administered?
    - What was the nature and seriousness of the injury?
    - Where did the incident occur?
    - When did the incident occur (date, time of day)?
    - Were there any witnesses?

2. Contractor supervisor immediately calls the project representative or other National Grid point of contact. All incidents shall be entered into the Incident Management System (IMS) as soon as possible by the National Grid project representative or National Grid designee. When dialing 1-866-322-5594, the caller will be prompted to select option 2 for anything other than an employee injury.

3. Contractor shall conduct an investigation within 24 hours of the incident that will identify contributing factors and root cause analysis relating to the incident and the corrective actions that will be taken to prevent future occurrence. This information will be documented in the ISN system.

4. Contractor vehicle accidents occurring during the performance of work will also be investigated and reported to National Grid.

Other Reporting

National Grid may periodically request the following annualized data for all work activities limited to National Grid operations:

- Lost Time Incident (LTI) rate for workers
- Restricted Work rate
- OSHA Recordable Incident (ORI) rate

4.0 TECHNICAL SAFETY REQUIREMENTS

4.1 Personal Protective Equipment (PPE) Requirements – General

Applies to: All contractors (regardless of risk ranking)

1. Basic PPE attire at construction sites and other similar work zones include, at a minimum: hard hat, safety shoes and safety glasses with side shields, and ANSI certified Class 2 or Class 3 Hi-visibility (hi-vis) clothing / vests. Contractors shall refer to the US Department of Transportation's Manual on Uniform Traffic Control Devices (MUTCD) to determine the correct class of hi-vis clothing / vests or wear the higher class. The contractor and their employees, including subcontractors are expected to follow the same rules and protocols as National Grid personnel.

2. The contractor shall ensure that their employees and subcontractors use protective safety toe footwear when working in areas where there is a danger of foot injuries due to falling or rolling objects, or objects piercing the sole, and where such employee's feet are exposed to electrical hazards. In addition, during inclement weather conditions or adverse events, the addition of anti-slip footwear or outer foot wear may be appropriate. Electrical Hazard (EH) rated footwear is required at all times. EH rated overshoes are required when working on or near (within Minimum Approach Distance MAD) around electrical equipment over 50 volts, when working in electric substations, excavating in and around electrical duct banks or in an area of expected downed wires per OSHA 1910.136 and ASTM standard F-2413-05.

3. Guidance for additional PPE is referenced in other sections of this document.

4.2 Flame Resistant Clothing Requirements

Applies to: All contractors; as needed

1. Flame Resistant (FR) clothing shall be worn when personnel work on energized equipment/lines or when distance and position will expose the worker to electric arc or flame hazards. FR clothing shall also be worn during live gas work as outlined in the gas PPE Matrix (Gas Policy SHE01001) and within LNG operations locations as required. FR clothing also includes arc- resistant rain gear. This additional ensemble may also be required as part of the job for contractor personnel. Contact a National Grid representative for a copy or to view the PPE matrix.

2. FR clothing shall be worn as the outermost layer of clothing and when workers measure voltages, test or ground electrical equipment/lines.

3. FR clothing shall be worn when work requires the use of rubber protective equipment or the use of insulated live line tools.

4. FR clothing shall be worn when workers control/operate electrical equipment over 50 volts at the device location or are within 10 feet of equipment which is being physically operated/ worked on by another worker.

5. Visitors are not required to wear FR clothing in substations or production plants unless they are engaged in electrical work. The National Grid project representative will be able to determine whether FR clothing will be required based on the specific contractor task. Note: Gas contractor FR requirements may differ slightly. Please refer to National Grid PPE Matrix for Gas operations within Gas Policy SHE01001 as needed.

6. FR clothing shall meet a minimum arc rating of 8 cal/cm^2 (HRC 2) for energized electrical equipment unless otherwise specified based on increased potential exposure as indicated in the Arc Flash Tables in H-807 *Arc Flash Analysis and Mitigation* program.

7. Additional FR clothing protection is required when performing work on the distribution system in NY North and New England (legacy National Grid) stations. Contact a National Grid representative for a copy. (NG Employees: If the link does not work, copy and paste the url into your internet browser)
http://us3infonet/sites/eng_delivery_svcs/Pages/ArcFlashMitigation.aspx#2015

8. Contractors who may be involved with tasks requiring the implementation of this program shall be informed by National Grid. Contractors will be required to follow all aspects of OSHA and any other applicable regulation as it applies to the tasks they perform.

4.3 Rubber Gloves and Sleeves

1. Rubber glove use is required for work on all electrical apparatus at 50 Volts or greater. Rubber gloves shall be donned before the worker leaves the ground and shall be worn until the worker returns to the ground (commonly referred to as “ground to ground”, “cradle to cradle”)
2. Class 0 gloves are required for exposures up to 1000 Volts.
3. Class 2 gloves are required for voltages between 1000-15,000 Volts.
4. Rubber sleeves must be worn where work is conducted within the MAD of primary electrical apparatus that is not tested, de-energized and grounded.
5. For voltages 23 kV and above, workers can use specialized equipment or work practices as long as these workers have been appropriately trained and qualified. National Grid may request training records from the contractor.
6. Rubber glove exceptions for specific jobs (other than those listed in this section) are permitted only with the dated, written approval of a Division Director.
7. It is the contractor’s responsibility to wear class 2 rubber gloves when grounding trucks or equipment due to a possible difference in potential.

Exceptions

No rubber gloves are required:

- When working in a properly established equi-potential zone.
- When the operator remains at the same potential as the equipment by being off the ground and on the equipment.
- When a qualified worker performs transmission “hot stick” work on lines 69 kV or greater and no other energized wires are on the pole or structure below the worker.
- When work is performed on transmission structures carrying only energized conductors (115kV and above) and the Live

Line Techniques are not being employed. While performing these activities, the worker shall utilize conductive clothing such as conductive gloves, boots, leg straps and/or any other applicable conductive clothing.

- When climbing a steel structure to perform structural reinforcements while maintaining MAD from energized conductors or apparatus.

- When climbing a steel structure to access an area that has been properly grounded.

4.4 Isolation of Energized Apparatus

1. **Non-Reclosing Criteria and Live-Line Maintenance and Construction:** The appropriate interrupting devices (breakers, reclosers, circuit switches, etc.) will be placed on NON-RECLOSING in accordance with National Grid tagging procedures.

2. **Tagging Out Lines or Apparatus**

   The National Grid Construction Supervisor or designee shall coordinate all switching and tagging in accordance with the most current EOP on Clearance and Control.

   Upon receipt of Clearance, the project representative will present the Contractor's Person in Charge with the "Contractor Permission to Work Form" (Form NG0060), which states the specific apparatus that has been de-energized and that certain device(s) are tagged in the Protective Position and will remain so until the Contractor's Person in Charge informs the construction supervisor or designee of the completion of the work utilizing the "Contractor Completion of Work" section of the "Contractor Permission to Work" form.

   The original transferred copy needs to be returned after the completion of work section is filled out & signed. In some cases the tailboard is outside & is susceptible to elements & damage; a copy shall be utilized in the field instead of the original.

   No work will be performed until the "Contractor Permission to Work Form" is received from the construction supervisor stating that the equipment has been de-energized and a clearance to work has been given. The Contractors Permission to Work Form and a written grounding plan shall be attached to the crews Job Briefing and be kept at the work location.

After the “clearance” is received from the National Grid Construction Supervisor, the various substation conductor bus and equipment to be worked will be tested and “Grounds” installed. Grounds shall be rated for the fault current of the line/equipment being grounded. (Note: Rubber Gloves and FR clothing are required when installing and removing grounds). The contractors “Person in Charge” (Construction Supervisor/General Foreman) shall be responsible for determining the location and number of grounds.

Vehicles and equipment may utilize a single 4/0 cu for grounding inside the substation. Employees working on de-energized lines and equipment shall always work between grounds.

Prior to the application of any personal protective grounds, the circuit to be worked on must be tested for the presence of voltage using an approved potential detector. The worker must verify the detector is in operating order prior to and after testing for voltage. MAD must be maintained during the testing, and appropriate PPE shall be worn. Testing for voltage shall be done at the point where the grounding devices are to be attached. All phases of the circuit to be worked on shall be tested at each location that grounds are installed.

When an Air Gap is required to create a work zone, the component (a tap) shall be removed in whole from the system. When National Grid switches out lines or apparatus, any grounds that may be installed shall only be considered a visual reference, and shall not be considered a means to protect the Contractor’s employees. The Contractor is responsible to install their personal grounds, in accordance with all OSHA, Federal, State and local safety procedures. National Grid may provide guidance on the minimum size of the grounds to be used based on circuit available fault current. Refer to *Electric Operating Procedure D002,* for applicable grounding size. Ground rods shall be fully driven into the earth away from the workers and work area. T-Bar ground rods are not to be used on National Grid property.

The National Grid Construction Supervisor shall review the contractor’s plan for the quantity and locations of grounds, ensuring that the work the contractor is performing is between grounds, covering all potential sources. All three phases shall be grounded. (In stations, from each phase to the station ground grid). Grounds shall be placed as close to the work area as reasonably possible, between the work area and all potential sources of inadvertent energization. A copy of the grounding plan shall be kept with the job safety brief.

It is the contractor's responsibility to account for all their grounds. The contractor shall provide, maintain, and enforce a ground tracking program suitable to National Grid. In the instance of a zone expanding/collapsing, remaining grounds shall be listed on the Contractor Permission to Work Form and verbally communicated to the construction supervisor.

3. Grounding Mobile Equipment

When mobile equipment requires grounding, it shall be solidly grounded by means of appropriate sized copper cable while using rubber gloves. The cable shall be fastened to a securely attached clean metallic portion of the equipment, or shall be fastened to a grounding stud provided for the purpose at one end and an adequate ground at the other end.

Non insulated booms such as digger derricks that have the possibility of encroaching the MAD shall be grounded and barricaded. The ground is to trip the circuit and the barricade is to protect anyone who may become in contact with the truck during this energization.

4. Minimum Approach Distance (MAD)

Refer to OSHA 29 CFR 1910.269 for more information and details regarding qualified and unqualified workers.

4.5 Appointment of a Safety Observer

A safety observer shall be required if an employee (operator) determines that it is difficult to accurately determine the distance between the equipment (minimum approach distance) and energized parts. The Safety Observer shall never be a substitute for minimum approach distance (MAD), personal protective equipment (PPE), insulate/isolate techniques or work area identification as a form of employee protection.

The person in charge of the work (contractor or National Grid), shall appoint a qualified employee or employees to perform the task of a safety observer. The personal in charge shall:

1. Ensure a documented job brief is completed and includes the name of the safety observer, additional subjects such as the location of gas lines, energized equipment, in or adjacent to the work area and the limits of any de-energized work area

2. Discuss the scope of work and communication techniques used to warn or notify the equipment operator of hazardous conditions.
3. Communicate any changes to work and job completion to the safety observer
4. Select another safety observer if there is a need for the existing observer to have break in service.

The safety observer is a qualified employee who has been appointed by the person in charge based on the hazard assessment and the job brief. The safety observer shall:

1. Observe the worker performing the task/activity until all hazards have been eliminated or the task/activity has been completed
2. Have shown proficiency in the task/activity being observed and have a full understanding of the job and the hazards associated with the task/activity.
3. Remain continuously focused on the task/activity being performed and not perform or assist any other job activities while observing the worker performing the task/activity
4. Notify the person in charge if there is a need to have a break in service. Work must stop until a new observer is appointed or the safety observer returns.

A safety observer shall also be required when a critical lift is being performed. A critical lift plan shall be required during the following circumstances:

1. An object is lifted over energized apparatuses or assets where a failure of the lifting equipment or rigging could result in a significant safety hazard or cause significant disruption in service to National Grid customers.
2. The crane or other lifting apparatus is anticipated to be operated above 80% of its rated capacity for the specific load chart for the lift.
3. A man basket (pinned or suspended) is to be utilized. All fall protection rules shall be followed when in a man basket.
4. Two cranes will be used in concert to lift a single object
5. Internal substation construction involving all power transformers, control houses, capacitor banks and transmission breakers.
6. Lifts in LNG or Gas plants where a hazard assessment or job brief identifies a significant risk.
7. The lifted load will be less than twice the minimum approach distance (MAD) of the nearest energized part. Until a qualified electrical worker confirms the MAD, loads and equipment shall maintain a 20 foot

distance. Once nominal voltage is established, the MAD will be according to OSHA tables.

8. The lifted load is hoisted over buildings or the general public.

4.6 Work Zone Traffic Control

1. If work activity is on or near a road, the contractor and their subcontractors shall comply with all applicable parts of the most current US Department of Transportation's Manual on Uniform Traffic Control Devices (MUTCD), state, local Work Zone Traffic Control requirements and the National Grid Work Zone Traffic Control Manual. Please contact your National Grid representative for a copy of the manual found in the Safety Homepage on the Infonet.

2. If pedestrian traffic is disrupted, pedestrians should be provided with a path that is reasonably safe, convenient and accessible. Pedestrians should not be led into conflicts with work site vehicles, equipment or operations.

3. If working in areas covered by state permits issued to National Grid, contractors shall comply with the provisions (work practices and notifications) of the permit language. These permits must be available on the job site upon request.

4.7 Qualified Gas Worker

Applies to gas projects/activities

1. Gas contractor employees will be operator qualified as required and defined according to the Code of Federal Regulations, Transportation, 49, Subpart 192.801 through 192.809.

2. Until these qualified employees have demonstrated proficiency in the work practices involved, they are considered employees undergoing on-the-job training and must be under the direct supervision of a qualified person at all times. According to the definition of a "qualified employee", the employee also must have demonstrated an ability to perform work safely at his or her level of training.

3. National Grid requires contractors with gas qualified employees to provide documentation on how they qualify their workers.

4. Additionally any qualifications' of contractor personnel shall be in full accordance with the Company's Operator Qualification written plan, (OQ Plan) Refer to the most current list of covered tasks in accordance with

National Grids' Operator Qualification Program and the Northeast Gas Association, (NGA).

4.8 Qualified Electrical Worker

Applies to electrical projects/activities

1. According to 1910.269(a)(2)(ii), a qualified electrical employee must be trained and competent in the following prior to starting work:

    - The skills and techniques necessary to distinguish exposed live parts of electrical equipment
    - The skills and techniques necessary to determine the nominal voltage of exposed live parts
    - The MAD specified in 1910.269 corresponding to the voltages to which the qualified employee will be exposed
    - The proper use of special precautionary techniques, personal protective equipment, insulating and shielding materials, and insulated tools for working on or near exposed energized parts of electrical equipment

2. Until these qualified employees have demonstrated proficiency in the work practices involved, they are considered employees undergoing on-the-job training and must be under the direct supervision of a qualified person at all times. According to the definition of a "qualified employee", the employee also must have demonstrated an ability to perform work safely at his or her level of training.

3. National Grid requires contractors with electrically qualified employees to provide documentation on how they qualify their workers.

4.9 Qualifying Non-Electrical Worker

Applies to: All qualifying non-electrical contractors working near energized lines and equipment; as needed

1. The contractor shall provide orientation for non-electrical workers entering and working within restricted areas such as a substation and those working near energized lines and equipment.

2. The information provided to these workers must meet the requirements of paragraph 1910.269(a)(2)(ii). However, the orientation and training may not be as comprehensive as the qualified electrical worker would be.

They must know:

- What is safe and not safe to touch in the specific areas they will be entering;
- The maximum voltage of the area;
- The MAD for the maximum voltage within the area;
- Proper use of personal protective equipment and in the work practices necessary for performing their specific work assignments within the area.

3. Until these workers have demonstrated proficiency in the work practices involved, they are considered to be employees undergoing on-the-job training and must be under the direct supervision of a qualified person at all times.

4.10 Asbestos, Lead and other Hazardous Materials

1. Asbestos and lead materials associated with electrical and gas equipment includes, but is not limited to: cement-type cable covering, cable wrap, wire coatings, coal tar pipe wrap, and transite panels and conduits. Asbestos and lead materials may also be present in building materials including but not limited to: paint, mastics, caulking, insulation and roofing materials.

2. Where asbestos and other hazardous material is present and likely to be disturbed, the National Grid project representative and contractor shall coordinate how the asbestos, lead or other hazardous materials will be managed and shall consult National Grid's Safety & Environmental department as appropriate.

3. Removal of this material must be done by individuals specifically trained and qualified to handle asbestos and lead. Refer to National Grid Safety Procedures, F-615, F-617 and F-619 for guidance on asbestos and lead handling and removals. For more information, contact a National Grid representative for a copy of these procedures.

Note: Contractors who will encounter asbestos or lead as part of their work shall reference in their safety plan how they will address this hazard.

4.11 Lift Plans for Work Near Energized Electrical Equipment

1. All work involving hoists, cranes or other lifting equipment **within 10' of energized electrical equipment** must have a detailed lift plan/procedure.

2. As a minimum Lift Plans shall include the following:

    a. Designated Operator and Signal person

    b. Detailed travel and flight path that ensures the boom and material being raised is controlled 100% of the time and will maintain the appropriate clearance

    c. Designated cover up and isolation to ensure employee and equipment safety in the event of an unplanned action or failure

    d. Emergency action plan with detailed instructions to respond to unplanned/uncontrolled event during the lift or positioning of the lifting equipment.

    e. Documented load weight and equipment lifting limits

    f. Rigging equipment and methods that will be used during the lifting. Sign off/approval from the management official responsible for the work

4.12 Fall Protection

1. Fall protection or fall restriction devices shall be used when working at heights over 4 feet with the exception of ladder use, when three points of contact are maintained. Examples of fall protection include appropriate guardrail systems, completed/approved scaffolding and personal fall arrest. For more information, see the National Grid Safety Procedure H806 *Fall Protection*.

2. All fall protection shall be inspected before use each day to determine if equipment is in good working condition. Defective equipment shall not be used and shall be removed from service.

3. A worker may enter or exit an aerial lift (at heights above four (4) feet) provided that fall protection such as guardrails or a fall arrest system is used while the worker moves between the lift and the working surface. Before any such transfer is made, the employee shall be properly tied-off to an adequate support, the pole or structure prior to and in the direction of the transfer.

Exceptions to fall protection shall be in accordance with Federal & State requirements.

4.13 Herbicide Application

1. Vegetation spraying shall be conducted unescorted only by contractor employees who have been designated as a Qualified Electrical Worker, where applicable.

2. The spray applicator shall have ID cards issued by Security with background checks available from the contractor.

3. National Grid management shall require a schedule of the spraying in their areas.

4. Once spraying begins, the contractor must contact local management on a daily basis to inform them of progress or changes to the schedule.

5. The contractor shall post all stations with dated signs indicating when the station was sprayed. These signs should not inhibit access to the station.

6. The contractor shall ensure that any stored materials and equipment do not get covered with “overspray”. Overspray represents a substantial safety hazard and cannot be allowed.

7. When applying herbicides, contractor employees shall wear appropriate PPE in accordance with product labels.

5.0 UNDERGROUND OPERATIONS WORK

In addition to the other requirements referenced in this document, this section covers requirements that are specific to underground operations work.

5.1 PPE Requirements

All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0.

5.2 Enclosed Space Assessment, Ventilation, Entry and Rescue

Refer to the National Grid EOP-UG006 *Underground Inspection and Maintenance* and National Grid Safety Procedure I-902 *Enclosed Space Procedure* for more information regarding enclosed space requirements.

1. Contractors are required to follow all procedures in this document in regards to enclosed spaces (manholes, sidewalk vaults, etc.), including assessment, ventilation, entry and rescue.

2. Each enclosed space shall be tested prior to removing manhole lids and entry. Atmospheric testing shall be continuous for the duration of the entry using a calibrated, industry approved atmospheric tester.

3. When performing hot lead work or when indicated by atmospheric monitoring, engineering controls such as forced mechanical ventilation shall be used when working in National Grid manholes at all times.

4. All contractors who are qualified electrical workers will treat these spaces as “enclosed spaces” and follow non-entry rescue provisions.

5. In some situations a boom is allowed for retraction from an enclosed space. Refer to Safety Procedure I-902 for more information.

6. Steel cable or wire rope for non-entry rescue is prohibited.

5.3 Equipment Safety Inspection

1. Inspect underground facilities (manholes, vaults, hand holes, splice boxes, junction boxes, pad mount transformers, switchgear and submersible equipment, etc.) each time a crew performs work at one of these facilities. All separable components in these facilities shall be inspected by infrared instrumentation. A National Grid representative can provide details from the National Grid EOP-UG001 *Infrared – Non-Contact Thermometer Inspection Requirement for Underground Equipment* for more information.

2. The infrared (IR) thermometer or camera shall, at a minimum, have a range of -25°F to 1400°F with a plus or minus 1% accuracy. For more details and current operating procedures, contact a National Grid representative regarding EOP UG001.

3. The format for data collected shall follow the National Grid EOP UG006 *Underground Inspection and Maintenance* requirements. Please contact a National Grid representative for more information.

4. "Touch Potential" testing of metal street lighting poles is required as a part of any maintenance work. For more information, a National Grid representative can provide a copy of the National Grid EOP G016 *Elevated Equipment Voltage Testing* and National Grid Work Methods Bulletin #04-26 *Touch Potential Testing of Metal Street Lighting Poles.*

5. Touch Potential testing results shall be recorded on the job safety brief and the manhole inspection form which shall be given to the National Grid Construction Supervisor or designee.

6. All contractors working for National Grid shall use materials and equipment in accordance with the manufacturing guidelines. It is the contractors' responsibility to understand the manufacturers' limits and prescribed use of their tools and equipment before each use.

7. Workers shall test and verify that the underground cable is de-energized and guillotine the cable if needed from outside the hole. Rubber gloves shall be worn at all times while performing this task.

6.0 OVERHEAD LINE WORK

In addition to the other requirements referenced in this document, this section covers requirements that are specific to overhead line work.

6.1 PPE Requirements

All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0. In addition, contractors will follow ground-to-ground and cradle-to-cradle use of rubber gloves while performing work on energized overhead lines. Any foreign wire, including those on a pole or structure constitutes an energized source and requires the use of rubber gloves (ex: Cable TV, telephone, fire alarm wire, etc.).

6.2 Fall Protection

All contractors who climb structures such as wood poles or transmission towers shall utilize enhanced fall protection equipment (fall arrest devices) and techniques (ex: *Buckingham Buck-Squeeze, Miller StopFall* or *Jelco Pole Choker*). When working on wooden and steel structures, a full body harness and lanyard shall provide 100% fall protection at all times (100% tie off, Shepperd's Hook, etc.). Climbers shall never be allowed to drop or slide down a pole or structure more than two feet.

Exceptions to fall protection shall be in accordance with Federal & State requirements.

6.3 Pole/Structure Inspection

Contractor shall ascertain the structural integrity of the pole or other structure prior to installation, removal, repair or modification of the equipment on the structure.

1. Prior to climbing any pole, an inspection and test of the condition of any pole being climbed shall be performed. The weight of the employee, the equipment being installed and other working stresses (such as the removal or re-tensioning of conductors) can lead to the failure of a defective pole or one that is not designed to handle the additional stresses.

2. If the pole is found to be unsafe to climb or to work from, it must be secured so that it does not fail while an employee is on it. The pole can be secured by a line truck boom, by ropes or guys, or by lashing a new pole alongside it. [29 CFR 1910.269(q)] If measures cannot secure the pole, the contractor must cease operations and notify the National Grid Construction Supervisor or designee

6.4 Electrical Work Methods

1. Jumpers of any type shall not be used to keep transformers, risers or transformer banks energized for the purpose of changing potted porcelain cutouts. A National Grid representative can provide information to the National Grid Electric Operation Procedure (EOP) D001 *Cutouts – Open Type* for more information.

2. Potted porcelain cutouts must be changed out when work is being completed on a pole even if this is not planned in the scope of the work provided.

3. Properly rated and inspected slings, chains or tongs shall be utilized to move poles and equipment. Winch lines must not be wrapped around poles or looped around transformer ears to lift without a sling or chain.

6.5 Transmission Overhead Lines

1. For work on transmission circuits, red tape shall be placed around any energized pole, pole structure, or tower adjacent to the de-energized line.

2. When one circuit of a double circuit pole or tower line is de-energized for work, a red or orange flag shall be placed on the energized side of the pole or tower nine feet below the lowest energized conductor. In addition, a red or orange flag shall be placed on the lower cage on the side toward the energized circuit at each arm level as employees work on them or pass them.

3. All contractors using ATV's, UTV's or RTV's for transmission or forestry work, are required to follow all local OHRV requirements for PPE and driving safety. Training shall include classroom and in-field instruction as well as a formal driving assessment on an annual basis for each type of vehicle planned for use: i.e. UTV specific training for UTV's and ATV specific training for ATV use. All contractor employees must be fully trained and qualified before use Proof of individual operator training certifications for each operator shall be available at all times. US DOT rated helmets and safety glasses/goggles are required for any vehicle that does not have a seatbelt and a roll cage. In equipment with a roll cage and seatbelt, operators can utilize a hard hat and chin strap.

4. At the end of each day, unless other arrangements have been made for an extended outage, grounds will be removed and the National Grid project representative will be notified that all personnel are "clear" of the conductor bus work and equipment.

5. Wherever transmission line workers "touch" wires, a personal ground shall be installed at the work area to establish an equipotential zone, unless workers are engaged in live-line barehand work (29 CFR 1926.964)

7.0 SUBSTATIONS

In addition to the other requirements referenced in this document, this section covers requirements that are specific to substations work.

For additional information, a National Grid representative can provide a copy of the National Grid Substation Maintenance Procedure SMP 499.01.2 *Protective Grounding Procedure* under the Substation Work Methods Infonet page for specifics regarding substation grounding practices.

Grounding plans for substation, major distribution and transmission projects will be submitted to the National Grid construction supervisor a minimum of 1 week prior to construction for review. This plan will show the steps, work area limits and ground cable size and amount. Once reviewed with the National Grid and prior to

starting the job, the plan will be reviewed by the contractors with all employees and subcontractors on the project.

The use of an “Equipotential” step/platform or a conductive mat is required for access and egress from the following:

a. Crane or any other equipment, including aerial lift equipment, that is connected to the substation ground grid and/or bonded to transmission line conductors when working outside of the station fence
b. In the rights-of-way
c. In areas inside the substation where there is no ground grid present.

When work is performed inside the substation and there is a ground grid available, the “Equipotential” step/platform or conductive mat is not necessary.

All vehicles shall be grounded and barricaded per OSHA standards and the National Grid Electric Operating Procedure G026 *Mechanized Equipment Grounding*.

Proper clearances shall be maintained from adjacent energized substation bus, energized portions of substation equipment and other transmission lines at all times.

Use of proper insulated tooling (shotguns and sticks) shall be utilized per NECA standard maintaining MAD.

7.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0.

2. Contractors who perform any ground breaking activities in a substation within a pre-marked area will require Dig Safe marks to be in place; otherwise, the job must be suspended and the National Grid construction supervisor or project representative shall be notified of the condition.

3. When using non-insulated man-lifts, and if provided by the manufacturer, a secure point of attachment for lifelines, or lanyards or deceleration devices shall be utilized, independent of the means to support or suspend the employee. Workers feet shall also always remain on the floor.

7.2 Notification of Control Authority When Entering a Substation

1. When a contractor enters and exits a National Grid substation, the contractor shall ensure that the System Control Center is notified. While work is being conducted, gates must be monitored at all times or the gates shall be locked. For more information, contact a National Grid representative regarding National Grid EOPG022 *Substation Security*.

2. Unescorted entry in substations can only be provided to contractors who provide assurance that their employees and subcontractors are electrically qualified as specified in 29 CFR 1910.269. Refer to Section 4.0 of this document

3. All National Grid specifically identified bulk power stations will require NERC-CIP training, certification and approval prior to entry to those sites.

7.3 Substation Work Area Identification (SWAI)

1. Contractors who will be working in substations shall follow the SWAI procedure. National Grid will provide a copy of this procedure if required by the project. For more information, contact a National Grid representative regarding National Grid SMP499.10.2 *Substation Work Area Identification Procedure*.

2. Qualified contractors as referenced in section 4.8 of this document shall install their own work area identification. National Grid shall arrange work area identification for non-qualified workers as required.

3. Designated storage areas for items not being used will be posted in the yard and should be the only place these items are kept.

8.0 GAS OPERATIONS WORK

In addition to the other requirements referenced in this document, this section covers requirements that are specific to Gas operations work. For more information, contact a National Grid representative regarding National Grid General Safety Requirements SHE1001 *Gas Policy* which can be found following this link:
http://dc-gasweb1/MelSite/WMSafetyAll.asp .

8.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0.

2. The contractor shall wear all appropriate PPE and Class 2 rubber gloves for personal protection when digging or probing within 2 feet of known electrical conductors and when the location of energized conductors is unknown.

8.2 Gas Operations

1. Any contractor who performs covered tasks shall be operator qualified (OQ) as defined in the DOT Title 49 CFR, Subpart N and all applicable state requirements pursuant to the state the contractor is working in. Additionally, any qualifications of contractor employees shall be in full accordance with the Company's Operator Qualification written plan, (OQ Plan) Refer to the most current list of covered tasks in accordance with National Grids' Operator Qualification Program and the Northeast Gas Association, (NGA).

    a. The Operator Qualified status of contractor employees must be regularly updated and accessible through the ISN system. This listing must detail employees' current tasks they are qualified for, the next recertification date, associated documentation and a documented annual acknowledgement in ISN on their qualified workers as referenced in section 3.1 of this document.

    b. Contractor personnel involved with covered tasks may require certification by National Grid and an orientation of the involved tasks and National Grid Company standards. National Grid reserves the right to validate contractor qualifications prior to performing Live Gas work.

    c. Atmospheres are to be tested with a properly calibrated Combustion Gas Indicator (CGI) or Gas Measurement Instrument (GMI) in accordance with National Grid excavation procedures as required.

    d. Each employee in an excavation shall be protected from cave-ins by an adequate protective system, such as sloping, benching or an appropriate shoring system. For more information, contact a National Grid representative regarding National Grid Safety Procedure M-1301 *Standards for Working in Excavations.*

9.0 FORESTRY AND VEGETATION MANAGEMENT

In addition to the other requirements referenced in this document, this section covers requirements that are specific to vegetation management work.

9.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0.

2. For work along roads and other areas of vehicular traffic, contractors shall wear high visibility clothing or vests.

3. Flame Resistant Clothing is not required per the applicable OSHA Forestry standard. Forestry contractors must instead wear natural fiber clothing when working within 10 feet of energized equipment.

4. Forestry contractors must wear a properly adjusted full-body fall protection harness connected to an appropriate lanyard when working from an aerial lift. The lanyard must connect to an attachment anchored to either the boom or bucket mounting hardware. Attachment points anchored through only the fiberglass portion of the bucket are not acceptable.

5. Forestry contractors will be required to wear chaps while operating a chainsaw or when assisting and/or working in close proximity to a chainsaw that is being operated.

6. Saws shall not be left unattended with the engine running.

7. When a contractor employee carries a saw, the engine shall be off and/or covered or the saw shall be carried with the blade to the rear and locked.

8. Tree crews will not be allowed to fly their buckets in between the primary and secondary cables if the MAD will be violated in process of doing so.

9.2 Equipment and Work Methods

1. Forestry contractors shall utilize fiberglass sticks and stick saws for work around energized equipment. Additionally, integrity tests shall be performed and documented annually. Test results and expirations shall be available on each vehicle as needed.

2. Forestry contractors shall perform and document dielectric testing of all aerial units annually. Test results and expirations shall be available on each vehicle as needed.

3. For lump sum or unit price mileage trimming projects, a single foreman may supervise up to four (4) bucket trucks on the same project. The minimum

qualifications for the "lead" person on each of the other trucks shall be a Journeyman Tree Trimmer or equivalent (Qualified Line Clearance Tree Trimmer). At least one other employee on the truck shall be an OSHA defined, Qualified Line Clearance Tree Trimmer Trainee. For Upstate New York only, it is understood that a Qualified Line Clearance Tree Trimmer shall carry the title, wage and benefits as outlined in IBEW LU 1249's existing contract of a Journeyman Treeman and that a Qualified Line Clearance Tree Trimmer Trainee shall carry, at a minimum, the title, wage and benefits as outlined in IBEW LU 1249's existing contract of a Treeman Trainee, 2nd year.

9.3 Training

1. Forestry contractor management will be required to attend safety council meetings hosted by National Grid as required. The contractor shall ensure that all appropriate safety personnel for the National Grid territory are in attendance.

2. Forestry contractors shall implement and provide the required training and certification programs necessary to provide OSHA defined Qualified Line Clearance Tree Trimmers or Qualified Line Clearance Tree Trimmer Trainees. Qualifications shall be provided in the ISN system. Forestry contractors shall provide an update HASP by April 1st of each year for all work being conducted at National Grid.

3. All contractors using ATV's, UTV's and RTV's for transmission or Forestry work are required to follow all local OHRV requirements for PPE and Driving safety

10.0 LNG PRODUCTION, TRANSPORT AND HANDLING

In addition to the other requirements referenced in this document, this section covers requirements that are specific to LNG Production facilities.

All contractors working at LNG plants will sign in and out of plants daily in the contractors log book. All other gas supply facilities and subcontractors require authorization under the contractor management official. If required by the project, trained National Grid plant personnel shall initially, and as needed, review and re-issue as needed, a work permit process which shall which describe the work being performed, valves with their locations and Lock-out/Tag-out numbers.

10.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0 and shall include FR outer clothing.

2. Cryogenic protective gloves/gauntlets and face shields are required when making connections to load / unload LNG. National Grid retains the right to enhance PPE requirements as conditions warrant. The use of additional PPE shall be based on the task performed and the PPE matrix for work in production plants.

10.2 Training

1. Contractors who transport LNG/propane at National Grid facilities are required to be certified in first aid/CPR and are required to complete frost-bite awareness training. Documentation of training records shall be maintained in the ISN system.

2. National Grid expects contractors working at LNG plants to meet the requirements of 49 CFR 193 Subpart H for health, training or experience and/or any applicable National Grid procedures that supersede the above requirements. Contractors shall provide documentation on their qualified workers, as referenced in section 3.1 of this document.

3. All Contractor personnel performing work in LNG plants must meet the requirements of the National Fire Protection Association (NFPA), part 59.

11.0 ELECTRIC GENERATION

In addition to the other requirements referenced in this document, this section covers requirements that are specific to Electric Generation.

11.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0

2. Hearing protection is required when working anywhere inside a generation plant and/or outside the plant where noise may be excessive. Acoustic barriers shall be maintained by the contractor as needed.

3. Safety shoes with a minimum height of six-inches are required in Generation plants.

4. Contractors working in generation plants are required to wear 8-Cal clothing protection. For additional guidance, a National Grid representative can provide reference to Electricity Distribution Operations Infonet webpage under Electric Generation's Policies and Procedures EGO-028 *Personal Protective Clothing* & EGO-029 *Personal Protective Equipment*.

11.2 Training

1. Required training may include; PCB's, asbestos, mercury, confined space awareness and excavation competent person requirements. HAZCOM is required by contractors working in generation plants as applicable.

2. Contractors who work at a National Grid Generation Station shall attend an orientation regarding plant safety and as required, US Coast Guard Maritime Security (MARSEC) policies.

3. Equipment training is required per federal, state and local regulations and National Grid procedures. Operators of any powered industrial vehicle must be qualified and documentation shall be documented.

11.3 Equipment & Excavations

1. All excavations shall be performed in accordance with EGO-0005 *Procedure for Excavation in National Grid Generation Facilities* and National Grid Safety Procedure M-1301 *Standards for Working in Excavations.* For additional information, contact a National Grid representative for copies.

2. Gasoline and diesel powered fork trucks shall NOT be used inside the plant or other enclosed facility. Only propane/electric fork trucks are permitted except where additional hazards may exist.

3. All wood products necessary for the work must be made of flame retardant material.

11.4 Equipment Isolation

For isolation of hazardous energy sources while working in Generation plants, please contact a National Grid representative regarding EGO-0010, *Control of Hazardous Energy Sources-Work Permit System.*

12.0 CIVIL CONSTRUCTION

In addition to the other requirements referenced in this document, this section covers requirements that are specific to civil construction work.

12.1 PPE Requirements

1. All contractors shall comply with the applicable PPE and WZTC requirements referenced in Section 4.0.

2. Rubber gloves shall be worn while carrying out work in and around energized or identified direct buried lines, live duct banks, transformer enclosures, manholes, switch gear and other electrical apparatus when performing civil investigations, installations or repairs.

12.2 Enclosed Space Assessment and Ventilation

Contact a National Grid representative regarding the National Grid EOP-UG006 *Underground Inspection and Maintenance* and National Grid Safety Procedure I-902 *Enclosed Space Procedure* for more information regarding enclosed space requirements.

1. Contractors are required to follow all procedures in this document in regards to enclosed spaces (manholes, sidewalk vaults, etc.), including assessment, ventilation, entry and rescue.

2. Each enclosed space shall be tested prior to removing manhole lids and entry. Atmospheric testing shall be continuous for the duration of the entry using a calibrated, industry approved atmospheric tester.

3. When performing hot work or when indicated by atmospheric monitoring, engineering controls such as forced mechanical ventilation shall be used when working in National Grid manholes at all times.

7. All contractors who are qualified electrical workers will treat these spaces as “enclosed spaces” and follow non-entry rescue provisions.

8. In some situations a boom is allowed for retraction from an enclosed space. Refer to Safety Procedure I-902 for more information.

9. Steel cable or wire rope for non-entry rescue is prohibited.

12.3 Equipment Safety Inspection

All contractors shall comply with the applicable equipment safety inspection procedures referenced in Section 5.3

12.4 Excavation Requirements

All excavation work shall be performed under the control of a competent person. All soils in National Grid territories are to be considered class “C”, considered unstable and shall require all excavations be performed in accordance with OSHA 1926.651, EGO-0005 *Procedure for Excavation in National Grid Generation Facilities* and National Grid Safety Procedure M-1301, *Standards for Working in Excavations.* For more information, contact a National Grid representative for a copy.

Crews that are performing Excavations shall include an excavation log with their job brief that states the soil type, expected depth and length as well as final depth and length. All required steps need to prevent collapse will be documented on this form as well prior to entry.

Protective systems shall be used for certain manhole installations. These scenarios are covered below:

- The hazard assessment, competent person and/or National Grid supervisor deems it necessary
- If an excavation for a manhole in a roadway is completed and installation of manhole and backfill is not able to be done before the day is complete, a protective system will be required before road plating
- Installation of any manhole 3 way or greater in size/

Where trench boxes are required to be built on site, the contractor shall submit a PE stamped plan and the location shall be designated on the excavation drawings.

All lifts (not limited to materials and equipment) shall be planned and rigged by a competent person. A lift plan shall be provided for all “critical lifts” and must be submitted by a qualified professional to the National Grid representative prior to the lift taking place.

12.5 Cable fault finding and replacements

For excavation work needed to support faulted cables and emergency cable locates, the use of Cable Avoidance Tooling (CAT) shall be used in addition to Dig Safe requirements as an added safeguard to further pin point unidentified buried cables.

For excavations within the tolerance zone, all hand digging in and around direct buried cables shall require basic PPE, non-metallic handled shovels, rubber gloves, FR clothing and EH rated work boots with over shoes.

All excavation equipment shall be grounded in accordance with NG EOP G026. For additional information, contact a National Grid representative.

The use of GPR (Ground Penetrating Radar) shall also be required to verify the Dig Safe/811 locates after award of the project and prior to excavation. This shall include electric URD, UCD and Substation projects.

12.6 Technical Review

Where and when applicable, all trench and excavation work shall be reviewed and stamped by a civil PE in the state of record and will be executed under the supervision of a trenching and excavation competent person. All leading edges of trenches and excavations shall be appropriately demarcated, clearly posted and controlled to prevent unauthorized persons from entering and inadvertently falling into the excavation. All trenches and excavations shall be closed as soon as practical/possible. All excavations shall be fully controlled for the duration of the exposure by adequately substantial means to withstand the environment and conditions expected to be present.

All pot holing/test holing and exploratory excavations shall utilize vacuum excavation whenever near known underground utilities or hazards, and when the potential for unknown hazards such as live electrical or gas conveyances exist. When using vacuum extraction in combination with air blowing/air knife tools, all persons in the immediate area shall be wearing safety glasses in addition to a full face shields.

13.0 AVIATION

1. Helicopter Crews of two or more shall perform a preflight documented job brief.

2. Helicopter work shall require the use of aviation helmets for both the pilot and passengers.

3. Helicopter pilots and passengers shall participate in the "Flying in the Wire and Obstruction Environment” training prior to flight.

4. Helicopter pilots shall meet the following minimum flight time experience:

a. 2000 hours as Pilot in Command or Second in command of a rotor craft
b. 1000 hours in a turbine rotorcraft / helicopter
c. 100 hours in a helicopter of the make and model to be utilized at National Grid
d. 300 hours flight time in Wire Environments

For more information, contact a National Grid representative for a copy of EOP T012 *Helicopter Utilization & Notifications.*

14.0 TRANSPORTATION RISKS

Contractor shall define transportation related activities that can have potential process safety consequences. National Grid shall determine if additional risk assessment is needed and contractor shall participate in the assessment. Contractor shall modify their process to mitigate risk that is determined to be intolerable.

APPENDIX A: NATIONAL GRID CONTRACTOR RISK MATRIX

National Grid Contractor Risk Matrix			
Category	**Description of Work**	**Impact of Work**	**Examples to be included in this category (including, but not limited to)**
Medium / High Risk Exposure **Tier I** **Inclusion in ISN Program is Required**	Physical Work, activity, or service that is performed on National Grid property site or is performed off-site where Owner Client has responsibility and is liable for work performed. Includes, but is not limited to, any activity requiring confined space entry, elevated work, work on operating systems involving hazardous energy, and most work requiring a general work permit, hot work permit, or confined space permit.	Work, activity, or service having: • A potential for causing a catastrophic operational incident; • Access to operations; and/or • A direct role in site operations or maintenance, where failure could result in serious harm to employee or public well-being, company assets, or the environment Also includes any Contractor personnel's job function which has no direct or very limited supervision for operational checks.	• Maintenance, Construction and demolition contractors • Chemical cleaning, tank cleaning • Electricians and Instrumentation Technicians • Movers • Welding • Heavy equipment operations • Well drilling and testing • Environmental investigation, remediation, monitoring activities • Hazardous waste handling and/or transport • Excavation • Food service and handling • Equipment Inspection (e.g., X-ray & other NDT) • On-site sampling / gauging activities (not including escorted storm water sampling) • Common carriers transporting Owner Client-owned LNG or petroleum products • Landscaping services • Snow Removal • Janitorial services

			• Vacuum truck affecting/involving process operations • Oil Spill Response Organizations (OSRO)
Low Risk Exposure **Tier II** **Inclusion in ISN Program is NOT Required**	Work that is office based such as: • Consultants that do not perform work or activities as described in the Medium/High Risk exposure category • Offsite services • On-site vendor pick-up/delivery and repair services • Work performed by public and private utilities • Personnel on-site with Visitor Status, when escorted	Work, activity, or service having an indirect role and no, or limited, access to operations or maintenance where failure could result in serious harm to employee or public well-being, company assets, or the environment.	• Mail/package/part delivery or pick-up (e.g. UPS, Fed EX, vendor-specific) • Samples pick-up by laboratory/courier • Office machine servicing (copiers, printer, computer, etc.) • Laboratory apparatus servicing • Storm water Sampling Labs/Contractors (When Escorted by Owner Client personnel) • Deliver/supply services (vending machine, bottled water, laundry) • Municipal waste pick-up • General trash removal services • Off-site repair/fabrication shops (such as pump, safety valve, piping, vehicle) • Telephone, electric, local municipal utility services • Regulatory representatives • Technical representatives • Engineering services (when escorted by Owner) • Auditors
SVP of SHE can require any contractor to be part of ISN when deemed as a potential risk to National Grid			

Appendix G

National Grid COVID-19 Health & Safety Plan

FORWARD

National Grid's vision is to be a world-class safety organization, with zero injuries every day. A critical component of achieving this vision is the careful development, implementation and maintenance of safety procedures. This guidance document, COVID-19 Health and Safety Plan, describes pandemic response measures, taken by National Grid, to help prevent the spread of COVID-19.

Questions regarding this guidance should be referred to National Grid's Safety Department.

4.2 COVID-19 Incident Reporting 6

1.0 SCOPE OF HEALTH & SAFETY PLAN

National Grid has developed this Health & Safety Plan (HASP) to uniformly apply pandemic response measures to help prevent the spread of the COVID-19 virus. National Grid field personnel and crews have been provided this information and communications.

2.0 PROJECT PERSONNEL

2.1 Roles and Responsibilities

National Grid shall be responsible for the safety of all its employees and shall ensure COVID-19 pandemic measures are in place. Key National Grid personnel are as follows:

Incident Command Structure

The National Grid Incident Command Structure (ICS) has been activated within all Business Units of National Grid's US Operations to respond to the COVID-19 pandemic. Members of the ICS review and approve all operational decisions, with the Incident Commander ultimately responsible for these decisions. The Incident Commander relies upon subject matter experts within the ICS, including the Operations Officer, the Safety and Health Officer, to help set standards and guidance for protective measures to be used to limit the spread of the COVID-19 virus. These Officers, in turn, utilize the expertise of other members of the organization within Operations, Safety, and Health, to assess risks associated with the work being performed and provide guidance on the most effective measures to be used by employees to protect themselves, their coworkers, our customers, and members of the public.

Field Supervisor

The Field Supervisor shall have the responsibility for monitoring and enforcing National Grid COVID-19 pandemic measures and shall ensure that all employees have received and reviewed this Health & Safety plan.

- Serve as the appointed supervisor to oversee field personnel and ensure pandemic measures are being followed
- Ensure field personnel have the appropriate pandemic supplies
- Disseminate all new National Grid COVID-19 communications to all field employees
- Where non-compliance is observed, take prompt corrective action; and
- Have the authority to order a safety stop in the event of a serious safety issue.

Crew Leader

The National Grid crew leader shall be in charge of the day-to-day details of the work to be performed. They shall ensure that work is performed in accordance with National Grid COVID-19 pandemic measures. They will:

- Walk the job site at the start of each day to ensure a safe work environment;
- Where non-compliance is observed, take prompt corrective action; and
- Have the authority to order a safety stop in the event of a serious safety issue.
- Perform the daily job safety briefing before commencing work, whenever a visitor arrives to the job site, and if there is a significant change in the work or when an extended break occurs. As part of the COVID-19 pandemic response, the COVID-19 job brief checklist (Appendix A) shall be used in addition to the applicable departmental job brief form.

Employees

National Grid employees are responsible for following all COVID-19 pandemic measures;

- Each employee is responsible for reporting to supervision any symptoms of COVID-19, of any direct contact with an individual confirmed to have COVID-19, or in contact with a person in quarantine.
- Each employee is obligated to call a safety stop when a hazardous condition is observed.
- All lone workers shall conduct a self-assessment utilizing the COVID-19 job brief checklist (Appendix A) and adhere to the guidance outlined in this plan.

National Grid Field Safety Representative

National Grid Field Safety Representatives conduct routine and random crew visits to National Grid job sites. The National Grid Field Safety Department shall act as a resource for National Grid field personnel to effectively implement this COVID-19 Health & Safety Plan and will be available on an as-needed basis for inquiries related to this HASP.

3.0 COVID-19 PANDEMIC RESPONSE MEASURES

3.1 COVID-19 Symptoms

COVID-19 Symptoms may include the following:

- Fever
- Cough

- Shortness of Breath
- Chills
- Repeated shaking with chills
- Muscle Pain
- Headache
- Sore Throat
- New loss of taste or smell

3.2 Hygiene and Social Distancing

- Wash your hands often with soap and water for at least 20 seconds, especially after using the restroom, before eating, and after blowing your nose, coughing, or sneezing. Hand washing is the best way to prevent the spread of viruses.
- If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.
- **Proper hand washing/sanitizing products will be provided to all employees**
- Maintain a minimum of 6' social distance from other employees on site while performing work and during routine breaks. When work tasks prevent this, ensure proper face coverings are continued to be worn and proper hygiene
- Avoid touching your eyes, nose, and mouth.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces using a disinfecting cleaning spray or wipe; if not available, use a soap and water solution.
- All cleaning product trash and potentially contaminated PPE will be stored in a trash bag and immediately disposed of at a National Grid facility at the end of each shift. Trash should not accumulate in any National Grid vehicle. Immediately wash hands upon disposing of trash bag.

3.3 COVID-19 PPE and Face Coverings

- Face coverings are a requirement for all National Grid employees. Face coverings must be worn by all employees:
    - When working in public places
    - When working in a customer's premises
    - When social distancing is not able to be maintained with a co-worker, customer or member of the public in a National Grid facility, barn/yard, work location or company vehicle.
- Non-Fire-Retardant/Arc Rated Face Covering– use when there is no potential for a gas ignition or electric arc flash. This can be National Grid supplied or a personal face covering. Fire Retardant Face Covering – must be used when there is potential for a gas ignition or electric arc flash.
- **Additional COVID-19 PPE guidance is provided in the attached Premise**

Entry Guidelines

3.4 COVID-19 Virus Risk Assessment and Adopted Measures

National Grid's prescribed measures (work practices, PPE, hygiene) were selected based upon the risk assessments completed by subject matter experts and reported up through the ICS for approval. They are based upon the Centers for Disease Control & Prevention (CDC) and OSHA guidance, as well as input from Operations, Safety, and Health team members. They are believed to address all risks posed to our workforce, as well as to our customers and members of the public, when jobs are conducted in public places. These measures are reviewed on a continuous basis, for both effectiveness and to ensure the latest guidance is incorporated, with changes made, as necessary, after these reviews.

4.0 COVID-19 REPORTING PROCESS

4.1 COVID-19 Job Brief Checklist

In addition to the applicable departmental job brief form, all crew leaders shall utilize the COVID-19 job brief checklist to facilitate crew discussion regarding symptoms of COVID-19 and allow for discussion to help facilitate the reporting of a COVID-19 incident. All visitors to the job site will be required to have the job brief and COVID-19 checklist reviewed with them by the crew leader prior to entry on the job site.

Remember to maintain social distancing while conducting the job brief

4.2 COVID-19 Incident Reporting

To ensure the safety of all employees and the public, any employee shall immediately contact their Supervisor and National Grid Employee Services if one of the following conditions occur:

- Employee is exhibiting symptoms of COVID-19
- Employee has been in close contact of another individual with COVID-19
- Employee has been in close contact of another individual who is currently being quarantine for a suspected case of COVID-19

Close contact is defined as being within 6' of a sick/quarantined individual for more than 15 minutes.

Please refer to the COVID-19 Suspected/Confirmed Positive Process guidance document in Appendix A.

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED.
FOR LATEST VERSION, PLEASE REFER TO THE NATIONAL GRID SHE INFONET SITE.

Appendix A – National Grid COVID-19 Communications

PRINTED COPIES ARE NOT DOCUMENT CONTROLLED.
FOR LATEST VERSION, PLEASE REFER TO THE NATIONAL GRID SHE INFONET SITE.

A Message from John Bruckner

National Grid US Coronavirus Incident Commander

Updated Guidance on Face Coverings

April 16, 2020

The state of New York and the state of Rhode Island recently issued executive orders requiring all essential employees who are working in public places to wear face coverings when distance from the public or co-workers cannot be maintained. As a result, we are updating our company policy to align safety standards for all employees.

We had previously communicated that wearing a face covering was voluntary based on CDC recommendations. We are now **requiring** National Grid employees to wear face coverings in the situations below. Please note that this applies to both **office** and **field-based** employees, and applies across **all jurisdictions**.

Face coverings must be worn:

- ✓ When working in public places
- ✓ When working in a customer's premises
- ✓ When social distancing is not able to be maintained with a co-worker, customer or member of the public in a National Grid facility, barn/yard, work location or company vehicle.

- This directive is effective at 8:00 pm this evening for all New York employees.
- It is effective starting this Saturday for all Rhode Island and Massachusetts employees.
- If you are working from home, our company guidance remains: If you can work from home, you should.

What qualifies as a face covering?

Employees may use either a company-issued or a personal face covering, depending on preference and availability. These include:

- Disposable masks, which need to be changed daily or if significantly dirty.
- Reusable FR Balaclavas, which need to be laundered daily, according to CDC cleaning guidance.
- Reusable FR neck warmers, which need to be laundered daily, according to CDC cleaning guidance.
  - Please note: Face pieces must be made from Flame Resistant (FR) material if they are worn when working in an energized zone or there is potential for a gas ignition.

nationalgrid

How to get a face covering:

Our procurement and warehouse teams are working directly with teams to ensure a steady supply of face coverings.

It is our intention to provide company-supplied face coverings widely, but in instances where one is not available or preferred, a personal covering may still be used.

Operations teams should work through their normal channels to order face coverings. We will be providing further guidance to office-based colleagues on where they can access face coverings.

CDC guidance on personal face coverings can be found here:

- https://www.cdc.gov/coronavirus/2019-ncov/prevent-getting-sick/cloth-face-cover.html
- https://www.cdc.gov/coronavirus/2019-ncov/downloads/DIY-cloth-face-covering-instructions.pdf

Face coverings should:

- Fit snugly but comfortably against the side of the face
- Be secured with ties or ear loops, if provided
- Include multiple layers of fabric
- Allow for breathing without restriction
- Be removed from behind head or ears to minimize hand contact with face
- Be laundered and machine dried if reusable

Cleaned, dried coverings can be kept in a clean plastic bag until needed for use

It is important to note that face coverings, whether company-issued or personal, are not a substitute for taking measures that are known to be effective in stopping the spread.

Handwashing, and maintaining a social distance of 6 feet apart from others remains the most critical guidance that we can follow.

Sincerely,

John Bruckner

nationalgrid

COVID-19 Job Brief Checklist

Please Distribute

Revised 5/7/2020

During this trying time it is important that we maintain our same level of focus at work locations conducting hazard assessments and identifying risks prior to the start of each task. Prior to beginning work at every location, when conditions, job focus or crew members change, after each meal period and after any prolonged interruption to the work, a **Job Briefing** shall be held.

The work to be performed shall be discussed and assigned, and the safety aspects of the job shall be reviewed. The National Grid protocol to screen all individuals to determine who may have been exposed to COVID-19 outside of work **must be reviewed** at the start of the workday and Job Briefing.

(Employees working alone shall conduct a self-assessment to determine if they may have been exposed to COVID-19 outside of work or should their condition change during the workday)

The questions are:

- ☐ Are you feeling ill in any way? For instance, do you have any of the following symptoms: A fever? A cough? Shortness of breath? Chills? Repeated shaking with chills? Muscle pain? Headache? Sore throat? New loss of taste or smell?
- ☐ Have you had close contact with a symptomatic person (e.g., fever, cough, and/or shortness of breath, chills, repeated shaking with chills, muscle pain, headache, sore throat, new loss of taste or smell) within the last 14 days?
- ☐ Have you had close contact with a person who was tested with results pending or positive for coronavirus within the last 14 days?
- ☐ Have you recently been out of state for non-work related travel (within the last 14 days)?

*Employees who answer **"YES"** to any of these questions must distance themselves from others, not enter the work area, and immediately contact their supervisor privately for further instruction.*

The employee must also contact the National Grid Employee Services Hotline 1-888-483-2123.

Employees who answer **"NO"** to all of these questions proceed with work activities as planned.

Please note on the Job Brief that you asked these COVID-19 Screening Questions.

To reduce multiple people handling the job brief during the COVID-19 pandemic crew leaders should handle all documentation and record who is present on site after they have reviewed the job brief with each employee or visitor.

REMINDER - Please be sure to follow CDC recommendations

- Maintain a minimum 6' social distance from other people
- Employees must wear a face covering: when working in public places, when working in a customers premise, or when social distancing is not able to be maintained with a co-worker, customer, or member of the public in a National Gird facility, barn/yard, work location, or company vehicle.
- Avoid touching your eyes, nose, and mouth.
- Clean and disinfect frequently touched objects and surfaces using either a EPA registered disinfectant (Lysol, Clorox, etc.), soap and water, or a bleach and water mixture (1/3rd cup bleach per gallon of water)
- Use the fold of your arm to cover a sneeze or cough
- Wash your hands often with soap and water for at least 20 seconds, especially after going to the bathroom; before eating; and after blowing your nose, coughing, or sneezing.
    - If soap and water are not readily available, use an alcohol-based hand sanitizer with at least 60% alcohol. Always wash hands with soap and water if hands are visibly dirty.

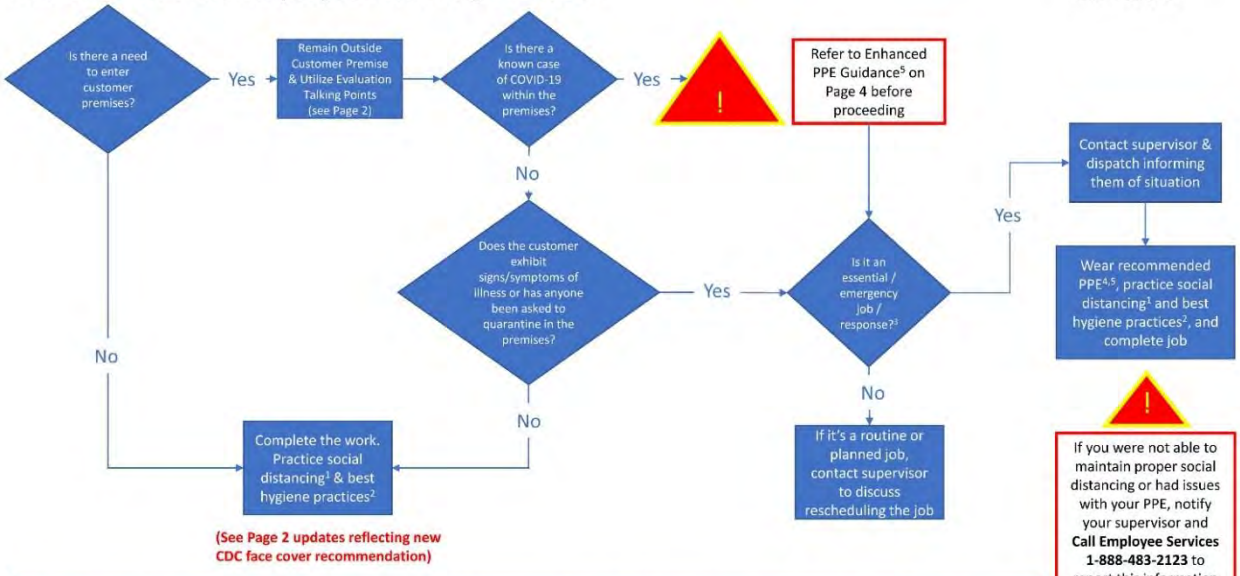
Guidance for Field Employees Entering Premises

Issued 4/7/20



(See Page 2 updates reflecting new CDC face cover recommendation)

See Page 2 for additional information on Talking Points, CDC Recommendations for (1) Social Distancing and (2) Best Hygiene Practices
See Page 3 for National Grid (3) Emergency Work at a Premises and (4) Standard PPE Guidance
See Page 4 for National Grid (5) Enhanced PPE Guidance

1

Issued 4/8/20

Talking Points - Engage Customer

Prior to entry, engage the customer and advise of social distancing practices. Here are some questions and statements.

- Does someone within the premises have a known case of COVID-19? Has someone within the premises tested positive for the COVID-19 virus?

(IF ANSWER IS 'YES' TO EITHER OF THE ABOVE QUESTIONS, REFER TO ENHANCED PPE GUIDANCE ON PAGE 4)

- Do you mind if I follow the social distancing practice today?
- Is anyone currently sick inside the premises?
- If you are feeling sick, would you mind remaining in another room while I am working This is a best practice policy my company is recommending. Can you tell me where your equipment is located?
- I will do my job, keep you updated and tell you when I am done

(1) Social Distancing

- Maintain at least 6 feet distance between yourself and the customer at all times
- Where social distancing measures cannot be maintained, face cover can be worn to help limit the spread of the virus (see National Grid's Face Cover Guidance for details)

(2) Best Hygiene Practices

- Face covering can be worn in public settings where social distancing measures cannot be maintained (see National Grid's Face Cover Guidance for details)
- Use alcohol-based hand sanitizer (at least 60% alcohol), before and after each home visit; OR wash hands using soap and water for 20 seconds

2

Issued 4/8/20

(3) Emergency Work at a Premises

On arrival, assess the premise/situation in its entirety and consider these questions.

- Is it a multi-unit building?
  - Is the unit where work is required affected?
- What work can be done without interaction/entry?
- Is entry through a side or back door possible to limit exposure?
- Can make safe actions be taken without interaction/entry?
  - Securing Outside Meter/Curb Valve
- Would a hardship be caused by isolating the service?

Note: These questions and considerations are meant to help guide in the decision making process. There may be instances where access to a premise cannot be avoided in order to address immediate public safety concerns. Please reference the Social Distancing and applicable PPE Guidance in all situations.

(4) Standard PPE Guidance for Entering a Premises (No Known COVID-19 cases are present)

- Avoid touching ANYTHING in customer premises other than company equipment and customer equipment related to the job
- Wear disposable latex or nitrile gloves to prevent touching contaminated surfaces
- Latex or nitrile gloves should be donned before entering the home
  - If work gloves are needed to perform the task, remove disposable latex or nitrile gloves and dispose of them. Don work gloves and perform task. Once task is complete remove work gloves and store them. Don a new pair of disposable latex or nitrile gloves to exit the home.
- Remove latex or nitrile gloves and dispose in way that won't create other opportunities for exposure
- Immediately wash / sanitize hands after removing latex or nitrile gloves
- All other PPE normally required for the work being performed should be used

3

Issued 4/8/20

(5) Enhanced PPE Guidance for Entering a Premise (Where a Known COVID-19 Case is Present)

The most effective way to protect the employees from contracting the virus is physical distance; if at all possible, the customer diagnosed with COVID-19 should be asked to move to a separate room before premises entry. When available and practicable, the following PPE items may be used at the premises with a known COVID-19 case present. These PPE items can be used in combination with our Social Distancing and Best Hygiene Practices to limit the spread of the virus.

- N-95 / KN-95 mask (see Page 5 for pictures of typical N-95 / KN-95 masks available)
- Reusable Face Shield
- Disposable Surgical Gloves (nitrile or latex)
- All other PPE required for doing the work (i.e. safety glasses, hard hat, etc.)
- If desired, FR-rated balaclava may be worn to provide additional protection while working

The following steps should be taken while conducting work in the premises:

- Prepare a paper or plastic bag for disposal of used PPE prior to entering the premises.
- Avoid touching ANYTHING in customer premises other than company equipment and customer equipment related to the job.
- Wear disposable latex or nitrile gloves to prevent touching contaminated surfaces.
- Any PPE should be donned before entering the home.
- If a mask is in use, avoid touching your face or adjusting the mask.
- If work gloves are needed to perform the task, remove disposable latex or nitrile gloves and dispose of them. Don work gloves and perform task. Once task is complete remove work gloves and store them. Don a new pair of disposable latex or nitrile gloves to exit the home.

Once work is completed in the home, follow these steps to safely remove the PPE items

- Remove face shield, taking care to avoid touching your face. Clean / disinfect and store properly.
- Remove mask from the back of the head first, taking care to avoid touching your face. Place used mask in a bag and dispose in normal trash.
- If balaclava has been worn, remove covering from back of head, similar to removal of mask.
- Remove latex or nitrile gloves (turn inside out while removing) and place in a bag. Dispose of bag in normal trash.
- Immediately wash / sanitize hands after removing latex or nitrile gloves, following Best Hygiene Practices.

4

Issued 4/8/20

Typical N-95 / KN-95 masks

5

Safeguarding your Vehicle

Now, more than ever, with COVID-19, precautions to safeguard your vehicle when transferring the vehicle to another employee, or when taking your vehicle in for maintenance, is very important.

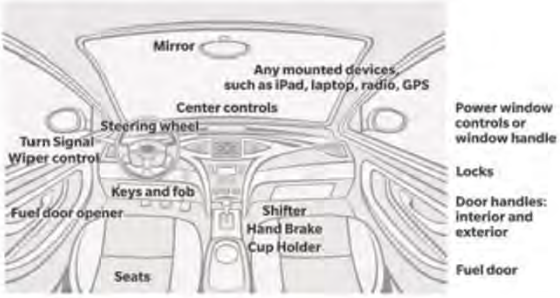
Here are some high-touch areas that should **never** be missed:

• Mirror • Center controls • Keys and fob • Wiper control • Climate control • Audio controls • Hand brake • Seats *(driver/passenger)*/Seatbelts • Fuel door opener • Windows • Headrests • Armrests	• All mounted devices *(any and all electronic devised used - i.e. iPad, laptop, radio, GPS, phone chargers)* • Steering wheel • Headlight • All cabin lighting controls • Shifter • Cup holder • Door handle*(inside and out)*/Window control/locks • Air vent • Sun visors

Use disinfectant wipes, diluted bleach solution, or damp soapy water wipes when cleaning all hard surfaces throughout the vehicle.

To guide your efforts when cleaning the vehicle, think about where droplets would fall when you sneeze or cough (*for example: do you turn your head to the side?) and remember to think about your own personal safety:*

- Be sure to wash your hands for **20 seconds** after completing the cleaning process.
- If you take your vehicle home at night, be sure to lock it to prevent it from being compromised.
- Make sure you have a mask and gloves (when/where appropriate).



Before you leave or enter the vehicle – here's a checklist to keep you safe and your team members safe as well:

Activity to Safeguard	☑
Keys / Fob	
Door Handles (interior/exterior)	
Steering Wheel, Shift Lever, Brake Lever, Wiper Stalk, Turn Signal Stalk	
Air Vents, Console, Dashboard, Cup Holder	
Exterior and Interior Fueling Latch, Cover, Cap	
Seats, Seatbelts, Headrests	
Mirrors, Windows, Window Controls	
Interior Lights	
Sun Visors	
Passenger and Driver Door Armrests, Grab Handles, Seat Adjusters	
All Electronic Devices used while in vehicle (iPads, Navigation Systems, Phone Chargers, Laptops, etc.)	

Additional considerations for crew trucks:

Handles on bin doors	
Equipment controls (bucket / digger)	

**** Please consider any other touch point identified by a crew member but not listed***

Appendix B

Community Air Monitoring Plan

Community Air Monitoring Plan
Williamsburg Works Site Parcels 3 and 4

In accordance with NYSDEC and NYSDOH requirements for a Community Air Monitoring Plan (CAMP), a perimeter air-monitoring plan will be implemented at the site during each phase of the field activities. The objective of the perimeter air-monitoring plan is to provide a measure of protection for the downwind community (i.e., off-site receptors, including residences and businesses and on-site workers not involved with the site field activities) from potential airborne contaminant releases as a direct result of field activities. The perimeter air-monitoring plan is a stand-alone document and will be available on site. The VOC Monitoring, Response Levels, and Actions are presented as follows.

Air Monitoring Response Levels and Actions

VOCs

Response Level	Actions
>5 parts per million (ppm) above background for 15-minute average	▪ Temporarily halt work activities ▪ Continue monitoring ▪ If VOC levels decrease (per instantaneous readings) below 5 ppm over background, work activities can resume
Persistent levels >5 ppm over background <25 ppm	▪ Halt work activities ▪ Identify source of vapors ▪ Corrective action to abate emissions ▪ Continue monitoring ▪ Resume work activities if VOC levels 200 feet downwind of the property boundary or half the distance to the nearest potential receptor is <5 ppm for a 15-minute average ▪ If VOC levels are >25 ppm at the perimeter of the work area, activities must be shutdown

Particulates

Response Level	Actions
>100 µg/m^3 above background for 15-minute average or visual dust observed leaving the site	▪ Apply dust suppression ▪ Continue monitoring ▪ Continue work if downwind PM-10 particulate levels are <150 mcg/m3 above upwind levels and no visual dust leaving site
>150 µg/m^3 above background for 15-minute average	▪ Stop work ▪ Re-evaluate activities ▪ Continue monitoring ▪ Continue work if downwind PM-10 particulate levels are <150 µg/m3 above upwind levels and no visual dust leaving site

Introduction

STANDARD OPERATING PROCEDURE

1. Introduction

This document presents the Standard Operating Procedures (SOPs) for the Atlantic and New England Regions of GEI Consultants, Inc. (GEI). The primary intent of the document is to promote consistency in application of Standard Operating Procedures (SOPs) for environmental field and some office operations. Application and use of SOPs will be considered and may be discussed in annual staff reviews.

This SOP document encompasses a broad range of activities to improve the planning, implementation, and documentation of most environmental field and some office operations. The methodologies presented in this manual may not be applicable to site-specific situations. If you are uncertain about a procedure, confirm its adequacy with the project manager, client, and/or regulatory bodies to confirm that procedures are consistent with their expectations.

The document is organized according to the chronological sequence of typical work flow proceeding from project setup to field activities, data collection, and report preparation tasks.

Two types of documents are contained herein:

- General Guidance Procedures – Documents intended to be informative and not prescriptive. These documents are designed to provide necessary background information to adequately understand the process.
- Standard Operating Procedures – Documents intended to describe standard procedures and limitations.

2. SOP Layout Design

2.1. Header Information

- Each SOP contains within its name a two letter abbreviation of the general category in which it belongs (i.e. RE-001 means it is in Site Reconnaissance). The table of contents provides the definition for each abbreviation. The SOP name and number is provided in the header and footer of the document. The revision number is provided in the header of each SOP.
- The effective date is provided in the header of each SOP. The effective date provides the date when the revisions to the SOP are in effect and provides information as to the last time the SOP was updated. Each SOP should contain the most up-to-date version and effective date.

2.2. Footer Information

- Each footer contains the page number and total page numbers as well as a second reference to the SOP name. This should help organize and collate pages.

2.3. Body of Text

- Limitations are provided to describe precautions or common issues associated with the performance of the procedure.
- References provide sources consulted for development of the SOP.
- Attachments provide reference to external documentation that should be reviewed in conjunction with the SOP.
- At least one contact person is provided at the bottom of each SOP. These people should be contacted with any questions or comments on the particular SOP. The contact can clarify the SOP or edit as necessary.

2.4. Process for editing/updating SOPs

Should you need to make a global change to an existing SOP, the current .pdf version can be found on the Intranet.

In order to make your changes, you will need to request a WORD copy of the SOP from Andrea Hippler or Ryan Hoffman. Once you have made your changes, the SOP should be e-mailed to Andrea Hippler and Ryan Hoffman with a note as to what changed.

This document has been provided to all staff performing environmental field tasks for GEI's Atlantic and New England Regions.

PM-001 Utility Markout and Clearance

1. Objective

Describe typical utility markout/clearance procedures prior to and during excavation. All markout procedures should be performed in accordance with local and state regulations.

Many states, by law, require that utility companies are notified before excavation begins. Actual procedures and requirements differ by state. City/state government may have additional requirements for utility markout procedures. Check the requirements in the locality before beginning. Also check with the GEI project manager to determine whether it is most appropriate for GEI or the drilling/excavation subcontractor to handle mark out and clearance.

2. Execution

Public Utility Markouts

- The drilling/excavation locations should be marked with white paint, stakes, or flags.
- The contractor should call the appropriate one call communication network for the state the work is being conducted in. Refer to the Reference section in this SOP for contact information. Contractors shall provide all necessary information to the one call system. Sample location maps may be provided to clarify sampling locations. The contractor shall provide GEI with the utility clearance ticket number.
- If necessary, contact the municipalities or other utility owners to mark their water, sewer, or other lines if they do not belong to the one call system. The contractor should keep a record of these calls.
- Utility plans, if available, should be obtained from the property owner or municipal offices.
- Prior to excavation, a visual check should be made that all utilities companies and municipalities have marked their locations. This includes looking for signs that a utility exists, and verifying that the markings agree with a visual check. If they do not, contact the appropriate utility to remark their locations.
- Utilities will generally only markout and clear utilities in roadways or other public property up to the property boundary. Owners of fiber optic cables, natural gas pipelines, and other high hazard utilities will often markout on private property if requested. The contractor should request this. See section on private utility clearance below.
- Public agencies, utilities, contractors, other associations, manufacturers and all others involved in excavation should adopt the American Public Works Association (APWA) Uniform Color Code using ANSI standard Z535.1 Safety Colors for temporary marking and utility identification, as follow:

The APWA Uniform Color Code

1. **White** – Proposed Excavation
2. **Pink** – Temporary Survey Markings
3. **Red** – Electric Power Lines, Cables, Conduit and Lighting Cables
4. **Yellow** – Gas, Oil, Steam, Petroleum & Gaseous Material
5. **Orange** – Communications, Alarm or Signal Lines, Cables or Conduit
6. **Blue** – Potable Water
7. **Purple** – Reclaimed Water, Irrigation and Slurry Lines
8. **Green** – Sewers and Drain Lines

However, not all organization do use these colors. Make sure the color scheme is understood.

- The excavator/contractor and consultant begins work on the scheduled work date and time (if all the facility operators have responded) taking care to find and preserve any markings that have been made.
- If markings may be disturbed during work, establish offset marks to create reference points for the underground utilities. Take photographs of the markings before starting work.
- When digging near a buried utility, the excavator/contractor and consultant should be aware of their proximity to the utility and use caution.
- If there is uncertainty about the accuracy of the markings or there are too many utilities in a given location to excavate or drill safely, consideration should be given to hand-digging the first few feet, vacuum excavation, or use of a utility location company as detailed below in Private Utility Markouts.
- Some clients may require hand or vacuum clearance to a minimum depth. Check with the GEI project manager.
- If exposing a utility, the excavator/contractor should provide proper support and protection for the utility to prevent damage. Contact the utility operator for support, guidance, or assistance.
- When the excavation is complete, the excavator/contractor should provide proper backfill for any utilities that have been exposed.

Private Utility Markouts

- Utility markouts on private property should follow the steps outlined above in public utility markouts with the additions below.
- If work is conducted on private property where public utilities may not provide markouts and the property owner cannot provide accurate utility plans, it is

recommended to use a company to determine the utility locations using one or more of the following technologies:

i. Electro-Magnetic (EM) device: This technology uses an electro-magnetic field in the subsurface to accurately locate metallic lines or non-metallic lines incorporating a metallic trace wire along their surface. The field is created either by direct contact to the pipe or tracewire, or by an induced current via radio waves.
ii. Sewer Sonde: For non-metallic lines where internal access is possible (such as clean-out ports in a sewer), a beacon or 'sonde' that emits a signal to the surface receiver as it is snaked through the pipe provides the same accuracy as the EM detector. If the internal condition of the pipe is desired, a camera can be deployed instead of a simple sonde.
iii. Ground Penetrating Radar (GPR): This technology involves radar waves reflecting to a surface receiver which provides a visual real-time map of the subsurface by which anomalies (such as pipes or tanks) may be detected. It has limitations in clay or wet soils and requires a skilled operator for interpretation. GPR should be considered for high risk utilities (e.g. PVC natural gas lines without trace wire) where line-of-sight project from site entry point to a kiosk or other building is uncertain.

- Utility markout on private property should include clearance for other types of underground structures such as underground storage tanks, septic systems, utility or access tunnels, and in-ground irrigation systems.

3. Limitations

- Markout notification time usually does not include holidays. Make sure holidays are considered and markout time is scheduled accordingly. Do not conduct excavation or drilling prior to the required wait time. Do not mark excavation locations using spray paint if it is raining or snowing enough so that the paint markings will be washed away. Consider using long stakes instead of paint if snow is predicted. Excavations within the tolerance zone should be performed with non-powered hand tools until the marked utility is exposed. The tolerance zone may be determined by the utilities, law or codes.
- When excavating close to an underground utility, it is good practice for the contractor/excavator to have a spotter assist and guide the machine operator.
- Take care not to damage the conduit or protective coating of a utility. If the excavator/contractor damages this, leave the damaged utility exposed and immediately call the utility owner.
- If contact to a gas utility occurs, notify police, fire, and emergency personnel, and evacuate employees and general public. No attempt should be made to tamper with or correct the damaged utility.

Section 3

Field Documentation (FD)

STANDARD OPERATING PROCEDURE

FD-001 Field Notebook

1. Objective

Describe methods for documentation of field activities.

Documentation of site activities is a crucial part of the field investigation process. The field notebook serves as the record of field activities performed or observed during the project. It provides a factual basis for preparing field observation reports, if required, and reports to clients and regulatory agencies. Example field notes are provided in Attachment A.

2. Execution

- Use a separate all-weather bound notebook for each site/location/project number. Spiral notebooks should not be used because pages can be easily removed.
- Write neatly using black or blue pen, preferably a waterproof pen. Use of pencil is also acceptable only with approval of the project manager, such as in but not limited to, certain field conditions [e.g., cold or wet weather].
- Write the project name, project number, book number (i.e., 1 of 3), and date on the front cover. On the inside cover, identify the project name, project number, and "Return Book To:" the office address of the project manager.
- Number all of the pages of the field book starting with the first entry.
- Record activities as they occur. Record only facts and observations, regardless of whether they appear to be relevant at that time.
- Identify conditions or events that could affect/impede your ability to observe conditions (e.g. snow-covered ground surface, inability to access areas of interest).
- Neatly cross out mistakes using a single line and initial them. Erasures are not permitted.
    - If an error is made on an entry in the field notebook, the individual who made the entry should make the corrections. The corrections must be initialed and dated by the person making the correction.
- Sign or initial and date the bottom of every page with an entry if the project requires such documentation.
- Place a diagonal line through unused portions of a page.
- Record the following information upon each arrival at the site:
    - Date/time/weather.
    - GEI personnel.
    - Purpose of visit/daily objectives.
    - People (client, contractor, landowners, etc.) present upon GEI arrival.

- Record the following information during the course of the day:
  - Conversations with contractors/subcontractors, clients, visitors, GEI staff, landowners (site or abutters). If possible, record complete names, titles, and affiliations.
  - Time of arrival and departure of individuals.
  - Activities as they occur.

- Additional examples of observations to record may include and are not limited to:
  - Type and quantity of monitoring well construction materials used.
  - Use of field data sheets or electronic logging equipment (e.g. boring logs, monitoring well sampling logs, etc.).
  - Ambient air monitoring data.
  - Field equipment calibration information.
  - Locations and descriptions of sampling points.
  - Contractor/Subcontractor progress.
  - Sample media (soil, sediment, groundwater, etc.).
  - Sample collection method.
  - Number and volume of sample(s) collected and sample bottle preservatives used.
  - Sample identification number (s) and date and time of sample collection.
  - Approximate volume of groundwater removed before sampling.
  - Any field observations made such as pH, temperature, turbidity, conductivity, water level, etc.
  - References for maps and photographs of the sampling site(s).
  - Information pertaining to sample documentation: bottle lot numbers/ dates, method of sample shipments, chain-of custody record numbers, and overnight shipping numbers.
  - Surveying data (including sketches with north arrows).
  - Changes in weather.
  - Rationale for critical field decisions.
  - Recommendations made to the client representative and GEI Project Manager.
  - Site sketch of conditions at the end of the day.
  - Summary of work completed/work remaining.
  - Allow time at the end of the day to complete entries in the notebook.

GEI Consultants

STANDARD OPERATING PROCEDURE

FD-002 Field Observation Report

1. Objective

Describe methods to generate a Field Observation Report.

The Field Observation Report is used to record a summary of activities, observations, and decisions made during the day's field work. The daily field observation report serves as a permanent record of the day's activity for the Project Manager (PM), In-House Consultant (IHC), and/or client.

2. Execution

- If required, at the close of the day's field work, a Field Observation Report should be prepared by the individual responsible for the field notebook. This report should be completed before leaving work for the day. Contents of the report should include, at a minimum, the following information:
    - A record of person(s) present at the site, time of arrival, departure times (e.g., GEI, contractor(s), client, etc.).
    - A record of the daily objective(s) and the activities performed (e.g., drilled five borings in the overburden).
    - A summary of deviation(s) from the field plan or objectives.
    - A summary of field decisions made, who made them, and the basis for such decisions.
    - A diagram, sketch, and/or map showing the location and extent of the work or other significant observation(s) made during the day.
    - Recommendations that may result from field observations and actions that may result from implementation of those recommendations.
    - A summary listing and field sketch showing location(s) of field activity.
- Submit a draft report to the PM/IHC for review. Complete any editorial changes, sign, date, and submit the report to PM/IHC for approval/signature. Field Observation Reports should be written neatly. They are not required to be typed unless specifically requested by the PM.

3. Limitations

- The Field Observation Report is not a substitute for the field notebook.
- Not all projects require daily Field Observation Reports.
- The Field Observation Report should be based primarily on factual information. Opinions, if necessary, should be identified as such. Any speculation should be clearly noted in the report as such.

- The Field Observation Report should never be released to anyone other than the PM/IHC prior to review and sign-off unless explicitly authorized by the PM/IHC.

Contractor:	ABC Contracting	**Page:**	1 of 2
Subcontractor:	NA	**GEI Proj. No.**	99999-0

SOP FD-002 - Attachment A – Example Field Observation Report

Time of Arrival: 0700 **Departure: 1440** **Weather: Overcast, Raining, 55^{0}F**

Persons Contacted, Company
Jane Doe, ABC Contracting

GEI Representatives
Bill Smith

Purpose of Site Visit: To observe excavation of soils for new guard booth and sidewalk.

Observations:

1. **Excavation**
   a. Areas for guard booth and sidewalk were laid out by ABC with stakes, string, and spray paint. Locations were between the pavement and wetland area; no excavation occurred in the wetland area.
   b. Staging area for soil stockpile was located to the west of the excavation, along the fenceline; polyethylene sheeting was placed beneath the pile.
   c. HDPE membrane delivered to site; stored in garage area through the inside fence.
   d. ABC crew began hand digging area for sidewalk and guard booth. Sidewalk area measured 22 feet long by 4 feet wide by 4 inches deep. Guard booth area measured 12 feet long by 10 feet wide by 9 inches deep. Utility pole and bollard locations started today.
   e. Rain continued to get worse in the afternoon; ABC covered the entire excavation and soil stockpile with poly sheeting and secured the sheeting with grade stakes.

2. **Subgrade Preparation**
   a. Subgrade preparation for the sidewalk and guard booth areas at the site is complete.

3. **Dewatering**
   a. No dewatering occurred today.

4. **Air Monitoring**
   a. During excavation, I monitored the breathing zone of the workers with an organic vapor meter (OVM). No headspace readings were measured in soil samples S-1 through S-8.

GEI

STANDARD OPERATING PROCEDURE

FD-003 Sample Management and Chain of Custody

1. Objective

Describe methods to label sample containers, manage the samples, and prepare Chain of Custody documentation for the samples. Sample transport is also addressed.

2. Project Setup

When setting up a sampling event, inform the recipients of the samples (laboratories) and recipients of laboratory results (data group and project managers). Discuss with the laboratory the sampling media, turnaround times, and reporting limits for appropriate regulatory criteria for the site. Include the data group on correspondence so that turnaround times, data validation, and project deliverable schedules can be tracked successfully.

- Laboratory - Number of samples, analyses needed: bottle orders and holding times, turnaround times needed, reporting limits needed for regulatory criteria.
- Data group - Number of samples, analyses requested, turnaround times and reporting limits requested, data validation needed, regulatory criteria to use for tabulating results, deliverables needed, and project name and number.
- Schedule - Inform the laboratory and Data Group of schedule delays, changes to analyses, and expediting.

3. Sampling Execution

- Review the work plan prior to sampling to determine the following:
  - Sample matrix and sampling method.
  - Required analysis and sample volumes.
  - Sample container type and preservative requirements.
  - Required analysis methods and/or report formats.
  - The turnaround time required by the project.
  - If the data will be sent directly from the laboratory to the data validator, Project Manager, or Data Group.
  - Holding time restrictions for sampling media and analytical methods.
  - Sample naming convention used for this project site.
- Sample labels should be filled out using a waterproof or permanent marker or pen. Required information includes:
  - Sample ID.
  - Date and time (military time) of sample collection.
  - Project number.
  - Sample preservatives.
  - Sampler's initials.
  - Laboratory analytical methods.

- Place the label on the jar or bottle, not on the cap. Sample custody begins at this time.
- Record the above information in the field notebook.
- Individually wrap sample jars with packing material, if needed. See SOP SC-002 for guidance on packaging samples for shipment to the laboratory by way of common carrier. Place samples in a cooler with bagged ice or freezer packs (blue ice) immediately after collection. Add sufficient ice or freezer packs to cool samples to approximately 4°C.
- Complete a chain of custody (COC) for the samples as described below. GEI or laboratory COCs may be used as long as they contain fields for all required sample information as described in Section 2.1.

3.1. Chain-of-Custody (COC) Completion

- Fill out COC neatly and in permanent ink. Alternatively, an Excel version of the GEI COC is available and can be filled out electronically.
- Certain analyses (i.e. air analysis by TO-15) require specialized, laboratory issued COCs. Make sure any specialized COCs are available before sample collection.
- Record the project name and number, the sampler's name(s) and the state where the samples were collected.
- For each sample, enter the sample identification number, date and time (military time) collected, the number of sample containers, and any additional information to fulfill project, client or regulatory requirements.
- Record the type of analysis (including laboratory method; e.g. EPA-SW846 Method XX) requested and the preservative (if appropriate) in the vertical boxes.
- Field duplicates should be anonymous to the laboratory, but must be recorded for use by the Data Group. To keep track of this information, link the field duplicate with the proper sample in the field notebook. If required by the Project Manager or Data Group, also document this information on or attach a note to the GEI copy of the COC.
- Trip blanks for large sites should be named similar to the samples they are collected with so that there are not two of the same sample name for the same site. For example, "OU1TB-122509" and "OU3TB-122509" would avoid any mistakes.
- Strike incorrect entries on the COC with a single line, followed by the initials of the person making the correction, the date, and the correct entry.
- When sample custody is ready to be relinquished, complete the bottom of the form with date and time (military time) and signatures of relinquisher and receiver of samples as indicated. The sample collector is always the first signature while the analytical laboratory is the final signature. Theoretically, all individuals handling the samples between collection and laboratory should sign the form; however, if a common carrier (i.e., Federal Express, UPS) is used for shipping, GEI must identify the carrier in the 'Received by' box on the

COC. If the sampler hand delivers the samples to the laboratory, the received box must be signed by the laboratory.

- If the samples are placed in a designated secure area (e.g. GEI sample fridge), note this location in the "Received by" box on the COC.
- GEI uses both single sheet and triplicate COCs. If using the triplicate COCs (white, yellow, and pink copies), the pink copy should be retained by the sampling personnel and provided to the Data Group for proper filing. The white and yellow copies should accompany the samples to the laboratory.
- If you are using the single sheet COC, make a copy of the COC after it has been signed by the lab courier and forward it to the Data Group.
- Prior to sample shipment by common carrier, the COC must be placed inside the cooler in a Ziplock bag or other watertight package.
- If a common carrier such as FedEx is used to transport the samples to the laboratory, include the carrier tracking number and identify the carrier in the "Received by" box on the COC.
- If a courier is used to transport samples to the laboratory (lab courier or GEI personnel), the courier signs the COC in the "Received by" box.
- Place a custody seal on the cooler if shipping via common carrier.
- Transport samples to the laboratory as soon as possible. It is preferable to transport the samples directly to the laboratory from the field. Samples brought back to the office for storage prior to submission to the laboratory must be kept cold (4° C).
- Unused sampling containers/media that are sent back to the lab should be included on a separate COC.
- After the samples are sent to the laboratory, the GEI copy of the COC must be forwarded to the Data Group: datagroup@geiconsultants.com.

4. Limitations

- Keep the number of people involved in handling samples to a minimum.
- Where practical, only allow people associated with the project to handle the samples.
- Always document the transfer of samples from one person to another on the COC.
- The COC should always accompany the samples.
- Give samples positive identification at all times that is legible and written with waterproof or permanent ink.
- When sending samples via a common carrier, use one COC per package.
- Where practical, avoid sending samples from more than one site with separate COCs in a single package.

THE LEADER IN ENVIRONMENTAL TESTING

PACKING SAMPLES FOR SHIPMENT BACK TO THE LABORATORY

A. Line cooler with bubble wrap and large plastic bag. Use absorbent pad inside the bag if bottles contain preservatives.

B. Wipe outside of bottles and put glass in individual bubble bags & seal. Place bottles & the temperature blank into cooler. Leave room for ice in between bottles & on top.

C. Place double bagged or loose ice randomly around bottles throughout the cooler.

D. Place large bag of ice or loose ice on top of the bottles. In warm weather, the cooler should be packed with as much ice as possible.

E. Close outer bag, compress excess air out of bag, twist top and knot. If necessary, use more bubble wrap to fill the dead air spaces. Place chain of custody (COC) and other paperwork in plastic bag and seal. Place on top of cooler.

F. Close cooler, place signed and dated Custody Seals over opening. Tape over the Custody Seal and seal cooler securely. Fill out overnight shipping waybill and attach to the top or handle of the cooler. Attach Saturday delivery stickers if needed. Ship according to DOT regulations.

STANDARD OPERATING PROCEDURE

FD-004 Photo Documentation

1. Objective

Describe methods to document and retain photographic records.

Keeping a record of photographs taken is crucial to their validity as a representation of existing conditions.

2. Execution

- Photographs of a site, individual samples, or other observations should be taken using a digital camera.
- Set the camera to record the time and date for each photograph.
- All photographic records, along with the following information, should be recorded in the field notebook (SOP FD-001).
    - If applicable, the compass direction describing the direction the photograph was taken (e.g. looking southeast). This may not apply to photographs of individual samples.
    - Brief description of what the photograph is intended to show.
- The field notebook should note who took the photographs.
- The photographs should be electronically backed up on a computer or other data storage device.
- If photographs will be used in a report, memo, or letter, they should be placed on a photograph record template and the relevant information describing the photograph should be inserted into the caption section for each photograph.

3. Limitations

- Some clients and regulatory agencies require photographs of every subsurface soil sample collected. These photographs typically include a "whiteboard" which indicates the site, the boring ID, and the depth of the sample, while logging details are recorded in the field notebook. Under these circumstances, it is not necessary to include compass directions or descriptions.

STANDARD OPERATING PROCEDURE

FD-006 Handheld Global Positioning Receiver Operation

1. Objective

Use handheld global positioning system (GPS) receivers to locate sample points and site features with "Mapping-Grade" accuracy.

Use handheld GPS receivers to "stake out" proposed sample point locations within the limits of "Mapping Grade" accuracy.

2. Execution

- Handheld GPS receivers provide a low-cost and user-friendly method for locating sample points and site features with a fair degree of horizontal accuracy.
- In simplistic terms, GPS works by measuring the distance from numerous orbiting satellites to a point on the earth surface. Individual satellites broadcast their real-time location in terms of x,y and z coordinates, and the distance from each satellite is measured as a function of the length of time that a time-stamped signal takes to reach the receiver. Built-in GPS software derives new points by intersecting the distances from known orbital locations – in much the same way that points are located by intersecting tape-measured distances from building corners or other pre-existing site features.
- Late-model handheld GPS receivers utilize a real-time differential correction technique called WAAS (Wide Area Augmentation System). This system was designed to provide greater confidence and reliability in using GPS data for commercial aircraft landing approaches, and the additional correction improves all GPS operations.
- Handheld GPS receivers display navigational information on a variety of standard pages. Although each manufacturer uses slightly different formats, all receivers toggle back and forth between the following visual presentations:
- A "satellite" page displays the relative orbital location of all GPS satellites that are currently being tracked by the receiver. The display may include information on the real-time geometrical strength of the solution: satellite intercepts that cross at right angles provide more accurate solutions than intercepts that cross at acute or obtuse angles.
- A "track" page that displays the travel path of the receiver while it is turned on, along with the relative location of recorded points. Many GPS models have a "track-back" function that will guide the user on the same path back to the starting point
- A "navigation" page that displays instantaneous location and the real-time direction and velocity of travel. Some units provide two pages to display this information in different formats. Most units will report the overall "course

made good" (straight-line bearing and distance from the starting point) at any point.

- A "waypoint" page that allows users to "Go To" a created point or previously recorded point by providing a straight-line bearing and distance to the point. The information is instantaneously updated as the user moves along; some units display a pointing arrow that directs the user to the direction of travel. Be careful of go-to lines that lead through swamps or over cliffs – if you will be travelling in difficult terrain have a paper copy of the USGS quadrangle and a compass on hand for navigation.
- Signal strength degrades significantly next to buildings and underneath tree canopy. Most GPS receivers have an "averaging" function to improve the accuracy of shielded locations. GPS users can also improve precision by locating points three times, at different times of the day. Two of the solutions will generally be closer to each other than to the third and can be averaged for a more reliable fix.
- Most GPS receivers default to latitude and longitude, but data is more accurate and easier to input and when expressed in UTM coordinates to the nearest meter. The handheld GPS setup will have a function somewhere to change to UTM. Most of Connecticut is in UTM Zone 18 but the easternmost parts are in Zone 19.
- Consult "Corpscon" the datum translator available from the National Geodetic Survey website. Corpscon translates instantly from latitude/longitude to UTM coordinates to state plane coordinates and provides tools to identify UTM Zones. Also consult the Trimble, Garmin and Magellan websites for technological improvements and discussion of advanced techniques.

3. Limitations

- Handheld GPS receivers operating in unobstructed locations are currently reckoned to provide 2-5 meter accuracy, meaning that the true location of measured points lie within an "error ellipse" with axes of 2-5 meters centered on the measured location. In other words, even under the best of conditions a real-time GPS solution may be as much as 20 feet off the true horizontal location of a point.
- Due to geodetic restrictions, vertical locations (elevations) have less than half the accuracy of horizontal locations, meaning that even under the best of conditions, a surface elevation displayed on a handheld GPS receiver may be off by more than 50 feet.
- Horizontal and vertical data derived from handheld GPS receivers should never be considered more than relatively accurate, and this level of uncertainty should be identified in any discussion of positional tolerance.

Section 4

Drilling Methods (DM)

STANDARD OPERATING PROCEDURES

DM-001 General Guidance on Determination of Appropriate Drilling Methods

1. Objective

There are multiple drilling methods which can be employed based on the type of stratum (e.g. overburden or bedrock) and the end use of borehole. End uses include geotechnical investigation, subsurface soil sampling, and monitoring well installation or a combination thereof.

The following text describes different methods of drilling with considerations for their use to collect groundwater and/or subsurface soil samples. Profiles of subsurface conditions encountered and well installation details must be recorded on logs. Procedures for field documentation are provided in Section 4 - Field Documentation.

2. Hollow-Stem Augers (HSAs)

Borings can be installed in unconsolidated formations using solid-stem or hollow-stem augers (HSAs). The augers are advanced by rotation and the drill cuttings are brought to the surface by travelling up the outside of the auger flights in a screw-like manner. HSAs have the advantage of allowing the well to be installed inside the hollow stem of the auger, which prevents the borehole from collapsing. Upon reaching the planned well depth, the casing and screen are placed inside the HSAs and the flights are individually removed while the annular space around the well is filled with the filter pack and grout, as appropriate. Conversely, solid-stem augers must be completely removed from the borehole before well installation, which can lead to collapse of the borehole. For this reason, solid stem augers are seldom used for installation of monitor wells.

HSAs come in a variety of sizes and allow collection of soil samples utilizing split spoons or Shelby tubes. Samples are collected ahead of the augers for determining soil/sediment type, stratigraphy, depth to the water table, and for collecting soil samples for chemical analysis. During this process, the standard penetration test (SPT, ASTM Method D 1586) can also be performed. The HSA method also has an advantage over mud-rotary drilling techniques in that drilling mud is not used. Drilling mud can contaminate the soil samples and potentially reduce the yield of the wells.

A disadvantage of the method is that HSAs cannot be used to drill into competent bedrock or through large boulders. Also, "heaving or running sands" can be forced up inside the augers as a result of strong vertical groundwater gradients, which can hamper efforts to collect soil samples or complete well installation. Furthermore, the maximum depth achievable using HSAs, which is generally shallower than other methods, is dependent not only on the ability of the rig (e.g., horsepower, rig-torque, weight of augers etc.), but also the lithology of the material drilled.

3. Rotary Drilling

Rotary drilling methods include both direct rotary and reverse-circulation rotary. Direct rotary is more commonly used in environmental investigations, whereas reverse-circulation rotary is used in drilling large-diameter water supply wells. In direct rotary drilling the borehole is advanced by rotating the drill pipe (rods) and bit to produce a cutting action. The cuttings are removed from the borehole by continuous circulation of a drilling fluid. The fluid or "mud" is pumped down the inside of the drill pipe and is circulated back to the surface on the outside of the pipe. The fluid removes the drill cuttings from the borehole and cools and lubricates the bit. Mud used during direct rotary consists of additives (e.g., bentonite), water, or air.

Reverse-circulation rotary drilling is similar to direct rotary except the drill rigs are larger and the flow of the drilling fluid is reversed. The drilling fluid moves upward inside the drill pipes and circulates back to the borehole via settling pits. The drilling fluid returns to the borehole via gravity and moves downward in the annular space between the drill pipe and borehole wall. Drilling fluids for reverse-circulation rotary are generally water and any suspended particles picked up from the surrounding formations.

Mud-rotary methods can be used to drill in both unconsolidated and consolidated (bedrock) formations. In addition, drilling mud stabilizes the borehole and limits the potential for borehole collapse. Disadvantages of using the mud-rotary method include the difficulty in determining the depth to the water table, the potential for drilling mud to impact soil samples and dragging of contamination into deeper zones since the drill cuttings are re-circulated in the borehole. Wells installed using this method typically take longer to develop than wells installed using the HSA or air-rotary methods due to the invasion of mud filtrate into the formation.

In air-rotary drilling, compressed air is directed down the inside of the drill pipe. As in mud-rotary drilling, air removes the cuttings and lubricates the bit. However, since air has no viscosity, it cannot be used to stabilize a borehole therefore, casing must be advanced in unconsolidated formations to keep the borehole open. This is why air rotary methods are best suited for drilling in bedrock formations. The percussion-type air-rotary "hammer" bit provides the best penetration rate when drilling bedrock consisting of crystalline rock. However, when drilling above the water table, an air-rotary bit can grind the soil and bedrock to a fine powder which is blown out of the hole with air and which has the potential to be inhaled. Therefore, drilling above the water table using air-rotary methods requires the addition of potable water to the borehole for dust control. In addition, the air compressor should be of the oil-less variety, or have a filter to prevent any oil from entering the borehole.

A disadvantage of using rotary methods while drilling in unconsolidated formations is the requirement of pulling the drill pipe out of the hole each time a split-spoon soil sample is collected (and the SPT is performed). This adds up to considerable amounts of time when deep wells are being installed or when continuous split-spoon

sampling is being performed. As stated above, split-spoons used to collect soil samples can become contaminated when they are advanced down a mud-filled borehole.

A special type of rotary drilling is bedrock coring, wherein a special core bit and barrel are used to retrieve relatively undisturbed core samples of the bedrock. Coring allows better characterization of bedrock lithology and other features including orientation of fractures and bedding planes, which can control contaminant migration. Core barrels can either be unoriented or oriented. An oriented core is scribed with respect to magnetic north. Although more expensive than collecting an unoriented core, this method gives the true orientation of the features encountered in the core.

Drilling fluids are generally air (air-rotary) or bentonite and/or water (mud-rotary). Water added to a borehole must be of potable quality. The source of the potable water used during the installation (and development) of monitor wells should be documented (e.g., in the Remedial Investigation Report).

Bentonite is high swelling clay with sodium montmorillonite as its primary clay mineral. Bentonite is added to water to increase the viscosity of the drilling fluid so that drill cuttings can be removed from the borehole more effectively. At the same time, the viscosity must be low enough to allow cuttings and coarse-grained particles to settle out once they are circulated out of the hole. Bentonite also adds weight to the drilling fluid, which helps to maintain borehole stability.

4. Sonic Drilling

The method involves driving a core barrel using vibration, rotation, and a downward force to collect soil samples. A sonic drill rig looks and operates very much like a conventional top-drive rotary or auger rig. The main difference is that a sonic drill rig has a specially designed, hydraulically powered drill head or oscillator, which generates adjustable high-frequency vibrational forces. The oscillator uses two eccentric, counter-rotating balance weights or rollers that are timed to direct 100 percent of the vibrational energy at 0 and 180 degrees. There is an air spring system in the drill head that insulates or separates the vibration from the drill rig itself. The sonic head is attached directly to the drill pipe or outer casing, sending the high-frequency vibrations down through the drill pipe to the bit.

A core barrel is advanced using vibration, rotation, and downward force to collect continuous soil cores up to 20 feet in length. The bit at the end of the core barrel contains carbide teeth allowing the core barrel to be advanced through most overburden, soft bedrock, and minor obstructions such as bricks and boulders. Once the core barrel has been advanced, a secondary or "over-ride" casing is advanced down to the same depth as the inner core barrel. The over-ride casing keeps the borehole from collapsing while the inner core barrel is removed. Once the core barrel is removed, the soil core is pushed out of the core barrel through the use of

vibration and either air or water pressure. Soil core diameters are dependent on the size of core barrel used and range from 3 to 12 inches. The use of multiple over-ride casings of increasing diameter allows the borehole to be telescoped down through multiple confining units. The setup used in sonic drilling makes this drilling method amendable to collecting soil cores and installing wells in angled boreholes. With only the bottom of the inner and outer core barrel exposed to the aquifer at any given time, determining the location of the water table can be difficult.

While this drilling method has the capability of drilling through and providing samples of coarse gravels, boulders, and tight clays, these situations will result in slow drilling or advancement of the core barrel. The result is a hotter core barrel and a longer contact time between the core barrel and the encased soil core. The aforementioned conditions will increase the probability that the sonic method will raise the temperature of the soil core and facilitate VOC and SVOC loss.

The ability to quickly install deep borings and wells, while generating a large-diameter continuous soil core, makes this drilling technique invaluable when continuous soil sampling is needed to assess deep or complex geological situations. However, sonic drilling's high cost, relative to other drilling methods, may be prohibitive for small projects or shallow boreholes. The higher cost of the drilling method should be weighed against the cost savings incurred due to its faster drilling rate and high quality of the soil core produced.

5. GeoProbe®-Direct Push

The method involves hydraulically pushing hollow rods into the subsurface for the purpose of collecting soil and/or groundwater samples (e.g., Geoprobe®). The method can be used to collect discrete soil samples or install small-diameter wells used to collect groundwater samples.

Advantages of the direct-push method include the relatively quick collection of groundwater samples and, when used along with a mobile laboratory, collection of data in "real" time. The method allows for collection of multiple samples in a day with the potential for achieving contaminant delineation in one mobilization of the field equipment. The data can also be used to select locations of permanent monitor wells.

Disadvantages of the method include the fact that the data quality achieved is often suitable only for screening purposes. Direct-push methods typically result in very turbid samples since an oversize borehole is not produced and a filter pack is not used. Turbid samples can produce higher metal concentrations in groundwater samples since metals are typically adsorbed onto soil particles. Use of direct-push methods can also cause cross-contamination since contamination from shallow zones may be driven down to deeper zones. Due to the narrow diameter of the direct-push rods, samples are often collected with peristaltic pumps. When samples are collected for volatile organic compounds (VOCs) using peristaltic pumps, some

of the volatiles may be lost due to the pressure drop produced by the suction lift. In such cases, the VOC data must be qualified accordingly. For this reason, use of the peristaltic pump for collecting groundwater samples for VOC analysis is not recommended and approval for its use should first be obtained from the project manager or geologist.

Another disadvantage of using direct-push technology for collecting groundwater samples is the potential to breech confining units. To prevent this, soil sampling using direct-push technology or conventional split-spoon sampling techniques should first be performed to identify the presence, depth and lateral extent of confining units. Pushing through confining units should be avoided if the presence of dense, non-aqueous-phase liquid (DNAPL) or very soluble compounds such as Methyl Tertiary Butyl Ether (MTBE) are suspected or the contaminant plume appears to be diving in the aquifer.

Matt Glunt
Cathy Johnson

STANDARD OPERATING PROCEDURE

DM-002 Hollow-Stem Auger

1. Objective

Describe standard operating procedures for drilling of overburden soil borings using hollow-stem augers.

2. Execution

- Confirm that the appropriate measures have been taken for clearance of potential subsurface utilities. The responsibility for clearance may vary, depending on the client.
- Inspect the drilling rig to make sure it is clean and that the down-hole equipment has been steam-cleaned or pressure-washed. Record observations in the field notebook (See SOP FD-001).
- Observe that the augers are vertical when the first section is advanced into the ground.
- Use a 140-lb hammer to drive the sampler, unless conditions necessitate using a 300-lb hammer (see SOPs SM-001, *Split-Spoon Sampling* and SM-0003, *Soil Classification,* for details). Count and record the number of blows per 6-inch increments, confirming blow counts with driller if necessary).
- Decontaminate the split-spoon sampler after each use (see *Equipment Decontamination,* SOP QA-001) or use another decontaminated split-spoon sampler.
- Ensure that the drillers advance the augers only after they have inserted the auger plug (to prevent soil from entering the augers while advancing to the next sample interval).
- Request that the drillers remove the auger cutting bit/plug and insert the split-spoon sampler into the interior of the augers. Measure the stick-up of the rods attached to the sampler to ensure that the nose of the spoon is in virgin soil below the augers.
- Watch for signs of a soil strata change at depth during drilling (i.e., change in blow counts, change in soil color, soil wetness, soil contamination, bouncing of the drill rig, etc.). If important to the investigation, stop drilling and collect a soil sample.
- If subsurface soil samples are being collected with split-spoon samplers, ensure that the drillers use a 30-inch drop of the 140-pound hammer. The number of blow-counts for each 0.5 foot penetration provides important geotechnical data.
- Repeat until the borehole has been drilled to the desired depth.
- If a monitoring well is not installed in the soil boring, fill the boring with either cement/bentonite grout or properly-tamped and hydrated bentonite. Check with Project Manager and/or the appropriate regulatory personnel before using drill cuttings to backfill the boring.

- If a monitoring well will be installed, refer to SOP DM-007.
- Complete boring log and, if necessary, well installation logs (SOP SM-003, *Soil Classification*).
- Record boring locations on a site map and in a field notebook sketch. If the boring location will not be surveyed, measure each location from on-site reference points and record the information in the field notebook so that the location can be plotted on site figures.

3. Limitations

- In areas of significant soil contamination, hollow-stem augers may cross-contaminate upper soil layers as contaminated cuttings move up the auger flights. The potential also exists for contaminated augers to carry contamination to deeper soil strata
- If significant unanticipated contamination is encountered during drilling, stop drilling to confer with the project manager and evaluate health and safety conditions. If the borehole is to be advanced below the contaminated strata, use telescoping techniques (see SOP DM-008 *Monitoring Well Telescoping Techniques*) to avoid cross-contaminating underlying geologic strata.
- When drilling below the groundwater table in fine to medium sands, the potential exists for the phenomenon of "running sands" or "blow in" to occur. Frequent measurements inside the hollow-stem augers after the drill bit/plug is removed will indicate if running sands are present. If sands start to flow into the auger, pour clean water into the augers and keep the augers filled during sampling.
- If necessary, arrange for the storage of contaminated soil cuttings and water in drums or other appropriate containers in a secure place at the site. Containers should be labeled.
- Plan the drilling program to drill borings from the least- to most-contaminated areas. Be prepared in advance and know where alternative drilling locations are in the event that problems are encountered at each planned soil boring location. Alternative locations will need to have utility clearance.
- Down-hole drilling equipment should be steam cleaned or pressure-washed between holes unless otherwise directed by the project manager.
- Record when standard operating procedures are deviated from. The drilling inspector should also record any detected odor from the boring and depth encountered.

GEI Consultants

STANDARD OPERATING PROCEDURE

DM-004 Sonic Drilling

1. Objective

Describe common sonic drilling procedures.

Prior to drilling confirm that utility clearance has been completed and that the drilling rig has been appropriately decontaminated.

2. Execution

- Collect soil cores in runs of 5 to 10 feet. Some sonic rigs can collect a 20 foot sample, but the process generates a significant amount of heat that may degrade sample quality.
- Classify and sample the soil located within the liner.
- Excess soil should be placed in a 55-gallon drum for disposal.
- The core barrel should be cleaned with tap water following each use.
- The core barrel is then advanced within the isolation casing to collect the next soil core interval.
- Add water between the inner core barrel and the outer override casing. This will reduce friction between the casings and adsorb heat.
- Maximize drilling advance rate. The faster the core barrel is advanced, the less likely the core barrel will heat up. Drilling with a 3-inch diameter core barrel and a 5-inch diameter override casing, instead of the standard 4-inch core barrel and 6-inch over-ride casing, may increase advance rates and reduce the potential for soil core heating.
- If a significant decrease in drilling advance rate is observed, stop drilling and remove soil that has accumulated in the core barrel. Resume drilling through the resistant material (gravel, boulder, hard clay, etc.). When the resistant material has been penetrated and the drilling advance rate increases, stop drilling and remove what material has accumulated in the core barrel.
- Wash down the core barrel with cool water to cool the core barrel and associated casing, and resume drilling.
- If a well is to be installed in the borehole, the sandpack and grout are placed as the core-barrel and over-ride casing(s) are selectively vibrated out of the ground. The vibratory action should facilitate settlement of the sandpack and grout. Upon completion, no casing is left in the ground other than the well casing and screen.

3. Limitations

- Disturbance of the soil core is most likely to occur during removal of the soil core from the core barrel. The soil cores are usually vibrated out of the core barrel into plastic bags approximately 5 feet in length. As the plastic bags are

a little larger than the soil core itself, fragmentation of the soil core may occur as the core is extruded into the bag or while the bagged core is being moved in an unsupported manner. Soil conditions that are prone to disturbance include wet or dry zones that contain little or no fines, and well graded sands that contain significant volumes of water.

- If integrity of the soil core is of concern, the following procedures should be implemented:
  - Measures should be taken to ensure that the core, from the time it is extruded from the core barrel, is rigidly supported through the use of some type of cradle or carrying device.
  - The core should not be removed from its cradle until all sampling of the core has been completed. Acrylic liners are available for some core sizes and can be used to hold the core together upon removal from the core barrel.
  - If the soil is to be sampled for volatile organic compounds (VOCs), acrylic liners must be used.
  - Sampling of the soil core for VOCs or semi-volatile organic compounds (SVOCs) must be approved on a case by case basis. Proposals for VOC or SVOC soil core sampling must include provisions to minimize core fragmentation and heat generation, such as:
    - Acetate liners in the core barrel so that the soil core does not have to be extruded out of the core barrel.
    - Limit the length of soil core generated during a given downhole run.
    - Implement practices to reduce the residence time of the soil core in the core barrel.
- For the analysis of SVOCs, the use of the acetate liners is not required.
- The large diameter of the core barrel enables ground water sampling equipment to be placed inside the core barrel so that discrete depth groundwater samples can be collected during borehole advancement.

STANDARD OPERATING PROCEDURE

DM-006 Geoprobe® Direct Push Boring

1. Objective

Describe standard operating procedures (SOP) for drilling of overburden soil borings using Geoprobe® and MacroCore® technologies.

2. Execution

- Confirm that appropriate measures have been taken for clearance of potential subsurface utilities. The responsibility for clearance may vary, depending on the client.
- Inspect the drilling rig to make sure it is clean and that the down-hole equipment has been decontaminated (QA-001). Record condition of all down-hole drilling equipment.
- Make sure the sampler is fitted with a piston rod assembly to block the sample tube until the desired subsurface sample interval is attained. Upon reaching the target sample depth, the piston tip will be released and the discrete sampler device is then advanced to collect the representative sample. This reduces the volume of slough that is collected.
- When the sampler is brought to the ground surface, it should be opened immediately, and the length of recovery should be measured and recorded.
- Log the soil sample using USCS procedures (SOP SM-003). Collect analytical samples if necessary (SOP SM-001).
- Decontaminate the cutting shoe if necessary (SOP QA-001 Equipment Decontamination) and have driller reassemble the parts with a new liner.
- Repeat the procedure described above until refusal or the boring is terminated.
- Periodically verify that depths cited by drillers are accurate.

3. Limitations

- If significant unanticipated contamination is encountered during drilling, stop drilling to confer with the project manager and re-evaluate health and safety conditions.
- Arrange for the storage of contaminated soil cuttings and water in drums or other appropriate containers in a secure place at the site (see SOP SC-003, *Investigation Derived Waste Management*).
- If possible, plan the drilling program to drill borings from the least to most contaminated areas. Be prepared in advance and know where alternative drilling locations are in the event that problems are encountered at soil boring locations. These locations must also have been cleared by the state or local utility service prior to drilling.

GEI Consultants

STANDARD OPERATING PROCEDURE

DM-007 Monitoring Well Construction and Installation

1. Objective

Describe installation procedures for overburden monitoring wells screened across or below the groundwater table.

Well dimensions (well diameter, screen length, and screen slot-diameters) will be specified in the Work Plan. This SOP assumes the monitoring wells will be constructed of flush-joint PVC pipe and the screened section will have factory-slotted openings.

2. Execution

Attachment A provides a diagram of typical shallow, intermediate, and deep groundwater monitoring well construction detail. A Groundwater Monitoring Well Installation Log is in Attachment B.

- Measure and record the depth of the completed soil boring before beginning the well installation.
- If possible, measure the depth to groundwater in the borehole over a 10 to 15 minute period to ensure that the groundwater elevation has approximately stabilized. Compare the saturated soil depth estimated from split-spoon samples to the measured water level in the borehole. If drilling water has been used during boring advancement, pump the water out of the borehole to the static water depth, based on examination of the soil samples, and monitor the recovery of groundwater until the level has stabilized.
- If it is not possible to accurately measure the depth to groundwater in the borehole due to low permeability in the formation, use the saturated soil depth observed in the collected samples or measured water depth in a nearby existing monitoring well to estimate the depth to water in the borehole.
- For shallow monitoring wells, select the monitoring well screen and riser lengths so that the slotted section of the screen intersects the groundwater table. Screen lengths of 15 feet or less are preferred and 10 foot screens are most common. If the water table is seasonally high or low or if the well is in a location where the water table is likely to be tidally influenced, appropriately place the screened section to allow for the screen to intersect likely future water tables.
- For intermediate or deep wells screened entirely below the water table, select the monitoring well screen and riser lengths as described in the Work Plan. Screen lengths of 10 feet or less are preferred.
- If the borehole is deeper than the desired well depth or the bottom of the well is close to a change in soil strata, then fill the base of the borehole with bentonite. Keep in mind that bentonite swells when hydrated, and that filter

sand should be placed at the bottom of the borehole above the bentonite before installing the well.

- Prevent well materials from contacting foreign substances during installation. Precautions may include requiring the driller to wear clean gloves while handling well materials and requiring that well materials not be placed onto the ground or pavement without a protective barrier such as polyethylene sheeting being present
- Confirm that the driller installs a minimum one-inch sump with a bottom cap to the bottom of the well screen. See the Work Plan for locations that may require larger sumps.
- Monitoring wells can be constructed of either 1, 1.5, 2 or 4 inch inner diameter (ID) Schedule 40 threaded flush-jointed PVC. Refer to the work plan for the site-specific requirements. Flush-threaded well materials should be used. Do not allow the driller to use glues, as they typically contain solvents that could affect on groundwater quality.
- Stainless steel well materials may be used if required in the Work Plan. Select slot size based on grain size of the formation and on requirements in the Work Plan.
- Confirm that the driller places at least 12 inches of clean uniformly graded medium quartz filter sand pack into the base of the borehole, if required in the Work Plan.
- The driller should remove the drilling casing/augers from the borehole slowly, at a maximum of 2-foot intervals, at the same time that filter sand is added. The drillers should take frequent measurements of the depth to sand.
- Confirm that the driller has added adequate sand to surround the area around the slotted section. The filter sand should extend at least 2 feet above the top of the slotted section.
- The driller should place a bentonite seal above the filter pack. If the seal is above the water table, use at least 5-gallons of potable water to hydrate the bentonite before grouting the remaining annular space, or otherwise backfilling the remaining annular space as discussed with the Project Manager. Tamp seal. It should extend 1 to 2 feet above the filter sand.
- If required by the Work Plan, the driller should use bentonite-cement and grout the annular space from the top of the bentonite seal to the ground surface. Bentonite cement grout should be placed using tremie methods. Grout should be mixed in approximately the following proportions: 7.5 gallons water to one 94-lb bag of cement to 2-4 lbs of pulverized bentonite. The grout must be mixed using a pump (such as one on the rig) to ensure proper mixing.
- The drillers should cut the monitoring well riser at an angle or make "V"-notch in the riser pipe as a benchmark for surveying and groundwater measurements. The driller should cut the well riser so that the top of the well will be approximately 3 inches below the top of protective casing. The top of

the riser should be close enough to the top of the surface casing to allow reading of depth markings on a water level indicator tape.

- The protective surface casing is either a flush-mounted roadbox or a steel "stick up" pipe. The base of either type of casing should extend at least 1 foot into the grout below the ground surface (below the frost line) whenever possible.
- The protective casing should be set by placing cement in the annular space between the protective casing and the borehole up to the ground surface. If possible, the driller should slope the cement radially away from the protective casing at the ground surface to promote surface water runoff.
- In areas of high traffic or areas of parking lots and/or roadways where plowing occurs, set the roadbox flush with the ground surface to avoid damage to the well.
- If the well is installed in a high-traffic area and is completed with a steel "stick up" pipe, additional protection such as steel pole bumpers around the steel "stick up" pipe may be necessary.
- If possible a locking cap should be placed on the steel "stick up" pipe. If the surface casing is flush mounted, a locking expansion plug should be placed, if possible, inside the top of the well riser pipe.
- All well locations should be photodocumented in accordance with SOP FD-004 Photodocumentation.
- Label the outside of the protective well casing with a paint pen. If the well is not going to be surveyed, measure the location to nearby landmarks so that the well may be located in the future and plotted on figures. Make sure to enter this information in the field notebook). If possible, place a brightly colored stake or other identifier adjacent to the well.
- Develop the well (see SOP DM-009, *Monitoring Well Development*).

3. Limitations

- Do not screen across different hydrostratigraphic units (for example, outwash sands, confining layers or till) unless specified in the Work Plan or approved by the Project Manager.

- If the formation is composed of a material that is uniformly coarser than the filter sand, the grain size of the filter sand should be increased. Consideration should also be given to changing the slot size on the well screen. Differences in average grain size should generally not be greater than a factor of two to four times.

- Do not use drill cuttings to backfill during monitoring well installation unless specified by the work plan or project manager.

STANDARD OPERATING PROCEDURE

DM-009 Monitoring Well Development

1. Objective

Describe standard procedures to remove fluids from monitoring wells (introduced during drilling) and maximize the movement of groundwater into the well by removing fine particles in the well and sand pack around the screen.

2. Execution

To prevent cross contamination between monitoring wells, use dedicated equipment and/or appropriately decontaminated equipment to perform monitoring well development. See SOP QA-001 Equipment Decontamination and the Work Plan for more information.

For deep or large diameter monitoring wells, it may be necessary to use a re-usable pump system, such as a Grundfos pump, to develop monitoring wells.

- Calculate the volume of water in the monitoring well (one well volume) using the following table:

Well diameter (inches)	Volume (gal/ft)
1	0.04
1.5	0.09
2	0.16
3	0.36
4	0.65
6	1.50

The equation used to establish these volumes is presented in Section 4.

- Calculate or estimate the amount of water introduced to the borehole during drilling. At a minimum, this is the amount of water that should be removed during development. Removing less water than was introduced and allowing additional time for the surrounding formation to clear of injected drilling fluids may be considered as an alternative if the volume of introduced water was large.

- Record the volume of water purged in the field notebook or on the Monitoring Well Sampling Form (Attachment A).

- Collect a sample of water from the monitoring well with the selected submersible pump (e.g. 12-volt whale pump or Grundfos pump), a bailer, or a

Waterra system. Record the physical properties (color, turbidity, odors, etc.) of the sample.

- The volume of water that should be removed will depend on the work plan, local regulatory guidance, and/or the volume of water that was introduced during drilling and well installation. Typical guidance for the removal volume includes:
    - Ten well volumes.
    - The volume of fluid added during drilling.
    - The volume required to remove enough suspended particles so that the turbidity of the water is less than 50 nephelometric turbidity units.

If needed, pump the ground water into a 5-gallon pail so that the volumetric flow rate and total water volume from the pump or bailer can be calculated.

Measure the groundwater level in the well during development to assess if the pumping rate is sufficient to create a drawdown in the well.

Observe the groundwater every few well volumes during the pumping and record the physical properties (color and turbidity).

If required by the Work Plan, conduct surging in the monitoring well. See the Work Plan for the method of well surging to be used. If surging is necessary, do so only after initial pumping at the well has occurred and fine sediments have been removed.

Slowly move the surge block up and down in the well. Periodically remove the surge block and purge the groundwater until it is relatively clear again. Start at a slow pace and progress to a faster surging action through time.

3. Limitations

Always remove groundwater with fine particles from the well before surging. The fine particles may be forced into the well screen by the surging action. They may also damage the pump.

If the ground water in the monitoring well is contaminated, the water removed during well development may need to be placed in a properly-labeled drum and disposed of in accordance with local, state, and federal regulations (see SC-003 Investigation Derived Waste).

If the soils around the well screen are composed of fine-grained silts and clays, over-pumping and mechanical surging is not recommended since these more vigorous

techniques can cause mixing of the fines into the filter pack. To develop these wells, use of a bailer is recommended.

There are occasions when the turbidity of groundwater cannot be meaningfully reduced. On these occasions, a minimum of ten volumes should be removed, and the Project manager should be consulted.

Sampling of groundwater should generally not occur within one week after development. In some regions or regulatory jurisdictions, a minimum of two weeks may be required before sampling. If no water was introduced to the formation during drilling, this waiting period may be shortened if required by the project. See the Work Plan for additional information.

STANDARD OPERATING PROCEDURE

DM-010 General Guidance on Monitoring Well Abandonment

1. Objective

Describe methods to abandon a monitoring well.

The goal of monitoring well abandonment is to seal the borehole so it cannot act as a conduit for movement of contaminants or liquids from the ground surface to the water table or between aquifers.

General procedures for well abandonment are provided below but do not supersede state or local regulations. Make sure all well abandonment procedures adhere to appropriate regulations.

2. Execution

The following methods for abandoning unconsolidated (overburden) and consolidated (bedrock) monitoring wells should be performed by a licensed drilling contractor, if required by law or regulatory authorities. The following listed methods are general guidance for abandoning monitoring wells. The Work Plan and state and local requirements should be reviewed for additional requirements.

2.1 Unconsolidated (overburden) Monitoring Wells

Unconsolidated (overburden) monitoring wells should be abandoned in the following manner, see the Work Plan for additional requirements:

- Remove the protective casing and concrete pad.
- If possible, overdrill the monitoring well casing and sand pack using hollow-stem augers or casing to at least one foot below the depth of the boring/well as indicated in the soil boring log.
- If possible, remove the monitoring well riser, sand pack, bentonite seals and grout.
- Once the well materials have been removed, add cement/bentonite grout using tremie methods starting at from the bottom of the borehole as the augers or casing are removed.
- If the well materials cannot be removed by overdrilling, the riser should be cut off at a depth of between two and five feet below the ground surface and the remaining well materials may be filled with grout using tremie methods. The grout mixture will be as specified for the well installation (see SOP DM-001 General Guidance on Determination of Appropriate Drilling Methods)
- Add grout to the point where the riser was cut off or to a depth of approximately two feet below the ground surface. From that point up to ground surface, backfill with native soil material surrounding the boring/well.

2.2 Consolidated (bedrock) Monitoring Wells

Consolidated (bedrock) monitoring wells or open holes will be abandoned in the following manner. See the Work Plan for additional requirements:

- Remove the protective casing and concrete pad;
- Remove the monitoring well materials from the hole. If the materials cannot be removed, cut off the well riser between two feet to five feet below grade. If feasible, cutting off the riser at five feet is optimal.
- Add cement/bentonite grout via tremie methods from the bottom of the well up to the ground surface. The grout mixture should be as specified for the well installation SOP DM-001 General Guidance on Determination of Appropriate Drilling Methods
- Add grout to the point where the riser was cut off or to a depth of approximately 2 feet below ground surface. From that point up to ground surface, backfill with native soil material surrounding the boring/well.

Section 5

Sample Collection and Field Screening (SC)

STANDARD OPERATING PROCEDURE

SC-001 Environmental Sample Types and Sampling Strategies

1. Objective

Describe types of samples and strategic approaches to sample locations.

Refer to Attachment A for guidance on compatible sampling materials.

2. Sample Types

Grab Samples

A grab (or discrete) sample is a single aliquot (part of the sampled media) collected from a single location at a specific time.

Surface soil samples are typically "grab" samples. Volatile organic samples are always grab samples because the least amount of sample disturbance is necessary.

Composite Samples

Composite samples are non-discrete samples composed of more than one aliquot collected from different sampling locations and/or at different points in time. Analysis of composite samples produces an average value.

Composite samples are frequently collected to characterize waste soil that has been stockpiled for eventual disposal. Several grab samples are collected from the stockpile and are blended together into a single sample.

Screening Samples

Screening samples may be grab or composite in nature. However, they offer potential advantages such as rapid results and low cost. The trade-off is that they may only provide results within a range and/or they may have elevated detection limits. Screening samples are most often used to evaluate presence/absence and/or indications of the potential magnitude of impacts.

3. Sampling Strategies

Generally, there are three sampling strategies: random, systematic, and judgmental sampling.

- Random sampling involves collection of samples in a non-systematic fashion from the entire site or a specific portion of a site.
- Systematic sampling involves collection of samples based on a grid or a pattern which has been previously established.
- Judgmental sampling is the collection of all other samples. This sampling might be from areas most likely to be contaminated, areas most likely to be clean, or areas where information is lacking.

Often, a combination of these strategies is the best approach depending on the type of the suspected/known contamination, the uniformity and size of the site, the level/type of information desired, etc.

4. Attachments

Attachment A - General Guidelines for selecting equipment

5. Contacts

Ryan Hoffman

General Guidelines for selecting equipment on the basis of construction material and target analyte(s)

[✔, generally appropriate for use shown; Si, silica; Cr, chromium; Ni, nickel; Fe, iron; Mn, manganese; Mo, molybdenum; CFC, chlorofluorocarbon; B, boron]

Construction material for sampling equipment		Target analyte(s)	
Material	**Description**	**Inorganic**	**Organic**
		Plastics[1]	
Fluorocarbon ploymers[2] (other varies available for differing applications)	Chemically inert for most analytes	✔ (potential source of fluoride)	✔ (Sorption of some organics)
Polypropylene	Relatively inert for inorganic analytes	✔ (not appropriate for Hg)	**Do not use**
Polypropylene (linear)	Relatively inert for inorganic analytes	✔ (not appropriate for Hg)	**Do not use**
Polyvinyl chloride (PVC)	Relatively inert for inorganic analytes	✔ (not appropriate for Hg)	**Do not use**
Silicone	Very porous. Relatively inert for most inorganic analytes	✔ (potential source of Si)	**Do not use**
		Metals	
Stainless steel 316 (SS 316)	SS-316-metal having the greatest corrosion resistance. Comes in various grades. Used for submersible pump casing.	✔ (Potential source of Cr, Ni, Fe, and possible Mn and Mo) **Do not use** for surface water unless encasted in plastic.	✔ Do not use if corroded[3]
Stainless steel 304	Similar to SS-316, but less corrosion resistant	**Do not use**	✔ Do not use if corroded[3]
Other metals: brass, iron, copper, aluminum, galvanized and carbon steels	Refrigeration-grade copper or aluminum tubing are used routinely for collection of CFC samples	**Do not use**	✔ Routinely used for CFCs Do not use if corroded[3]
		Glass	
Glass, borosilicate (laboratory grade)	Relatively inert. Potential sorption of analytes	✔ **Do not use** for trace element analyses. Potential source of B and Si	✔

[1]Plastic used in connection with inorganic trace-element sampling should be uncolored or white. Tubing used for trace metal sampling should be cleaned by soaking in 5-10 percent HCl solution for 8-24 hours, rinsing with reagent water (metals free) and allowed to air dry in mercury-free environment. After drying, the tubing is doubled-bagged in clear polyethylene bags, serialized with a unique number, and stored until used.

[2] Fluorocarbon polymers include materials such as Teflon™, Kynar™, and Tefzel™ that are relatively inert for sampling inorganic or organic analytes. Only fluoropolymer should be used for samples that will analyzed for mercury because mercury vapors can diffuse in or out of other materials, resulting in either contaminated or biased results.

[3] Corroded/weathered surfaces are active sorption sites for organic compounds.

STANDARD OPERATING PROCEDURE

SC-002 Environmental Sample Handling

1. Objective

Describe appropriate environmental sample handling procedures.

The procedures include collection and transport of environmental samples to a laboratory for chemical analysis. Appropriate sample handling should ensure that samples are properly:

- labeled and documented;
- preserved;
- packaged; and
- transported

2. Execution

- Prior to mobilizing to the field, select a shipper or arrange for a courier for sample delivery to the laboratory. If using a shipper (i.e., FedEx or UPS) determine the time constraints for pickup requests, the location and hours of the nearest shipping office, and any size/weight restrictions.
- A waterproof or permanent ink pen should be used for all labels. The label should have an adhesive backing and be placed on the jar or bottle, not on the cap. In addition, clear packing tape can be placed over the sample label to secure it to the bottle as moisture from the samples can loosen the label adhesive.
- Record the following information on the label and in the field notebook (See SOPs FD-001 and FD-003):
    - Project number
    - Sample identification (i.e. MW-201 or SS-2)
    - Date and time (military time) of collection
    - Sampler's initials
    - Analysis methods
    - Preservative, if present
- Pre-preserved laboratory jars are preferable and should be used whenever practicable. If sample jars are not pre-preserved, add preservative as appropriate.
- At each sampling location, samples should be collected in order of volatility, most volatile first. Samples collected for volatile analysis should be placed in sample containers immediately upon retrieval of the sample.
- Aqueous samples for volatile analysis should be collected without air bubbles.
- The collection and preservation method of soil samples for volatile analysis may depend on project, client, or state regulatory requirements. Check with your Project Manager and/or SOPs SM-001 and SM-002 where appropriate.

- Care must be taken to avoid getting soils on the threads of sample jars, which can cause a faulty seal.
- If compositing samples in the field, specify the basis for composite (i.e. volume, weight, spoon recovery, etc.) and record in the field book the procedure for compositing the sample.
- Once samples have been collected and labeled, place samples in a cooler with sufficient bagged ice or freezer packs (blue ice) (if allowed) to chill samples to 4°C. If using ice, use double-bagged ice.
- Complete the chain-of-custody (COC) (SOP FD-003).
- If transporting the samples by way of a shipper:
    i. The sample cooler should have water drains securely sealed with duct tape, both on the inside and outside of the cooler.
    ii. Place a layer of packing material on the bottom of the cooler as a cushion.
    iii. Individually wrap each sample bottle with bubble packing or suitable packing material and place the wrapped bottles upright in the cooler with sufficient packing material between samples to avoid breakage.
    iv. Methanol preserved samples for volatiles analysis should be packed so they remain upright with the soil completely covered by the methanol during transport.
    v. Place a layer of packing material on top of the sample bottles.
    vi. Place bagged ice or freezer packs on top of the packing material. Fill the remaining space in the cooler with packing material to eliminate the possibility of vertical movement of samples.
    vii. Place the completed and signed chain-of-custody form in a sealable plastic bag and place on top of the packing material in the cooler, or tape it to the inside lid of the cooler.
    viii. Fill out the appropriate shipping or courier forms and attach to the top or handle of the cooler. If necessary, place the proper shipping labels on the cooler. Have the courier sign the COC form (or write pickup by FEDEX, UPS, etc. with date and time). Place a signed and dated custody seal on the cooler.
- All samples should be submitted to the laboratory as soon as possible. In many cases, same day shipping will be required by the client or the project manager. Be clear on this before beginning the field work.
- A copy of the waybills should be kept by the field supervisor to track shipments if necessary.

3. Limitations

- If samples are shipped on a Friday, call the laboratory ahead of time to confirm that personnel will be at the laboratory to receive and log-in the samples.
- During warm weather, make sure to use plenty of ice in the shipping container.

- Field personnel should be aware of analyses which have short hold times and schedule sampling events and shipping accordingly. Shipment of samples for analyses with short hold times must be arranged for in advance. Refer to the project work plan, quality assurance project plan, or state/federal regulations for holding time and preservative information. Contact the laboratory ahead of time when shipping samples with short hold time to ensure the lab is prepared for these analyses.
- For glassware containing preservatives (e.g., HCl, HNO_3), take care not to overfill the container, thus flushing the preservative out of the bottle.
- Never composite samples for VOCs in the field. Collect individual aliquots and direct the laboratory to perform compositing, if needed.
- Collection of aqueous samples should not be performed over the opening of a monitoring well. Preservatives from overfilling, a marker pen or other objects could fall into the well.
- If the recharge volume for a monitoring well is low, completely fill all volatile vials and then collect the minimum sample volume required for each remaining analysis.
- During subsurface soil sampling, if the recovery from the split-spoon sample is inadequate, if appropriate, resample the bottom of the borehole to obtain proper sample volume.
- Laboratories will homogenize and test the contents of the sample container, unless directed otherwise. Samples should not contain rocks, twigs, leaves, etc… unless these materials are of interest.

STANDARD OPERATING PROCEDURE

SC-003 Investigation Derived Waste

1. Objective

Describe characterization and management of Investigation Derived Waste (IDW) resulting from site investigation activities.

IDW is solid and/or aqueous waste generated during environmental site investigations.

2. Execution

- Determine the suspected contamination type and impacted media based on previous investigations, available analytical data, and/or site history.
- Consider the following when selecting IDW management option(s):
    - Anticipated volume of IDW to be generated during on-site activities
    - Potential contaminants and their concentrations
    - Proximity to population centers and the potential for unauthorized site access
    - Potential exposures to workers
    - Potential for environmental impacts
    - Community concerns
    - Potential storage areas
    - Regulatory constraints
    - Potential on-site treatment options
    - Duration of storage
    - Client concerns or requirements
- Review IDW Management Options summarized in Attachment A for each media suspected of contamination.
- Select IDW Management Option(s) prior to the commencement of field activities that will generate waste materials.
- Include the selected IDW Management Option(s) in the Field Plan or other project documents.

Considerations and guidelines for IDW management for specific field tasks are provided below.

2.1. Test Pit Excavation

- Segregate contaminated soil from uncontaminated soil using visual and/or field screening methods.
- Use appropriate barrier (such as two layers of 6-ml plastic sheeting) for temporary stockpiling of contaminated soil adjacent to test pit.

- Backfill test pits with uncontaminated soil, unless otherwise directed by project manager.
- If directed by the Project Manager to return contaminated soil to the test pit, backfill soil in the same order as the soil was excavated from the test pit.

2.2. Boring/Monitoring Well Installation

- For auger borings, segregate contaminated soil (determined by visual and/or field screening methods) from uncontaminated soil during drilling. Segregate residual contaminated soil from split-spoon sampling.
- Auger cuttings or sediment generated by drive and wash may be spread around the ground surface at the boring location if it is acceptable to the client and the governing regulatory agency. If not, IDW may be placed in an appropriate area or container pending characterization and appropriate disposal. (A useful rule of thumb is to assume generation of one 55-gallon drum of cuttings for each 20 feet drilled with 7-¼-inch-I.D. augers).
- Segregate contaminated drilling fluid from uncontaminated fluid for rotary wash borings.
- Drilling fluid management options include pouring the drilling fluid on the ground near the boring location, if acceptable to the client and governing regulatory agency, or containerizing the fluid in drums or tanks.

2.3. Well Development/Sampling

Contaminated groundwater removed from wells by pumping or bailing for the purpose of well development and sampling may be poured on the ground near the well, if it is acceptable to the client and the governing regulatory agency. Otherwise, it should be containerized in drums or tanks.

2.4. Decontamination Fluids

Decontamination fluids may be poured on the ground in the vicinity of the well if approved by the project manager. Alternatively, the fluids may be containerized in drums or tanks.

2.5. Disposable Personal Protective Equipment

Disposable personal protective equipment (PPE) should be managed like any other IDW. However, with the clients' and project manager's approval, it may be removed from the site and disposed of as ordinary rubbish if it has not come into contact with contaminated materials.

3. Limitations

- The simplest IDW management option is to return the IDW to its source location.
- However, the selected IDW management options must meet state/federal regulations and have the client's approval. Consult with state/federal policies for IDW-related matters.

- The client is responsible for the disposal of IDW, should disposal be necessary.

Leslie Lombardo

Attachment A: - SUMMARY OF IDW MANAGEMENT OPTIONS
GEI Consultants, Inc. Standard Operating Procedures
Management of Investigation - Derived Waste

Type of IDW	Generation Processes	Management Options	Remarks
Soil	Boring/monitoring well installation Test pit excavation Soil sampling	Return to source location immediately after generation	Acceptable, if authorized by the client, the governing regulatory agency, and the project manager.
		Spread around boring, test pit, or original source location	Acceptable, if authorized by the client, the governing regulatory agency, and the project manager.
		Containerize and temporarily store on site	Can temporarily store in stockpiles or covered containers (i.e. drums, roll-off containers). Stockpiles must be underlain by plastic sheeting and covered with plastic sheeting. Plastic sheeting must be secure. Storage consistent with state/federal regulations.
		Send to off-site, treatment or disposal facility within appropriate timeframes	Requires proper shipping documents (i.e. manifest, Bill of Lading, etc.), analytical characterization
		Store for future treatment and/or disposal.	Storage consistent with state/federal regulations. If a RCRA hazardous waste, must meet RCRA Container/Waste Pile/Tank requirements (see notes)
		Store temporarily awaiting laboratory analysis.	Storage consistent with state/federal regulations. Can temporarily store in stockpiles or covered containers (i.e. drums, roll-off containers). Stockpiles must be underlain by plastic sheeting and covered with plastic sheeting. Plastic sheeting must be secure.
Sediment/Sludge	Sludge pit sampling Sediment sampling	Return to source immediately after generation	Acceptable, if authorized by the client, the governing regulatory agency, and the project manager.
		Store temporarily on site.	Storage consistent with state/federal regulations.
		Send to off-site facility within 90 days	Requires manifests, analytical characterization
		Store for future treatment and/or disposal.	Storage consistent with state/federal regulations. If a RCRA hazardous waste, must meet RCRA Container/Waste Pile/Tank requirements (see notes)

Attachment A: - SUMMARY OF IDW MANAGEMENT OPTIONS
GEI Consultants, Inc. Standard Operating Procedures
Management of Investigation - Derived Waste

Type of IDW	Generation Processes	Management Options	Remarks
Aqueous liquids (groundwater, surface water, drilling fluids, other wastewater)	Well installation/development Well purging during sampling Ground water discharge - pump tests Surface water sampling	Pour onto ground close to well	Non-hazardous liquids only. Should not exhibit a sheen or separate phase product. Do not discharge to the ground up-gradient of the source location. Ensure that it is permissible by local, state, and Federal regulations Is acceptable to the client, the governing regulatory agency, and the project manager.
		Store temporarily on site	If a RCRA hazardous waste, must meet RCRA Container/Waste Pile/Tank requirements (see notes)
		Send to off-site commercial treatment unit within appropriate timeframes	Refer to State regulations for appropriate timeframe. Requires appropriate shipping documents (i.e., manifest, Bill of Lading), analytical characterization
		Send to POTW	Obtain appropriate discharge permit(s)
		Store for future treatment and/or disposal.	Storage consistent with state/federal regulations. Consistent with final remedial action
		Discharge to surface water	OK if it complies with state and federal regulations. Obtain appropriate discharge permit(s).
Decontamination fluids	Decontamination of PPE and equipment	Store temporarily on site	If a RCRA hazardous waste, must meet RCRA Container/Waste Pile/Tank requirements (see notes)
		Send to off-site facility within appropriate timeframes	Requires manifests, analytical characterization
		Store for future treatment and/or disposal. Storage consistent with state/federal regulations.	Consistent with final remedial action
Disposable PPE	Sampling, drilling, and test pit excavation observation, other on-site activities	Store temporarily on site	Dispose of appropriately after characterization
		Place in on-site industrial dumpster	Project-specific determination required – must be acceptable to client and project manager
		Send to off-site facility within 90 days	Project-specific determination required
		Store for future treatment and disposal.	Storage consistent with state/federal regulations. Project-specific determination required

Notes:

1) PPE - personal protective equipment
2) POTW - publicly owned treatment works
3) Generation processes listed here are provided as examples.
   IDW may also be generated as a result of other site activities.
4) RCRA Container/Waste Pile/Tank requirements:
   Containers; 40 CFR 264 Subpart I and 265 Subpart I
   Waste Piles; 40 CFR 264 Subpart L and 265 Subpart L
   Tanks; 40 CFR 264 Subpart J and 265 Subpart J

STANDARD OPERATING PROCEDURE

SC-004 Headspace VOC Screening

1. Objective

Describe methods to obtain site-specific measurement of the total volatile organic compound (VOC) concentrations present in the headspace of a jar containing soil.

This information can be used for several purposes:

- Segregate soil based on degree of contamination.
- Identify samples for quantitative analysis of VOCs.
- Evaluate the presence or absence of VOCs in soil.

2. Execution

- A photoionization detector (PID) or flame ionization detector (FID) instrument is used to measure VOCs in jar headspace (JHS) screening.
- Select the appropriate instrument, lamp, and calibration gas for the site-specific contaminants. Calibrate the instrument in accordance with the manufacturer's instructions before JHS screening begins. Record the type of calibration gas, detector, lamp, and results of calibration in the field notebook.
- Note the highest VOC concentration that the instrument measures in air in the work area before performing JHS screening. Record this as the initial background concentration.
- Half-fill a clean, glass jar with the soil. Quickly cover the open top with one or two sheets of clean, aluminum foil and screw on the cap to tightly seal the jar. Label the jar with the sample location and sample depth.
- Allow headspace development for at least 10 minutes at an ambient temperature of 50°F or greater. Vigorously shake the jar for 15 seconds at the beginning and end of the headspace development period. When ambient temperatures are below 50°F, place the jar in a heated vehicle or building during the headspace development period.
- After headspace development, remove the screw cap to expose the foil seal. Quickly puncture the foil seal with the instrument's sampling probe and insert it to a point at about one-half of the headspace depth.
- Record the highest VOC concentration that the instrument displays as the JHS concentration. The highest concentration should occur between 2 and 5 seconds after probe insertion.

3. Limitations

- The instruments may work poorly in the rain and in freezing temperatures. Under such conditions, operate the instrument in a heated vehicle or building if possible.

- Prevent water and soil particles from entering the tip of the instrument probe. Use a filter on the instrument's probe.
- Measure background VOC conditions and perform JHS screening away from non-site-related VOC sources, such as vehicle and heavy equipment exhaust.
- The VOC concentration on the instrument's display may vary when the air contains high VOC concentrations or high moisture.
- JHS screening is a guide that helps the screener to segregate soils into broadly defined categories. JHS screening results may differ by orders of magnitude from laboratory testing results.
- Note that states may have specific procedures for field monitoring. In Massachusetts, the Massachusetts Department of Environmental Protection (DEP) requires that screening of gasoline-contaminated soil be performed in accordance with Attachment II of the DEP's policy #WSC-94-400 Interim Remediation Waste Management Policy for Petroleum Contaminated Soils. Consult this procedure or any relevant guidance documents for assistance.

Solid Matrix Sampling (SM)

STANDARD OPERATING PROCEDURE

SM-001 Soil Sampling Techniques Including Split-Spoon

1. Objective

Describe standard procedures for the collection of surface and subsurface soil samples.

The definition of "surface" soil varies considerably between regulatory organizations. Surface soils may be classified as soils between the ground surface and 2 inches below ground surface, ground surface and 6 inches below ground surface, and even as much as ground surface and 24 inches below ground surface.

The definition of subsurface soil will vary in relation to the definition of surface soil. In general, subsurface soil is everything deeper than surface soil.

Refer to state-specific regulations for the definitions of surface and subsurface soils.

2. Execution

2.1. Surface Soil Sampling

Collection of surface soil samples can be accomplished with tools such as spades, shovels, trowels, scoops, etc. A flat, pointed mason trowel to cut a block of the desired soil is helpful when undisturbed profiles are required.

- Carefully remove the top layer of soil or debris to the desired sample depth with a pre-cleaned spade.
- Using a decontaminated stainless steel scoop, plastic spoon, or trowel, remove and discard a thin layer of soil from the area which came in contact with the spade.
- If volatile organic compound (VOC) analysis is to be performed, transfer the sample directly into an appropriate labeled sample container with a stainless steel lab spoon, small diameter core device, or equivalent and secure the cap tightly.
- Place the remainder of the sample into a decontaminated stainless steel, plastic, or other appropriate container, and mix thoroughly to obtain a homogenous sample representative of the entire sampling interval.
- Either place the sample into appropriate labeled containers and secure the caps tightly; or, if composite samples are to be collected, place a sample from another sampling interval or location into the container and mix thoroughly.
- When compositing is complete, place the sample into appropriate labeled containers and secure the caps tightly.

2.2. Sampling with Hand Augers and Thin Wall Tube Samplers

Several types of augers are available; these include: bucket type, continuous flight (screw), and post-hole augers. Bucket type augers are generally better for direct sample recovery because they provide a large volume of sample in a short time. When continuous flight augers are used, the sample can be collected directly from the flights. The continuous flight augers are satisfactory when a composite of the complete soil column is desired. Post-hole augers have limited utility for sample collection as they are designed to cut through fibrous, rooted, swampy soil and generally cannot be used below a depth of approximately three feet.

2.2.1 Auger Sampling

- Clear the area to be sampled of any surface debris (e.g., twigs, rocks, litter). It may be advisable to remove the first three to six inches of surface soil for an area approximately six inches in radius around the drilling location.
- Attach the decontaminated auger bit to a drill rod extension, and attach the "T" handle to the drill rod.
- Begin augering, periodically removing and depositing accumulated soils onto a plastic sheet spread near the hole. This prevents accidental brushing of loose material back down the borehole when removing the auger or adding drill rods. It also facilitates refilling the hole, and avoids possible contamination of the surrounding area.
- After reaching the desired depth, carefully remove the auger from the hole. When sampling directly from the auger, collect the sample after the auger is removed from the hole.

2.2.2 Thin-Walled Core Sampling

- Remove auger tip from the extension rods and replace with a pre-cleaned thin wall tube sampler. Install the proper cutting tip.
- Carefully lower the tube sampler down the borehole. Gradually force the tube sampler into the soil. Do not scrape the borehole sides. Avoid hammering the rods as the vibrations may cause the boring walls to collapse.
- Remove the tube sampler, and unscrew the drill rods.
- Remove the cutting tip and the core from the device.
- Discard the top of the core (approximately 1 inch), as this may represent material knocked down from the sides of the boring and not the layer of interest. Place the remaining core into the appropriate labeled sample container.

One type of thin-wall sampler is depicted in Attachment A (this is typically used with a mechanical drill rig).

For either method, If VOC analysis is to be performed, transfer the sample into an appropriate, labeled sample container with a stainless steel lab spoon, small diameter core sampler, or equivalent and secure the cap tightly. VOC samples should be collected first to minimize the potential for losing volatiles prior to sample collection.

Place the remainder of the sample into a stainless steel, plastic, or other appropriate container and mix thoroughly to obtain a homogenous sample representative of the entire sampling interval. Then, either place the sample into appropriate, labeled containers and secure the caps tightly; or, if composite samples are to be collected, place a sample from another sampling interval into the container and mix thoroughly.

When compositing is complete, place the sample into appropriate, labeled containers and secure the caps tightly.

If another sample is to be collected in the same hole, but at a greater depth, reattach the auger bit to the drill and assembly, and follow previous steps, making sure to decontaminate the auger and tube sampler between samples.

Abandon the hole according to applicable state regulations. Generally, shallow holes can simply be backfilled with the removed soil material.

2.3. Sampling at Depth with a Split-Spoon (Barrel) Sampler

Split-spoon sampling is generally used with a mechanical drill rig to collect undisturbed soil cores of 18 or 24 inches in length. A series of consecutive cores may be extracted with a split-spoon sampler to give a complete soil column profile, or an auger may be used to drill down to the desired depth for sampling. The split-spoon is then driven to its sampling depth through the bottom of the augured hole and the core extracted. A diagram of the split-spoon sampler assembly is provided as Attachment A.

When split-spoon soil sampling is performed to gain geologic information, work should be performed in accordance with ASTM D1586-08a, "Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils". The following procedures are used for collecting soil samples with a split-spoon:

- Select the size (length and diameter) of split-spoon sampler based on the amount of soil that is needed for characterization. The ASTM standard for N-values is 1 3/8 - inch I.D (2-inch O.D.). Specify spoon size and basket type to driller prior to mobilization to the site. Split spoon samplers are typically available in 1 3/8 – and 3 – inch I.D. sizes. A larger barrel may be necessary to obtain the required sample volume. Note on the boring log where larger split spoon barrels are used because the ASTM standard penetration test does not apply when driving split spoons larger than 1 3/8 I.D. (2-inch O.D.).

- Select a soft or stiff basket for the spoon (a softer basket generally works better for loose or soft material).
- Prior to hammering the split spoon to collect the sample, verify that the split-spoon is seated at the beginning of the desired sample interval. If it is seated above the interval, have driller clean out the hole prior to sampling. Record all depth measurements relative to ground surface.
- Assemble the sampler by aligning both sides of barrel and then screwing the drive shoe on the bottom and the head piece on top. See diagram in Attachment A.
- Place the sampler in a perpendicular position on the sample material.
- For all soil samples, use a 140-lb hammer falling 30 inches to drive the sampler, unless conditions necessitate using a 300-lb hammer.
- Record in the site fieldbook or on field data sheets the length of the tube used to penetrate the material being sampled, the split-spoon inside and outside diameters, and the hammer weight,
- Count and record the number of blow counts per 6-inch increments (confirming blow counts with driller if necessary).
- Withdraw the sampler, and open by unscrewing the bit and head and splitting the barrel. The length of recovery and soil type should be recorded on the boring log. If a soil sample is desired, a decontaminated stainless steel knife or spatula should be used to divide the tube contents in half, longitudinally. If possible, avoid collecting soil that has come in contact with the walls of the spoon, and soil at the top of the spoon.
- Without disturbing the core, transfer it to appropriate labeled sample container(s) and seal tightly.
- Note any material in the nose (shoe) of the spoon.
- Immediately collect a sample for VOCs (if required by the site-specific field sampling plan) by collecting soil from the entire length of the split spoon, unless otherwise specified by the project manager. When the most impacted interval is sampled for laboratory analysis, screen the spoon with the field instrument first, then collect the soil sample for VOC analysis from the appropriate interval.

3. Limitations

- Weather conditions (e.g., frozen ground) may prevent the collection of samples and should be considered prior to sample collection.
- Tools plated with chrome or other materials should not be used.
- Be aware of local laws regarding subsurface utility clearance prior to conducting subsurface investigations. Contact DigSafe or local utility companies as required.
- Be aware of the length of the drill string, the sample depth, and the required stickup of the drill string to ensure accurate sample interval measurement.
- If drilling with hollow-stem augers, the removal of the drill string from the hole, prior to attaching the split-spoon sampler, may cause soils to be sucked up

into the augers (blow-in running sands). Upon recovery, determine if there is blow-in in the split spoon sampler. In general, blow-in is more unconsolidated than the rest of the sample and lacks stratification (do not include blow-in for recovery of sample collection).

- If soils consist of loose sands or soft clay, the drill string and sampler may advance slightly under its own weight, giving a false depth for soil collection.
- Never sample more than two spoons consecutively without advancing the augers unless material is tight. Do not let the split spoon penetrate more than it can hold.
- In many instances, groundwater will fill the auger and the split-spoon.

STANDARD OPERATING PROCEDURE

SM-003 Classification of Soil Samples in the Field

1. Objective

Describe methods to classify soil samples collected in the field in a consistent manner.

2. Execution

- Describe soil samples according to *ASTM D2488-09a, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) and* Attachments A and B. This standard is the basis for the Unified oil Classification System.
- Identify and record the soil in terms of the major and minor constituents (i.e., sand gravel, silt, clay), Unified Soil Classification Symbol, sample structure, plasticity and dilatancy for fine-grained soils, color, local or geologic name if known (e.g., Boston Blue Clay or glacial till), odor, presence of iron or other staining, and presence of organic matter, shells, debris, or other unusual characteristics of the same.
- If a soil split-spoon sample contains more than one soil type (for example, the upper portion is silty sand and the lower portion is clay) describe each type separately.
- Record sampler type, blow counts, soil description, etc. on the boring log (see Attachment C).
- GEI consistently applies one modification to the ASTM standard: Use "widely graded" and "narrowly graded" instead of "well-graded" and "poorly graded," respectively.

3. Limitations

Certain projects or clients will require the use of other classification systems. Other classification systems should not be used unless specifically required by the client. If the client requires that we use the Burmister method, obtain the details from the client. An example breakdown is shown below, but some clients (MassDOT, for example) have their own breakdown.

- "and" = 35-50%
- "some" = 20-35%
- "little" = 10-20%
- "trace" = 1-10%

- Describing soil samples is often difficult during cold or wet weather. Make sure your field notes describe these conditions. When possible, collect archive samples and verify sample descriptions in the office.

- The ASTM Standard Practice for Classification of Soils for Engineering Purposes (D2487) may be used in conjunction with the Visual-Manual Method to confirm the soil classification. D2487 includes laboratory testing.

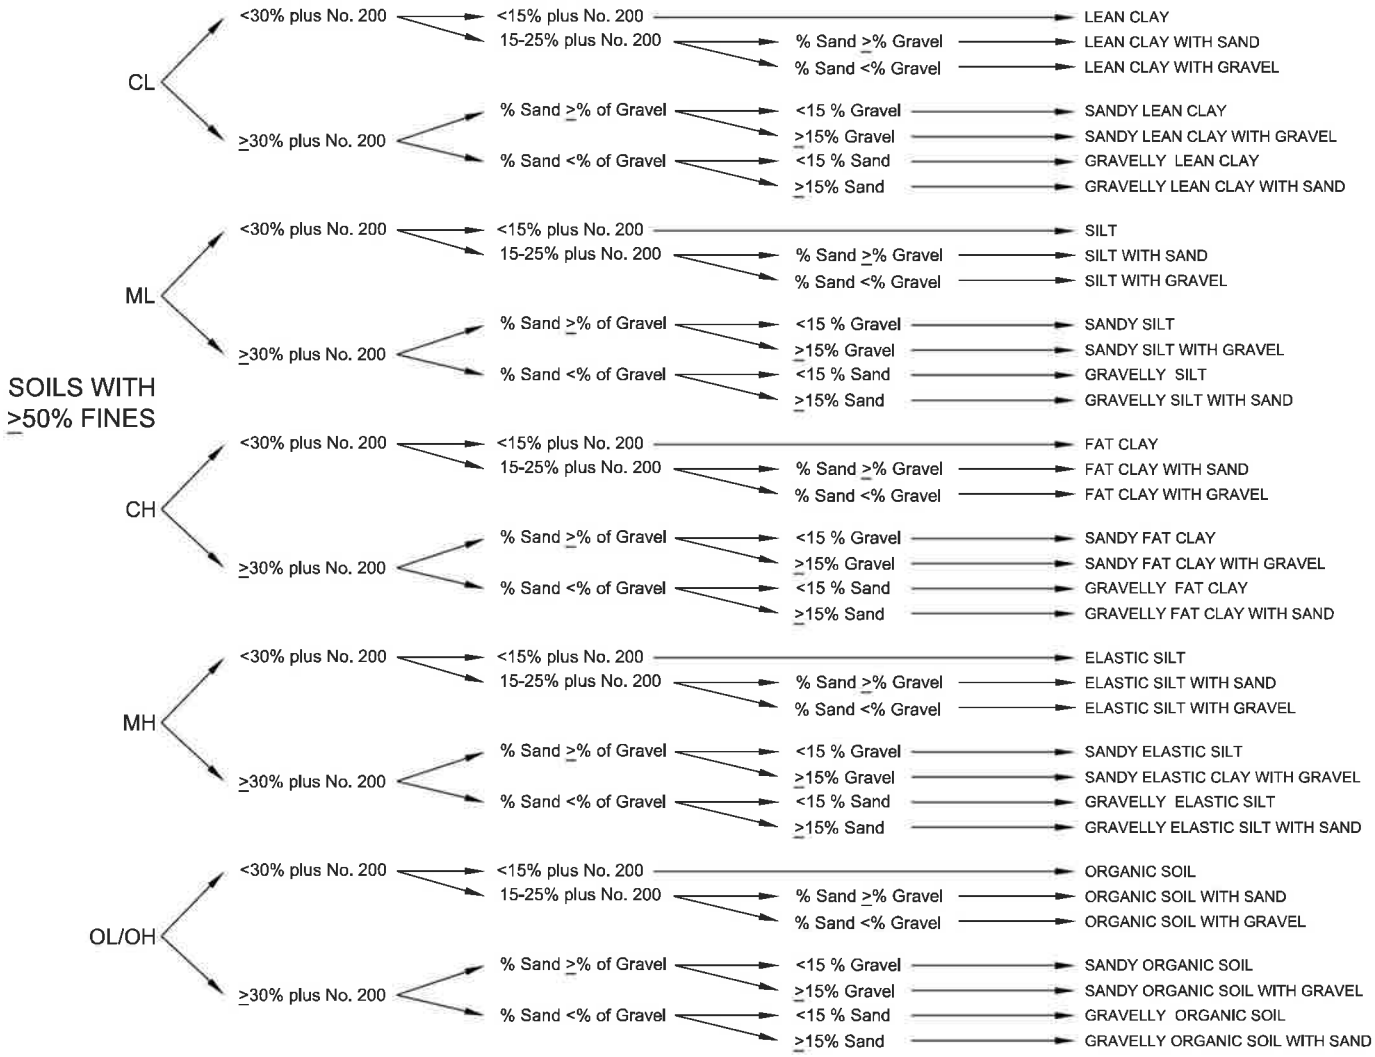
FINE-GRAINED SOILS
VISUAL-MANUAL DESCRIPTIONS



ID OF INORGANIC FINE SOILS FROM MANUAL TESTS

Symbol	Name	Dry Strength	Dilatancy	Toughness*
ML	Silt	None to low	Slow to rapid	Low or thread cannot be formed
CL	Lean Clay	Medium to high	None to slow	Medium
MH	Elastic Silt	Low to medium	None to slow	Low to medium
CH	Fat Clay	High to very high	None	High

1. GROUP NAME and (SYMBOL)
2. Describe fines, sand, and gravel components, in order of predominance. Include plasticity of fines. Include percentages of sand and gravel.
3. Color
4. Sheen, odor, roots, ash, brick, cementation, torvane and penetrometer results, etc.
5. "Fill," local name or geologic name, if known

PEAT

Peat refers to a sample composed primarily of vegetable matter in varying stages of decomposition. The description should begin: PEAT (PT) and need not include percentages of sand, gravel or fines.

CRITERIA FOR DESCRIBING PLASTICITY

Description	Criteria
Nonplastic ML	A 1/8-in. (3 -mm) thread cannot be rolled at any water content
Low Plasticity ML, MH	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit *
Medium Plasticity MH, CL	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit
High Plasticity CH	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit

* Toughness refers to the strength of the thread near plastic limit. The lump refers to a lump of soil drier than the plastic, similar to dry strength.

Describing the Plasticity of Soil Samples

M. Paster – November 2008

References ASTM D 2487 – Soil descriptions – lab
ASTM D 2488 – Soil descriptions – field
ASTM D 4318 – Atterberg limits testing

GEI Practice for Boring and Test Pit Logs

Describe the fines as:

Non-plastic
Low plasticity (The GEI laminated sheets incorrectly use "slightly plastic" for "low plasticity.")
Medium plasticity
High plasticity

Example: ~25% low plasticity fines

Toughness and dry strength:

You should use these tests to help decide how plastic the fines are. Record the results in the remarks column of the field log, but not in the soil description and not necessarily in the typed log.

On final logs, if Atterberg limits tests have been performed:

Do not use the descriptive terms non-plastic, low plasticity, etc. for samples on which Atterberg limits tests have been run. Instead, just give the percentage of fines and then report the actual Atterberg limits at the end of the description.

For example, the end of a silty sand description might be:
. . . ~25% fines, ~10% gravel max size ½ inch, gray. PL=23, LL=35.

(Atterberg limits tests are performed on the fraction of the sample finer than the No. 40 sieve, not just the fines. So the Atterberg limits data applies to the sample, not just to the fines.)

Hints:

High plasticity soils are rare in New England. If you think it's high plasticity, it's probably medium. Some Boston blue clay and some Connecticut River varved clays are high plasticity, but if you think you've found some, check with the project manager.

In New England, if ~10% fines or more, generally stick with GM, SM, ML, and CL. Occasionally GC, SC, CH. Don't use MH unless you have Atterberg limits data.

Estimating plasticity in the field, GEI guidance based on ASTM D 2488:

Plasticity	1/8-inch thread	Dry strength	Toughness
non	Cannot be rolled at any water content.	Dry specimen crumbles when handled.	Only slight pressure needed to roll thread near plastic limit.
low	Thread can barely be rolled.	Dry specimen crumbles with some finger pressure.	Slight to medium pressure needed to roll thread near plastic limit.
medium	Thread is easy to roll. Not much time needed to reach plastic limit.	Dry specimen crumbles with considerable finger pressure.	Medium pressure needed to roll thread near plastic limit.
high	Takes considerable time rolling and kneading to reach plastic limit.	Dry specimen cannot be broken with finger pressure.	Considerable pressure needed to roll thread near plastic limit.

Non-plastic vs. low plasticity:

ASTM D 2488 (soil descriptions - field) defines non-plastic and low plasticity based on the 1/8-inch thread as shown in the table above.

ASTM D 4318 (Atterberg limits testing) indicates that a sample should be called non-plastic for either of the following cases:

- The liquid limit test (dropping the cup) or the plastic limit test (rolling out the thread) cannot be performed because the plasticity is too low.
- The plastic limit is greater than or equal to the liquid limit.

Unfortunately, there are some soils that are low plasticity based on D 2488 (a thread can be rolled), but are non-plastic based on D 4318 (the liquid limit cannot be measured or PL≥LL).

GEI considers these soils to have low plasticity, because that is how they "look" and "feel." We want to document this information so that other people will have a better feel for what the soil looks like and how it behaves. So, if the soil was low plasticity based on D 2488, but non-plastic based on D 4318, that should be explained in the letter or report, and possibly in a note on the log.

SANDY SILT (ML) ~60% slightly plastic fines, ~40% mostly fine sand, 1" thick layer of fine to medium sand with <20% fines, gray.

LEAN CLAY (CL) ~90% moderately plastic fines, ~10% fine sand, olive. Boston Blue Clay. Sv = 0.5, 0.5, 0.8 tsf, Qp = 1.0, 1.5, 1.6 tsf

Stratified CLAYEY SAND (SC) and WIDELY GRADED SAND (SW) SC layers 1 to 2 inches thick consist of fine sand with ~30% moderately plastic fines, gray. SW layers 1 to 4 inches thick consist of fine to coarse sand, ~10% gravel to 1/2 inch, <5% fines, brown. Hydraulic Fill.

EXAMPLE ROCK DESCRIPTIONS

(0-9"): GRANITE, hard, one piece, joint surface slightly weathered, pink.
(6-60"): PHYLLITE, joints ~ 45° generally parallel to foliation, 9" to 44" moderate to severe jointing and joint weathering. 44" to 60" single piece, green-gray.

ARGILLITE, medium hard, moderately weathered joints, gray. Cambridge Argillite.

GEOPROBE AND ROTOSONIC

When SPTs are not performed, note sample density (sands) or stiffness (clays) in description.

CRITERIA FOR DESCRIBING DILATANCY OF FINE-GRAINED SOILS

Description	Criteria
None	No visible change in the specimen
Slow	Water appears slowly on the surface of the specimen during shaking and does not disappear or disappears slowly upon squeezing.
Rapid	Water appears quickly on the surface of the specimen during shaking and disappears quickly upon squeezing.

SPT: Standard Penetration Test

30-inch drop with 140-lb hammer
1 3/4 to 2 1/4 turns around cathead
2-inch O.D. split spoon sampler

ENV'L TERMINOLOGY FOR SOIL DESCRIPTIONS

- **Ash** - Typically silt-size to medium sand-size.
- Do not use the term "cinders." This is not a technical term. Instead, use "ash," "burnt wood," "burnt material," or a similar term.
- **Coal-like material** - If it looks like coal but you aren't sure.
- **Clinker** - Vitrified (glass-like) or heat-fused material. Often burned impurities in coal. Often looks like pumice, but heavier.
- **Slag** - Similar to clinker, but normally refers to residue from metal ore processing.

- **Sheen** - Iridescent petroleum-like sheen. Not to be used for a "bacterial sheen," which can be distinguished by its tendency to break up on the water surface at angles. Petroleum sheen will be continuous and will not break up.
- **Stained** - Use with a color ("brown-stained") to indicate that the soil is stained a color other than its natural (unimpacted) color.
- **Coated** - Soil grains are coated with NAPL (oil, tar, etc.). There is not enough NAPL to saturate the pore spaces. ("Split spoon sampler coated with brown oil." "Soil grains coated with gray substance with slight gasoline-like odor.")
- **Saturated** - The entire sample pore space is saturated with NAPL. If you use this term, be sure it is not water saturating the pore spaces. Depending on viscosity, the NAPL may drain from a soil sample. ("Sample saturated with green, sticky substance.")
- **Blebs** - Discrete sphericals of NAPL in a soil matrix that was not visibly coated or saturated. ("Occasional blebs of reddish-brown tar.")
- **Oil** - Exhibits a petroleum odor, different from MGP odors.
- **Tar** - Exhibits an MGP odor (e.g. naphthalene-like odor).

- **Odors** - Use terms such as "naphthalene-like odor" or "petroleum-like odor." Use modifiers (strong, moderate, slight) to indicate odor intensity.

STANDARD OPERATING PROCEDURE

SM-004 Test Pit Excavation

1. Objective

Describe methods for excavating test pits and documenting findings.

The test pit is used to characterize geologic strata, subsurface conditions and provide access for collection of representative soil samples from these strata.

2. Execution

- Before digging begins, proper permits and notifications must be obtained, in accordance with applicable rules or regulations.
- Make sure that utility clearance has been conducted. Contact the property owner to determine the location of underground utilities. Verify, with the contractor that local/regional utility clearance service has been contacted. Ask subcontractor to provide local/regional utility clearance service authorization number and record this in the field notebook. Show the contractor the approximate excavation area, and have the contractor confirm that the area is suitable for excavation. Clearance may require marking of subsurface explorations prior to contacting utility clearance service.
- Have contractors pressure wash or steam clean equipment before beginning field activities, if necessary.
- Observe the contractor excavating the designated area.
- If contamination is suspected, have the contractor place excavated material on plastic sheeting.
- During excavation, monitor ambient air for contaminants of concern identified in the site-specific Health and Safety Plan. Record readings in field notebook (see SOP FD-001 Field Notebook).
- Record in a field book or test pit log:
    - Test pit dimensions,
    - Soil classifications (see SOP SM-003 Soil Classification)
    - Visual and olfactory indications of contamination
    - Subsurface structures
    - Obstructions to excavation
    - Any other observations relevant to the project objectives
    - Take photographs of excavation and completed test pit walls, etc. (SOP FD-004 Photodocumentation).
- Record technical information on a PDA, test pit log form, or a field book.
- Label sample bottles (see SOP SC-002 Sample Handling).
- Screen soil samples for contaminants of concern and record results in the field notebook or test pit log.
- Collect soil samples from the test pit as designated in the work plan including sidewalls and bottom at designated depths, at strata changes, or based upon

field screening using remote sampling equipment (backhoe bucket, stainless steel remote sampler, etc.). Do not enter a test pit unless side slopes satisfy Occupational Safety and Health Administration (OSHA) regulations and other health and safety concerns have been addressed.

- Transfer soil samples to the appropriate glassware according to soil sampling SOPs (SOP SM-002 VOC Soil Collection and Preservation Method, etc.).
- Store samples on ice in a cooler (see SOP SC-002 Sample Handling and SOP FD-003 Chain-of-Custody).
- Backfill excavation as soon as possible with material as described in the field plan. Place the excavated material back in the excavation in approximately the same strata it came from.
- Segregate contaminated soil as necessary (see SOP SC-003 IDW). Properly identify segregated material and secure as described in the work plan.
- Measure dimensions of excavation and record in the field notebook or test pit log. If sampling locations are to be surveyed, mark the corners and provide surveyor with location ID.
- Sketch dimension and location of the test pit relative to a site reference point and record in the field notebook. Note the sample locations by number on a cross-section sketch and plan view sketch.

3. Limitations

- Never enter the excavation unless it is shored or the sidewalls are sloped in accordance with OSHA regulations and all proper personal protective safety precautions have been considered and implemented.
- Terminate excavation if the flow of groundwater into the excavation adversely affects the stability of the excavation (i.e., slumping). Make sure to note in the field notebook or test pit log the depth to ground water.
- Terminate excavation if drums, tanks, or other potential sources of contamination are observed. Record visible drum markings, labels, and any other pertinent information on the test pit log and in the field notebook. Photograph drums and materials. Consult with the project manager before filling the excavation.
- Do not leave an open test pit unattended.

Field Descriptions of Samples at Urban Impacted Sites

The intent of this document is to provide field personnel guidelines for logging soil conditions and observed impacts in a consistent and factual manner. This guidance recognizes that prejudging field conclusions regarding the potential source(s) or nature of a particular impact should be avoided and instead conclusions should be based on multiple lines of evidence (field observations, laboratory physical and chemical analyses, historic site uses, location of observed impacts, etc.).

SOIL LOGGING

- All soils are to be logged using the **Unified Soil Classification System** (ASTM D 2488 field descriptions).
- A photograph of the entire sample core should be taken. Additional photographs may be necessary to document impacted material.
- A calibrated **PID** (Photoionization Detector) should be used to screen all soil samples. PID readings should be taken every 6 inches of recovery and the interval reading should be included on the boring logs.
- The soil sample core should be scored or cut along the long axis so that the all of the soil lithology can be observed, when practical.
- **Moisture terms**: dry, moist and wet.
- **Color terms** –Color terms should be used to describe the "natural color" of the sample as opposed to staining caused by contamination (see below).
- **Representativeness** – Soil logs should include specific notes if the field representative believes that there is a possibility the soil sample being described is not representative of the interval sampled or is indicative of multiple sources of contamination.
- **Intervals for Description** – the field description should be for discrete intervals within the sampler, specifically pointing out small-scale units and changes within each sample interval. The description should also include the amount of sample recovered and note other conditions (such as a change in drilling conditions, etc.), as well as consistently adjusting the sample interval described (i.e. – identify the percentage of sample actually recovered and note any potential causes of the loss if possible) and note other conditions (such as a change in drilling conditions, etc.).

DESCRIPTION OF CONTAMINANTS

Visual Contamination Descriptors

- **NAPL** (Non Aqueous Phase Liquid) – a separate phase liquid that may be lighter than water (LNAPL) or denser than water (DNAPL). NAPL arises from a variety of industrial sources and can have varying consistency (viscosity) and can range from non-viscous to highly viscous (taffy-like). NAPL observations should be accompanied by applicable olfactory with smell for industrial sources (see descriptors below) and other visual observations (e.g., color and viscosity).

- **Sheen –** iridescent sheen. This is not to be used to describe a "bacterial sheen", which can be distinguished by its tendency to break up at angles on the water surface; whereas a non-bacterial sheen will be continuous and will not break up.

- **Blebs –** discrete, spherical shaped NAPL in or on the soil matrix. Include additional descriptors to the extent practicable such as the approximate size and quantity (number of blebs or qualitative estimate) to the extent practical.

- **Coated –** soil grains are coated with NAPL – there is not sufficient NAPL present to saturate the pore spaces. Use modifiers such as light, moderate or heavy to indicate the degree of coating.

- **Saturated –** the entirety of the pore space for a sample interval is saturated with NAPL. Care should be taken to ensure that the saturation described is not related to water in the sample. Depending on the viscosity, NAPL saturated materials may freely drain from a soil sample and should be documented accordingly.

- **Stained** – visible, unnatural discoloration of the soil, with no visible free product.

- **Solid NAPL –** NAPL that is in a solid or semi-solid phase. The magnitude of the observed solid NAPL should be described (discrete granules or a solid layer).

  Other Visual Impacts and Descriptors– Other visual impacts that are not naturally occurring should also be noted along with appropriate visual descriptors. These other visual observations could include the observation of debris, wood chips, staining, anthropogenic materials, or other notable visual characteristics and general observations characterizing common urban fill. The above impacts should be described using other visual descriptors as applicable. Descriptors may include, but not be limited to, color, consistency, thickness, etc.

Olfactory Descriptors

- Note odors similar to mothballs, driveway sealer, highway paving oil or other odors that are acrid, burnt, or sulfur-like, etc.
- Other odors that are not believed to be natural should also be identified with descriptors such as organic, ammonia, sweet, chemical etc., as applicable.
- Use modifiers such as strong, moderate or slight to indicate intensity of the observed odor.
- In instances where multiple odors are present, a combination of descriptors should be used to clearly identify where these co-mingled impacts are present.

DNAPL/LNAPL

- **Density of NAPL –** a jar shake test can be performed to preliminarily determine in the field whether observed NAPL is either denser or lighter than water. Care should be taken in recording and interpreting the results, as experience indicates that the apparent result immediately following the test may change with time. Laboratory testing for density of the NAPL is recommended to confirm results. The depth at which the NAPL is encountered on soil with respect to the groundwater surface is not diagnostic and should not be used a basis for identifying the density of NAPL in the field.

- **Viscosity of NAPL –** if NAPL is present a qualitative description of viscosity should be made. The following should be used:

  Highly Viscous (taffy-like)
  Viscous (No. 6 fuel oil or bunker crude-like)
  Low viscosity (No. 2 fuel oil-like or water-like)

GROUNDWATER SAMPLING OBSERVATIONS

- Any observations of sheen, blebs, NAPL, smearing or coating of the sampling equipment, odor, etc. made during groundwater sampling are to be included in the groundwater sample collection log.

COLOR CHART (ATTACHED) For Use in Cross-Sections, Extent Maps, and Similar Interpretative Depictions

The color chart attached is intended to help visually depict the nature and location of impacts observed during an investigation. The chart would be used for new sites or sites transitioning from the Site Characterization to the Remedial Investigation phase (or are in the early stages of the Remedial Investigation phase). The colors should be included in investigation summaries on cross sections to support an understanding of the nature and extent of impacts. In addition, the colors may also be placed on boring logs (although not a requirement) in the final report. In either case, the colors will be used in interpretive depictions of nature and extent once the lines of evidence support a determination of the appropriate color selection. Since the investigation of a site is dynamic, the use of a particular color or a combination of colors may change if other lines of evidence suggest such a change is appropriate.

In instances where multiple impacts are present, a combination of colors should be used (such as a color with cross hatching) to clearly identify where these co-mingled impacts are present.

Color Descriptions of Samples at Urban Impacted Sites

	RGB Color	Auto Cad Index
NAPL SATURATED	255,0,0	10
NAPL COATED MATERIAL	255,0,255	210
SOLID NAPL	129,64,0	34
NAPL BLEBS, GLOBS, SHEEN	255,191,0	40
STAINING, ODOR	255,255,0	50
INDUSTRIAL IMPACTS - (PETROLEUM OR OTHER UNNATURAL) SATURATION & SHEENS	0,191,255	140
INDUSTRIAL IMPACTS - (PETROLEUM OR OTHER UNNATURAL) STAINING & ODORS	170,234,255	141
WOOD CHIPS/BLUE DISCOLORATION/SULFER-LIKE ODOR	0,0,255	170
NO OBSERVED IMPACTS	0,165,0	92

Note: In instances where multiple impacts are present, a combination of colors should be used (such as a color with cross hatching) to clearly identify where these co-mingled impacts are present.

Section 7

Groundwater (GW)

STANDARD OPERATING PROCEDURE

GW-001 Water Level and NAPL Measurement

1. Objective

Describe procedures to measure the depth to water and non-aqueous phase liquid (NAPL) thickness in an open borehole, cased borehole, monitoring well or piezometer.

2. Equipment and Materials

Field forms and/or field notebook.

- Decontamination fluids
- Bailer
- Weighted cotton string
- Oil/Water interface probe
- Water level meter (if oil/water interface probe is not available)

Water level and NAPL measurements can be collected by a variety of methods. A water level meter is used to collect depth to water measurements however an oil/water interface probe or other methods must be used to gauge NAPL depths. An electronic oil/water interface meter, consists of a cable divided into incremental measurements of 0.01 feet, and probe that consists of an infra-red circuit that detects the presence of a liquid, and a conductivity circuit that differentiates between conductive liquid (water) and non-conductive liquid (LNAPL or dense non-aqueous phase liquid [DNAPL] product). Typically, a steady tone and light indicate a non-conductive liquid (e.g. product) and an intermittent tone and light indicate a conductive liquid (e.g. water). Refer to the manufacturer's instructions for details. Alternately, water level and NAPL measurements can be collected using a water level meter, clear bailer and weighted cotton string. Each method of data collection is described below.

3. General Information

- The water level in a monitoring well or piezometer should be allowed to stabilize for a minimum of 24 hours after development or construction before groundwater elevation and/or NAPL measurements are collected. The water level in a borehole can be measured during drilling; however, this should be noted in the field notebook.
- Water levels in multiple wells should be collected within the shortest timeframe practicable.
- Water and NAPL levels should be measured from the designated survey point as specified by the surveyor or highest point (or "V" notch) on the PVC. If the well is new, mark the datum point with an indelible marker and note reference location in

field book. Discuss with the project manager what reference point should be used to collect water measurements for specific sites.

- Water level and/or NAPL measurements should be made before any water is removed from wells because doing so may influence groundwater levels in the area of the investigation.
- Measurements should be made approximately three times to confirm the measurement. Each time a measurement is made it should be determined to the nearest one-hundredth of a foot (0.01).
- Water level and/or NAPL measurements should first be collected at the wells that are least contaminated and proceed towards the wells that are most contaminated. Decontaminate the water level meter or oil/water interface probe prior to initial use and after use at each location. If NAPL is encountered at a well where it was previously not observed, contact your project manager before continuing.
- Refer to the oil/water interface probe or water level meter instruction manual for guidance on indicator signals, as these may differ by manufacturer.

4. Execution

4.1 Water Level and NAPL Measurements Using Interface Probe

- Open wells to the atmosphere and allow them to equilibrate prior to collecting LNAPL depth measurements.
- LNAPL Depth (if present): Measure the LNAPL/air interface by slowly lowering the interface probe to the LNAPL surface. Be ready to stop as soon as the probe signals the LNAPL surface.
- Record the depth to LNAPL.
- Groundwater Depth: Continue slowly lowering the probe until it signals the presence of water.
- Record the depth to water.
- The LNAPL thickness is determined by subtracting the water depth from the LNAPL depth.

The depth and thickness of DNAPL can sometimes be determined by slowly lowering the interface probe past the LNAPL (if present) and water layers. Record the depth to the DNAPL layer. Finally, measure the depth to the well bottom.

The DNAPL thickness is determined by subtracting the DNAPL depth from the depth to well bottom.

- Decontaminate the interface probe and tape according to SOP QA-001.
- Dispose of any NAPL-impacted debris properly.
- Check with the Project Manager if you are uncertain of the appropriate disposal method.

4.2 LNAPL Measurements Using Clear Bailer

If LNAPL is suspected at a site, an oil/water interface probe should be used when gauging water level and NAPL measurements. However, a water level meter and a clear bailer may be used instead to estimate approximate LNAPL thickness if an oil/water interface probe is not available.

- Open wells to the atmosphere and allow them to equilibrate prior to collecting LNAPL depth measurements.
- Slowly lower the water level meter until contact with fluid is indicated by the meter.
- Record the depth to fluid measurement.
- Lower a clear bailer into the well and slowly into the LNAPL. Do not submerge the bailer.
- Slowly raise the bailer out of the well and measure LNAPL thickness in the bailer using a ruler or tape measure.

Calculating Depth to Groundwater

The depth to water can be calculated as follows:

DTW = DTF + PT
DTW = Depth to Groundwater
DTF = Depth to Fluid
PT = Measured Product Thickness

Calculating Corrected Depth to Groundwater

Once the LNAPL thickness is known and the depth to groundwater is known, the corrected depth to groundwater can be calculated.

Corrected DTW = Static DTW – (PT x G)
DTW = Depth to Ground Water
PT = Measured Product Thickness
G = Specific Gravity (density of free product / density of water)

4.3 DNAPL Measurements Using Weighted Cotton String

A weighted cotton string may be used to estimate approximate DNAPL thickness.

- Secure cotton string.
- Secure clean steel nuts and/or washers.

- Tie the string to the nuts/washers, so that there is adequate weight.
- Lower the weighted string into the well slowly, until a firm bottom is sensed.
- Remove the weighed string and measure the DNAPL coated portion of the string.
- Record the thickness.
- Dispose of any NAPL-impacted debris properly. Check with the Project Manager if you are uncertain of the appropriate disposal method.

5. Health and Safety Considerations

The health and safety considerations for the work associated with this SOP, including both potential physical and chemical hazards, will be addressed in the site specific Health and Safety Plan (HASP). The collection and accumulation of NAPL presents the potential for significant hazards that need to be managed. A detailed job safety analysis (JSA) should be completed prior to the start of work.

6. Considerations

- Weak batteries in water level and oil/water interface meters frequently produce weak or gradual auditory and/or visual responses, making it difficult to accurately determine when the probe of the unit has come in contact with ground water or NAPL. As such, it is recommended that electronic ground water-level indicators be tested before they are brought out into the field.
- Electronic oil/water interface meters do not respond to distilled water. Do not use de-ionized water to test these units.
- Wells that are not vertical may result in probe contact with the side of the well casing providing a false measurement. Once the probe has come in contact with ground water in the well, water may be trapped by capillary action between the probe and the well casing. If this happens, the unit may continue to signal even after the probe has been raised above the ground water surface. The deeper the well, the more likely this problem may occur. To correct this, the cable should be raised several feet above the water and shaken to remove water from the probe. A new ground water-level measurement should then be collected. If the signals from the unit are not abrupt or reproducible, the probe and tape may need to be retrieved and dried off before trying again.
- Accumulation of sediment, organic material, or floating debris in the probe may also result in gradual or non-reproducible readings. Wells that are constructed with metal inner casings may lead to difficulties in collecting reproducible ground water-level measurements because the inner sides of the well casing are conductive.

- In some cases, a rubber grommet or metal centralizer may need to be placed on the probe so that it cannot contact the inner casing.
- Well gauging equipment should be properly decontaminated between wells and piezometers to avoid cross contamination.
- Water levels in wells may be influenced by changes in river stages, pumping of nearby wells, precipitation, tides, etc.
- Using a bailer to estimate LNAPL thickness can result in inaccuracies because successful use of the bailer is dependent upon the expertise of the operator and assumes the check valve does not leak upon retrieval.
- The optical sensor on interface probes may become damaged if solvents are used to clean NAPL from the probes.
- The optical sensor may become smeared when used to measure NAPL, rendering pinpoint accuracy to an estimate at best.
- Close attention to decontamination procedures will improve accuracy, operational life, and reduce the risk of cross contamination with other wells.
- LNAPL thickness can be affected by fluctuations in the water table. In some cases, an LNAPL's thickness may decrease when the water table rises, while its thickness increases as the water table drops. In other cases, fluctuating water tables may cause sudden appearances and disappearances of LNAPL layers.
- Monitoring points with LNAPL can pose a problem when measuring the level of groundwater. Floating LNAPL can depress the groundwater level in a monitoring well or piezometer and distort the measurement. Therefore, the Corrected Depth (CD) formula shown above should be applied to groundwater level measurements in monitoring points where LNAPL are present:
- Some interface probes are factory-calibrated based on an assumed conductivity of NAPL and water, both of which may vary. An interface probe that is functioning properly may not be able to discern different NAPLs at all sites.
- An interface probe may not successfully provide both LNAPL and DNAPL measurements in the same well because the probe is coated by LNAPL and loses its ability to detect DNAPL.
- DNAPL, in particular, may be only slightly heavier than water, or may be neutrally buoyant. As a result, it can be easily disturbed. Once it is disturbed, meaningful measurements can be difficult or impossible to obtain. As such, all tapes or probes used for measurements should be used slowly.

Ryan Hoffman – (781) 721-4091 Boston

STANDARD OPERATING PROCEDURE

GW-002 Non-Aqueous Phase Liquid (NAPL) Recovery

1. Objective

Provide procedural guidance for routine recovery of non-aqueous phase liquids (NAPL).

2. Equipment and Materials

The following materials and equipment may be necessary for this procedure:

- SOP GW-001 Water Level and NAPL Measurement
- Oil/water interface probe
- Appropriate pump and required tubing/piping
- Double check valve bailers and string
- Drums or buckets for NAPL collection
- Proper personal protective equipment (PPE) including gloves and protective eyewear
- Drum labels
- Field data sheets or logbooks
- Decontamination supplies and plastic sheeting
- Additional equipment identified by site-specific work plan and health and safety plan (HASP)

3. General Information

Refer to SOP GW-001 and record the depth to NAPL and depth to water measurements If you are using an oil/water interface probe, first check to see if the unit is functioning correctly. Note: De-ionized water will not provide a correct reading. Check the interface probe battery and replace if necessary.

Interface probes usually distinguish between NAPL and water by sounding solid or intermittent tones. See the manufacturer's instructions for details.

4. Execution

4.1 General Measurement Procedures

Using an oil/water interface probe will provide a depth to water and a depth to NAPL in each monitoring well. Refer to probe manual to determine changes between liquid types (water, light non-aqueous phase liquid [LNAPL] and dense non-aqueous phase liquid [DNAPL]). To achieve accurate depth measurements, ensure the oil/water interface

probe is decontaminated (GEI SOP QA-001) prior to and between each measurement taken at each well.

To calculate the volume of NAPL in monitoring wells with well diameters specified below, use the following respective equations:

Light non-aqueous Phase Liquid (LNAPL) Volume

$$LNAPL\,V = (DTW - P_1) \times C$$

Dense Non-Aqueous Phase Liquid (DNAPL) Volume

$$DNAPL\,V = (TD - P_2) \times C$$

Where, V = Volume
DTW = Depth to Water
TD = Total Depth
P_1 = Depth to LNAPL
P_2 = Depth to DNAPL

Conversion factors (C) for wells based on well diameter size are noted in the table below.

Well Diameter (inches)	Conversion Factor (liters)	Conversion Factor (gallons)
2	0.6178	0.1632
4	2.4711	0.6528
6	5.561	1.469

Note: Well diameter sizes are noted for outer diameter. Conversion factors assume Schedule 40 PVC riser and screen, if well is constructed of different material appropriate conversion factors must be used to calculate accurate NAPL volume.

Once measurements have been taken and calculations have been made, collection of NAPL may commence.

4.2 NAPL Collection Procedures

Collection of NAPL shall be accomplished using common recovery techniques or technologies including:

- Peristaltic pump
- Bailer

Some projects require on-going NAPL recovery efforts. For these projects installation of dedicated recovery methods should be considered.

Special care shall be taken to prevent any recovered NAPL from spilling or coming into contact with the ground and sampling personnel. This includes the use of proper personal protective equipment (PPE), including gloves and protective eyewear (Tyvek® if necessary), along with plastic sheeting set beneath the pump, tubing, and collection

container (sealed top 55-gallon drum or 5-gallon bucket with lid), and the surrounding work area. A site-specific work plan, HASP and job specific job safety analysis need to be developed prior to the start of work. The specific operating procedures for common recovery methods are discussed in the following sections.

4.2.1 Sampling and Recovery via Peristaltic Pump:

LNAPL

- Take and record the required measurements prior to commencing pumping.
- Cut a length of poly tubing (T1) that is long enough to extend approximately 12-inches beyond the LNAPL layer. Cut an additional length of poly tubing (T2) that will be connected to the discharge side of the peristaltic pump silicone tubing that is long enough to extend from the pump to the NAPL collection container. Cut a length of silicone tubing (approximately 8-inches) for use in the peristaltic pump head.
- Insert the silicone tubing into the peristaltic pump head. Check the flow direction of the pump to ensure that the pump will be removing fluid and not pumping air into the well when removal begins.
- Insert T1 into the intake side of the silicone tubing. Lower the intake side into the well and secure in place just below the top of LNAPL.
- Insert T2 into the discharge side of silicone tubing and secure to the NAPL collection container with a clamp.
- Turn pump flow rate to lowest setting. Turn the pump on and slowly increase the pump rate to begin LNAPL removal from the well. Use the oil/water interface meter to measure the depth to LNAPL. Lower the intake tubing as necessary until all of the LNAPL has been recovered from the well.
- Once the LNAPL has been recovered from the well, collect and preserve a sample if required, in accordance with laboratory standards.
- Following completion of LNAPL recovery, disconnect the tubing from the pump, secure the well and road box, and clean/decontaminate the pump and oil/water interface probe, prior to moving to the next location.
- Impacted tubing will either be containerized for proper disposal or left in well for reuse.

DNAPL

- Take and record the required measurements prior to commencing pumping.
- Cut a length of poly tubing (T1) that is long enough to extend to the bottom of the well including additional length to attach to the pump intake. Cut an additional length of poly tubing (T2) that will be connected to the discharge side of the

peristaltic pump silicone tubing that is long enough to extend from the pump to the NAPL collection container. Cut a length of silicone tubing (approximately 8-inches) for use in the peristaltic pump head.

- Insert the silicone tubing into the peristaltic pump head. Check the flow direction of the pump to ensure that the pump will be removing fluid and not pumping air into the well when removal begins.
- Insert T1 into the intake side of the silicone tubing. Lower the intake side into the well and secure in place just above the bottom of the well.
- Insert T2 into the discharge side of silicone tubing and secure to the NAPL collection container with a clamp.
- Turn pump flow rate to lowest setting. Turn the pump on and slowly begin to remove DNAPL from the well. DNAPL removal will be complete when the pump begins to discharge water. Use the oil/water interface meter to check the DNAPL thickness during the removal process. Take care not to pump an excessive amount of water.
- Once the DNAPL has been purged from the well, collect and preserve a sample if required, in accordance with laboratory standards.
- Following completion of DNAPL recovery, disconnect the tubing from the pump, secure the well and road box, and clean/decontaminate the pump and oil/water interface probe, prior to moving to the next location.
- Impacted tubing will either be containerized for proper disposal or left in well for reuse.

4.2.2 Sampling and Recovery via Double Check Valve Bailer:

LNAPL

- Take and record the required measurements prior to commencing bailing.
- Ensure the work area is covered in plastic sheeting to avoid potential spills of water and/or NAPL.
- Tie the bailer to a piece of string that will allow the bailer to reach just below the LNAPL layer. Use the oil/water interface meter to determine the appropriate depth.
- Using slow and controlled motions while lowering (and raising) the bailer to the appropriate depth, commence bailing LNAPL out of the well and draining the bailer directly into collection container.
- Once the LNAPL has been purged from the well, collect and preserve a sample, if required, in accordance with laboratory standards.

DNAPL

- Take and record the required measurements prior to commencing bailing.
- Ensure the work area is covered in plastic sheeting to avoid potential spills of water and/or NAPL.
- Tie the bailer to a piece of string that will allow the bailer to reach the bottom of the well.
- Using slow and controlled motions while lowering (and raising) the bailer to the bottom, commence bailing DNAPL out of the well and draining the bailer directly into collection container.
- Once the DNAPL has been purged from the well, collect and preserve a sample, if required, in accordance with laboratory standards.

4.3 Waste Management and Disposal

Investigation derived waste should be managed in accordance with GEI SOP SC-003. DNAPL waste management and disposal should be evaluated on a site by site basis.

4.4 Troubleshooting Information

If there are any performance problems with the oil/water interface probe which result in inability to achieve the proper measurements presented in Section 5.1, or if there are any problems with the peristaltic pump, consult the appropriate section of the probe instruction manual for the checkout and self-test procedures. If the problem persists, consult the manufacturer's customer service department immediately for further instructions.

Lower temperatures can affect the ability to pump and/or bail NAPL. Weather should be taken into consideration when scheduling gauging and recovery sampling events.

4.5 Data and Records Management

All information pertaining to maintenance of the oil/water interface probe and the peristaltic pump shall be maintained in the project file. Field measurements (depth to water, NAPL, etc.) and all calculations (NAPL column length, volume of NAPL, etc.) shall be recorded on the appropriate field data sheets or in the logbook consistent with GEI SOP Section 5.

4.6 Limitations

- NAPL gauging and recovery can be challenging and requires adaptive thinking. A variety of measurement and collection techniques may be necessary to properly execute the work.
- Exposure to NAPL can accelerate the required maintenance/replacement intervals for tools and equipment.

5. Health and Safety Considerations

The health and safety considerations for the work associated with this standard operation procedure, including both potential physical and chemical hazards, will be addressed in the site specific Health and Safety Plan (HASP). The collection and accumulation of NAPL presents the potential for significant hazards that need to be managed. A detailed JSA should be completed prior to the start of work.

STANDARD OPERATING PROCEDURE

GW-003 Low Flow (Low Stress) Groundwater Sampling

1. Objective

Describe methods to collect groundwater samples most likely to produce results that represent aquifer conditions.

Low-flow purging is limited to wells that, with sustained pumping, exhibit no continuous drawdown.

2. Execution

- Prior to groundwater sampling consult with the project manager to confirm that the type of pump is appropriate and consistent with the approved work plan.
- Record activities in the field notebook (see SOP FD-001 Field Notebook) and on a Monitoring Well Sampling Record such as the examples in Attachment A. Use a separate form for each sampling location and event. You may forego the forms and record all information in the field notebook if the Project Manager approves.
- Calibrate pH, temperature, Specific Conductance (SC), turbidity, Dissolved Oxygen (DO), and Oxidation-Reduction Potential (ORP) on the meter(s). Use calibration methods provided by the manufacturer of the equipment. Note that appropriate calibration for dissolved oxygen requires a water saturated air environment, along with measured temperature and barometric pressure.
- Begin with the monitoring well believed to have the least contaminated groundwater and proceed systematically to the well with the most contaminated groundwater. Check the well, the lock, and the locking cap for damage or evidence of tampering.
- Slowly and gently measure the depth to water with a water level probe and/or oil-water interface probe. Do not measure depth to well bottom at this time (wait until sampling has been completed). Measure water level in accordance with SOP GW-001 Water Level Measurement.
- Attach new polyethylene or Teflon lined tubing to the sampling pump and the flow-through cell that contains the meter probes.
- Slowly and gently insert new polyethylene or Teflon lined tubing to the pump intake (or use dedicated tubing that remains in the well) and to the middle of the saturated screened interval or to the pre-determined sampling depth.
- The tubing intake should be kept at least two (2) feet above the bottom of the well to prevent disturbance or suspension of any sediment or Non-Aqueous Phase Liquid (NAPL) present in the bottom of the well. Record the depth of the pump intake.

- If possible, position your sampling equipment and tubing so that it is in the shade. The goal is to minimize the effect of sunlight raising the temperature of water being collected.
- Start the pump on the lowest setting and increase slowly until flow begins. Adjust the pumping rate so that drawdown in the well is minimal (0.3 feet or less, is desirable but not mandatory). Use a pumping rate between 100 to 1,000 milliliters per minute (mL/min) (or approximately 0.1 to 1 quarts per minute). Measure flow rate on the pump or using a graduated container every 3 to 5 minutes and record. The minimum purge volume will be twice the combined volumes of the sampling string (i.e. pump, tubing, and flow-through cell).
- While purging, record water levels every 3 to 5 minutes and monitor and record the water quality indicator parameters: pH, temperature, specific conductance (SC), dissolved oxygen (DO), and turbidity. If specified in the field sampling plan also include ORP.
- Purging is complete when, after three consecutive measurements, the water quality parameters have stabilized as follows:

    - pH (+/- 0.1 standard units)
    - temperature (+/- 3%)
    - SC (+/- 3%)
    - turbidity (+/- 10% if >5 NTU; if 3 values are <5 NTU, consider the values as stabilized)
    - DO (+/-10% if >0.5 mg/L; if 3 values are <0.5 mg/L, consider the values as stabilized)
    - ORP (+/- 10 mV)

- Dispose of purge water according to the field plan.

Sample Collection:

- Following purge, remove the discharge tubing from the flow-through cell. Do not disturb pump and tubing between stabilization and sample collection.
- Fill sample containers directly from the sampling device in order of decreasing volatility (i.e., Volatile Organic Compounds (VOC) samples are collected first; see SOP SC-002 Sampling Handling). Fill all containers from the discharge end of the tubing. Collect samples at a flow rate equal to the steady state purge rate.
- If not using a dedicated pump, remove sampling device and decontaminate (see SOP QA-001 Equipment Decontamination). Discard used tubing.
- Store samples in a cooler on ice for transport to the laboratory.
- Measure depth to bottom of well.

- Secure the well cap.

3. Limitations

- Prior to departure for the field, obtain available information on well construction for use in field investigation (i.e., screen and riser material, well diameter and depth, screened interval, optimum sampling depth, etc.).
- If possible, when using dedicated equipment, install equipment into well at least 24 hours before sample collection to minimize disturbance of the water column and/or suspension of sediments or NAPL on bottom.
- If water quality indicator parameters do not stabilize after removing 3 to 5 well volumes or 2 hours, contact the Project Manager. Three options will be available: 1) continue purging until stabilization; 2) discontinue purging and do not sample; or 3) discontinue purging and sample.
- The key indicator parameter for VOCs is DO. The key indicator parameter for all other samples is turbidity.
- Fill all sample containers with minimal turbulence by allowing the groundwater to flow from the tubing gently down the inside of the container.
- Consult with the project manager before field filtering samples for metals if using low-flow sampling.
- Be aware of any preservatives in the sample bottles and handle with care, in accordance with the Health and Safety Plan.

STANDARD OPERATING PROCEDURE

GW-004 pH and Temperature Measurement

1. Objective

Describe methods for measuring the pH and temperature of liquids using a combination pH/temperature meter.

2. Execution

Calibration

- Calibrate the meter according to the equipment manufacturer's instructions at the beginning of each day of use. Calibration for pH shall be performed using at least two buffer solutions. Solutions chosen should be similar to the expected pH of the liquids tested (pH 7 and 4 buffer solutions are preferred in most cases for groundwater or surface water measurements).
- Check calibration at the end of the day by reading the two solutions used in calibration. Also perform additional field checks as needed based on observed readings (i.e., inconsistent readings). Record measurements and time of measurement in the field book or sample sheet. If the readings are outside +/– 0.2 pH units, recalibrate the meter.

Sample Measurement

- Immediately prior to testing a sample, decontaminate testing container and probe assembly with one rinse of distilled water. Do not use methanol to rinse the probe. Methanol rinses could damage the probe.
- Gently dry the probe with a paper towel and shake beaker to remove excess solution. Visually inspect the bottom of the probe to ensure that liquid or sediment is not trapped between outer casing and probe.
- Pour the sample into the testing container and insert both temperature and pH probe. Stir sample for 30 seconds using both probes. Let the probes equilibrate in the sample solution for another 30 seconds. Measure and record the temperature. Measure and record pH reading after stabilization or 60 seconds, whichever is sooner. A reading has stabilized if pH units have not changed +/– 0.1 pH units during a 30 second period.
- Record pH to the nearest 0.1 unit and temperature to the nearest whole number.

3. Limitations

- Coatings and particulates may affect the response of the probe; more thorough cleaning using a weak alconox solution and distilled water rinse

and gently wiping the probe surface with a paper towel may be required to clean the surface of the probe.

- Temperature affects both the response of the instrument to pH and the actual pH of the sample. The Automatic Temperature Compensation (ATC) function compensates for the variation in the response of the meter only. Therefore, the pH must always be reported with temperature.
- The probe is a fragile thin glass bulb surrounded on three sides by a plastic casing. Care must be taken in handling the probe to avoid breakage.
- Do not use buffer solutions past their expiration date.

STANDARD OPERATING PROCEDURE

GW-005 Turbidity Measurement

1. Objective

Describe calibration and use of a Hach nephelometer/turbidimeter.

The meter is used to measure turbidity of liquids by quantifying how much light passes through them. Turbidiity readings are required to be read using a portable (e.g Hach) instrument directly from the tubing before going through the flow-through cell.

This SOP is specific to a Hach turbidimeter. Follow manufacturer's recommendations for other meters.

2. Execution

i. Turn the meter "ON".
ii. Rinse the sample cell 3 times with distilled water.
iii. Fill the cell to the fill line with distilled water and then cap the cell.
iv. Wipe off excess water and streaks with a non-abrasive lint-free paper or cloth (preferably lens paper).
v. Open the cover and insert the cell (arrow to the front) into the unit and close the cover.
vi. Press "READ" and wait for the 'light bulb' icon to go off. Record the reading.
vii. Using the Gelex standards, repeat steps above. Record all measurements (note anomalies).
viii. Fill the cell with sample liquid to the fill line (about 15 mL) and replace the cap on the cell.
ix. Wipe off excess water and any streaks with a non-abrasive lint-free paper or cloth (lens paper).
x. Press "I/O" and the instrument will turn on. Place the meter on a flat, sturdy surface. Do not hold the instrument while making measurements.
xi. Insert the sample cell, arrow to the front, in the instrument. Close the lid.
xii. Select manual or automatic range selection by pressing the range key.
xiii. Use signal average mode if the sample causes a noisy signal (display changes constantly). Select signal averaging mode by pressing the "Signal Average" key.
xiv. Press Read. The display will show "---- NTU" and then the turbidity in NTU. Record the result after the lamp symbol turns off.
xv. Rinse the cell with distilled water.
xvi. Confirm the validity of the sample measurement by double-checking with one of the Gelex standards.

xvii. Periodically check the turbidity meter during the day by using the Gelex secondary standards provided.
xviii. Perform a post calibration at the end of the day and record all measurements.

3. Limitations

If the turbidity measurements are for National Pollutant Discharge Elimination System (NPDES) reporting purposes, all samples with values above 40 NTU must be diluted with turbidity free water (e.g. distilled water) and sample turbidity is calculated by multiplying the reading of the diluted sample by the dilution factor.

STANDARD OPERATING PROCEDURE

GW-006 Specific Conductance Measurement

1. Objective

Describe standard methods to measure conductivity of water using a field conductivity meter.

2. Execution

- Calibrate the meter according to equipment manufacturer's instructions at the beginning of each day of use. Calibration shall be performed using a standard KCl or other solution recommended by the manufacturer.
- Record the make, model, and serial or identification number of the instrument and calibration information in the field notebook.
- Check calibration at the end of the day by measuring the standard used in calibration and record in field book. Also perform additional field checks as needed based on observed readings (i.e., inconsistent readings). If the readings are outside +/- 0.02 mS/cm, the meter must be recalibrated. Initial calibration should be conducted under the same conditions (i.e., temperature, and location) of field testing.
- Immediately prior to testing a sample, decontaminate testing container and probe assembly with distilled water.
- Gently dry the probe with a paper towel and shake container to remove excess solution.
- Pour sample into the container and insert probe. Stir sample with the probe for approximately 10 seconds. Let the probe equilibrate in the sample solution for another 30 seconds. Measure conductivity and record in the field notebook.
- Record conductivity to the nearest whole number.

3. Limitations

- Oily coatings and particulates may affect the probe's response; more thorough cleaning using a weak alconox solution and distilled water rinse and gently wiping the probe surface may be required to clean the surface of the probe.
- If sample liquid is contaminated, (e.g. stained, conductance >0.75 mS/cm), rinse probe with distilled water immediately after measuring sample to minimize fouling of probe.
- Do not use calibration solutions past their expiration date.

4. References

Standard Methods for the Examination of Water and Wastewater, 18th Edition, Method 4500-H. American Public Health Association (1992).

Saskia Oosting

STANDARD OPERATING PROCEDURE

GW-007 Dissolved Oxygen Measurement

1. Objective

Describe calibration and field use of dissolved oxygen meter.

2. Execution

- Place instrument in the intended operating position (vertical, tilted, or horizontal) before it is prepared for use and calibrated.
- Recalibration may be necessary when the instrument operating position is changed.
- Attach the prepared probe to the Probe connector of the instrument and adjust the retaining ring finger tight. Check that membrane is intact and check for presence of air bubbles under membrane. If bubbles are present or membrane is damaged, prepare probe again according to manufacturer's instruction.
- Place approximately 1/8 inch of water into the bottom of the calibration cup. Place the probe into the cup and engage only one thread of the calibration cup onto the probe to ensure that the DO probe is readily vented to the atmosphere. Make sure the DO and temperature probes are not in contact with the water. Wait approximately 10 minutes for the air in the calibration cup to become water saturated and for the temperature to equilibrate.
- Calibrate meter according to the procedures outline in the instrument manual. Calibrate probe to a zero oxygen solution provided by manufacturer, and water saturated air.
- The calibration procedure may require correction factors or input of site-specific barometric pressure and temperature. Correction factors can be found at:

  http://water.usgs.gov/owq/FieldManual/Chapter6/6.2_v2.1.pdf

- Otherwise, use appropriate instruments at the site to determine temperature and pressure.
- Perform Dissolved Oxygen Measurement using the following procedure:
  i. Submerge probe in flow-through chamber or water body.
  ii. Gently raise and lower probe in sample.
  iii. Allow sufficient time for probe to stabilize to sample temperature and dissolved oxygen.
  iv. Read and record the temperature and the value of the dissolved oxygen in mg/L.
  v. Document field analysis data and general observations in the field log book or groundwater sampling sheet.

3. Limitations

- Collect DO measurements in the field during sampling. Storing samples in containers will alter the DO concentration of the sample.
- Detection Limit (DL) = 0.1 mg/L for 0-10 mg/L range; do not record values less than Detection Limit: a zero reading is recorded < 0.1 mg/L.

Saskia Oosting

STANDARD OPERATING PROCEDURE

GW-008 Temporary Groundwater Sampling Points

1. Objective

To define the procedures for installation of temporary groundwater sampling points (hereafter referred to as well point) for measuring depth to groundwater and collecting groundwater samples. Well points may aid in the placement of permanent monitoring wells.

A well point is a small diameter (1-2 inch) probe constructed of continuously wrapped stainless steel or wrapped stainless steel gauze screen over perforated carbon steel pipe. No filter or gravel pack is used in the installation.

Well point installations are not the only type of temporary monitoring wells. Alternative temporarily well constructions should be discussed with the project manager and may be more appropriate based on-site conditions.

2. Execution

2.1. Installation

- The well point can be placed with the use of a conventional hollow-stem auger rig, Geoprobe®, slide hammer, jack hammer, rotary hammer, or by hand.

- The well point may be driven through the unsaturated zone only in known "clean" soils. Driving the well point through contaminated soil may carry contamination downward with the point resulting in analytical sample results which are biased high. In areas with contamination above the desired screening zone, the well points should be installed with the aid of either hollow-stem augers or Geoprobe®, to “case off” contamination from the upper layer.

- If the well point is to be installed in an oversized (20% larger than the well point) pre-drilled hole, the hollow-stem augers or bull drive point must be advanced to a point which is just above the targeted sample zone. The well point is then placed in the hole and advanced beyond the bottom of the hole by hammering or pushing into place. The use of pre-drilled holes will reduce clogging of well point screens when driving.

- If the well point is used for piezometeric data, make a survey mark on top of the casing as a reference point for water level measurements.

- Caution must be used when using well points in areas of contaminated soil. Possible cross contamination may be introduced to the screen as it passes through the zone of contamination.

2.2. Sampling Procedures

Development of a well point is not required prior to sampling. Sampling of groundwater or collecting piezometric data must be performed by one of several recommended methods described in this manual.

After sample collection, (See Groundwater Sampling SOP) the well point is removed by back hammering or pulling the tool out with the rig hydraulics.

STANDARD OPERATING PROCEDURE

GW-010 Slug Tests

1. Objective

Describe methods to use slugs, pressure transducers, and data loggers to collect data that will support calculation of horizontal hydraulic conductivity of distinct geologic strata.

General Information

Slug tests are performed on single monitoring wells to estimate the hydraulic conductivity of the aquifer in which the well is screened. The test consists of adding or removing a known volume (slug) to or from the well to instantaneously change the water level. Subsequently, the recovery of the water level back to the static water level is measured. The resulting data are used to determine the hydraulic conductivity of the aquifer test zone using an appropriate analytical method.

Falling head tests can only be performed in fully-penetrating wells (well screened completely below the water table). Rising head tests can be performed in both fully- and partial-penetrating wells.

2. Execution

2.1 Setup

- Determine how water levels will be recorded. If the geologic materials in the test zone are expected to be slightly permeable (e.g., a glacial till or clay), then measurements may be recorded manually with an electronic water level indicator. If the geologic materials in the test zone are expected to be moderately- or highly-permeable (e.g., outwash sands), record measurements using a pressure transducer attached to an automatic data logger.

  The remainder of this SOP assumes that an automatic data logger is being used to measure water levels.

- Check to see if test equipment functions prior to leaving for the site.
- Decontaminate the transducer and cable using alconox and distilled water. Do not use methanol. Do not use transducer in wells containing non-aqueous phase liquid (NAPL).
- Make initial water level measurements
- Test wells in the following order: from the least contaminated to the most contaminated, and from low to high expected permeability, where possible.
- Measure the static water level (i.e., depth to water) in the well to be tested manually using an electronic water level indicator. Record all

measurements taken during the test in the field log book or on the attached log form.

- Install the pressure transducer as far below the deepest point of insertion of the slug bar or bailer as possible. Allow the transducer to thermally equilibrate for 15 to 30 minutes (to allow instrumentation wiring to expand/contract) before measurements are taken.
- Secure the transducer cable at ground surface with tape or weight to keep the transducer at a constant depth.
- Cover sharp edges of the well casing with duct tape to protect the transducer cables.
- Transducer measurement setup: For wells screened in sand and silty sand, a linear setting of one reading per second is generally used. In coarser soil where full recovery may occur over a few seconds, a linear setting for more frequent readings is necessary. If a transducer is used for silt and clay, a linear setting of one reading per minute, or a logarithmic setting, may be used to avoid risk of exceeding the memory capacity of the transducer.

2.2 Field Procedure – Rising Head Test

In this test, a slug is inserted in the well prior to the test and the water level is allowed to return back to static level. The test is then started by removing the slug from the well and immediately measuring rising water levels. In wells where recovery is slow, this test can be performed by pumping or bailing water from the well and immediately starting measurements.

- Record the initial water level and other setup information on the attached form.
- Fully submerge the slug bar or bailer into the water column of the well.
- Allow the water level in the well to return to static condition after both the slug and transducer have been inserted. The transducer readout should indicate the height of water above the transducer.
- When the water level in the well has returned to static condition, start the transducer ("Start Test" if using Win Situ software). Periodically view graphical data during the test, to confirm adequate data collection.
- Rapidly remove the slug bar or bailer from the water column and well. Avoid moving or pulling up the transducer cable when removing the slug.
- Continue recording water levels with the transducer until the water level has recovered to within 15 percent of the original static water level relative to the initial test displacement (85 percent recovery), or until one hour has elapsed. If less than 50 percent recovery has been achieved after one hour, continue to collect measurements every 10 to 20 minutes.
- Where possible, repeat the test to establish the repeatability of measurements and calculated hydraulic conductivity results.
- As soon as practicable, download data stored in the transducer and transfer data.

2.3 Field Procedure – Falling Head Test

In this test, a slug is inserted in the well at the start of the test and the falling water levels are measured immediately. In wells where recovery is slow, this test can be performed by adding water to the well and immediately starting measurements.

- Record the initial water level and other set up information on the attached form.
- Allow the water level in the well to return to static conditions after the transducer has been inserted. The transducer readout should indicate the height of water above the transducer.
- When the water level in the well has returned to a static condition, begin recording transducer readings ("Start Test" if using Win Situ software).
- Fully submerge the slug bar or bailer into the water column of the well.
- Periodically view graphical data during test, to confirm adequate data collection. The transducer should continue to record water levels until the water level has recovered to within 15 percent of the original static water level relative to the initial test displacement (85 percent recovery), or until one hour has elapsed. If less than 50 percent recovery has been achieved after one hour, continue to collect a measurement every 10 to 20 minutes.
- Where possible, repeat the test to establish the repeatability of measurements and calculated hydraulic conductivity results.
- As soon as practicable, download data stored in the transducer and transfer data.

3. Additional Information

- Do not perform hydraulic conductivity tests on wells that have not previously been developed and allowed to equilibrate.
- It is critical to either add or remove the slug to the well as quickly as possible and to start collecting depth-to-water measurements immediately.
- The early-time data is critical because the rate of recovery of head in the well is exponential. Collect measurements frequently at the start of all variable head tests.
- The time required for a slug test to be completed is a function of the volume of the slug, the hydraulic conductivity of the formation, and the type of well completion. The slug volume should be large enough that a sufficient number of water level measurements can be made before the water level returns to equilibrium conditions. Two bailers connected in series can be used to increase the slug volume, provided the water column is deep enough.
- Decontaminate all down well equipment before using it in the well.

- NAPL will damage the transducer. Gauge recovery manually in these instances.
- Where possible, take periodic water level readings manually during recovery. The manual data are used to check for transducer noise or movement.
- If using automatic data loggers, download the data as soon as possible. Batteries in the data loggers may run down and result in a loss of data.
- Be prepared to containerize water generated from rising head tests if the water is contaminated.
- Where possible, take more than one pressure transducer to site. This will provide backup and allow testing of multiple wells simultaneously.

4. Calculations

The simplest interpretations of piezometer recovery are Hvorslev (1951) and Bouwer and Rice (1976). The analyses assume a homogenous, isotropic medium in which soil and water are incompressible. Spreadsheets and software are available to calculate hydraulic conductivity from slug test data according to the methods below.

Hvorslev's expression for hydraulic conductivity (K) is:

$$K = \frac{r^2 \ln (L/R)}{2 L T_0} \qquad for\ L/R > 8$$

where:
K = hydraulic conductivity [ft/sec]
r = casing radius [ft]
L = length of open screen (or borehole) [ft]
R = filter pack (borehole) radius [ft]
T_0 = Basic Time Lag [sec]; value of t on semi-logarithmic plot of H-h/H-H_0 vs. t, where H-h/H-Ho = 0.37
H = initial water level prior to removal
of slug
H_0 = water level at t = 0
h = recorded water level at t > 0

(Hvorslev, 1951; Freeze and Cherry, 1979)

The Bouwer-Rice expression for hydraulic conductivity (K) is:

$$K = \frac{r^2 \ln (R_e/R) \ln(h_o/h_t)}{2 L t}$$

where:
r = casing radius [ft]
t = time of drawdown measurement since start of test [sec]

h = drawdown of water in well at time = t [ft]
h_o = drawdown of water in well at t = 0 (initial drawdown) [ft]
L = length of open screen (or borehole) [ft]
R_e = effective radius (radius of influence) [ft]
R = gravel pack radius [ft]

Both the Hvorslev and Bouwer-Rice methods can be applied for partially-penetrating wells. Hvorslev is generally applicable only to fully penetrating wells.

STANDARD OPERATING PROCEDURE

GW-011 Constant Head Permeability Testing

1. Objective

Describe procedures for performing constant head borehole permeability testing in granular soils. Constant head permeability testing is used when the soil permeability is sufficiently high for testing to be practical.

2. Execution

- All borehole permeability testing shall be performed below the static groundwater table. As the boring is advanced, attempt to determine the static groundwater level by:
  - Observing the water content of samples collected from the boring to identify the transition from moist to saturated soil.
  - For higher permeable soils, allowing the water level in the borehole to stabilize before performing the test.
  - If the borehole is left open overnight or for an extended period, measure the static groundwater level in the borehole at the beginning of the next day.
  - Measure the water level in nearby observation wells or piezometers.
  - If a well or piezometer is installed in the borehole, measure the water level in the well or piezometer after the water level has stabilized.
- Advance the drill casing to the top of the test zone and clean the borehole to the bottom of the casing.
- Obtain a split spoon sample in the test zone below the bottom of the casing.
- Advance the borehole 2 feet below the bottom of the casing using a side discharge roller bit. The roller bit should be only slightly smaller than the inside diameter of the casing. Record the diameter of the casing and the diameter of the roller bit. Avoid jetting the borehole walls or bottom during cleaning. Continue flushing the borehole until return water is clear.
- Measure the depth to groundwater in the borehole over a 10 to 15 minute period to observe if the groundwater elevation has approximately stabilized. Compare the saturated soil depth estimated from split-spoon samples to the measured water level in the borehole.
- Using a weighted tape, sound the bottom of the borehole to verify that the hole is cleaned to the correct depth and caving hasn't occurred. If more than 3 inches of wash remains in the borehole, lower the roller bit back to the bottom of the borehole and continue to clean the borehole.
- Measure and record the depth to the bottom of the borehole to the nearest 0.05 feet.
- Determine the length of the test zone (L = distance from the bottom of the casing to the bottom of the borehole) to the nearest 0.05 feet and record on the field form.
- Add clean water to fill the casing.

- Using a calibrated flow meter, adjust the flow rate into the casing so the water level remains within 0.5 inches of the top of the casing. Once the water level has stabilized, take a flow meter reading at the start of the test (time=0). Record the inflow volume at regular intervals (generally 1 minute) for a period of 10 minutes.
- Check the depth to the bottom of the borehole after completion of the test to check for caving.
- Record all measurements and observations on the Borehole Permeability Test Field Data Form.

3. Limitations

Site-specific conditions must be evaluated to determine appropriate test intervals. Test interval shall be determined by the Project Manager or their designee.

STANDARD OPERATING PROCEDURE

GW-014 Dense Non-Aqueous Phase Liquid (DNAPL) Measurement and Recovery

1. Objective

Provide procedural guidance for routine gauging and recovery of dense non-aqueous phase liquids (DNAPL) related to former manufactured gas plant (MGP) operations.

2. Execution

2.1 Equipment and materials

The following materials and equipment are necessary for this procedure:

- Oil/water interface probe
- Appropriate pump and required tubing/piping
- Double check valve bailers and string
- Drums or buckets for NAPL collection
- Proper PPE including gloves and protective eyewear
- Drum labels
- Field data sheets or logbooks
- Decontamination supplies and plastic sheeting
- Additional equipment identified by site-specific work plan and HASP
- Example specifications of DNAPL management equipment is included as Attachment A.

2.2 General Measurement Procedures

Using an oil/water interface probe will provide a depth to water and a depth to product in each monitoring well. Refer to probe manual to determine changes between liquid type. To achieve accurate depth measurements, ensure the oil/water interface probe is decontaminated (GEI SOP QA-001 prior to and between each measurement taken at each well.

To calculate the volume of product in monitoring wells with these specifications, take the following measurements:

- Total well length
- Depth to water
- Depth to product (s) – c1 and c2

Using the following equations, determine the length of the water column and the length of the product column:

[1] (a) – (b) = Water column length (d)
[2] (a) – (c1) = Product column length (e) dense non-aqueous phase liquid (DNAPL)

Calculate the volume of DNAPL product in the well using the following equation:

DNAPL for a 2" diameter well
[4] (e) x 0.1632 = Volume (gallons) of product in well
(e) x 0.6178 = Volume (liters) of product in well

DNAPL for a 4" diameter well
[4] (e) x 0.6528 = Volume (gallons) of product in well
(e) x 2.4711 = Volume (liters) of product in well

DNAPL for a 6" diameter well
[4] (e) x 1.469 = Volume (gallons) of product in well
(e) x 5.561 = Volume (liters) of product in well

Once measurements have been taken and calculations have been made, collection of dense non-aqueous phase liquid (DNAPL) may commence.

2.3 DNAPL Collection Procedures

Collection of DNAPL shall be accomplished using common recovery techniques or technologies as follows:

- Peristaltic pumps
- Bailers
- Positive displacement down hole pumps (e.g. Hammerhead, Blackhawk pumps, etc)

Special care shall be taken to prevent any purged DNAPL causing a spill and coming into contact with the ground and sampling personnel. This includes the use of proper personal protective equipment (PPE), including gloves and protective eyewear (Tyvek® if necessary), along with plastic sheeting set beneath the pump, tubing, and collection container (sealed top 55-gallon drum or 5-gallon bucket with lid), and the surrounding work area. A site-specific work plan, HASP and job specific job safety analysis need to be developed prior to the start of work. Examples of DNAPL specific management equipment and tools are included as Attachment A. The specific operating procedures for common recovery methods are discussed in the following sections.

2.3.1 Sampling and recovery via peristaltic pump with dedicated tubing:

- Take and record the required measurements prior to commencing pumping.
- Connect the dedicated tubing to the peristaltic pump with the long end of the silicon tubing set to discharge water and product directly into either a 5-gallon bucket or a 55-gallon closed-top drum, ensuring that the entire set-up is underlain by plastic sheeting.
- Begin purging the well, occasionally checking the depth to water and depth to product.
- Once the DNAPL has been purged from the well, a sample will be collected and preserved if required, in accordance with laboratory standards.

- Following completion of NAPL recovery, disconnect the tubing from the pump, secure the well and road box, and clean/decontaminate the pump and oil/water interface probe, prior to moving to the next location.
- Impacted tubing will either be containerized for proper disposal or left in well for reuse.

2.3.2 Sampling and recovery via double check valve bailer:

- Take and record the required measurements prior to commencing bailing.
- Ensure the entire work area is covered in plastic sheeting to avoid potential spills of water and/or product.
- Tie the bailer to a piece of string that will allow the bailer to reach the bottom of the well.
- Using slow and controlled motions while lowering (and raising) the bailer to the bottom of the well, commence bailing product out of the well and draining the bailer directly into either a 5-gallon bucket or a 55-gallon closed-top drum.
- Once the NAPL has been purged from the well, collect and preserve the analytical sample, if required, in accordance with laboratory standards.

2.3.3 Sampling via piston-style pumps (HammerHead, Blackhawk etc)

For significant accumulations of DNAPL a variety of dedicated pumping technologies exist. Refer to manufacturer-specific operating procedures and site specific means and methods.

2.4 Waste Management and Disposal

Investigation derived waste should be managed in accordance with GEI SOP SC-003. Additional care should be taken with DNAPL while infrequent the potential for hazardous waste characteristics does exist. DNAPL waste management and disposal should be evaluated on a site by site basis as discussed in Section 3.

2.5 Troubleshooting Information

If there are any performance problems with the oil/water interface probe which result in inability to achieve the proper measurements presented in Section 5.1, or if there are any problems with the peristaltic pump, consult the appropriate section of the probe instruction manual for the checkout and self-test procedures. If the problem persists, consult the manufacturer's customer service department immediately for further instructions.

Lower temperatures can affect the ability to pump and/or bail NAPL. Weather should be taken into consideration when scheduling gauging and recovery sampling events.

2.6 Data and records management

All information pertaining to maintenance of the oil/water interface probe and the peristaltic pump shall be maintained in the project file. Field measurements (depth to

water, product, *etc.*) and all calculations (product column length, volume of product, *etc.*) shall be recorded on the appropriate field data sheets or in the logbook consistent with GEI SOP Section 5.

2.7 Health and safety considerations

The health and safety considerations for the work associated with this SOP, including both potential physical and chemical hazards, will be addressed in the site specific Health and Safety Plan (HASP). The collection and accumulation of NAPL presents the potential for significant hazards that need to be managed. A detailed job safety analysis (JSA) should be completed prior to the start of work.

3. Limitations

- DNAPL gauging and recovery can be problematic and requires adaptive thinking. A variety of measurement and collection techniques may be necessary to properly execute the work.
- Exposure to DNAPL can accelerate the required maintenance/replacement intervals for tools and equipment.
- A site specific work plan, HASP and JSA needs to be developed prior to commencing work. The documents should address: safety, recovery technologies, waste containment and waste management.

Section 8

Air Sampling and Monitoring (AR)

STANDARD OPERATING PROCEDURES

AR-001 General Guidance on Work Zone Monitoring Methods

1. Objective

Protect human health by measuring air quality at the perimeter of a work area.

2. Execution

Walk-around perimeter and work zone monitoring for Total Volatile Organic Compounds (TVOC), Respirable Particulate matter less than 10 microns (RPM_{10}), and odor will occur along the perimeter of the project site on a regular and as-needed basis. Specific site conditions that will trigger walk-around perimeter or work zone monitoring include:

- visible dust
- odor complaints
- detection of TVOCs and/or RPM_{10} at levels approaching or exceeding action levels
- direction by the site oversight consultant or client

Perimeter air monitoring and work zone monitoring, in the absence of any specific triggering criteria, will be conducted on a regular basis during the normal work day. Particular attention will be given to the direction of any residences or other sensitive receptors.

At the time when a triggering condition is observed, the walk-around perimeter and work zone monitoring will occur continuously until the conditions that triggered the monitoring have subsided. Additional temporary monitoring points may be established due to changing site or meteorological conditions.

TVOC concentrations will be monitored and recorded using a Rae Systems MiniRAE 2000 Portable Ionization Detector (PID) or equivalent. RPM_{10} will be measured and recorded using a MIE personal DataRAM 1200 (PDR-1200) portable real-time aerosol monitor equipped with a PM-10 monitor and Gilian personal air sampling pump. AR-002 Suspended Particulate Matter in Ambient Air using the MIE DataRAM Real-time Aerosol Monitor (Portable) provides guidance on the use of this meter. Odors will be noted based on the n-butanol scale, as adapted from ASTM E544-99.

At each monitoring point, the 15-minute average value of TVOC and RPM_{10}, sample time, and sample location will be collected and recorded. The odor intensity based on the n-butanol scale will be monitored over a 15-minute period and recorded. At each location, air temperature, wind direction, and wind speed may be monitored and recorded using a hand-held wind meter.

Odors as a function of naphthalene concentration will be monitored over a 15-minute period and recorded. To measure naphthalene concentrations, the zNose™ Model 4200 system will be used. The zNose™ is an ultra-fast gas chromatograph (GC) that is capable of analyzing airborne concentrations of VOCs and SVOCs in less than one minute. The zNose™ uses a surface acoustic wave (SAW) detector that changes in vibration frequency as compounds elute from the column and condense onto the surface of the detector.

The zNose™ is a portable instrument and will be positioned downwind of the remedial activities. Up to five samples will be analyzed for naphthalene concentrations over a 15-minute period. The concentrations will be averaged to produce a 15-minute result. The calibration will be checked at the start of the day, at mid-day, and at the end of the day. An air blank will be run every two hours. A blank will also be run if a reading exceeds the calibration range of the instrument.

The zNose™ also has the capability of generating fingerprint images of the chemical constituents in the vapor called VaporPrints™. A VaporPrint™ of an air sample can be collected through a headspace analysis. This VaporPrint™ can be compared to others generated at the perimeter and off-site to see if remedial operations are the source of the odors. VaporPrints™ can allow for identification of odors that may not be affiliated with remedial operations.

To monitor cyanide (as hydrogen cyanide gas), a real-time hand-held meter in conjunction with the Dräger Chip Measuring System (CMS) will be used. Types of continuously monitoring equipment include the V-RAE by Rae Systems and the Mini-Warn by Dräger Safety Systems and are available from rental equipment suppliers. Due to potential interference from sulfur compounds, hydrogen sulfide gas (H_2S) will also be monitored for comparison to the hydrogen cyanide gas levels detected. Hydrogen cyanide gas detections will also be confirmed with CMS Dräger tubes due to this interference. The Dräger CMS can quantify other gases that could potentially provide false positives for hydrogen cyanide gas (including sulfur dioxide, hydrogen sulfide, phosphine gas, chlorine, and nitrogen dioxide) detected by the real-time meter.

At each location, air temperature, wind direction, and wind speed will be monitored and recorded using a hand-held wind meter.

STANDARD OPERATING PROCEDURE

AR-002 Air Sampling for Dust (Particulate Matter) using the MIE DataRAM™ Real-Time Aerosol Monitor

1. Objective

Describe standard procedures for the real-time monitoring of airborne particulate matter using a MIE DataRAM™ model DR-2000 real-time aerosol monitor.

The MIE DataRAM™ is a real-time, portable monitor that measures airborne particulate matter. It is capable of monitoring total suspended particulate matter, particulate matter less than 10 microns (PM_{10}), and particulate matter less than 2.5 microns ($PM_{2.5}$) by using an appropriate orifice to control the size of the particles being measured. The DataRAM can be programmed to collect continuous real-time data, or to record time averaged data.

2. Materials

- MIE DataRAM™ model DR-2000
- Shelter/Enclosure - a pre-constructed enclosure capable of protecting the instrumentation from severe weather conditions during sample collection
- Omnidirectional inlet
- Inlet heater
- $PM_{2.5}/PM_{10}$ impactor
- IBM compatible computer loaded with MIE DataRAM™ software
- Field notebook

3. Meter Calibration

- Assemble all necessary DataRAM™ attachments.
- Make sure the power selector switch on the rear panel is in the "on" position. Turn on the power by pressing the "on" button on the front display panel of the DataRAM™. "Main Menu I" will appear on the screen.
- Activate the zero mode by pressing the button indicating zero.
- When the screen indicates the zero mode is complete, activate the span check mode by pressing the button indicated, and follow the prompts that appear on the screen.
- Record the time of the zeroing and the calibration difference percent in the field notebook. If the zeroing procedure takes longer than 5 minutes press "exit" and then "off," and then put the power switch on the rear panel of the instrument in the "off" position. Wait several minutes, turn on the power and zero the instrument again. If the calibration difference percent is more than ±5% then follow the "Calibr Diff" Resetting Procedure in the DataRAM™ Instruction Manual.
- Set the DataRAM™ to automatically log data. Refer to the Instruction Manual for details on how to set the data logging function.

- Record the instrument flow rate from the parameters menu in the field notebook.

4. Sample Collection

- Set the DataRAM™ at the predetermined sampling location in a rain or weatherproof containment, with only the inlet tubing exposed to ambient air.
- Start the run.
- When sampling is completed, terminate run and download data using the RS-232 cable connector and the MIE DR-COM software.
- Once the data file has been successfully downloaded and saved in an appropriate location, clear the data from the instrument memory.

5. Limitations

Each instrument must be calibrated using the internal reference standard and zeroed at the start of each sampling event and at a frequency of once per day throughout the duration of the sampling event.

The DataRAM™ can be programmed to collect continuous real-time data, or can collect "averaged" real-time data. These various options should be addressed prior to field operations and must be referenced in an approved work plan. This work plan must be available to all field personnel.

Project objectives will usually dictate the sampling location. In general, for air monitoring, meters are usually placed near breathing height and away from objects that can interfere with air motions. Since the DataRAM™ is measuring particulate matter, placement of the instrument directly on the ground should be avoided to prevent the sampling of dust concentrations that may not be representative of the air that is intended to be sampled (e.g. air at breathing height).

STANDARD OPERATING PROCEDURE

AR-003 Air Sampling for PM_{10} Particulate Matter using the High-Volume Sampler Method

1. Objective

Describe standard procedures for the collection of air samples for laboratory analysis of PM_{10} particulate matter using the high volume sampler method.

2. Materials

- General Metal Works (GMW) Model IP 10-8000 or equivalent. The GMW sampler can be rented.
- Calibration kit, as specified for the selected sampler.
- PM_{10} sampling filters, to be supplied by the contract laboratory. A Whatman QM-A quartz filter is currently the only commercially available PM_{10} filter that satisfies all criteria specified in 40 CFR 50, Appendix J. .
- Ice chest for sample storage or shipping.

3. Sampling

This method measures the mass concentration of particulate matter with an aerodynamic diameter equal to or less than 10 micrometers (µm). A high volume (HV) sampler draws a known volume of ambient air at a constant flow rate through a size selective inlet and through one or more filters. Particulates of 10 µm or smaller are collected on the filter(s) during the prescribed time period. Each sample filter is weighed before and after sampling to determine the net weight gain of the collected PM_{10} sample.

A HV sampler consists of two basic components: a specially designed inlet that transmits only particles equal to or less than 10 µm in diameter and a flow control system capable of maintaining a constant flow rate within the design specifications of the inlet.

3.1. Sampler Installation

- On receipt of the sampler, inspect all shipping cartons to ensure that all components have been received and verify that the unit is operational.
- On site, assemble the unit according to the manufacturer's instructions. Check all power cords and tubing for crimps, cracks, and breaks. The HV sampler should be placed on a sturdy platform or table, with the air inlet 4 to 6 feet above ground level.
- The sampler should be strategically placed according to the work plan or objectives of the study and located free of any obstructions to ambient air flow.
- The HV sampler requires 110 V AC power. The electrical outlet should be protected by a ground fault interrupter and water proof electrical connectors should be used.

- Operate the sampler for 30 minutes to ensure that the motor is operating at full performance.
- Calibrate the sampler in accordance with the instructions provided with the appropriate calibration kit. Proper calibration of the sampler is critical.
- Field personnel should be familiar with both the sampling unit and the calibration procedure before attempting to record data.

3.2. Sampling Procedure

- Operate sampler as per manufacturer's instructions.
- Filters are received from the laboratory numbered and pre-weighed in their individual envelope or folder within an envelope. Powder free latex gloves, or equivalent, should be worn during the handling of filters. Only touch the edges of the filter.
- Examine the filter support screen to confirm that it is clean. If it appears to be dirty, wipe it clean using lint free wipes such as laboratory wipes or equivalent. Check the gasket to be sure that it is in good condition. The filter is placed on the support screen with the numbered side facing down. Tighten thumb nuts on alternate corners to properly align and seat the gasket. The nuts should be only hand tightened to avoid damaging the gasket.
- Record the sampler serial number, filter ID number, sampler location, sampling date, and the operator's initials in the field notebook, any field data sheets being used, and on the back of a clean chart and install the chart in the flow recorder.
- Turn the sampler on and allow it to equilibrate to operating temperature, about 3 to 5 minutes. Verify that the recorder is operating and that the pen is inking. Allow the sampler to run for the required sampling interval.
- When sampling interval is completed, turn off the sampler and carefully remove the filter as soon as possible. Sample degredation can occur if the filter is left in the sampler for an extended period of time. The filter should be folded in half with the exposed side inward and the folded filter carefully placed in its respective folder and/or envelope. When removing and folding the filter touch only the outer edges. Powder free latex gloves, or equivalent, should be worn when handling filters.
- Record the following parameters in the field notebook and in any field data sheet being used:
    1. Elapsed time of sampling interval in minutes
    2. Average recorder response in arbitrary units
    3. Starting flow rate and ending flow rate
- The average flow rate for GMW Model IP 10-8000 sampler should be close to 1.13 m^3/min.
- Calculate the total flow rate for the sampling interval by time weighted averaging the flow rate readings. Air monitoring results where the flow rates

varied more than +/- 10%, from beginning to end, should be qualified accordingly and discussed with the project manager.

- The exposed filters, folded in half, are placed back into their shipping envelope and forwarded with completed chain of custody forms to the contracted laboratory for analyses. Follow the contracted laboratory's instructions for handling and returning the exposed filters.

4. General Guidance

The total volume of air sampled is determined from the measured volumetric flow rate and the sampling time. The mass concentration of PM_{10} in the ambient air is calculated as the total mass of collected PM_{10} particles divided by the total volume of air sampled. The PM_{10} measurement is expressed as micrograms (µg) per standard cubic meter (µg/std M^3). The sampled volume must be corrected to EPA standard conditions, 25° C, 760 mm Hg or 101 kPa.

A field blank may be collected, which consists of an unexposed filter removed from its envelope, put in place in the HV sampler, immediately removed, folded, replaced in its envelope and sent to the laboratory. Field blanks, if collected, should be taken at a frequency of one per twenty samples. If fewer than twenty samples will be collected during one week, collect one field blank weekly during sampling.

STANDARD OPERATING PROCEDURE

AR-005 Hydrogen Cyanide Work Zone Air Monitoring Procedures

1. Objective

Describe real-time monitoring of hydrogen cyanide gas during field activities.

2. Equipment

To monitor cyanide (as hydrogen cyanide gas), the GEI field representative should utilize a real time handheld meter in conjunction with the Dräger Chip Measuring System (CMS) during subsurface activities including subsurface excavations, borings and monitoring well installation, materials handling, and groundwater sampling in areas with confirmed or suspected cyanide impacts.

Continuous monitoring equipment includes the V-RAE by Rae Systems and the Mini-Warn by Dräger Safety Systems, and are available from rental equipment suppliers. Due to potential interference from sulfurs, hydrogen sulfide gas (H_2S) should also be monitored for comparison to the hydrogen cyanide gas levels detected. Hydrogen cyanide gas detections will also be confirmed with CMS Dräger tubes due to this interference. The Dräger CMS can quantify other gases that could potentially provide false positives for hydrogen cyanide gas (including sulfur dioxide, hydrogen sulfide, phosphine gas, chlorine, and nitrogen dioxide) detected by the real time meter.

3. Calibration

Prior to commencing work on-site, the real-time cyanide meter should be calibrated in accordance with the equipment manufacturer's specifications. If the meter is calibrated in the field, the daily calibration results should be recorded in the field notebook.

4. Execution

Cyanide will be monitored around the perimeter of the work zone on a regular basis. Continuous monitoring should be completed every fifteen minutes if sulfur odor or suspected purifier waste material (former MGP sites only) is encountered. Measurements should be monitored in the breathing zone and should be recorded into the field notebook or on an applicable form. In the event that hydrogen cyanide is detected, the GEI field representative should proceed as follows:

4.1. Action Level: HCN ≤1 ppm for 15-minute average using real time meter

- Run CMS Dräger tube.
- Continue monitoring with real time meter.
- Continue work if CMS Dräger tube for hydrogen cyanide reads <2 ppm.

4.2. Action Level: 1 ppm < HCN < 2ppm for 15-minute average using real time meter.

- Run CMS Dräger using hydrogen cyanide gas chip and confirm <2 ppm concentration.
- Continue monitoring with real time meter.
- Run CMS Dräger tube using sulfur dioxide, hydrogen sulfide phosphine chip to evaluate potential interference.
- Recalibrate the real time meter and continue to monitor the work zone.

4.3. Action Level: HCN 2 ppm on CMS Dräger tube

- Stop work and move (with continuous monitoring meter) at least 25 feet upwind from excavation or until continuous monitoring meter registers <1 ppm.
- Run CMS Dräger hydrogen cyanide chip and re-evaluate activities
- Continue monitoring with real time meter.
- Allow area to ventilate and continue to monitor while returning to the work zone.
- Do not move into an area when readings are >1 ppm without confirming with additional CMS Dräger measurement.
- May resume work if Dräger tube for cyanide reads <2 ppm.

5. Limitations

No air purifying respiratory protection is available for hydrogen cyanide gas.

The American Conference of Industrial Hygienists (ACGIH) Threshold Limit Value (TLV) for Hydrogen Cyanide is 4.7 ppm.

Quality Control – Quality Assurance (QA)

STANDARD OPERATING PROCEDURE

QA-001 Equipment Decontamination

1. Objective

This SOP describes methods used to decontaminate reusable sampling equipment for projects that require collection of organic and inorganic analytical samples. The goal is to minimize cross-contamination between samples. This maximizes confidence that field samples will be representative of specific locations and conditions.

Refer to the work plan or project manager to determine if different decontamination methods are acceptable.

2. Execution

- All contractor-provided equipment (augers, rods, spoons, backhoe buckets) should be decontaminated by steam cleaning or pressure washing prior to coming on site. If there is doubt about cleanliness of drilling tools, they should be decontaminated before use at the site.
- Sampling equipment decontamination is a sequential procedure consisting of the following steps:

    - Alconox-solution wash (or equivalent non-phosphate detergent)
    - Potable water rinse
    - A ten percent reagent grade nitric acid wash should be used to strip potential inorganic contaminants from sampling devices.
    - Laboratory grade 100 percent methanol, should be used to strip potential organic contaminants from sampling devices.
    - Three distilled/deionized water rinses.

- Alconox solution is a mixture of approximately 1 cup of Alconox per 1 gallon of potable water. Alconox solution wash requires scrubbing the equipment with a brush soaked in Alconox solution to remove visible contamination or dirt from sampling devices.
- Split-spoon samplers must be decontaminated prior to collecting each sample. The procedure follows:

    - Overall wash and scrub in a bucket of Alconox solution
    - Potable water rinse.
    - 10% nitric rinse
    - 100% laboratory grade methanol rinse
    - Three distilled-water rinses.

The same procedure is applied to all devices that may contact soil or groundwater slated for analytical samples - spoons and knifes used to inspect or sample soils; water level indicators; oil/water interface probes.

Equipment used for well development of multiple wells must be decontaminated between wells.

Pumps and tubing should be flushed using a minimum of one gallon of Alconox-solution followed by a gallon of potable water. Some projects may require methanol (in much lower quantities) and distilled water instead of or in addition to the Alconox-solution and potable water.

For pumps and tubing, a final rinse of the sampling equipment may be performed with the water being sampled.

Equipment blanks measure the effectiveness of the decontamination procedures. Blanks should be collected per guidance provided in QA-002, Field Quality Control Samples.

3. Limitations

- Do not store the deionized/distilled water in polyethylene bottles, use Nalgene, glass, or Teflon. Polyethylene may leach phthalates.
- Do not attempt to decontaminate string or rope - replace it.
- Due to eye and skin absorption hazards, safety glasses and gloves must be worn when handling decontamination solvents.
- Decontamination procedures may also require modification based on state or federal requirements.
- Steam cleaning or pressure washing with potable water is generally an acceptable decontamination method for drilling equipment (i.e., augers). Check with the work plan.
- Dedicated equipment need not be decontaminated beyond initial decontamination prior to field use.

STANDARD OPERATING PROCEDURE

QA-002 Field Quality Control Samples

1. Objective

Field Quality Control (QC) samples are used to monitor the reproducibility and representativeness of field sampling. The QC samples are handled, transported, and analyzed in the same manner as the associated field samples. QC samples may include trip blanks, equipment blanks, and field duplicates.

2. Execution

2.1. Trip blanks

- Used to monitor possible sources of contamination from transport, storage, inadequate bottle cleaning, or laboratory methodologies.
- Sample containers filled at the laboratory with analyte-free water are transported to and from the site, and are not opened until time of analysis.
- Trip blanks are stored with the sample containers prior to and after field activities and remain with the collected samples until analyzed.
- Generally, one trip blank per volatiles analysis (e.g. volatile organic compounds) shipment.
- Consider submitting a trip blank when sample shipment is by Fed Ex or other large carrier, or laboratory courier.
- Trip blanks should be recorded in the field notebook and on the chain-of-custody that same as all other samples.

2.2. Equipment blanks

- Equipment blanks (also known as equipment rinsate blanks) are used to monitor possible sources of contamination associated with sample collection. Monitors on-site sampling environment, sampling equipment decontamination, sample container cleaning, the suitability of sample preservatives and analyte-free water, and sample transport and storage conditions
- Equipment blanks are collected by pouring laboratory supplied or distilled or deionized water over sampling tools that have been decontaminated per the work plan, into sample containers.
- Equipment blanks are stored with the associated field samples until submitted for analysis.
- Generally collected when site conditions indicate site related contamination is a concern. Check project-specific work plan and/or quality assurance project plan for required frequency.
- Prepare equipment blanks immediately after the equipment is cleaned in the field and before leaving the sampling site.
- Prepare equipment blanks by rinsing the decontaminated sampling equipment set with the appropriate type of analyte-free water and collecting the rinse water in appropriate sample containers.

- If a potable water rinse is the typical final step, collect the equipment blank with analyte-free water after the potable water rinse.
- Equipment blanks should be recorded in the field notebook and on the chain-of-custody that same as all other samples.

2.3. Field Duplicates

- Used to evaluate the precision and representativeness of the sampling procedures.
- Field duplicates are two samples collected from the same location using the same procedures. Both samples are submitted to the laboratory as individual samples with different sample identification.
- Field duplicates from groundwater sampling for all analyses except volatiles analysis are collected by alternating filling sample containers from the same sampling device. Field duplicates for volatiles analysis are filled sequentially.
- Soil or sediment field duplicates are collected by homogenizing the sample for all analyses except volatiles. The homogenized sample is then divided into two equal portions and placed in separate sample containers. Field duplicates for volatile analysis are collected at two adjacent sampling locations.
- Each sample is assigned different sample identifications.
- Field duplicates are generally collected at frequency of 1/20 samples. Check project-specific work plan and/or quality assurance project plan for required frequency.
- All field QC samples should be labeled in the field and submitted “blind” to the laboratory – as if they are separate, primary samples.
- Field duplicates should be recorded in the field notebook and on the chain-of-custody that same as all other samples.
-

2.4. Matrix-Spike samples (MS/MSD)

- Matrix spike and matrix spike duplicate samples (MS/MSDs) are environmental samples that are spiked in the laboratory or in the field with a known concentration of a target analyte(s) to verify percent recoveries.
- Matrix spike and matrix spike duplicate samples are primarily used to check sample matrix interferences. They can also be used to monitor error due to laboratory bias and poor precision. However, a data set of at least three or more results is necessary to statistically distinguish between laboratory performance and matrix interference.
- Generally, the laboratory is required to extract and analyze MS or MS / MSDs at a minimum frequency of 5% of samples being analyzed for the target analyte(s). If the project or client criteria require an MS or MS/MSD, collect sufficient volume in the appropriate containers, and designate the sample to be used as the MS or MS/MSD on the chain of custody.
- Calculate the percent recovery for all spiked analytes for both the MS and MSD. For MS/MSDs also calculate the relative percent difference (RPD). The

RPD for each spiked analyte is calculated using the amount detected not percent recovery. If your data will be subjected to validation, the % recovery and the RPD will generally be determined by the validator.

2.5. Typical QA/QC Frequency

- QA/QC frequency is determined by project, client or regulatory criteria and should be verified prior to sample collection. Generally, QA/QC samples are collected according to the frequency described below:

Duplicate Samples	One per sampling event, one per 10 samples collected, or one every two weeks, whichever comes first.
Equipment Blanks	For each equipment type that is not dedicated or disposable - one per sampling event, one per 20 samples collected, or one every two weeks, whichever comes first.
Trip Blanks	One per sample delivery group, or in each cooler containing VOC soil or aqueous samples, depending on project.
MS or MS / MSDs	One MS or MS/MSD per sampling event, one per 20 samples collected, or one every two weeks, whichever comes first.

3. Limitations

- Trip blanks must never be opened in the field.
- Trip blanks are usually for VOCs only because less volatile compounds are not likely to cross-contaminate other samples by simply being in close proximity.
- Laboratory-grade water must be used during the collection of equipment blanks.
- Field duplicates must have different sample identifications.

Quality Assurance Glossary

"Analytical Services Protocol" or "ASP" means the New York State Department of Environmental Conservation (NYSDEC's) compendium of approved EPA and NYSDEC laboratory methods for sample preparation and analysis and data handling procedures.

"Confirmatory Sample" means a sample taken after remedial action is expected to be complete to verify that the cleanup requirements have been met. This term has the same meaning as "post remediation sample."

"Contract laboratory program" or "CLP" means a program of chemical analytical services developed by the United States Environmental Protection Agency (EPA) to support CERCLA.

"Data Usability Summary Report, (DUSR)" is a document that provides a thorough evaluation of the analytical data to determine whether or not the data, as presented, meets the site/project specific criteria for data quality and use.

"Effective solubility" means the theoretical aqueous solubility of an organic constituent in groundwater that is in chemical equilibrium with a separate phase mixed product (product containing several organic chemicals). The effective solubility of a particular organic chemical can be estimated by multiplying its mole fraction in the product mixture by its pure phase solubility.

"Environmental Laboratory Accreditation Program" or "ELAP" means a program conducted by the New York State Department of Health (NYSDOH), which certifies environmental laboratories through on-site inspections and evaluation of principles of credentials and proficiency testing.

"Intermediate Sample" means a sample taken during the investigation process that will be followed by another sampling event to confirm that remediation was successful or to confirm that the extent of contamination has been defined to below a level of concern.

"Method detection limit" or "MDL" means the minimum concentration of a substance that can be measured and reported with a 99 percent confidence that the analyte concentration is greater than zero and is determined from the analysis of a sample in a given matrix containing the analyte.

"Non-targeted compound" means a compound detected in a sample using a specific analytical method that is not a targeted compound, a surrogate compound, a system monitoring compound or an internal standard compound.

"Practical quantitation level" or "PQL" means the lowest quantitation level of a given analyte that can be reliably achieved among laboratories within the specified limits of precision and accuracy of a given analytical method during routine laboratory operating conditions.

"PAH" means polycyclic aromatic hydrocarbon as defined by United States Environmental Protection Agency (USEPA) Method 8270.

"Quality assurance" or "QA" means the total integrated program for assuring the reliability of monitoring and measurement data, which includes a system for integrating the quality planning, quality assessment and quality improvement efforts to meet data end-use requirements.

"Quality assurance project plan" or "QAPP" means a document, which presents in specific terms the policies, organization, objectives, functional activities, and specific quality assurance/quality control activities designed to achieve the data quality goals or objectives of a specific project or operation.

"Quality control" or "QC" means the routine application of procedures for attaining prescribed standards of performance in the monitoring and measurement process.

"Semi volatile organic compound" or "SVOC" means compounds amenable to analysis by extraction of the sample with an organic solvent. For the purposes of this section, semi volatiles are those target compound list compounds identified in the statement of work in the current version of the EPA Contract Laboratory Program.

"Target analyte list" or "TAL" means the list of inorganic compounds/elements designated for analysis as contained in the version of the EPA Contract Laboratory Program Statement of Work for Inorganics Analysis, Multi-Media, and Multi-Concentration in effect as of the date on which the laboratory is performing the analysis. For the purpose of this chapter, a Target Analyte List scan means the analysis of a sample for Target Analyte List compounds/elements.

"Targeted compound," means a hazardous substance, hazardous waste, or pollutant for which a specific analytical method is designed to detect that potential contaminant both qualitatively and quantitatively.

"Target compound list plus 30" or "TCL+30" means the list of organic compounds designated for analysis (TCL) as contained in the version of the EPA "Contract Laboratory Program Statement of Work for Organics Analysis, Multi-Media, Multi-Concentration" in effect as of the date on which the laboratory is performing the analysis, and up to 30 non-targeted organic compounds (plus 30) as detected by gas chromatography/mass spectroscopy (GC/MS) analysis. For the purposes of this chapter, a Target Compound List+30 scan means the analysis of a sample for Target Compound List compounds and up to 10 non-targeted volatile organic compounds and up to 20 non-targeted semi volatile organic compounds using GC/MS analytical methods. Non-targeted compound criteria should be pursuant to the version of the EPA "Contract Laboratory Program Statement of Work for Organics Analysis, Multi-Media, and Multi-Concentration" in effect as of the date on which the laboratory is performing the analysis.

"Tentatively identified compound" or "TIC" means a non-targeted compound detected in a sample using a GC/MS analytical method, which has been tentatively, identified using a mass spectral library search. An estimated concentration of the TIC is also determined.

"Unknown compound" means a non-targeted compound, which cannot be tentatively identified. Based on the analytical method used, the estimated concentration of the unknown compound may or may not be determined.

"Volatile organics" means organic compounds amenable to analysis by the purge and trap technique. For the purposes of this chapter, analysis of volatile organics means the analysis of a sample for either those priority pollutants listed as amenable for analysis using EPA method 624 or those target compounds identified as volatiles in the version of the EPA "Contract Laboratory Program Statement of Work for Organics Analysis, Multi-Media, Multi-Concentration" in effect as of the date on which the laboratory is performing the analysis.

"**Waste oil"** means used and/or reprocessed engine lubricating oil and/or any other used oil, including but not limited to: fuel oil, engine oil, gear oil, cutting oil, transmission fluid, oil storage tank residue, animal oil and vegetable oil, which has not subsequently been refined.

1. Purpose

GEI Consultants, Inc. (GEI) has prepared this Quality Assurance Project Plan (QAPP) for the Williamsburg Works site located in Brooklyn, New York (the Site). The QAPP is a companion document to the draft *Remedial Investigation Work Plan Addendum – Parcels 3 and 4 Portion of Williamsburg Works Site* (RIWP Addendum) and Field Sampling Plan (FSP) dated December 2020. The project location is shown on Figure 1 of the RIWP Addendum. The QAPP presents the project scope and goals, organization, objectives, sample handling procedures and specific QA/QC procedures for samples collected under the RIWP Addendum.

Furthermore, this QAPP identifies project responsibilities, prescribes guidance and specifications to make certain that:

- Samples are identified and controlled through sample tracking systems and chain-of-custody (COC) protocols
- Field and laboratory analytical results are valid and usable by adherence to established protocols and procedures
- Laboratory data are validated so they can be applied to developing a conceptual understanding of the nature and extent of contamination of soils and ground waters at the Williamsburg Works site
- All aspects of the investigation, from field to laboratory are documented to provide data that are technically sound and legally defensible

The requirements of this QAPP apply to all contractor activities as appropriate for their respective tasks.

This QAPP was prepared based upon guidance provided by the NYSDEC:

- *DER-10, Technical Guidance for Site Investigation and Remediation.* New York State Department of Environmental Conservation. May 2010.

2. Project Goals and Objectives

On behalf of National Grid, GEI prepared an RIWP Addendum to investigate the nature and extent of impacts at the Williamsburg Works site in the Williamsburg neighborhood of Brooklyn, New York (Site). This QAPP was prepared to provide quality assurance guidelines for sampling proposed at the Site. The Site was used to manufacture gas from 1850 until prior to 1941.

3. Project Organization and Responsibility

Qualified Environmental Professional (QEP) is responsible for the implementation of the scope of work, including the supervision of contractors, field activities, and the evaluation and interpretation of data. The Consultant will direct the sampling activities and coordinate submittal of samples to testing laboratories. The project organization and key personnel for the Consultant are listed below:

Program Manager: Jim Ash
Project Manager (PM): Melissa Felter
Field Team Leader: TBD
Quality Assurance Officer: Lorie MacKinnon
Corporate Health & Safety Officer: Steve Hawkins
Data Validator: Lorie MacKinnon
Data Manager: Jaimie Wargo

The primary responsibilities of each of these personnel are described in the following table.

Key Project Personnel and Responsibilities		
Position	**Consultant Personnel**	**Areas of Responsibilities**
Program Manager	Jim Ash	▪ Overall program oversight ▪ Project management ▪ Project schedule ▪ Client contact regarding project related issues ▪ Personnel and resource management ▪ Review of project submittals ▪ Budgeting
Project Manager (PM)	Melissa Felter	▪ Client contact regarding project related issues ▪ Coordination of contractors ▪ Technical development and implementation of Work Plan and Field Sampling Plan ▪ Personnel and resource management ▪ Preparation and review of project submittals ▪ Preparation of project submittals ▪ Budgeting
Field Team Leader	TBD	▪ Client contact regarding project related issues on day to day basis as part of field operations ▪ Coordination of contractors ▪ Implementation of Work Plan and Field Sampling Plan ▪ Personnel and resource management ▪ Preparation of project submittals
Quality Assurance	Lorie MacKinnon	▪ QA/QC for sampling and laboratory

Key Project Personnel and Responsibilities		
Position	**Consultant Personnel**	**Areas of Responsibilities**
Officer		performance
Data Validator	Lorie MacKinnon	▪ Perform data validation activities ▪ Prepare data usability summary reports ▪ Evaluate data with regards to quality objectives
Data Managers	Jaimie Wargo Julie Dicostanzo	▪ Manage raw data from the laboratory

A New York State Department of Health (NYSDOH) Environmental Laboratory approval Program (ELAP) approved laboratory will be utilized to perform standard analytical chemistry parameters for surface soils, subsurface soil, groundwater, and soil vapor samples including:

- Volatile Organic Compounds (VOCs) by EPA Method 8260C
- Semi volatile Organic Compounds (SVOCs) by EPA Method 8270D
- Alkylated Polycyclic Aromatic Hydrocarbons (PAHs) by EPA Method 8270D SIM
- Target Analyte List (TAL) Metals including tin by EPA Method 6000/7000 series
- N-alkanes and Isoprenoids by EPA Method 8015D Modified
- Extractable Petroleum Hydrocarbon (EPH) by NJDEP EPH Method
- Per- and Polyfluoroalkyl Substances (PFAS) by LC-MS/MS using methodologies based on EPA Method 537
- Polychlorinated Biphenyls (PCBs) by EPA Method 8082
- Pesticides by EPA Method 8081
- Herbicides by EPA Method 8151A
- Total Cyanide by EPA Method 9014 (groundwater only)
- Free Cyanide by EPA Method 9014 (soils only)
- Disposal Parameters (total metals, Toxicity Characteristic Leaching Procedure (TCLP) by EPA 1311, Resource Conservation Recovery Act (RCRA) 8 metals by EPA 6000/ 7000 series, TCLP pesticides EPA 8081A, TCLP herbicides by 8151A, TCLP VOC by EPA 8260B, TCLP SVOC by EPA 8270C, paint filter test, ignitability by EPA 1030 (soils)/EPA 1010 (water), corrosivity by EPA 9040 (water)/ 9045 (soils) , reactivity [cyanide by EPA 7.3.3.2 and sulfide by EPA 7.3.4.2] by , total petroleum hydrocarbons (TPH) by EPA 8015B/ 418.1, total PCBs by EPA 8082, flashpoint, total organic halides (TOX) EPA 450.1, and % solids)
- VOCs including Naphthalene by EPA Method TO-15

The NYSDOH ELAP's relevant certifications are summarized in the following table.

Table 1 provides a summary of soil analyses, Table 2 provides a summary of groundwater analyses, and Table 3 provides a summary of soil vapor and outdoor air analyses. Table 4 provides a summary of quality assurance samples, holding times and analysis for each media.

Drilling and test pit excavation contractors will be identified once the work plan is approved.

4. Quality Assurance Objectives

This section establishes the QA objectives for measurements that are critical to the project. The QA objectives are developed for relevant data quality indicators. These indicators include the method detection limit, reporting limit, precision, accuracy, completeness, representativeness, and comparability. The data quality objectives (DQOs) are based on project requirements and ensure: (1) that the data generated during the project are of known quality and (2) that the quality is acceptable to achieve the project's technical objectives provided in the Work Plan. All analytical data will be provided by the laboratory using the New York State ASP Category B deliverable format.

Quantitation Limits are laboratory-specific and reflect those values achievable by the laboratory performing the analyses. However, in order to ensure that the analytical methodologies are capable of achieving the DQOs, measurement performance criteria have been set for the analytical measurements in terms of accuracy, precision, and completeness. The analytical methods to be used at this site will provide a level of data quality and can be used to evaluate potential impacts to soil and groundwater from the former Site operations, compared to NYSDEC Part 375 soil cleanup objectives and New York State Ambient Groundwater Standards, Criteria and Guidance values, and for purposes of risk assessment.

The overall QA objective is to develop and implement procedures for field sampling, chain-of-custody, laboratory analysis, and reporting which will provide results that are scientifically valid, and the levels of which are sufficient to meet DQOs. Specific procedures for sampling, chain of custody, laboratory instruments calibration, laboratory analysis, reporting of data, internal quality control, and corrective action are described in other sections of the QAPP.

The data quality indicators are presented in subsections 4.1 through 4.6. Procedures to assess the data quality indicators are given below in Section 13. Laboratory MDLs and PQLs for soils, groundwater, and soil vapor are located on Tables 5 through 7, respectively. Soil clean-up objectives and groundwater standards and guidance values are located on Tables 8 and 9.

4.1 Required Quantification Limit

The required quantification limit is the quantitative analytical level for individual analytes needed to make decisions relative to the objectives of the project. Quantitative limits may be expressed as the MDL or some quantitative level defined in terms relative to the program. It

should be noted that there is some ambiguity in the definitions and use of terms that define quantification limits. The MDL presented herein is a well-defined and accepted entity, although attainable only under ideal laboratory conditions.

Method Detection Limit: The MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero. MDL is determined from analysis of a sample in a given matrix type containing the analyte.

Practical Quantitation Limit: The PQL [also referred to as the reporting limit (RL)] is the concentration in the sample that corresponds to the lowest concentration standard of the calibration curve.

Laboratory MDLs and PQLs for soils, groundwater, soil vapor and ambient air are located on Tables 5 through 7, respectively.

4.2 Accuracy

Accuracy is the closeness of agreement between an observed value and an accepted reference value. The difference between the observed value and the reference value includes components of both systematic error (bias) and random error.

Accuracy in the field is assessed through the adherence to all field instrument calibration procedures, sample handling, preservation, and holding time requirements, and through the collection of equipment blanks prior to the collection of samples for each type of equipment being used (e.g., sample liners, drilling shoe, or stainless–steel sampling implements).

The laboratory will assess the overall accuracy of their instruments and analytical methods (independent of sample or matrix effects) through the measurement of "standards," materials of accepted reference value. Accuracy will vary from analysis to analysis because of individual sample and matrix effects. In an individual analysis, accuracy will be measured in terms of blank results, the percent recovery (%R) of surrogate compounds in organic analyses, or %R of spiked compounds in matrix spikes (MSs), matrix spike duplicates (MSDs) and/or laboratory control samples (LCSs). This gives an indication of expected recovery for analytes tending to behave chemically like the spiked or surrogate compounds. The laboratory accuracy will be evaluated in accordance with laboratory quality assurance plan and standard operating procedures located in Appendix A.

4.3 Precision

Precision is the agreement among a set of replicate measurements without consideration of the "true" or accurate value: i.e., variability between measurements of the same material for the same analyte. In environmental sampling, precision is the result of field sampling and analytical factors. Precision in the laboratory is easier to measure and control than precision in the field. Replicate laboratory analyses of the same sample provide information on analytical precision; replicate field samples provide data on overall measurement precision. The difference between the overall measurement precision and the analytical precision is attributed to sampling precision. Precision is measured in a variety of ways including statistically, such as calculating variance or standard deviation. The difference between the overall measurement precision and the analytical precision is attributed to sampling precision.

Precision in the field is assessed through the collection and measurement of field duplicates. Field duplicates will be collected at a frequency of one per twenty investigative samples per matrix per analytical parameter, with the exception of the waste characterization parameters. Precision will be measured through the calculation of relative percent differences (RPDs) as described below in subsection 13.2. The resulting information will be used to assess sampling and analytical variability. Field duplicate RPDs must be less than 50% for soil samples and less than 30% for aqueous samples. These criteria apply only if the sample and/or duplicate results are >5x the quantitation limit; if both results are <5x the quantitation limit, the criterion will be doubled. Duplicate samples are described in below in subsection 5.1.5. Table 4 summarizes the number of duplicates per media sampled.

Precision in the laboratory is assessed through the calculation of RPD for duplicate samples. For organic analyses, laboratory precision will be assessed through the analysis of MS/MSD samples and field duplicates. For the inorganic analyses, laboratory precision will be assessed through the analysis of matrix duplicate pairs and field duplicate pairs. MS/MSD samples or matrix duplicate pairs will be performed at a frequency of one per twenty primary samples per matrix. Duplicate samples are described in below in subsection 5.1.5. Table 4 summarizes the number of duplicates per media sampled.

4.4 Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared to the amount that was expected to be obtained under normal conditions. "Normal conditions" are defined as the conditions expected if the sampling plan was implemented as planned. The objective for completeness is a sufficient amount of valid data to achieve a predetermined statistical level of confidence. Critical samples must be identified, and plans must be formulated to secure requisite valid data for these samples.

Field completeness is a measure of the amount of (1) valid measurements obtained from all the measurements taken in the project and (2) valid samples collected. The field completeness objective is greater than 90 percent.

Laboratory completeness is a measure of the amount of valid measurements obtained from all valid samples submitted to the laboratory. The laboratory completeness objective is greater than 95 percent.

To ensure that these percentages are met, materials for crucial parameters will be retained if re-sampling is required and strict adherence to holding times will be required.

4.5 Representativeness

Representativeness is a qualitative parameter that expresses the degree to which data accurately and precisely represents either a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition within a defined spatial and/or temporal boundary. To ensure representativeness, the sampling locations have been selected to provide coverage over a wide area and to highlight potential trends in the data.

Representativeness is dependent upon the proper design of the sampling program and will be satisfied by ensuring that the RIWP Addendum and FSP are followed and that proper sampling, sample handling, and sample preservation techniques are used.

Representativeness in the laboratory is ensured by using the proper analytical procedures, appropriate methods, and meeting sample-holding times. These are provided in Table 4 and within Appendix A.

4.6 Comparability

Comparability is a qualitative parameter that expresses the confidence with which one data set can be compared to another. Comparability is dependent upon the proper design of the sampling program and will be satisfied by ensuring that the RIWP Addendum and FSP are followed and that proper sampling techniques are used. Maximization of comparability with previous data sets is expected because the sampling design and field protocols are consistent with those previously used.

Comparability is dependent on the use of recognized EPA or equivalent analytical methods and the reporting of data in standardized units. To facilitate data comparison, the data-reporting format as presented below will be used:

- Conventions (units reported as): for solids (weight/unit weight [i.e., mg/kg]); for liquids (weight/unit volume [i.e., mg/L]); for air (weight/unit volume [i.e., mg/m3]).
- Use common chemical name with corresponding chemical abstract system (CAS) code.
- Report all data for soils on a dry-weight basis.

5. Sampling Plan

Environmental sampling will include subsurface soil, groundwater, and waste characterization sampling. Subsurface soil borings and monitoring wells will be installed utilizing drilling methods presented in the FSP. Groundwater samples will be collected utilizing low-flow sampling methods, peristaltic pumps, bailers, whale pumps, or bladder pumps. Performing grab or composite sampling by appropriate hand-held sampling equipment will be the preferred method for waste characterization sampling. Analytical samples and analysis methods are described in the RIWP Addendum and sampling methods and procedures are described in the FSP.

5.1 Sample Type, Location, and Frequency

Samples required by the RIWP Addendum are described below.

5.1.1 Subsurface Borings Soil Sampling

Soil borings locations will be sampled utilizing drilling methods listed in the FSP. Soil borings may be completed as permanent monitoring wells. The actual number of subsurface soil samples and their location may be modified based upon subsurface utilities and property access. The number and location of samples will vary based upon access and subsurface obstructions. Soils will be evaluated through visual, olfactory, and field screening observations in accordance with the FSP. Soil samples will be collected and submitted for laboratory analysis in general accordance with the RIWP Addendum and the FSP. Monitoring wells will be installed in accordance with the RIWP Addendum and FSP. A summary of subsurface soil samples and analysis are located in Table 1.

5.1.2 Test Pit Sampling

Test pits will be excavated using a backhoe or other excavation equipment. Soils will be evaluated through visual, olfactory, and field screening observations in accordance with the FSP. Soil samples will be collected and submitted for laboratory analysis in general accordance with the RIWP Addendum and the FSP. A summary of subsurface soil samples and analysis are located in Table 1.

5.1.3 Groundwater Sampling

Monitoring wells will be gauged and sampled. Groundwater samples will be collected from monitoring wells screened across the water table or targeted intervals at the proposed sample locations. Groundwater samples will be collected and submitted for laboratory analysis in

general accordance with the FSP and RIWP Addendum. Water quality parameters including temperature, pH, turbidity, salinity, dissolved oxygen (DO), oxidation reduction potential (ORP), and specific conductance, will be collected prior to laboratory analysis in general accordance with the FSP. A summary of groundwater samples and analysis are located in Table 2.

5.1.4 Soil Vapor Sampling

Soil vapor sample points will be installed and samples will be collected in general accordance with the *New York State Department of Health's "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"*. For exterior soil vapor locations, the soil vapor samples will be collected from temporary soil vapor probes, which will be installed, to a depth of approximately five feet below grade. Soil vapor samples will be collected in certified clean SUMMA canisters and submitted for laboratory analysis in general accordance with the FSP and Work Plan. A summary of soil vapor samples and analysis are located on Table 3.

5.1.5 Ambient Air Samples

Ambient air samples will be used to assess the potential for soil vapor intrusion. The proposed location is shown on Plate 1 of the Work Plan. A summary of ambient air sample and analysis are located in Table 3.

The proposed ambient air sample will be collected from the approximate breathing height (approximately 3 to 5 feet aboveground) utilizing an individually certified 6-Liter SUMMA® canister with a laboratory-supplied flow controller that is calibrated to an 8-hour period. The regulator flow rate will not exceed 0.2 liters per minute. Each SUMMA® canister will be shipped to an approved-NYSDOH ELAP registered laboratory for analysis. The sample will be analyzed for VOCs and naphthalene by the modified EPA Method TO-15.

5.1.6 Investigation-Derived Waste Sample Collection

Waste classification sampling will be conducted for soil and liquid wastes. The purpose of characterizing a waste is for its proper off-site disposal. Composite samples will be collected from the on-site waste storage vessels (drums or roll-off) for parameters required by the approved disposal facility. Soil samples will be collected utilizing stainless steel sampling tools, shovel, or auger that had been decontaminated. Liquid samples will be collected utilizing disposable bailer, peristaltic pump, a pump with tubing, or other similar methods. These samples will be handled in general accordance with sample handling procedures presented in the FSP. Investigation derived waste samples will be analyzed for parameters listed in Section 3 or other analyses that are required by the National Grid-approved facility.

5.1.7 Field QC Sample Collection

Field QC samples are used to monitor the reproducibility and representativeness of field sampling activities. The field QC samples are handled transported and analyzed in the same manner as the associated field samples. Field QC samples will include equipment blanks, trip blanks, field duplicates and MS/MSDs. The quantity, field QC sample type and analysis is detailed in Table 4.

Equipment Blank Samples are used to monitor the adequacy of decontamination procedures and possible sources of contamination such as potential laboratory methodologies. Equipment blanks will consist of laboratory-supplied, distilled or de-ionized water and will be used to check for potential contamination of the equipment, which may cause sample contamination. Equipment blanks will be collected by routing the distilled water through decontaminated piece of sampling equipment or disposable sampling equipment into laboratory supplied bottles. Non-dedicated field equipment will be decontaminated as specified below in subsection 4.3. Equipment blanks will be submitted to the laboratory at a frequency of one per 20 samples per matrix per type of equipment being used per parameter. Equipment blanks will be submitted daily for PFAS analysis. Equipment blanks will not be completed for waste characterization sampling activities.

Trip Blank Samples will consist of analyte free water and will be prepared by the laboratory. (Trip blanks are used to assess the potential for VOC contamination of samples due to contaminant migration during sample shipment and storage. Trip blanks will be transported to the project location unopened, stored with the site characterization samples, and kept closed until analyzed by the laboratory. Trip blanks will be submitted to the laboratory at a frequency of one per cooler, which contains samples submitted for VOC analysis.

Field Duplicate Samples, also referred to as blind duplicate samples, are two samples that are submitted form the same interval using the same sample procedures. Field duplicates will be used to assess the sampling and analytical reproducibility. Both samples are collected utilizing the same methods and are submitted for the same laboratory analysis however different sample identification numbers are used. Field duplicates will be submitted at a frequency of one per 20 samples for all matrices and all parameters. Field duplicates will not be completed for waste characterization sampling activities.

MS/MSD Samples are two additional aliquots of the same sample submitted for the same parameters as the original sample. However, the additional aliquots are spiked with the compounds of concern. Matrix spikes provide information about the effect of the sample matrix on the measurement methodology. MS/MSDs will be submitted at a frequency of one per 20 investigative samples per matrix for organic and inorganic parameters. MS/MSDs will not be completed for waste characterization sampling activities.

Refer to Table 4 for a summary of QC sample preservation and container requirements.

5.2 Sample Preservation and Containerization

The analytical laboratory will supply the sample containers for the chemical samples. These containers will be cleaned by the manufacturer to meet or exceed all analyte specifications established in the latest United States EPA's Specifications and Guidance for Contaminant-Free Sample Containers. Certificates of analysis are provided with each bottle lot and maintained on file to document conformance to United States EPA specifications. The containers will be pre-preserved, where appropriate (Table 4).

5.3 Equipment Decontamination

All non-dedicated sampling equipment shall be cleaned between each use in the following manner:

- Wash/scrub with a biodegradable degreaser ("Simple Green") if there is oily residue on equipment surface
- Tap water rinse
- Wash and scrub with Alconox (or non-phosphate soap) and water mixture
- Tap water rinse
- All equipment used to collect samples for VOCs and SVOC analysis will then receive a methanol rinse followed by a de-ionized water rinse.
- All equipment used to collect samples for metals analysis will then receive a 10% nitric acid solution rinse followed by a de-ionized water rinse.
- Equipment will be wrapped in polyethylene plastic or aluminum foil for storage or transportation from the designated decontamination area to the sampling location, where appropriate.

The drilling and excavation equipment will be decontaminated in general accordance with methods described in the FSP.

Groundwater sampling pumps will be cleaned by washing and scrubbing with an Alconox/water solution, rinsing with tap water and irrigating with de-ionized water.

Decontamination fluids will be containerized into United States Department of Transportation (USDOT)/UN-approved 55-gallon drums or containment vessels and will be characterized and disposed of by National Grid at an approved disposal facility.

6. Documentation and COC

6.1 Sample Collection Documentation

6.1.1 Field Notes

Field notes documenting field activities will be maintained in a field notebook in general accordance with the FSP. Field logbooks will provide the means of recording the chronology of data collection activities performed during the investigation. The logbook will be a bound notebook with water-resistant pages. Logbook entries will be dated, legible, and contain accurate and inclusive documentation of the activity. Each page of the logbook will be signed in permanent ink and dated. No erasures or obliterations of field notes will be made. If an incorrect entry is made, the information will be crossed out with a single strike mark, which is signed and dated by the sampler. The correction shall be written adjacent to the error.

Field logbooks will be reviewed at regular intervals by the field team leader, site manager and PM for completeness and representativeness. Logbooks will be supported by daily activity reports as described in the FSP.

6.1.2 COC Records

Sample custody is discussed in detail below in subsection 6.2. COC records are initiated by the samplers in the field. The field portion of the custody documentation should include:

- The project name
- Signature(s) of sampler (s) responsible for sample custody
- Sample ID number
- Date and time of collection
- Whether the sample is grab or composite
- Names of individuals involved in sampling
- Air bill or other shipping number (if applicable)

On a regular basis (daily or on such a basis that all holding times will be met), samples will be transferred to the custody of the respective laboratories, via third-party commercial carriers or via laboratory courier service. Sample packaging and shipping procedures, and

field COC procedures are described below in subsection 6.2.1 of this Plan. Sample receipt and log-in procedures at the laboratory are described below in subsection 6.2.2 of this Plan.

6.1.3 Sample Labeling

Each sample will be labeled with a pre-printed adhesive label using indelible ink. The label should include the date and time of collection, sampler's initials, tests to be performed, preservative (if applicable), and a unique identification. The following identification scheme will be used:

PRIMARY SAMPLES TYPES	QA/QC SAMPLE TYPES
SOIL SAMPLES	**FIELD BLANKS**
Test Pit-ID (SAMPLE DEPTH-FEET)	SAMPLE-ID – [DATE]
WW-TP-01 (0-0.2)	WW-FB-033107
Boring -ID (SAMPLE DEPTH-FEET)	**MATRIX SPIKE/DUP**
WW -SB-01 (10-15)	SAMPLE [ID] [DEPTH] [EITHER MS OR MSD]
GROUNDWATER SAMPLES	WW-TP-01 (2-4) MS/MSD
Monitoring Well-ID	WW-SB-01 (10-15) MS/MSD
WW-MW-01	WW-MW-01 (10-15) MS/MSD
SOIL VAPOR SAMPLES	**TRIP BLANKS**
Soil Vapor Point-ID	SAMPLE- ID [DATE]
WW -SV-01	WW-TB-063007
AMBIENT AIR SAMPLES	**BLIND DUPLICATES**
Outdoor Air	SAMPLE -ID[XX][DATE]
WW-OA-01	WW-SB-XX-063007
	WW-MW-XX-063007
	WW-SV-01-063007

This sample label contains the authoritative information for the sample. Inconsistencies with other documents will be settled in favor of the vial or container label unless otherwise corrected in writing from the field personnel collecting samples or the Data Manager and/or the Project QA Officer.

6.1.4 Sample Handling

Samples will be handled in general accordance with the FSP.

6.2 Sample Custody

The COC provides a record of the custody of any environmental field sample from the time of collection to the delivery to the laboratory. Custody is one of several factors that are necessary for the admissibility of environmental data as evidence in a court of law. Custody procedures help to satisfy the two major requirements for admissibility: relevance and

authenticity. Sample custody is addressed in three parts: field sample collection, laboratory analysis, and final evidence files.
A sample is considered to be under a person's custody if:

- The item is in the actual possession of a person
- The item is in the view of the person after being in actual possession of the person
- The item was in the actual physical possession of the person but is locked up to prevent tampering
- The item is in a designated and identified secure area

6.2.1 Field Custody Procedures

Samples will be collected following the sampling procedures indicated in the Work Plan and the FSP. A summary of samples and collection methods are provided above in Section 5 of this QAPP. Documentation of sample collection is described above in subsection 6.1. Sample COC and packaging procedures are summarized below. These procedures will ensure that the samples will arrive at the laboratory with the COC intact.

- The field sampler is personally responsible for the care and custody of the samples until they are transferred or dispatched properly. Field procedures have been designed such that as few people as possible will handle the samples.
- All bottles will be identified by the use of sample labels with sample numbers, sampling locations, date/time of collection, and type of analysis. The sample numbering system is presented above in subsection 6.1.3.
- Sample labels will be completed for each sample using waterproof ink unless prohibited by weather conditions.
- Samples will be accompanied by a completed COC form. The sample numbers and locations will be listed on the COC form. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the record. This record documents the transfer of custody of samples from the sampler to another person, to a mobile laboratory, and to the laboratory facility.
- All shipments will be accompanied by the COC record identifying the contents. The original record will accompany the shipment, and copies will be retained by the sampler and placed in the project files.
- Samples will be properly packaged for shipment and dispatched to the appropriate laboratory for analysis, with a separate signed custody record enclosed in and secured to the inside top of each sample box or cooler. Shipping containers will be secured with strapping tape and custody seals for shipment to the laboratory. The custody seals will be attached to the cooler and covered with clear plastic tape after being signed by field personnel.
- If the samples are sent by common carrier, the air bill will be used. Air bills will be retained as part of the permanent documentation. Commercial carriers are not

required to sign off on the custody forms since the custody forms will be sealed inside the sample cooler and the custody seals will remain intact.

- Samples remain in the custody of the sampler until transfer of custody is completed. This consists of delivery of samples to the laboratory sample custodian, and signature of the laboratory sample custodian on COC document as receiving the samples and signature of sampler as relinquishing samples.

6.2.2 Laboratory Custody Procedures

After accepting custody of the shipping containers, the laboratory will document the receipt of the shipping containers by signing the COC record. The laboratory will:

- Examine the shipping containers to verify that the custody tape is intact
- Examine all sample containers for damage
- Determine if the temperature required for the requested testing program has been maintained during shipment and document the temperature on the COC records
- Compare samples received against those listed on the COC
- Verify that sample holding times have not been exceeded
- Examine all shipping records for accuracy and completeness
- Determine sample pH (if applicable) and record on COC forms
- Sign and date the COC immediately (if shipment is accepted) and attach the air bill
- Note any problems associated with the coolers and/or samples on the cooler receipt form and notify the laboratory project manager, who will be responsible for contacting the data manager
- Attach laboratory sample container labels with unique laboratory identification and test
- Place the samples in the proper laboratory storage.

Following receipt, samples will be logged in according to the following procedure:

- The samples will be entered into the laboratory tracking system. At a minimum, the following information will be entered: project name or identification, unique sample numbers (both client and internal laboratory), type of sample, required tests, date and time of laboratory receipt of samples, and field ID provided by field personnel.
- The completed COC, air bills, and any additional documentation will be placed in the final evidence file.

7. Calibration Procedure

7.1 Field Instruments

Field instruments will be calibrated according to the manufacturer's specifications. Air monitoring instruments will be calibrated to a known reference gas standard and ambient air outside the work zone. Calibration will be completed daily. If concentrations of VOCs are encountered above the reference gas standard, the soil screening photoionization detector (PIDs) may be calibrated or re-checked against the reference gas standard. Water quality meters will be calibrated with known reference solutions. All calibration procedures performed will be documented in the field logbook and will include the date/time of calibration, name of person performing the calibration, reference standard used, and the readings. The following equipment has been identified for use to implement sampling required by the RIWP Addendum.

Subsurface Soil Sampling Activities:

- RAE Systems MultiRAE Plus equipped with VOC (10.6 eV lamp), lower explosive limit (LEL), percent oxygen, hydrogen sulfide and hydrogen cyanide
- RAE Systems MiniRAE 2000 (PID) with 10.6 eV lamp
- Drager Chip Measurement System (CMS) and compound specific chips (including benzene, hydrogen sulfide, hydrogen cyanide, etc.)
- MIE pDR 1200 with cyclone and pump [particulate monitor]
- MSA LC Pump or SKC 224-PCXR4 [air pump for dust monitoring]
- BIOS Dry Cal DC Lite Primary Flow Meter Model ML [air pump calibration]

Groundwater Sampling Activities

- In-Situ Multi-Parameter Troll 9000
- YSI 6280 XLM water quality meter

Similar field equipment can be substituted that perform the same functions can be substituted if selected equipment is not available from equipment supplier.

7.2 Laboratory Instruments

Calibration procedures for a specific laboratory instrument will consist of initial calibrations, initial calibration verifications, and/or continuing calibration verification. Detailed descriptions of the calibration procedures for a specific laboratory instrument are included in

the laboratory's quality assurance plan, which describe the calibration procedures, their frequency, acceptance criteria, and the conditions that will require recalibration. These procedures are as required in the respective analytical methodologies summarized in Tables 1 through 3 of this QAPP.

8. Sample Preparation and Analytical Procedures

Analytical samples will be collected in general accordance with the FSP and as specified in the RIWP Addendum. Tables 1 through 3 provide a sample collection matrix that is separated by media. Analytical samples will be collected into laboratory-preserved sample containers and will be preserved as indicated in Table 4.

9. Data Reduction, Validation, and Reporting

Appropriate QC measures will be used to ensure the generation of reliable data from sampling and analysis activities. Proper collection and organization of accurate information followed by clear and concise reporting of the data is a primary goal in this project. Complete data packages suitable for data validation to support the generation of a DUSR according to NYSDEC requirements will be provided by the analytical laboratory.

9.1 Field Data Evaluation

Measurements and sample collection information will be transcribed directly into the field logbook or onto standardized forms. If errors are made, results will be legibly crossed out, initialed and dated by the person recording the data, and corrected in a space adjacent to the original (erroneous) entry. Reviews of the field records by the field team leader, site manager, and PM will ensure that:

- Logbooks and standardized forms have been filled out completely and that the information recorded accurately reflects the activities that were performed.
- Records are legible and in accordance with good record keeping procedures, i.e., entries are signed and dated, data are not obliterated, changes are initialed, dated, and explained.
- Sample collection, handling, preservation, and storage procedures were conducted in accordance with the protocols described in the FSP and Work Plan, and that any deviations were documented and approved by the appropriate personnel.

9.2 Analytical Data Validation

The consultant will be responsible for performing an independent validation of the analytical data. Project-specific procedures will be used to validate analytical laboratory data. The basis for the validation will be the USEPA CLP National Functional Guidelines for Organic Data Review (February 2005) and the USEPA CLP National Functional Guidelines for Inorganic Data Review (October 2004), modified to accommodate the criteria in the analytical methods used in this program, and Region II Standard Operating Procedures (SOPs) for CLP Organic Data review (Revision 11, June 1996) and Evaluation of Metals for the CLP Program (Revision 11, February 1992). Critical functions for determining the validity of generated data are: (1) strict adherence to the analytical methods, (2) assurance that the instrumentation employed was operated in accordance with defined operating procedures, (3) assurance that quality parameters built into the analytical procedures have

been adhered to, and (4) confirmation that the DQOs have been met.

Table 4 highlights the QC criteria and holding time requirements for all analyses conducted under this program. These criteria will be used to evaluate and qualify the data during validation.

The consultant or qualified contracted personnel will validate analytical samples collected under the RIWP Addendum. Samples collected for waste classification will not be validated. Validation will include all technical holding times, as well as QC sample results (blanks, surrogate spikes, laboratory duplicates, MS/MSDs, and LCSs), tunes, internal standards, calibrations, target compound identification, and results calculations.

For all analyses, the laboratory will report results, which are below the laboratory's reporting limit; these results will be qualified as estimated (J) by the laboratory. The laboratory may be required to report TICs for the VOC and SVOC analyses; this will be requested by the consultant on an as-needed basis

The overall completeness of the data package will also be evaluated by the data validator. Completeness checks will be administered on all data to determine whether full data deliverables were provided. The reviewer will determine whether all required items are present and request copies of missing deliverables.

Upon completion of the validation, a report will be prepared. This report will summarize the samples reviewed, elements reviewed, any nonconformance with the established criteria, and validation actions. Data qualifiers will be consistent with EPA National Functional Guidelines. This report will be in a format consistent with NYSDEC's DUSR.

9.3 Analytical Data Validation

Laboratory deliverables will consist of an original hard copy data package that is in general accordance with NYSDEC ASP Category B data deliverable requirements.

10. Internal Quality Control

Laboratory and field quality internal control checks will be used to ensure the data quality objectives. At a minimum, this will include:

- Matrix spike and/or matrix spike duplicate samples
- Matrix duplicate analyses
- Laboratory control spike samples
- Instrument calibrations
- Instrument tunes for VOC 8260C and SVOC 8270D analyses
- Method and/or instrument blanks
- Surrogate spikes for organic analyses
- Internal standard spikes for VOC 8260C and SVOC 8270D analyses
- Detection limit determination and confirmation by analysis of low-level calibration standard

The laboratory quality plan for the selected ELAP is located in Appendix A.

Field quality control samples will include:

- Equipment blanks as outlined in Table 4
- Field duplicate samples as outlined in Table 4
- Trip blanks as outlined in Table 4
- MS/MSDs as outlined in Table 4

11. Performance and System Audits

Audits are an independent means of: 1) evaluating the operation or capability of a measurement system, and 2) documenting the use of QC procedures designed to generate data of know and acceptable quality.

Field audits may be completed to assess sample collection protocols, determine the integrity of COC procedures, and evaluate sample documentation and data handling procedures. Field audits may be scheduled by the QA officer, PM, site manager or in-house consultant, at their discretion. Written records of audits and any recommendations for corrective action will be submitted to the PM.

The QA officer is the interface between management and project activities in matters of project quality. The QA officer will review the implementation of the QAPP. Reviews will be conducted at the completion of field activities and will include the results of any audits and an evaluation of the data quality.

12. Preventative Maintenance

Preventative maintenance will be performed on field equipment in accordance with the manufacturer's recommendations. Preventative maintenance to field will be provided by the equipment vendor. The following equipment has been identified for use to implement the RIWP Addendum.

Subsurface Soil Sampling Activities:

- RAE Systems MultiRAE Plus equipped with VOC (10.6 eV lamp), LEL, percent oxygen, hydrogen sulfide and hydrogen cyanide
- RAE Systems MiniRAE 2000 PID with 10.6 eV lamp.
- RAE Systems VRAE Surveying Monitor with LEL, hydrogen cyanide, hydrogen sulfide, carbon monoxide, and percent oxygen.
- Drager CMS and compound specific chips.
- MIE pDR 1200 with cyclone and pump
- MSA LC Pump
- BIOS DCL-5k pump calibrator

Groundwater Sampling Activities

- In-Situ Troll 9000
- YSI 600 XLM

Similar equipment will be substituted that perform the same functions can be substituted if selected equipment is not available from equipment supplier.

Laboratory equipment calibration and maintenance procedures are specified in the ELAP laboratory quality manual located in Appendix A.

13. Specific Procedures to Assess Data Quality Indicators

QC analyses conducted as a part of the testing program will provide a quantitative quality assessment of the data generated and their adherence to the data quality indicators. The data quality indicators ensure that the quality assurance objectives for the project are met.

13.1 Detection Limits

13.1.1 Method Detection Limit

The MDL is defined as follows for all measurements:

MDL = (t[n-1,1-a=0.99]) x (s)

where: s = standard deviation of the replicate analysis,
t(n-1, 1-a=0.99) = student's t-value for a one-sided, 99 percent confidence level and a standard deviation estimate with n-1 degrees of freedom

The MDLs calculated by the laboratory are determined under ideal conditions. MDLs for environmental samples are dependent on the sample aliquot, the matrix, the concentration of analyte, and interference present in the matrix, the percent of moisture, dilution factor, etc. The MDL for each sample analysis will be adjusted accordingly.

13.1.2 *Reporting Limit*

The RL is the concentration of an analyte in the sample that corresponds to the lowest concentration standard of the calibration curve. As with the MDLs, the RLs are dependent on the sample aliquot, the final sample volume, the percent of moisture, dilution factor, etc.

The RL is determined as follows:

$$RL = \frac{Lowest\ conc.\ std\ (ng)}{Volume\ injected\ (uL)} \ x \ \frac{Sample\ aliquot\ (mL\ or\ g)}{Final\ volume\ (mL)} \ x\ DF\ x \frac{100}{(100 - \%M)}$$

where: DF = dilution factor, including all dilutions or lost samples not accounted for in a sample aliquot/final volume ratio
%M = percent moisture for solid samples.

13.2 Precision

Variability will be expressed in terms of the RPD when only two data points exist. The RPD is calculated as:

$$RPD = \frac{(Larger\ Value - Smaller\ Value)}{[(Larger\ Value + Smaller\ Value)/2]} \ x\ 100\%$$

For data sets greater than two points, the percent relative standard deviation (percent RSD) is used as the precision measurement. It is defined by the equation:

$$Percent\ RSD = \frac{Standard\ Deviation}{Mean} \ x\ 100\%$$

Standard deviation (SD) is calculated as follows:

$$SD = \sqrt{\sum_{i=1}^{n} \frac{(y_i - y)^2}{n - 1}}$$

where: SD = standard deviation
yi = measured value of the ith replicate
y = mean of replicate measurements
n = number of replicates

For measurements such as pH, where the absolute variation is more appropriate, precision is usually reported as the absolute range (D) of duplicate measurements:

D = | first measurement - second measurement |

or as the absolute standard deviation previously given. RPD, %RSD, and D are independent of the error of the analyses and reflect only the degree to which the measurements agree with each other, not the degree to which they agree with the true value for the parameter measured.

13.3 Accuracy

Accuracy is related to the bias in a measurement system. Accuracy describes the degree of agreement of a measurement with a true value. Accuracy will be expressed as percent recovery for each matrix spike analyte by using the following equation:

$$\% \ Recovery = \frac{Css - Cus}{Csa} \ X \ 100\%$$

where: Css = measured concentration in spiked sample
Cus = measured concentration in unspiked sample
Csa = known concentration added to the sample

Accuracy for a measurement such as pH is expressed as bias in the analysis of a standard reference sample according to the equation:

$$Bias = pH_m - pH_t$$

where: pH_m = measured pH
pH_t = the true pH of the standard reference sample

13.4 Completeness

Data completeness is a measure of the amount of usable data resulting from a measurement effort. For this program, completeness will be defined as the percentage of valid data obtained compared to the total number of measurements necessary to achieve our required statistical level of confidence for each test. The confidence level is based on the total number of samples proposed in the Work Plan.

Data completeness is calculated as:

$$Completeness = \frac{Number\ of\ valid\ data\ points}{Number\ of\ data\ points\ necessary\ for\ confidence\ level} x\ 100\%$$

The completeness goal is to generate a sufficient amount of valid data. It is anticipated that 95 percent of the data will be complete. Data validation criteria discussed in the work plan and Section 10 of this QAPP will be used to determine data completeness. Any data deficiencies and their effect on project goals will be evaluated in the DUSR.

13.5 Representativeness

Representativeness is a qualitative statement that expresses the extent to which the sample accurately and precisely represents the characteristics of interest of the study. Representativeness is primarily concerned with the proper design of the sampling program and is best ensured by proper selection of sampling locations and the taking of a sufficient number of samples. It is addressed by describing the sampling techniques, the matrices sampled, and the rationale for the selection of sampling locations, which are discussed in the field sampling plan and Work Plan

13.6 Comparability

Comparability is a qualitative parameter expressing the confidence that one set of data can be compared to another. Comparability is possible only when standardized sampling and analytical procedures are used.

14. Corrective Action

If unacceptable conditions are identified as a result of audits or are observed during field sampling and analysis, the PM, Field Team Leader, and QA officer will document the condition and initiate corrective procedures. The specific condition or problem will be identified, its cause will be determined, and appropriate action will be implemented.

The entire sampling program will be under the direction of the PM and QA officer. The emphasis in this program is on preventing problems by identifying potential errors, discrepancies, and gaps in the data collection, laboratory analysis, and interpretation process. Any problems identified will be promptly resolved. Likewise, follow-up corrective action is always an option in the event that preventative corrective actions are not effective.

The acceptance limits for the sampling and analyses to be conducted in this program will be those stated in the method or defined by other means in the RIWP Addendum and FSP. Corrective actions are likely to be immediate in nature and most often will be implemented by the contracted laboratory analyst or the PM. The corrective action will usually involve recalculation, reanalysis, or repeating a sample run.

14.1 Immediate Corrective Action

Corrective action in the field may be needed when the sample requirements are changed (i.e., more/less samples, sampling locations), or when sampling procedures and/or field analytical procedures require modification, etc. due to unexpected conditions. The field team may identify the need for corrective action. The Field Team Leader, Site Manager, and PM will approve the corrective action and notify the QA officer. The PM and QA officer will approve the corrective measure. The Field Team Leader and Site Manager will ensure that the corrective measure is implemented by the field team.

Corrective actions will be implemented and documented in the field record book. Documentation will include:

- A description of the circumstances that initiated the corrective action
- The action taken in response
- The final resolution
- Any necessary approvals

No staff member will initiate corrective action without prior communication of findings through the proper channels.

Corrective action in the laboratory will be completed in accordance with the quality assurance procedures located in the Appendix A. Any corrective actions completed by the laboratory will be documented in both the laboratory's corrective action files, and the narrative data report sent from the laboratory to the PM. If the corrective action does not rectify the situation, the laboratory will contact the PM, who will determine the action to be taken and inform the appropriate personnel.

If potential problems are not solved as an immediate corrective action, the contractor will apply formalized long-term corrective action if necessary.

Tables

Table 1. Soil Field Sampling Matrix
Quality Assurance Project Plan
Williamsburg Works Site Lots 16 and 30
Brooklyn, New York

SAMPLE SELECTION PROTOCOL:
1. Shallow soils within observed impacts (0 to 5' bgs) and below recent fill;
2. Subsurface soils within heaviest observed impacts below 5 feet (if present);
3. Subsurface soils below deepest observed visual impacts.

IF NO IMPACTS ARE OBSERVED:
1. Shallow soils (0 to 5' bgs) and below recent fill;
2. Water table interface;
3. Completion depth of boring.

Sample I.D.	Sample Location	Sample Number			Sample Zone Depths					Analysis (Method[1])

Section 3

INTRODUCTION AND SCOPE
(TNI V1:M2 – Sections 1, 2, 3)

The purpose of this *Quality Manual* is to describe the management system for ESS LABORATORY. The *Quality Manual* defines the policies, procedures, and documentation that assure analytical services continually meet a defined standard of quality that is designed to provide clients with data of known and documented quality and, where applicable, demonstrate regulatory compliance.

The *Quality Manual* sets the standard under which all laboratory operations are performed, including the laboratory's organization, objectives, and operating philosophy. The *Quality Manual* has been prepared to assure compliance with the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 **–** Management and Technical Requirements for Laboratories Performing Environmental Analysis (EL-V1-M1 through M7-ISO-2009-Rev.0.2). This Standard is consistent with ISO/IEC 17025:2005 requirements that are relevant to the scope of environmental testing services and thus, the laboratory operates a quality system in conformance with ISO/IEC 17025:2005(E). In addition, the policies and procedures outlined are compliant with the requirements of other State and Federal accreditation and certification programs, as listed in Appendix D.

The *Quality Manual* is available to regulatory bodies and their representatives, in English.

3.1 Scope of Testing

The laboratory's scope of analytical testing services includes those listed in Appendix D.

3.2 Table of Contents, References and Appendices

The Table of Contents is in Section 2 and Appendices are in Section 29.

This *Quality Manual* uses the references included in Modules 1, 2 and 4 of the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis; the International Standard ISO/IEC 17025:2005(E), Clause 2; USEPA SW-846 On-line; US Title 40 CFR, Parts 136, 141, 142, 143; Massachusetts 310 CMR 42.00; APHA/AWWA/WEF Standard Methods 20th and 22nd Editions; pertinent ASTM Methods, and various other references, as listed in ESS LABORATORY SOPs.

3.3 Glossary and Acronyms Used

Quality control terms are generally defined within the Section that describes the activity.

3.3.1 Glossary

The **Terms and Definitions** used by ESS Laboratory may be found in the references listed below.

3.3.1.1 **The TNI Standard:** Modules 1-7 in the 2009 TNI Environmental Laboratory Sector Standard – Volume 1 – Management and Technical Requirements for Laboratories Performing Environmental Analysis (EL-V1, M1 through M7, ISO-2009).

3.3.1.2 **ESS Laboratory Certificates of Analysis (Customer Reports) and SOPs.**

3.3.2 Acronyms

A list of acronyms used in this document and their definitions are:

AB	–	Accrediting Body
A2LA	–	American Association for Laboratory Accreditation
ANSI	–	American National Standards Institute
ASQC	–	American Society for Quality Control
ASTM	–	American Society for Testing and Materials
BLK	–	Blank
BS/BSD	–	Blank Spike/Blank Spike Duplicate (a/k/a LCS/LCSD)
°C	–	degrees Celsius
°F	–	degrees Fahrenheit
CAL	–	calibration
CAB	-	Conformity Assessment Body (A2LA)
CAS	–	Chemical Abstract Service
CCV	–	Continuing calibration verification
COC	–	Chain of Custody
DL	-	Detection Limit
DO	–	Dissolved oxygen
(I)DOC	–	(Initial) Demonstration of Capability
EPA	–	Environmental Protection Agency
g/L	–	grams per liter
GC/MS	–	gas chromatography/mass spectrometry
ICP-MS	–	inductively coupled plasma-mass spectrometry
ICV	–	Initial Calibration Verification
ISO/IEC	–	International Organization for Standardization/International Electrochemical Commission
lb/in2	–	pound per square inch
LCS/LCSD	–	Laboratory Control Sample/ Laboratory Control Sample Duplicate
LFB	–	Laboratory Fortified Blank
LIMS	-	Laboratory Information Management System (Promium "Element")
LOD	-	Limit of Detection
LOQ	-	Limit of Quantitation
LLOQ	-	Lower Limit of Quantitation
MB	-	Method Blank
MDL	–	Method Detection Limit
mg/Kg	–	milligrams per kilogram
mg/L	–	milligrams per liter
MRL	-	Method Reporting Limit

MS	–	Matrix Spike
MSD	–	Matrix Spike Duplicate
NELAC	–	National Environmental Laboratory Accreditation Conference
NELAP	–	National Environmental Laboratory Accreditation Program
NIST	–	National Institute of Standards and Technology
PE	-	Performance Evaluation
PT	–	Proficiency Test(ing)
PTP	-	Proficiency Testing Provider
PTPA	–	Proficiency Testing Provider Accreditor
QA	–	Quality Assurance
QC	–	Quality Control
QM	–	*Quality Manual*
RL	–	Reporting level
RPD	–	Relative percent difference
RSD	–	Relative standard deviation
SOPs	–	Standard operating procedures
SVOC	–	Semivolatile organic compound
SPK	–	spike
STD	–	standard
TNI	-	The NELAC Institute
µg/L	–	micrograms per liter
UV	–	Ultraviolet
VOC	–	Volatile organic compound
WET	–	Whole effluent toxicity

3.4 Management of the *Quality Manual*

The Quality Manager is responsible for maintaining the currency of the *Quality Manual*.

The *Quality Manual* is reviewed at least annually by the Quality Manager and laboratory personnel to ensure it still reflects current practices and meets the requirements of any applicable regulations or client specifications. Sections of the manual are updated by making a change to the Section and then increasing the revision number by one (x-xx in the case of a minor revision). The cover sheet of the *Quality Manual* (Section 1) must be re-signed and the Table of Contents (Section 2) is updated whenever a Section is updated.

The *Quality Manual* is considered confidential within ESS LABORATORY and may not be altered in anyway except by approval of the Laboratory Director and Quality Manager. If it is distributed to external users, it is for the purpose of reviewing ESS LABORATORY's management system and may not be used for any other purpose without written permission.

Section 4

ORGANIZATION
(TNI V1:M2 – Section 4.1; ISO/IEC 17025/2005(E) - Clause 4.1)

ESS LABORATORY, a DIVISION OF THIELSCH ENGINEERING INC, a legally responsible entity, is a commercial analytical testing laboratory specializing in environmental chemistry. ESS Laboratory, while owned by Thielsch Engineering, Inc., maintains independent management systems, has no conflicting interests, and does not support the functions of Thielsch Engineering, Inc.

ESS Laboratory was established in 1978 and was acquired by Thielsch Engineering, Inc. in June of 1996. The laboratory has evolved into a state-of-the art facility that provides a wide range of Analytical Services in support of:

- Soil and Water Pollution Monitoring
- Environmental Impact Assessment
- Industrial Process Control
- Effluent and Emission Pollution Control

These services are provided to various customers including:

- Federal and State agencies
- Engineering Firms
- Private Industry/Homeowners

The laboratory is responsible for carrying out testing activities that meet the requirements of the TNI Standard, the ISO/EIC 17025 Standard and that meet the needs of the client and appropriate regulatory authorities. These objectives are achieved through application of the policies and procedures outlined in this Section and throughout the *Quality Manual*:

- The laboratory assures that it is impartial and that personnel are free from undue commercial, financial, or other undue pressures that might influence their technical judgment.

- Management and technical personnel have the authority and resources to carry out their duties, including the implementation, maintenance and improvement of the management system, and have procedures to identify and correct departures from the laboratory's management system.

- Personnel understand the relevance and importance of their duties as related to the maintenance of the laboratory's management system.

- Ethics and data integrity policy and procedures (see Section 5 – "Management" and Section 19 – "Data Integrity Investigations") ensure personnel do not engage in activities that diminish confidence in the laboratory's capabilities.

- Confidentiality is maintained. Every effort to protect customers' confidential information and proprietary rights, including procedures for protecting the electronic storage and transmission of results, is made.

4.1 Organization

The laboratory is a commercial organization. The Tax ID number is available on request, when applicable.

The laboratory conducts analytical operations in Cranston, RI and operates a satellite in Hopkinton, Mass, the latter being solely for the purpose of subsidiary customer field services and courier services. The management system covers work at both locations.

The Corporate Organization Chart can be found in Figure 4-1 below:

The laboratory's organization chart can be found in Appendix B.

Additional information regarding responsibilities, authority and interrelationship of personnel who manage, perform or verify testing is included in Section 5 –"Management" and Section 20 – "Personnel". These Sections also include information on supervision, training, technical management, job descriptions, quality personnel, and appointment of deputies for key managerial personnel.

The laboratory has the resources and authority to operate a management system that is capable of identifying departures from that system and from procedures during testing, and initiates actions to minimize or prevent departures. It is the policy of ESS Laboratory not to engage in any activities that may endanger trust in the independence of its judgement regarding its testing activities.

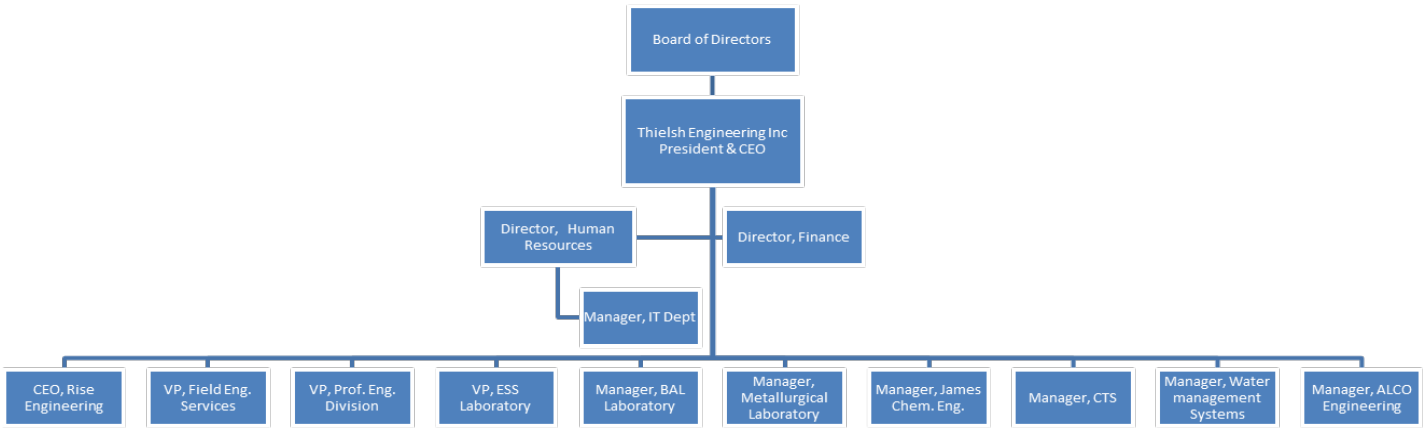
4.2 Conflict of Interest and Undue Pressure

The organizational structure indicated above minimizes the potential for conflicting or undue interests that might influence the technical judgment of analytical personnel.

Arrangements, such as policies and procedures to prevent commercial, financial or other influences that may negatively affect the quality of the work or negatively reflect on the competence, impartiality, judgment, quality of work or operational integrity are described in Appendix E.

In order to ease any scheduling pressures, employees are allowed flexible working hours, at the discretion of Management.

Figure 4-1 – Corporate Organization Chart



Section 5

MANAGEMENT
(TNI V1:M2 – Section 4.2; ISO/IEC 17025/2005(E) - Clause 4.2)

The laboratory maintains a management system that is appropriate to the scope of its activities.

5.1 Management Requirements

Top management ("Management") includes the Laboratory Director, Laboratory/ Operations/Technical Manager and the Quality Manager.

Management's commitment to good professional practice and to the quality of its products is defined in the Quality Policy statement, Section 5.3 below.

Management establishes, implements and maintains, by periodic review, a management system appropriate to the scope of its activities, ensuring that the laboratory documents its policies, systems, programs, procedures and instructions to the extent necessary to assure the quality of its data and ensures the integrity of the management system is maintained when changes to the management system are planned and implemented. Management ensures that its personnel are aware of the relevance and importance of their activities and how they contribute to the achievement of the objectives of the management system.

Management has overall responsibility for the technical operations and has the authority needed to generate the required quality of laboratory operations. Management ensures communication within the organization to maintain an effective management system and to communicate the importance of meeting customer, statutory, and regulatory requirements. Management assures that management system documentation is known and available so that appropriate personnel can implement their part. When changes to the management system occur or are planned, managers ensure that the integrity of the system is maintained.

Management is responsible for carrying out testing activities that meet the requirements of the TNI Standard, the ISO/IEC 17025 Standard, various state-specific regulations, and that meet the needs of the client.

Managers implement, maintain, and improve the management system, and identify noncompliance with the management system of procedures by using available tools such as audit and surveillance results, control charts, participation in a suitable program of inter-laboratory comparisons where possible, data analysis, corrective and preventive actions, customer feedback and management reviews, in efforts to monitor trends. Managers initiate actions to prevent or minimize noncompliance.

Management ensures technical competence of personnel operating equipment, performing tests, evaluating results, or signing reports, and limits authority to perform laboratory functions to those appropriately trained and/or supervised.

Personnel are hired with sufficient education to meet written specified job requirements and undergo mandatory on-the-job training per SOP 80_0016, culminating in a formal Demonstration of Capability for each method they perform, at which time they may act independently, per written method requirements. See also Section 20 – Personnel, of this Quality Manual.

Management is responsible for defining the minimal level of education, qualifications, experience, and skills necessary for all positions in the laboratory and assuring that technical staff have demonstrated capabilities in their tasks and maintain records of such demonstrations. Training is kept up to date as described in Section 20 – "Personnel" by periodic review of training records and through employee performance review.

Management bears specific responsibility for maintenance of the management system. This includes defining roles and responsibilities to personnel, approving documents, providing required training and adequate supervision, providing a procedure for confidential reporting of data integrity issues, and periodically reviewing data, procedures, and documentation. The assignment of responsibilities, authorities, and interrelationships of the personnel who manage, perform, or verify work affecting the quality of environmental tests is documented in the ESS Laboratory Policy Manual (Job Descriptions) and in this section.

Management ensures that all sample acceptance criteria are verified and that samples are logged into the sample tracking system and properly labeled and stored.

Management is responsible for recording all analytical and operational activities of the laboratory and recording the quality of all data reported.

Management ensures that audit findings and corrective actions are completed within required time frames.

Designated deputies are appointed by management during the absence of the Laboratory Manager, Laboratory/Operations/Technical Manager or the Quality Manager, and always if the absence is more than 15 days.

5.2 Management Roles and Responsibilities

The following laboratory management staff members are considered key management personnel:

5.2.1 Laboratory Director

The Laboratory Director is responsible for the overall quality, safety, financial, technical, human resource and service performance of the laboratory. The Laboratory Director provides the resources necessary to implement and maintain an effective quality and data integrity program.

5.2.1.1 Responsibilities

The Laboratory Director is responsible for:

a. Planning, directing and controlling the operation and development of the laboratory to meet financial and operational performance standards.

b. Building and leading a strong, cohesive management team that is continually focused on ESS Laboratory's key success factors in the areas of data quality, customer service, people management and financial discipline.

c. Ensuring that all operations are in compliance with the laboratory's quality assurance manual. Suspending any activities which do not meet the standards set forth in this quality manual.

d. Ensuring that personnel are free from any conflicts/undue pressures that might adversely affect the quality of their work.

e. Reviewing and approving all SOPs and policies prior to their implementation and ensuring all approved SOPs and policies are provided to laboratory personnel and are adhered to.

f. Ensuring that appropriate corrective actions are taken to address analyses identified as requiring such actions by internal and external performance or procedural audits.

g. Continually improving the effectiveness of the management system.

5.2.2 Quality Manager

The Quality Manager (or Officer) is responsible for the oversight and review of quality control data, but is independent from laboratory operations, per the laboratory organizational chart (Appendix B). The Quality Manager's training and proof of experience in QA/QC procedures, knowledge of analytical methods, and the laboratory's management system are available in the employee's records, which are kept in the Quality Assurance Department.

5.2.2.1 Responsibilities

The Quality Manager is responsible for:

a. serving as a focal point for QA/QC;

b. arranging or conducting annual internal audits without outside (e.g., managerial) influence;

c. notifying management of deficiencies;

d. independent oversight and review of quality control data;

e. having knowledge of analytical methods for which data is reviewed.

f. monitoring corrective actions;

g. ensuring that the management system related to quality is implemented and followed at all times;

h. monitoring and maintaining laboratory certifications;

i. keeping this *Quality Manual* current by updating as needed;

j. has the authority and responsibility for ensuring all personnel understand their contribution to the quality system;

k. ensuring communication takes place at all levels within the laboratory regarding the effectiveness of the quality system;

l. evaluating the effectiveness of training;

m. ensuring that personnel are aware of the relevance and importance of their activities and how they contribute to the achievement of the objectives of the management system; and

n. using available tools, such as audit and surveillance results, control charts, proficiency testing results, data analysis, corrective and preventive actions, customer feedback, daily operations reports and management reviews in efforts to monitor trends and continually improve the quality system.

5.2.3 Laboratory/Operations Manager/Technical Manager

The Technical Manager (or designee) is a full-time laboratory staff member and supervises laboratory operations and data reporting. The Technical Manager's proof of experience in the fields of accreditation may be found in the pertinent training file which is maintained by the Quality Assurance Department.

If the Technical Manager is absent for fifteen (15) calendar days or more, a deputy (see Table 5-1 below) with appropriate qualifications will perform the Technical Manager's duties. Beyond a thirty-five (35) calendar day absence, management will notify the primary accreditation body in writing of the absence of the Technical Manager and the appointment of the deputy.

The Technical Manager is not the technical manager of more than one accredited environmental laboratory.

5.2.3.1 Responsibilities

The Technical Manager is responsible for:

a. meeting the general and education requirements and qualifications found in Sections 4.1.7.2 and 5.2.6.1 of the TNI Standard - EL-V1M2-2009 and in Massachusetts 310 CMR 42.00;

b. ongoing monitoring of timeliness of response to client needs, performance data, and the validity of the analyses for the laboratory;

c. managing operations in accordance with laboratory policies pertaining to hiring, training and individual performance review;

d. ensuring operations meet laboratory budgetary control procedures;

e. providing opportunities for training and cross training to ensure smooth operations and enhancement of employees growth; and

f. continually improving the effectiveness of the management system.

5.2.4 Departmental Technical Supervisors

5.2.5 Support System and Administrative Managers

5.2.5.1 Project (Customer Services) Managers

5.2.5.2 Administration Department Supervisor

5.2.5.3 Sample Receiving Department Supervisor

5.2.5.4 IT/LIMS Administrator

5.2.5.5 Purchasing Agent

5.2.4.6 Sales Executives

5.2.6 Laboratory Key Personnel Deputies

The following table defines who assumes the responsibilities of key personnel in their absence:

Table 5-1 Key Personnel Deputies		
Key Personnel	**Deputy(ies)**	**Comment**
Laboratory Director	Operations/Technical Manager	
QA Manager	Laboratory Director /QA Officer	
Operations/Technical Manager	Laboratory Director	
Departmental Supervisors	Operations/Technical Manager	
Supervisor, Project Management	Other Project Managers	
Admin Supervisor	Laboratory Director	
Purchasing Agent	Corporate Purchasing	
IT/LIMS Administrator	Laboratory Director	
Sample Receiving Supervisor	Operations Manager	
Logistics Manager	Project Manager(s)	
Sales Executives	Other Sales Executives	

5.3 Quality Policy

Management's commitment to quality and to the management system is stated in the Quality Policy below, which is upheld through the application of related policies and procedures described in the laboratory's *Quality Manual*, SOPs and policies.

Quality Assurance/Quality Control (QA/QC) in the laboratory is a company-wide function that depends upon cooperative working relationships and multi-level review. Responsibilities for QA/QC functions begin with the bench scientist and extend to the Laboratory Director. The primary level of quality assurance resides with the bench scientist who, after matriculation in the laboratory training program, is responsible for:

- Precisely following the analytical methods as documented in the Standard Operating Procedures (SOP).
- Good Laboratory Practices (GLP)
- Good Automated Laboratory Practices (GALP)
- Good documentation skills
- Carefully documenting each step in the appropriate format
- Conscientiously obtaining peer review as required
- Promptly alerting laboratory managers and/or QA staff members to problems or anomalies.

The supervisor of each laboratory department is responsible for the quality of the data generated by the scientists in that department. The laboratory implements and monitors the specific QC protocols and QA programs within the laboratory to ensure a continuous flow of high-quality data. The laboratory provides its scientists with up-to-date resources including space, equipment, instrumentation, and time in order to accomplish top-quality performance.

All laboratory personnel are responsible for assisting the Laboratory Director with the implementation and maintenance of their quality functions. These responsibilities

may include monitoring QC practices, updating laboratory SOPs, and helping to manage analysis of Performance Evaluation samples.

Ultimately, the success of the QA program depends on the cooperation and support of the entire organization. ESS Laboratory's most valuable resource is its staff of dedicated professionals who take personal pride in the quality of their performance.

Management firmly believes that only by appropriately communicating the QA Plan to all employees, and ensuring that it is effectively implemented, can the needs of clients and regulatory bodies be met.

ESS Laboratory Quality Assurance Mission Statement

Our mission is to establish and implement a quality assurance program that provides our clients with data of known and documented quality in a timely manner.

From the moment an environmental sample arrives at the laboratory to the final reporting of reliable and accurate data, our quality assurance and quality control program is our key to continued success and, as company policy, is strictly enforced.

While the quality assurance manager directs and oversees all quality policies, we regard it as essential that employees at all levels of operation and management thoroughly understand the quality documentation and execute the program. The management of ESS Laboratory is committed to good professional practice, complying with all accreditation standards and improving the quality system and the effectiveness of the management system. Each ESS employee is individually responsible for realizing our commitment to quality and the achievement of our mission.

5.4 Ethics and Data Integrity System

The laboratory's Ethics and Data Integrity policy, program, training and investigations are discussed in Section 19 – "Data Integrity Investigations".

5.5 Documentation of Management/Quality System

The management system is defined through the policies and procedures provided in this *Quality Manual* and written laboratory Standard Operating Procedures (SOPs) and policies.

5.5.1 Quality Manual

The *Quality Manual* contains the following required items:

5.5.1.1 Document title;

5.5.1.2 Laboratory's full name and address;

5.5.1.3 Name, address (if different from above), and telephone number of individual(s) responsible for the laboratory;

5.5.1.4 Identification of all major organizational units which are to be covered by this quality manual and the effective date of the version;

5.5.1.5 Identification of the laboratory's approved signatories;

5.5.1.6 the signed and dated concurrence (with appropriate names and titles), of all responsible parties including the quality manager(s), technical manager(s), and the agent who is in charge of all laboratory activities, such as the laboratory director or laboratory manager;

5.5.1.7 The objectives of the management system and contain or reference the laboratory's policies and procedures;

5.5.1.8 The laboratory's official quality policy statement, which shall include management system objectives and management's commitment to ethical laboratory practices and to upholding the requirements of the referenced Standards; and

5.5.1.9 A table of contents, and applicable lists of references, glossaries and appendices.

This *Quality Manual* contains or references all required elements as defined by the TNI Standard - V1:M2, Section 4.2.8.4., and ISO/IEC 17025:2005(E), Clause 4.2.

5.5.2 Standard Operating Procedures (SOPs)

Standard operating procedures (SOPs) represent all phases of current laboratory operations including an effective date, revision number, and signature of the approving authorities, as designated in SOP 80_0012 (Document Control) and are available to all personnel. They contain sufficient detail such that suitably qualified personnel could perform the procedures. There are two types of SOPs used in the laboratory: 1) test method SOPs, which have specific requirements as outlined below, and 2) general use SOPs which document general procedures.

All technical SOPs (e.g., sample preparation, analytical procedures, sample storage, or sample receipt) shall be reviewed for accuracy and adequacy at least annually, and updated if necessary, and be readily accessible to all personnel. All such reviews shall be conducted by personnel having the pertinent background, are recorded, and made available for assessment.

Each accredited analyte or method has an SOP. Sometimes an SOP is a copy of a method, and any additions are clearly described. The laboratory's test method SOPs include the following topics, where applicable, per SOP 80_0012:

i. identification of the method;
ii. applicable matrix or matrices;
iii. limits of detection and quantitation;
iv. scope and application, including parameters to be analyzed;
v. summary of the method;
vi. definitions;
vii. interferences;
viii. safety;
ix. equipment and supplies;
x. reagents and standards;

xi. sample collection, preservation, shipment and storage;
xii. quality control;
xiii. calibration and standardization;
xiv. procedure;
xv. data analysis and calculations;
xvi. method performance;
xvii. pollution prevention;
xviii. data assessment and acceptance criteria for quality control measures;
xix. corrective actions for out-of-control data;
xx. contingencies for handling out-of-control or unacceptable data;
xxi. waste management;
xxii. references; and any tables, diagrams, flowcharts and validation data;
xxiii. data management and records;
xxiv. personnel qualifications;
xxv. equipment/instrument maintenance;
xxvi. computer hardware and software; and
xxvii. troubleshooting.

5.5.3 Order of Precedence

In the event of a conflict or discrepancy between policies, the order of precedence is as follows unless otherwise noted:

- Quality Manual
- SOPs and Policies
- Other (Work Instructions (WI), memos, flow charts, etc.)

Section 6

DOCUMENT CONTROL
(TNI V1:M2 – Section 4.3; ISO/IEC 17025/2005(E) - Clause 4.3

This Section describes how the laboratory establishes and maintains a process for document management. Procedures for document management include controlling, distributing, reviewing, and accepting modifications. The purpose of document management is to keep documents up to date and preclude the use of invalid and/or obsolete documents.

Documents can be SOPs, policy statements, standards, instruction manuals, specifications, calibration tables, charts, textbooks, posters, notices, memoranda, software, drawings, plans, etc. These may be on various media, whether hard copy or electronic, and they may be digital, analog, photographic or written.

The laboratory manages three types of documents: 1) controlled, 2) approved/uncontrolled, and 3) obsolete.

A controlled document is one that is uniquely identified, issued, tracked, and kept current as part of the management system. Controlled documents may be internal documents or external documents. Any documents providing instructions to laboratory personnel (e.g., operator aids) are considered part of the management system and are subject to document control procedures.

An approved document means it has been reviewed, and either signed and dated, or acknowledged in writing or by secure electronic means by the issuing authority(ies).

An uncontrolled document is watermarked with the ESS Logo and is watermarked "uncontrolled" at the top and bottom of the page.

Obsolete documents are documents that have been superseded by more recent versions or are no longer needed.

6.1 Controlled Documents

Documents will be reviewed, revised (as appropriate) and approved for use by authorized personnel in accordance with SOP 80_0012 (Document Control) and 80_0029 (Management of Procedure Documents), prior to issue.

Documents are reviewed (and revised, if necessary) at least annually to ensure their contents are suitable and in compliance with the current management systems requirements, and accurately describe current operations. Reviews (internal or external) of management system documentation shall be maintained and made available for assessment.

Approved hard copies of documents are available to staff at all locations where operations are essential to the effective functions of the laboratory; it is not laboratory policy to make SOPs available electronically.

Controlled internal documents are uniquely identified with 1) a unique name or number identification 2) date of issue, 3) revision identification, 4) page number, 5) the total number of pages (or a mark to indicate the end of the document), and 6) the signatures of the issuing authority (i.e. management) in accordance with SOPs 80_0012, 80_0016 and 80_0029. Documents are distributed by the Quality Assurance Manager in accordance with these SOPs.

A master list of controlled internal documents is maintained that includes location, and major revision number and dates. A master list of controlled external documents is also maintained that includes title, author, copyright date (where applicable), revision number or date of publication, and location. The controlled document list is maintained and kept in the QA Dept. files by the Quality Assurance Manager and is updated whenever revisions occur. Distribution lists of controlled documents are maintained by the Quality Assurance Manager. A list of active Standard Operating Procedures and major controlled internal documents is included as Appendix A.

6.1.1 Document Changes to Controlled Documents

Affected personnel are notified of changes to management systems documents and supporting procedures, including technical documents, in accordance with SOPs 80_0012, 80_0016 (Training) and 80_0029.

6.1.1.1 Paper Document Changes

Document changes are approved by the same function that performed the original review unless specifically designated otherwise.

The document management process allows for handwritten or minor modifications to documents. The date and approval is documented with the modifications and these changes are processed and tracked per SOP 80_0012.

All document modifications are approved. Changes that are not process modifications but clarifications may be performed without revision. Approval is required. The modified document is then copied and distributed, and obsolete documents are removed according to the master list of controlled documents.

Amendments/modifications to documents are incorporated into a new revision and reissued when the document is reviewed and updated on or before its scheduled review cycle.

A reason for the modification or change is provided as historical information in the revised document per SOP 80_0012.

6.1.1.2 Electronic Document Changes

Suggested revisions to electronic documents are presented to top management (Director, Operations and Quality) for review and approval. Changes to electronic documents are approved as outlined in SOP 80_0012.

Where practical, the altered text or new text in the draft is identified during the revision or review process to provide for easy identification of the modifications.

Procedures (Series 70 SOPs and 80_0040) have been established describing how changes in documents maintained in computerized systems are made and controlled.

6.2 Obsolete Documents

All invalid or obsolete documents are removed from general distribution, or otherwise prevented from unintended use.

Obsolete documents retained for legal use or historical knowledge preservation are appropriately marked and retained per SOP 80_0029. They are stamped "Archived" and initialed and dated by the QA Manager. Archived computer resident documents are kept on file in the QA Dept. for at least 10 years. Hardcopy documents may be retained, depending upon their nature.

Section 7

REVIEW OF REQUESTS, TENDERS AND CONTRACTS
(TNI V1:M2 – Section 4.4; ISO/IEC 17025/2005(E) - Clause 4.4)

The review of all new work assures that oversight is provided so that requirements are clearly defined, that the laboratory (lab) has adequate resources and capability and that the test method is applicable to the customer's needs. This process assures that all work will be given adequate attention without shortcuts that may compromise data quality.

NOTE: A request originates with a client who requires testing services; a tender is a proposal from the lab in response to the client's request, and a contract is the final agreement between lab and client.

Contracts for new work may be formal bids, signed documents, verbal, or electronic. The client's requirements, including the methods to be used, must be clearly defined, documented and understood. Requirements might include target analyte lists, project specific reporting limits (if any), project specific quality control requirements (if any), turnaround time, and requirements for data deliverables. The review must also cover any work that will be subcontracted by the laboratory.

7.1 Procedure for the Review of Work Requests

The Laboratory Director, Operations Manager, and Quality Manager determine if the laboratory has the necessary accreditations, resources, including schedule, equipment, deliverables, and personnel to meet the work request. The procedure is detailed in SOPs 80_0051 (Requests, Tenders & Contracts) and 80_0048 (Subcontracting).

Project Managers/Sales Representatives inform the client of the results of the review and if it indicates any potential conflict, deficiency, lack of accreditation, or inability of the lab to the complete the work satisfactorily.

The client is informed of any deviation from the contract including the test method or sample handling processes. All differences between the request and the final contract are resolved and recorded before any work begins. It is necessary that the contract be acceptable to both the laboratory and the client. Documentation of this process is described in SOP 80_0051.

The review process is repeated when there are amendments to the original contract by the client. The participating personnel are given copies of the amendments. The amendments are maintained per SOP 80_0051.

Note: For repetitive routine projects, the review might be made only at the initial inquiry stage, or on granting of a contract for on-going routine work performed under a general agreement with the client, provided the client's requirements don't change.

7.2 Documentation of Review

Records are maintained for every contract or work request, when appropriate. This includes pertinent discussions with a client relating to the client's requirements or the results of the work during the period of execution of the contract. Documentation of this process is outlined in SOPs 80_0051 and 70_0004 (Work Order Management). Records of all project-related communication with the client (including e-mails, fax, telephone conversation etc.) are kept per SOPs 80_0051, 70_0004 and 70_0008 (Sample Log-in).

Section 8

SUBCONTRACTING OF ENVIRONMENTAL TESTS
(TNI V1:M2 – Section 4.5; ISO/IEC 17025/2005(E) - Clause 4.5

When ESS Laboratory subcontracts work, whether because of unforeseen reasons (e.g. workload, need for further expertise, or temporary incapacity) or on a continuing basis (e.g. through permanent subcontracting, agency or franchising arrangements), this work is placed with a competent subcontractor. A competent subcontractor is one that complies with the appropriate standard for the work in question.

A subcontract laboratory is defined as a laboratory external to this laboratory, or at a different location than the address indicated on the front cover of this manual, that performs analyses for this laboratory. This also includes a laboratory under the same corporate umbrella.

When subcontracting analytical services, the laboratory assures work requiring accreditation is placed with an appropriately accredited laboratory or one that meets applicable statutory and regulatory requirements for performing the tests.

8.1 Procedure

ESS Laboratory maintains a list of subcontractors.

A copy of any required certificate and certified analyte list(s) from subcontractors is maintained as evidence of compliance. This information is maintained by the Quality Assurance Dept. and is kept in a network directory folder.

The certificate and analyte list are checked by the project manager(s) in conjunction with the Quality Manager/Officer, as needed, to ensure the subcontracting laboratory has the appropriate accreditation to do the work.

ESS Laboratory notifies the client of the intent to subcontract the work, in writing, gaining the approval of the client to subcontract their work prior to implementation, preferably in writing. Any verbal instructions are documented.

The laboratory performing the subcontracted work is identified in the final report. The laboratory assumes responsibility to the client for the subcontractor's work, except in the case where a client or a regulating authority specified which subcontractor is to be used. Procedure is detailed in SOP 80_0048.

The Quality Manager/Officer reviews the certification and supporting documentation on file prior to initiation of any work. A listing of all approved subcontracting laboratories and supporting documentation is filed in a network directory. A letter or e-mail is sent to the subcontracting laboratory, which will be NELAC-Accredited, if required, requesting the following information;

1. A copy of the quality manual (optional)
2. A copy of necessary certifications, if not available on company website.

Section 9

PURCHASING SERVICES AND SUPPLIES
(TNI V1:M2 – Section 4.6; ISO/IEC 17025/2005(E) - Clause 4.6)

The laboratory ensures that purchased supplies and services that affect the quality of environmental tests are of the required or specified quality, by using approved suppliers and products.

The laboratory has procedures for purchasing, receiving, and storage of supplies that affect the quality of environmental tests.

9.1 Procedure

Management reviews and approves the supplier of services and supplies and approves technical content of purchasing documents prior to ordering, in accordance with SOPs 80_0020 (Vendor Qualification) and 70_0003 (Purchasing).

Evaluation and selection of suppliers and vendors is performed, in part, on the basis of the quality of their products, their ability to meet the demand for their products, the overall quality of their services, their past history and competitive pricing. This is achieved through evaluation of objective evidence of quality furnished by the supplier, which can include certificates of analysis, recommendations, and proof of historical compliance with similar programs for other clients. To ensure that quality critical consumables and equipment conform to specified requirements, all purchases from specific vendors are approved by a member of the management staff (*standards and reagents must be of the appropriate analytical grade)*. No changes to brands or specifications is allowed without full review and approval by Management. Ongoing evaluation of suppliers is accomplished by ensuring the supplier ships the product or material ordered and that the material is of the appropriate quality, by signing packing slips or other supply receipt documents, after inspection. The purchasing documents contain the data that adequately describes the services and supplies ordered. The description may include type, class, grade, identification, specifications or other technical information.

The supplies received are inspected for breakage, leaks or any other damage. The supplies and chemicals are checked for description, vendor/source, quantity, receipt and expiration dates, concentration, lot/serial number certificate of analysis, calibration/verification records etc. per SOP 80_0013 (Supplies Review and Tracking). The supplies received are stored according to manufacturer's recommendations, laboratory SOPs or test method specifications.

Any documents received with the supplies and services, including specifications, certificates of analysis, warranties, maintenance records, calibration records etc., are kept on file, preferably electronically in the LIMS. Any such hard copy documents are filed by personnel in the department which ordered and received the supplies.

The purchased supplies and reagents that affect the quality of the tests are not used until they are inspected or otherwise verified as complying with requirements defined

in the test method, in accordance with SOP 80_0013 and related departmental SOPs 20_0001, 30_0003, 40_0039, 50_0006 and 60_0001; however, see following note.

NOTE: EPA Method 8270D, Section 9.6.7 states "When new reagents or chemicals are received, the lab should monitor the blanks associated with samples for any signs of contamination. It is not necessary to test every new batch of reagents or chemicals *prior to sample preparation* if the source shows no prior problems."

This ruling may also be considered for application to other methods.

9.2 Approval of Suppliers

The Purchasing Agent maintains a list of approved suppliers. The list is also included in 80_0020 (Vendor Qualification), a copy of which is available to all departments.

Section 10

SERVICE TO THE CLIENT
(TNI V1:M2 – Section 4.7; ISO/IEC 17025/2005(E) - Clause 4.7)

The laboratory collaborates with clients and/or their representatives in clarifying their requests and in monitoring laboratory performance related to their work. Each request is reviewed to determine the nature of the request and the laboratory's ability to comply with the request within the confines of prevailing statutes and/or regulations, without risk to the confidentiality of other clients.

10.1 Client Confidentiality

The laboratory confidentiality policy is to not divulge or release any information to a third party without proper authorization. Third party requests for data and information are referred to the client. Data and records identified as proprietary, privileged, confidential, or affecting national security are exempt from disclosure.

All electronic data (storage or transmissions) are kept confidential, based on technology and laboratory limitations, as required by client or regulation. Confidential client data and correspondence are stored electronically in the laboratory information management system, user e-mail records, internal network directories and secure online websites, which are password-protected and may only be accessed by authorized employees or clients.

Procedures are outlined in various administrative SOPs (70_0004, 70_0005 and 70_0008).

10.2 Client Support

Communication with clients, or their representative(s), is maintained in a timely manner, to provide proper instruction and modification for testing. Technical staff is available to discuss any technical questions or concerns the client may have.

The client, or their representative, may be provided reasonable access to laboratory areas for witnessing testing or substantiating qualifications.

Delays or major deviations to the testing are communicated to the client immediately (preferably within one hour, or at latest by close of business that day), in writing or by telephone, by the project manager.

The laboratory will provide the client with all requested information pertaining to the analysis of their samples. An additional charge may apply for additional data/information that was not requested prior to the time of sample analysis or previously agreed upon.

Value-added services include supplying data confidentially to clients as it is being generated, via the Element Data System *Client Connect* customer interface program.

The client will be notified by project management prior to changes in LIMS software or hardware configuration that will adversely affect customer electronic data.

10.3 Client Feedback

The laboratory seeks both negative and positive feedback following the completion of projects, and periodically for ongoing projects. Feedback provides acknowledgement, corrective actions where necessary, and opportunities for continuous improvement.

Negative customer feedback is documented as a customer concern (see Section 11 – "Complaints") in the ESS Incident Reporting system.

Feedback from clients is sought via a survey request on the ESS Laboratory website and by management/project managers/sales personnel during routine communications with clients, and is documented and circulated to staff members, normally by e-mail or verbally.

Section 11

COMPLAINTS
(TNI V1:M2 – Section 4.8; ISO/IEC 17025/2005(E) - Clause 4.8)

The purpose of this Section is to assure that customer complaints are addressed and corrected. This includes requests to verify results or analytical data. Complaints provide the laboratory an opportunity to improve laboratory operation and client satisfaction.

Complaints by customers or other parties are reviewed by management and an appropriate action is determined and implemented in a timely manner. All customer complaints are documented by the person receiving the complaint and addressed to the responsible manager.

If it is determined that the complaint has merit, the procedures outlined in Section 14 – Corrective Action are followed. If it is determined that a complaint is without merit, it is documented, and the client is contacted by project manager or sales executive.

A complaint, such as a concern that data is repeatedly late, should be reviewed for preventive action (see Section 15 – "Preventive Action") to minimize a future occurrence.

Section 12

CONTROL OF NON-CONFORMING ENVIRONMENTAL TESTING WORK
(TNI V1:M2 – Section 4.9; ISO/IEC 17025/2005(E) - Clause 4.9)

Non-conforming work is work that does not meet acceptance criteria or requirements. Non-conforming work can include departures from standard operating procedures or test methods or unacceptable quality control results (see Section 27 – "Quality Assurance for Environmental Testing"). Identification of non-conforming work can come through customer complaints, quality control, instrument calibration, evaluating consumable materials, staff observation, final report review, management reviews and internal and external audits.

12.1 Exceptionally Permitting Departures from Documented Policies and Procedures

Requests for departures from laboratory procedures are approved by top management and documented, and are only permitted after appropriate precision, accuracy and detection limit data have been generated and shown to satisfy client's criteria. The client must approve major modifications of any methods. Approved method variances are documented in the case narrative to the client. When SOPs representing different versions of the same method are available for use, the SOP title and method summary (which is found in the body of the SOP) describe the particular conditions of use for that method; such SOPs may only be used at client's direction or with client's approval, in writing.

Planned departures from procedures or policies do not require audits or investigations.

12.2 Non-Conforming Work

The lab policy for control of non-conforming work is to identify the nonconformance, determine if it will be permitted, and take timely and appropriate action commensurate with the risk to data quality. All employees have the authority to stop work on samples when any aspect of the process does not conform to laboratory requirements.

The responsibilities and authorities for the management of non-conforming work are detailed in SOP 80_0009 (Incident/Corrective Action). The procedure for investigating and taking appropriate corrective actions of non-conforming work are described in Section 14 – "Corrective Actions". Section 14.3 describes procedures for Technical Corrective Actions. Formal corrective action procedures must be followed for non-conforming work that could reoccur (beyond expected random QC failures) or where there is doubt about the laboratory's compliance to its own policies and procedures.

The investigation and associated corrective action of non-conforming work involving alleged violations of the company's Ethics and Data Integrity policies must follow the procedures outlined in Section 19 – "Data Integrity Investigations".

The laboratory evaluates the significance of the non-conforming work, and takes corrective action immediately. The customer is notified if their data has been impacted and work recalled, where necessary. The laboratory allows the release of non-conforming data only with approval by the Director or Operations Manager, on a case-by-case basis. Non-conforming data is clearly identified in the final report (see Section 28 – "Reporting the Results").

The discovery of a nonconformance for results that have already been reported to the customer must be immediately evaluated for significance of the nonconformance, its acceptability to the customer, and determination of the appropriate corrective action.

As stated above, the management of non-conforming work is detailed in SOP 80_0009 (Incident/ Corrective Action), which is a Quality Assurance Dept. SOP and copies of which are available to all departments; SOP 80_0009 is applicable to situations where non-conforming work could reoccur or where there is doubt that the laboratory is in compliance with its own policies and procedures. Corrective action for routine, non- recurring exceedances can be documented on raw data worksheets, logbooks, e-mail or other documents (e.g. temperature logs).

12.3 Stop Work Procedures

Halting work, or subsequent resumption of work, is authorized by top management, the LIMS administrator, departmental supervisors or analysts in accordance with SOP 80_0009 (Incident/Corrective Action) or pertinent SOPs.

Personnel will notify top management of any nonconformance, per SOP 80_0009 or pertinent SOPs. Management will review the significance of the nonconformance and develop a course of action. If data are questionable, client(s) will be notified, preferably within the hour, but definitely by close of business that day.

Should an investigation of a nonconformance indicate that its cause requires that use of method be limited until any necessary modifications are implemented, management will immediately notify affected personnel of the decision. The laboratory will hold relevant reports to clients pending the outcome of the review. The Quality Assurance Dept. will verify that the issue is resolved before work is allowed to resume; personnel will be notified by management accordingly. Management will document the incident, root cause and resolution using the corrective action procedures described in Section 14 – "Corrective Action".

The reporting of nonconformances involving alleged violations of the laboratory's Ethics and Data Integrity policies must be reported to the Quality Manager. Procedures described in Section 19– "Data Integrity Investigations" are followed.

Section 13

IMPROVEMENT
(TNI V1:M2 – Section 4.10; ISO/IEC 17025/2005(E) - Clause 4.10)

It is the policy of the laboratory to improve the overall effectiveness of the laboratory's management system and this is accomplished by the implementation of the various aspects of the management system: Quality policy and objectives (Section 5 – "Management"); internal auditing practices (Section 17 – "Internal Audits"); the review and analysis of data (Section 27 – "Quality Assurance for Environmental Testing"); the corrective action (Section 14 – "Corrective Action") and preventive action (Section 15 – "Preventive Action") processes; and the annual management review of the quality management system (Section 18 – "Management Reviews") where the various aspects of the management/quality system are summarized and evaluated, and plans for improvement are developed. Employees are encouraged to start discussions for improvements by initiating "Improvement Items" through the Incident Reporting system.

Section 14

CORRECTIVE ACTION
(TNI V1:M2 – Section 4.11; ISO/IEC 17025/2005(E) - Clause 4.11)

Corrective action is the action taken to eliminate the causes of an existing non-conformity, defect, or other undesirable situation, in order to prevent recurrence.

Deficiencies cited in incident reports, external assessments, internal quality audits, data reviews, customer feedback/complaints, control of nonconforming work or managerial reviews are documented and require corrective action. Corrective actions taken are commensurate with the magnitude of the problem and the degree of risk. All actions are documented.

14.1 General Procedure

The laboratory uses a database software program to document and track corrective actions (incident reports) in accordance with SOP 80_0009 (Incident/Corrective Action). This program is used to generate audit/code reports, which help management plan and assign priorities to corrective actions.

Employees are responsible for initiating incident reports, related corrective action (and also suggesting preventive action – see Section 15) on routine data reviews/activities where a nonconformance is found that could reoccur (beyond expected random QC failures) or where there is doubt about the compliance of the laboratory with its own policies and procedures, in accordance with SOP 80_0009. The Quality Assurance Dept. is responsible for monitoring and recording closure of the corrective action, per this SOP.

All deficiencies are investigated and a corrective action plan is developed and implemented if determined necessary. The implementation is monitored for effectiveness.

14.1.1 Cause Analysis

When failures due to systematic errors have been identified, the first step of the corrective action process starts with the initial investigation and determination of root cause(s) of the problem. A root cause investigation, which is a major tool for continuous process improvement, begins and ends with the question "Why did this deficiency occur". When a reason can no longer be identified then there is reasonable assurance that the cause has been isolated. Records are maintained in the database of nonconformances requiring corrective action to show that the root cause(s) was investigated, and include the results of the investigation.

Where there may be non-systematic errors and as such the initial cause is readily identifiable, or there are expected random failures (e.g. failed quality control), a formal root cause analysis is not performed and the process begins with selection and implementation of corrective action (also see Section 14.3 "Technical Corrective Actions").

14.1.2 Selection and Implementation of Corrective Actions

Where uncertainty arises regarding the best approach for analysis of the cause of a nonconformance that require corrective action, appropriate personnel will recommend corrective actions that are commensurate with the magnitude and risk of the problem and that will most likely eliminate the problem and prevent recurrence.

Management ensures that corrective actions are discharged by assigned personnel within the agreed upon time frame. The Quality Assurance Manager provides the necessary oversight by tracking progress.

14.1.3 Monitoring of Corrective Action

The Quality Assurance Manager will monitor implementation and documentation of the corrective action to assure that the corrective actions were effective. The Quality Assurance Manager will publish periodic status reports to top management, project managers and affected departmental managers, as well as Quality Assurance Dept. personnel, per SOP 80_0009. Normal expectation is to complete non-critical corrective action within thirty days. Critical corrective action is to be completed as soon as possible.

14.1.4 Improvement Items

The database software program is also used to compile employees' ideas for improvement. These ideas are ones that would increase quality and/or productivity in the laboratory or administrative procedures. There is no current limit to the type of improvement item that can be added to the database.

14.2 Additional Audits

Where the identification of nonconformances or departures from normal lab procedures cast doubt on the laboratory's compliance with its own policies and procedures, or on its compliance with the TNI or other regulatory Standards, the laboratory ensures that the appropriate areas of activity are audited in accordance with Section 17 – "Internal Audits" as soon as possible.

In many cases, the additional audits are follow-ups after the corrective action has been implemented to ensure it is effective. These are especially done when a serious issue or risk to the laboratory, or a repetitive nonconformance, have been identified.

14.3 Technical Corrective Action

Sample data associated with a failed quality control result are evaluated for the need to be reanalyzed or qualified. Unacceptable quality control results are documented, and if the evaluation requires cause analysis, the cause and solution are recorded (also see Section 12 – "Control of Nonconforming Environmental Testing Work").

Analysts routinely implement corrective actions for data with unacceptable QC measures. First level correction may include re-analysis without further assessment. If the test method SOP addresses the specific actions to take, they are followed. Otherwise, corrective actions start with assessment of the cause of the problem. Corrective actions shall be to a degree commensurate with the magnitude and the risk of the problem.

Corrective action for non-systematic errors, or expected random failures not subject to formal incident reporting, are documented in the comments section of respective logbooks, per SOP 80_0040. Corrective actions for any nonconformance that may reoccur (beyond expected random QC failures) or where there is concern that the laboratory is not in compliance with its own policies and procedures require that an incident report be completed (see Section 14.1).

Technical managers review incident reports and suggest improvements, alternative approaches and procedures, where needed.

If the data reported are affected adversely by the nonconformance, the affected data is clearly identified in the report and the customer is notified. If necessary, data will be recalled and a revised report meeting regulatory and client needs issued.

Section 15

PREVENTIVE ACTION
(TNI V1:M2 – Section 4.12; ISO/IEC 17025/2005(E) - Clause 4.12)

Preventive action is a proactive process to identify opportunities for improvement rather than a reaction to the identification of problems or complaints.

Preventive action includes, but is not limited to: review of nonconformance (incident report) database entries; review of QC (control chart) data to identify quality trends; regularly scheduled (daily) staff meetings to ensure client needs are being met; review of client feedback to look for improvement opportunities; review of proficiency testing data to look for borderline issues; annual managerial reviews; and review of scheduled instrument maintenance.

When improvement opportunities are identified or if preventive action is required, action plans are developed, implemented and monitored to reduce the likelihood of the occurrence of nonconformities.

Procedures for preventive actions include the initiation of such actions and subsequent monitoring to ensure that they are effective. The implementation and record maintenance of preventive action activities is outlined in SOPs 80_0009 (Incident/Corrective Action) and 80_0035 (Internal Assessment).

All personnel have the authority to offer suggestions for improvements and to recommend preventive actions, however management is responsible for implementing preventive action.

Section 16

CONTROL OF RECORDS
(TNI V1:M2 – Section 4.13; ISO/IEC 17025/2005(E) - Clause 4.13)

"Records" include all documents, such as this QA Manual and SOPs, data recordings that include annotations, such as daily refrigerator temperatures posted to a laboratory form, lists, spreadsheets, and analyst notes on a chromatogram. Records may be on any form of media, including electronic (a/k/a computer-resident) and hard copy. Records allow for the historical reconstruction of laboratory activities related to sample-handling and analysis. The terms "documents" and "records" are considered to be analogous.

The laboratory maintains a record system appropriate to its needs, records all laboratory activities, and complies with applicable standards or regulations as required. Records of original observations and derived data are retained to establish an audit trail. Records help establish factors affecting the uncertainty of the test and enable test repeatability under conditions as close as possible to the original.

16.1 Records Maintained

Records of all procedures to which a sample is subjected while in the possession of the laboratory are kept. The laboratory retains all original observations, calculations and derived data (with sufficient information to produce an audit trail), calibration records, personnel records and a copy of the test report, for a minimum of ten years from generation of the last entry in the records. At a minimum, the following records are maintained by the laboratory to provide the information needed for historical reconstruction:

i) All raw data, whether hard copy or electronic, for calibrations, samples and quality control measures, including analysts' worksheets and data output records (chromatograms, strip charts, and other instrument response readout records);

ii) A written description or reference to the specific method(s) used, which includes a description of the specific computational steps used to translate parametric observations into a reportable analytical value (all pertinent Standard Operating Procedures);

iii) Laboratory sample ID code;

iv) Date of analysis;

v) Time of analysis is always required if the regulatory holding time is stated in hours, or when time critical steps are included in the analysis (e.g., extractions and incubations);

vi) Instrumentation identification and instrument operating conditions/parameters (or reference to such data);

vii) All manual calculations (including manual integrations);

viii) Analyst's or operator's initials/signature or electronic identification;

ix) Sample preparation, including cleanup, separation protocols, incubation periods or subculture, ID codes, volumes, weights, instrument printouts, meter readings, calculations, reagents;

x) Test results (including a copy of the final report);

xi) Standard and reagent origin, receipt, preparation, and use;

xii) Calibration criteria, frequency and acceptance criteria;

xiii) Data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions;

xiv) Quality control protocols and assessment;

xv) Electronic data security, software documentation and verification, software and hardware audits, backups, and records of any changes to automated data entries;

xvi) Method performance criteria including expected quality control requirements;

xvii) Proficiency test results;

xviii) Records of demonstration of capability for each analyst;

xix) A record of names, initials, and signatures for all individuals who are responsible for signing or initialing any laboratory record;

xx) Correspondence relating to laboratory activities for a specific project;

xxi) Corrective action reports;

xxii) Preventive action records;

xxiii) Copies of internal and external audits including audit responses;

xxiv) Copies of all current and historical laboratory SOPs, policies and *Quality Manual*s;

xxv) Sample receiving records (including information on any interlaboratory transfers);

xxvi) Sample storage records;

xxvii) Data review and verification records;

xxviii) Personnel qualification, experience and training records;

xxviv) Archive records; and

xxviv) Management reviews.

16.2 Records Management and Storage

The laboratory maintains a record management system for control of laboratory notebooks, instrument logbooks, standards logbooks, and records for data reduction, validation, storage, and reporting, per SOPs 80_0040 (Logbooks), 70_0004 (Work Order Management), 70_0007 (Data Entry & Data Reporting) and 70_0008 (Sample Login). Hard copy data is recorded immediately and legibly in permanent ink while data generated by automated data collections systems are recorded electronically per SOP 80_0040 and various test SOPs. Hard copy corrections are initialed and dated with the reason noted for corrections other than transcription errors. A single line strikeout is used to make corrections so that the original record is not obliterated. In the case of electronic records, software audit tracking features provide an audit trail and notes may be added to electronic document fields, as required by SOP 80_0040 and various test SOPs.

All laboratory data is saved to computer systems which are networked to a Windows 2012 R2 server, which is the destination of all files. Daily backups to disk are done at 3:45 AM. Full backups are performed on Saturday and differential backups Sunday through Friday. 14 disk backups are kept on disk. Full disk backups are copied to tape on Sundays. The weekly tapes are kept for 4 weeks, the monthly tapes for 4 months, the quarterly tapes for 4 quarters, and the yearly tapes for 10 years.

Records, including electronic records, are easy to retrieve, legible, and protected from deterioration, computer viruses or damage; held secure and in confidence; and are available to accrediting bodies for a minimum of ten years or as required by regulation or contract. Records that are stored only on electronic media are supported by the hardware and software necessary for their retrieval. Access to protected records is limited to employees on a need to know basis, as determined by the Laboratory Director, to prevent unauthorized access or amendment. Access is password protected. Individual user names and passwords are required for all LIMS users.

Additional information regarding control of data is included in Section 22.5 – "Control of Data".

Procedures for identification, collection, indexing, access, filing, storage, maintenance and disposal of quality and technical records are found in the SOPs listed above and also in SOPs 80_0012 (Document Control) and 80_0029 (Management of Procedure Documents). Quality records shall include reports from internal audits and management reviews as well as records of corrective and preventive actions. Electronic storage is the primary medium for long-term storage of vital records.

Archived information are protected against fire, theft, loss, environmental deterioration, vermin, and in the case of electronic records, electronic or magnetic sources. Archived records have limited access and are kept in a secured and locked area. Electronic and hard copy records are archived onsite.

In the event that the laboratory transfers ownership or goes out of business, records are maintained or transferred according to client instructions. Appropriate regulatory and state legal requirements concerning laboratory records shall be followed.

16.3 Legal Chain of Custody Records

Evidentiary sample data are used as legal evidence. Procedures for evidentiary samples can be found in SOPs 10_0001, 10_0017 and the Sample Acceptance Policy.

A sample is in someone's custody if;

1. It is in one's actual physical possession;
2. It is in one's view, after being in one's physical possession;
3. It is in one's physical possession and then locked up so that no one can tamper with it;
4. It is kept in a secured area, restricted to authorized personnel only.

Section 17

AUDITS
(TNI V1:M2 – Section 4.14; ISO/IEC 17025/2005(E) - Clause 4.14)

Audits measure laboratory performance and verify compliance with the TNI, ISO 17025 and other regulatory Standards, and accreditation/ certification and project requirements. Audits specifically provide management with an on-going assessment of the management system. They are also instrumental in identifying areas where improvement in the management/quality system will increase the reliability of data. Audits are of four main types: internal, external, performance, and system. Section 17.5 discusses the handling of audit findings.

17.1 Internal Audits

Annually, the laboratory prepares a schedule of internal audits to be performed during the year. These audits verify compliance with the requirements of the management/quality system, including analytical methods, SOPs, the *Quality Manual*, ethics policies, data integrity, other laboratory policies, and the TNI/ISO 17025 Standards. Annual internal audits are carried out per SOP 80_0035.

It is the responsibility of the Quality Manager to plan and organize audits as required by the schedule and requested by management. These audits are carried out by trained and qualified personnel who are independent of the activity to be audited. The Laboratory Director shall determine the training and qualification requirements for audit personnel, including quality managers, and shall establish procedures to ensure that audit personnel have the necessary education or experience required for their assigned positions. These requirements and procedures must be recorded. Personnel conducting independent assessments shall have sufficient authority, access to work areas, and organizational freedom necessary to observe all activities affecting quality and to report the results of such assessments to laboratory management.

In addition to the scheduled internal audits, it may sometimes be necessary to conduct special audits as a follow-up to corrective actions, PT results, complaints, regulatory audits or alleged data integrity issues. These audits address specific issues.

The area audited, the audit findings, and corrective actions are recorded. Audits are reviewed after completion to assure that corrective actions were implemented and effective. If findings are observed that cast doubt on the validity of results, top management shall be informed immediately, the incident documented and timely corrective action implemented per Sections 12, 14 and 17.5, which includes notification of clients, when data is impacted.

17.2 External Audits

It is the laboratory's policy to cooperate and assist with all external audits, whether performed by clients or an accrediting body. Management ensures that all areas of

the laboratory are accessible to auditors as applicable and that appropriate personnel are available to assist in conducting the audit.

17.2.1 Confidential Business Information (CBI) Considerations

During on-site audits, on-site auditors may come into possession of information claimed as business confidential. A business confidentiality claim is defined as "a claim or allegation that business information is entitled to confidential treatment for reasons of business confidentiality or a request for a determination that such information is entitled to such treatment." When information is claimed as business confidential, the laboratory must place on (or attach to) the information at the time it is submitted to the auditor, a cover sheet, stamped or typed legend or other suitable form of notice, employing language such as "trade secret", "proprietary" or "company confidential". Confidential portions of documents otherwise non-confidential must be clearly identified or redacted. CBI may be purged of references to client identity by the responsible laboratory official at the time of removal from the laboratory. However, sample identifiers may not be obscured from the information.

17.3 Performance Audits

Performance audits may be Proficiency Test Samples, internal single-blind samples, double-blind samples through a provider or client, or anything that tests the performance of the analyst and method.

Proficiency Test Samples are discussed in Section 27 – "Quality Assurance for Environmental Testing".

17.4 System Audits

The Laboratory's management system is audited through Quality Dept. annual systems audits and annual management reviews. Refer to Section 18 – "Management Reviews" for further discussion of management reviews.

17.5 Handling Audit Findings

Internal or external audit findings are responded to within the time frame agreed to at the time of the audit. The response may include action plans that could not be completed within the response time frame. A completion date is established by management for each action item and included in the response.

Development and implementation of corrective actions to findings is the responsibility of the Quality Assurance Manager. Corrective actions are documented through the corrective action process described in Section 14 – "Corrective Actions".

Audit findings that cast doubt on the effectiveness of the laboratory operation to produce data of known and documented quality or that question the correctness or validity of sample results must be investigated. Corrective action procedures described in Section 14 – "Corrective Action" must be followed. Clients must be notified in writing if the investigation shows the laboratory results have been

negatively affected and the client's requirements have not been met. The client must be notified by close of business on the day the laboratory discovers the issue. Laboratory management will ensure that this notification is carried out within the specified time frame.

All investigations that result in findings of inappropriate activity are documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients. See Section 19 (Data Integrity Investigation) for additional procedures for handling inappropriate activity.

Section 18

MANAGEMENT REVIEWS
(TNI V1:M2 – Section 4.15; ISO/IEC 17025/2005(E) - Clause 4.15)

Top management reviews the management system on an annual basis and maintains records of review findings and actions.

18.1 Management Review Topics

The following are reviewed to ensure their suitability and effectiveness:

- The suitability of policies and procedures;
- Reports from managerial and supervisory personnel;
- The outcome of recent internal audits;
- Corrective and preventive actions;
- Assessments by external bodies;
- The results of interlaboratory comparisons or proficiency tests;
- Changes in the volume and type of the work;
- Customer feedback;
- Complaints;
- Recommendations for improvement;
- Other relevant factors, such as quality control activities, resources, and staff training.

18.2 Procedure

The procedure for management review is included in SOP 80_0035 (Internal Assessment).

Findings and follow-up actions from management reviews are recorded. Management will determine appropriate completion dates for action items and ensures they are completed within the agreed upon time frame.

Section 19

DATA INTEGRITY POLICY & DATA INTEGRITY INVESTIGATIONS
(TNI V1:M2 – Section 4.16; ISO/IEC 17025/2005(E) - Clause 4.16)

ESS Laboratory is committed to ensuring the integrity of its data and providing valid data of known and documented quality to its clients. Top management endorses its support for data integrity by implementing the specific requirements of the laboratory's data integrity program. The elements in ESS Laboratory's Ethics and Data Integrity program include:

- Documented data integrity procedures, signed and dated by top management,
- Documented data integrity training,
- An Ethics and Data Integrity Training Agreement signed by all management and staff, at the time of hire and annually thereafter following annual data integrity training. This Ethics Agreement includes a requirement that all suspected violations of the policy be reported to senior management.
- Procedures for confidential reporting of alleged data integrity issues, handling data integrity investigations and client notifications,
- An audit program that addresses in-depth, periodic monitoring of data integrity (see Section 17 – "Audits"). The Quality Assurance Manager has the responsibility of overseeing the Ethics and Data Integrity program.

19.1 Ethics and Data Integrity Procedures

The Ethics and Data Integrity Policy provides an overview of the program. Written procedures that are considered part of the Ethics and Data Integrity program include:

- Manual integration procedures (SOP 110_0016)
- Corrective action procedures (Section 14 of this QA Manual)
- Procedures for Data Integrity Investigations are detailed below
- Data recall procedures (Section 14 of this QA Manual)
- Data Integrity training procedures are detailed below and in SOP 80_0049

Management reviews data integrity procedures yearly and updates these procedures as needed. These procedures and the associated implementation records are properly maintained and made available for assessor review.

19.2 Training

Data integrity training is provided as a formal part of new employee orientation and a refresher is given annually for all employees; in the latter case, such training may be asynchronous* (see below). Employees are required to understand that

any infractions of the laboratory data integrity procedures shall result in a detailed investigation that could lead to very serious consequences including immediate termination, debarment or civil/criminal prosecution. This is discussed in the Ethics and Data Integrity Policy that every employee is required to sign at the time of hire. Attendance for required training is monitored through a signature attendance sheet demonstrating all staff have participated and understand their obligations related to data integrity.

An agenda is provided to each trainee prior to the training session. The following topics and activities are covered:

- The organizational mission and its relationship to the need for honesty and full disclosure in all analytical reporting;
- An ethics policy must be read and signed by all personnel;
- How and when to report data integrity issues;
- Recordkeeping;
- Analysts must record an explanation and sign off on all manual changes to data; and
- Where available in the instrument software, all electronic tracking and audit functions must be enabled.
- Discussion regarding all data integrity procedures;
- Data integrity training documentation;
- In-depth data monitoring;
- Data integrity procedure documentation;
- Improper data manipulations (detailed in SOP 80_0049);
- Adjustments of instrument time clocks;
- Inappropriate changes in concentrations of standards;
- The importance of proper written narration on the part of the analyst with respect to those cases where analytical data may be useful, but are in one sense or another partially deficient;
- Written ethics agreements;
- Examples of improper practices (detailed in SOP 80_0049);
- Examples of improper chromatographic manipulations (detailed in SOPs 80_0049 and 110_0016);

- Requirements for external ethics program training;
- Any external resources available to employees; and
- Consequences for data integrity infractions.

*Asynchronous online training tools enable communication and collaboration over a period of time through a "different time-different place" mode. These tools allow people to connect together at each person's own convenience and own schedule. Asynchronous tools are useful for sustaining dialogue and collaboration over a period of time and providing people with resources and information that are instantly accessible, day or night.

When contracted technical or support personnel are used, top management is responsible for ensuring that they are trained to the laboratory's management system and data integrity procedures, competent to perform the assigned tasks, and appropriately supervised.

Topics covered are provided in writing and provided to all trainees.

19.3 Confidential Reporting of Ethics and Data Integrity Issues

Confidential reporting of data integrity issues is assured as follows: A data integrity officer/advisor/ombudsman shall be appointed by senior management to determine the need for a detailed investigation when data integrity is in question. This will normally be the Quality Assurance Manager. The data integrity officer shall insure confidentiality and a receptive environment in which to privately discuss personal ethical dilemmas with staff or observed unethical practices by others. Confidential records of such discussions shall be kept by the data integrity advisor, who will keep top management informed of the need for any further detailed investigation.

19.4 Investigations

All investigations resulting from data integrity issues are conducted confidentially. They are documented and notifications are made to clients who received any negatively affected data that did not meet the client's data quality requirements. Procedures for investigation are included in SOP 80_0049.

Section 20

PERSONNEL
(TNI V1:M2–Section 5.2; ISO/IEC 17025/2005(E)-Clause 5.2)

ESS Laboratory employs competent personnel based on education, training, experience and demonstrated skills, as required. The laboratory's organization chart can be found in Appendix B.

20.1 Overview

All personnel are responsible for complying with all quality and data integrity policies and procedures that are relevant to their area of responsibility.

All personnel who are involved in activities related to sample analysis, evaluation of results or who sign test reports, must demonstrate competence in their area of responsibility. Appropriate supervision is given to any personnel in training and the trainer is accountable for the quality of the trainee's work. Personnel are qualified to perform the tasks for which they are responsible based on education, training, experience and demonstrated skills as required for their area of responsibility.

The laboratory management provides goals with respect to education, training and skills of laboratory staff. These goals are outlined in the ESS Policy Manual (Job Descriptions) and SOP 80_0016 (Training). Training needs are identified at the time of employment and when personnel are moved to a new position, or new responsibilities are added to their job responsibilities; appropriate training is provided. Ongoing training, as needed, is also provided to personnel in their current jobs. The effectiveness of the training must be evaluated before the training is considered complete.

Contracted personnel, when used, must meet the same competency standards and follow the same policies and procedures that laboratory employees must meet.

20.2 Job Descriptions

Job descriptions are available for all positions that manage, perform, or verify work affecting data quality, and are located in the ESS Laboratory Policy Manual (Job Descriptions). An overview of top management's responsibilities is included in Section 5 – "Management".

Job descriptions include the specific tasks, minimum education and qualifications, skills, and experience required for each position.

20.3 Training

All personnel are appropriately trained and are competent in their assigned tasks before they contribute to functions that can affect data quality. It is management's responsibility to assure personnel are trained in accordance with SOP 80_0016 (Training). Training records are used to document management's approval of personnel competency. The date on which authorization and/or competence is confirmed is included.

Training records are maintained by the Quality Assurance Manager and include safety training certificates. The latter are also kept track of in an online database by the corporate safety manager.

20.3.1 Training for New Staff

New staff members are given the following training, per SOP 80_0016 (Training Process):

Orientation (General Policies, Ethics and Data Integrity Agreement, Good Documentation and SOP/QA Manual training plan checklist), Initial Demonstrations of Capability, specialized training and formal safety training.

All new staff members are given introductory training and orientation upon arrival. The training is documented on training forms that outline what was covered during the training. The new employee also receives Data Integrity training and must sign-off on the Ethics and Data Integrity Policy.

The initial training for a new task contains the following steps:

- All documentation involved with a new and unfamiliar task is read and understood by the trainee.
- Training is under the direct supervision of a qualified senior analyst. During the time the trainee is in training, he/she may sign laboratory notebooks, logbooks, worksheets, etc., but they must be co-signed by the trainer, who is responsible for the data generated.
- The trainee demonstrates competency in the new task before they can operate independently. The competency for a test method is accomplished by a demonstration of capability as defined in Section 22 – "Environmental Methods and Method Validation". Approval of competency is noted by the date and initials or signature of the Technical Manager and Quality Assurance Manager on a training form.
- Each step of the training process is documented.
- The documentation is maintained in the employees training record.

Part-time, temporary, contracted and administrative personnel are trained, at a minimum, in the basic quality assurance and health and safety programs.

20.3.2 Ongoing Training

Staff members are given the following ongoing training:

- Annual Data Integrity per SOP 80_0049
- Annual QA Manual - current revision
- Annual Continuing Demonstration of Capability per Appendix F.2 of this manual and SOP 80_0016
- Annual Safety (Corporate, online)
- Any pertinent specialized training

Section 21

ACCOMODATIONS AND ENVIRONMENTAL CONDITIONS
(TNI V1:M2 – Section 5.3)

21.1 Environmental

The laboratory facility is designed and organized to facilitate correct testing of environmental samples. Environmental conditions are monitored to ensure that conditions do not invalidate results or adversely affect the required quality of any measurement. Such environmental conditions include lighting, energy sources, humidity, voltage, temperature, atmospheric cross-contaminants (via storage blanks) and vibration levels which could affect balance operation.

If the laboratory environment is required to be controlled by a method or regulation, the adherence is recorded. An example would be the recording of temperature during TCLP extraction.

Environmental tests are stopped when the environmental conditions jeopardize the results.

When conducting external sampling procedures, any mobile equipment such as pH meters or ISCO samplers are only operated under the environmental conditions for which they were designed and in accordance with pertinent SOPs.

21.2 Work Areas

Work areas may include access and entryways to the laboratory, sample receipt area, sample storage area, sample process area, instrumental analysis area, chemicals, gas cylinders and waste storage area, and data handling and storage area.

Access to, and use of, areas affecting the quality of the environmental tests is controlled by restriction of areas to authorized personnel only. See Section 21.4 below.

The laboratory work spaces are adequate for their use, and appropriately clean to support environmental testing and ensure an unencumbered work area.

Laboratory space is arranged to minimize cross-contamination between incompatible areas of the laboratory. Prep labs are isolated from instrumental labs; samples suspected of containing high concentrations of volatile analytes shall be isolated from other samples. Refrigerator storage and trip blanks shall be used to determine if cross-contamination may have occurred. Laboratory temperature/humidity/ ventilation are controlled via separate, dedicated HVAC units.

Testing occurs only within dedicated laboratory departments. Laboratory space is maintained and monitored to the specifications required for laboratory space and the testing performed. Electronic balances are located away from drafts and doorways and mounted on a marble slab in areas where their use is affected by vibrations. Neighboring test areas of incompatible activities are effectively separated. Specific work areas are defined and access is controlled. (Only authorized laboratory personnel and escorted signed-in visitors may enter the work area.)

Good housekeeping measures are employed to avoid the possibility of contamination. The laboratory procedure for good housekeeping includes such measures as:

- Janitorial service (internal) is in operation.
- Each employee is responsible for keeping their work area clean and tidy.
- A kitchen area, isolated from the testing labs, is the only place where eating/drinking is allowed.
- Smoking is prohibited in the laboratory. Employees are not allowed to wear cologne, perfumes or other personal care products that might contaminate the samples for volatile organics. Live plants and animals are prohibited in the laboratory area.

21.3 Building Security

The laboratory is a secure (locked) facility, accessible to authorized personnel only and is kept secure during off hours with an alarm system.

A visitor's logbook is maintained for every visitor to sign in and out. Visitors must be accompanied by laboratory personnel when in secure areas.

Signs are used to designate secure areas.

Security procedure is described in SOP 110_0015 (Lab Security).

Section 22

ENVIRONMENTAL METHODS AND METHOD VALIDATION
(TNI V1:M2 – Section 5.4; TNI V1:M4 - Sections 1.4, 1.5 and 1.6; and ISO/IEC 17025/2005(E)-Clause 5.4)

Methods and/or procedures are available and are used for all activities associated with the sampling, handling, transport, storage and analysis of the sample including preparation and testing. For purposes of this Section, "method" refers to both the sample preparation and determinative methods. A master list of analytical methods is located in Appendix C.

Before being put into use, a test method is confirmed by a demonstration of capability or method validation process.

All methods are published or documented. Deviations from the methods are allowed only if the deviation is documented, technically justified, authorized by management and accepted by the customer

22.1 Method Selection

A reference method is a method issued by an organization generally recognized as competent to do so (when ISO refers to a standard method, that term is equivalent to reference method). When a laboratory is required to analyze a parameter by a specified method due to a regulatory requirement, the parameter/method combination is recognized as a reference method.

The laboratory will use methods that meet the needs of the customer. Such methods will be based on the latest edition of the method unless it does not meet the needs of the customer.

The laboratory selects methods that are appropriate to the customer needs. When the regulatory authority mandates or promulgates methods for a specific purpose, only those methods will be used.

If a method proposed by a customer is considered to be inappropriate or out-of-date, the customer is informed and the issue resolved before proceeding with analysis of any samples (see Section 7 – Review of Requests, Tenders and Contracts).

If a method is not specified by the customer or is inappropriate, a method appropriate to the end use of the data will be selected using the process outlined below.

- If the data are to be submitted to a regulatory authority, the method(s) specified by the regulatory authority will be used.

- For drinking water compliance a method will be selected from those specified in 40 CFR Part 141, or the applicable state regulations.
- For NPDES permits, the method will be selected from those specified in 40 CFR Part 136.
- If the end use of the data is not regulatory or if the regulatory authority does not specify a method, the laboratory will determine the customer needs in terms of reporting level (e.g., LOD, LLOQ), bias (e.g., screening versus quantitative) and the laboratory capabilities and capacity. Based on these criteria, the laboratory will select an appropriate method based on the following hierarchy:
    - Resources published in regional, national or international standards;
    - Methods published by other technical organizations such as ASTM, Standard Methods, NIOSH or AOAC;
    - Methods develop by the instrument manufacturer; or
    - Laboratory–developed methods.

The customer will be informed of the selected method and must approve its use before being used to report data.

All communications between the laboratory and the customer are documented.

22.2 Non-Standard and Laboratory-Developed Methods

If the laboratory develops a method, the process of designing and validating the method is carefully planned and documented. All personnel involved in the method design, development and implementation will be in constant communication during all stages of development.

The procedure for methods development and validation is outlined below and in SOP 80_0024.

22.3 Method Validation

Validation is the confirmation, by examination and objective evidence, that the particular requirements for a specific intended use are fulfilled.

At a minimum, reference methods are validated by performing an initial demonstration of capability. Additional requirements are discussed for each technology.

All methods that are not reference methods are validated before use. The validation is designed so that the laboratory can demonstrate that the method is appropriate for its intended use. All records (e.g., planning, method procedure, raw data and data analysis) shall be retained while the method is in use. Based on the validation process, the laboratory will make a statement of the intended use requirements and whether or not the validated method meets the use requirements, in a specific Process Validation Protocol form per SOP 80_0024. The form will be filed in the QA Dept.

Method validation and Demonstration of Capability procedures can be found in:

- Appendix F.1 – Chemistry
- Appendix F.2 – Demonstration of Capability

22.4 Estimation of Analytical Uncertainty

Analytical Uncertainty: A subset of Measurement Uncertainty that includes all laboratory activities performed as part of the analysis.

When requested, the laboratory will provide an estimate of the analytical uncertainty, using quality control measurement data, as determined by SOP 110_0014:

a) The exact nature of some test methods may preclude rigorous, statistically valid estimation of analytical uncertainty. In these cases the laboratory shall attempt to identify all components of analytical uncertainty and make a reasonable estimation, and shall ensure that the form of data reporting does not give a wrong impression of the uncertainty. A reasonable estimation shall be based on knowledge of method performance and previous experience. When estimating the analytical uncertainty, all uncertainty components which are of importance in the given situation shall be taken into account.

b) In those cases where a well-recognized test method specifies limits to the values of the major source of uncertainty of measurement and specifies the form of presentation of calculated results, the laboratory is considered to have satisfied the requirements on analytical uncertainty by following the test method and reporting instructions.

c) The laboratory is only responsible for estimating the portion of measurement uncertainty that is under its control. Test reports shall include a statement of the estimated analytical uncertainty only when required by the customer. If a project requires analytical uncertainty to be reported, the laboratory shall report the estimated uncertainty based on project-specific procedures or, if not available, any other scientifically valid procedures.

The estimated analytical uncertainty can be expressed as a range (±) around the reported analytical results at a specified confidence level. A laboratory may report the in-house, statistically-derived Laboratory Control Sample (LCS) control limits based on historical LCS recovery data as an estimate of the minimum laboratory contribution to analytical uncertainty at a 99% confidence level. For testing laboratories, the laboratory shall ensure that the equipment used can provide the analytical portion of measurement uncertainty needed by the customer.

22.5 Control of Data

To ensure that data are protected from inadvertent changes or unintentional destruction, the laboratory establishes and uses procedures to check calculations and data transfers (both manual and automated).

22.5.1 Computer and Electronic Data Requirements

The laboratory assures that computers, user-developed computer software, automated equipment, or microprocessors used for the acquisition, processing, recording, reporting, storage, or retrieval of environmental test data are:

- Documented in sufficient detail and validated as being adequate for use;
- Protected for integrity and confidentiality of data entry or collection, data storage, data transmission and data processing;
- Maintained to ensure proper functioning and are provided with the environmental and operating conditions necessary to maintain the integrity of environmental test data; and
- Held secure including the prevention of unauthorized access to, and the unauthorized amendment of, computer records. Data archive security is addressed in Section 16 – "Control of Records" and building security is addressed in Section 21- "Accommodations and Environmental Conditions".

The Laboratory Director controls access to all programs that are used to acquire, process, record or report data. All programs have limited access and capabilities. All programs are password-protected or are protected by electronic ID. Each employee is granted access only to those programs that he or she uses, depending on his/her responsibilities and job description. Each employee is provided with an ID with electronic information unique to that individual. The ID must be read by the card reader before any employee can input bar-coding data. Passwords are unique to the individual, and cannot be shared. A programmer is given access to change the underlying code, but may not access or modify any data entry. A reviewer may review the data input, and may change entries only when a second reviewer concurs with the modification. Analysts input data, and have an opportunity to check data entries before permanently saving them. After the data has been saved,

modifications may be made only with the authorization of the supervisor. Validators may only review data and assign any validation codes necessary to help interpret the data. Once the data have been reviewed, the technical manager authorizes the data for release to the client. The technical manager may not change data, but may alert the applicable supervisor and analyst of any errors.

The laboratory uses spreadsheets to calculate final results from the raw data, per the test methods. Before reporting any results derived from these programs, the laboratory validates the underlying calculations per SOP 80_0047 (Computer Review & Validation).

After the spreadsheet is validated, the calculations are protected from inadvertent manipulations by access limitation, as described above. If any changes are made to the spreadsheet program, the laboratory revalidates the entire system before reporting results.

Data from all electronic media are backed up and backed up copies are stored as described in Section 16, to ensure that data are not lost.

22.5.2 Data Reduction

The analyst calculates final results from raw data, or appropriate computer programs provide the results in a reportable format. The test methods provide required concentration units, calculation formulas and any other information required to obtain final analytical results. As a part of the management system, the laboratory ensures that all manual calculations are checked by another individual (when possible) at a rate of one per project of all calculations. In addition all data transfers (data entry, transcribing raw or calculated data, etc.) will be similarly spot-checked for checked for accuracy. If checked values are found to be incorrect, the laboratory will recheck all entries. In addition, if the errors are attributed to one individual, 100% of the work done by the individual will be checked until the work is error-free.

The laboratory has a manual integration procedure, SOP 110_0016 (Manual Integration Policy & Procedure) that must be followed when integrating peaks during data reduction. This SOP is available to analysts in all departments where manual integration may be necessary.

The laboratory will report numerical data to three significant figures unless required to do otherwise by regulations.

All raw data must be retained electronically and it is maintained as described in Section 16 – "Control of Records".

22.5.3 Data Review Procedures

Data review procedures are located in Section 27.4 – "Data Review".

Section 23

CALIBRATION REQUIREMENTS
(TNI V1:M2 – Section 5.5; TNI V1:M4 - Section 1.7; ISO/IEC 17025/2005(E) - Clause 5.5)

23.1 General Equipment Requirements

The laboratory provides all the necessary equipment required for the correct performance of the scope of environmental testing performed by the laboratory.

All equipment and software used for testing and sampling are capable of achieving the accuracy required for complying with the specifications of the environmental test methods as specified in the laboratory SOPs.

Equipment is operated only by authorized and trained personnel (see Section 20 – "Personnel").

The laboratory has procedures for the use, maintenance, handling, transportation and storage of equipment and they are readily available to laboratory personnel. Manuals provided by the manufacturer of the equipment provide information on use, maintenance, handling and storage of the equipment. The laboratory maintains an inventory of equipment that includes additional information on storage location. Table 23-5 (below) summarizes planned equipment maintenance. These procedures ensure proper functioning of the equipment and prevent contamination or deterioration.

All equipment is calibrated or verified before being placed in use to ensure that laboratory specifications and relevant standard specifications are met, per SOP 110_0018 (Balance Calibration), 110_0005 (Volumetric Ware Calibration) and 110_0010 (Thermometer Calibration). Completed forms and related raw data are kept in the laboratory department electronic files, except for SOP 110_0010 which is maintained in the QA Department files.

Test equipment, including hardware and software, are safeguarded from adjustments that would invalidate the test result measurements by limiting access to the equipment (see Section 21-3 – "Building Security") and using password protection where possible (see Section 22-5 – "Control of Data").

Equipment that has been subject to overloading, mishandling, that has given suspect results, or shown to be defective or outside specifications is taken out of service. The equipment is isolated to prevent its use or clearly labeled as being out of service until it has been shown to function properly. If it is shown that previous tests are affected, then procedures for nonconforming work are followed and results are documented (see Section 12 – "Control of Nonconforming Environmental Testing Work" and Section 14 – "Corrective Action").

Should equipment be needed for a test that is outside of permanent control of the laboratory, the lab ensures the equipment meets the requirements of this manual by inspecting or otherwise testing prior to use.

When using external calibration services, traceability of measurement shall be assured by the use of calibration services from laboratories that can demonstrate competence, measurement capability and traceability. The calibration certificates issued by these laboratories shall contain:

1. The measurement results, including the conditions (e.g. Environmental) under which the calibrations were made that have an influence on the measurement results;

2. The measurement uncertainty and/or a statement of compliance with an identified metrological specification (when a statement of compliance with a specification is made omitting the measurement results and associated uncertainties, the laboratory shall record those results and maintain them for possible future reference);

3. When an instrument for calibration has been adjusted or repaired, the calibration results before and after adjustment or repair, if available, shall be reported;

4. A calibration certificate (or calibration label) shall not contain any recommendation on the calibration interval except where this has been agreed with the customer;

5. The calibration certificate shall relate only to quantities and the results of functional tests. If a statement of compliance with a specification is made, this shall identify which clauses of the specification are met or not met; this requirement may be superseded by legal regulations;

6. When opinions and interpretations are included, the laboratory shall document the basis upon which the opinions and interpretations have been made. Opinions and interpretations shall be clearly marked as such in a test report;

7. When a calibration has been subcontracted, the laboratory performing the work shall issue the calibration certificate to the contracting laboratory.

Each item of equipment and software used for testing and significant to the results is uniquely identified. Records of equipment and software are maintained in the ESS Inventory (a limited access computer database), equipment validation records, and maintenance records as well as various testing SOPs. This information includes the following:

a) identity of the equipment and its software;

b) manufacturer's name, type identification, serial number or other unique identifier;

c) checks that equipment complies with specifications of applicable tests;

d) current location;

e) methods performed on the specific instrument;

f) manufacturer's instructions, if available, or a reference to their location;

g) dates, results and copies of reports and certificates of all calibrations, adjustments, acceptance criteria, and the due date of next calibration;

h) maintenance plan where appropriate, and maintenance carried out to date; documentation on all routine and non-routine maintenance activities and reference material verifications;

i) any damage, malfunction, modification or repair to the equipment;

j) date received and placed into service

k) condition when received (new, used, reconditioned)

l) operational status

23.2 Support Equipment

Support Equipment includes, but is not limited to: balances, weights, ovens, refrigerators, freezers, incubators, water baths, temperature measuring devices, volumetric/non-volumetric dispensing devices, water purification system, radiation monitors and thermal/pressure sample preparation devices.

All support equipment is maintained in proper working order. Electronic or hard copy records are kept for all repair and maintenance activities, including service calls, per SOP 40_0040 (Logbook Use and Control).

All raw data records are retained to document equipment performance. These records include logbooks, data sheets, or equipment computer files.

Regular maintenance of support equipment, such as balances and fume hoods is conducted at least annually. Fume hood air flow is checked at least monthly.

Maintenance on other support equipment, such as ovens, refrigerators, and thermometers is conducted on an "as needed" basis.

Records of maintenance to support equipment are documented in Instrument Maintenance Logs. Each piece of support equipment does not necessarily have its *own* logbook but is documented. Maintenance logbooks may be shared with equipment that is housed in the same laboratory area. See also Tables 23-2 below.

Table 23-2 Summary of Support Equipment Calibration And Maintenance

Instrument	Activity	Frequency	Documentation
Balance	1. Clean (check before use) 2. Check alignment 3. Service Contract	1. After use 2. Before use 3. Annually	Worksheet/log book Post annual service date on balance
ASTM Class 1 Weights	1. Only use for the intended purpose 2. Use plastic forceps to handle 3. Keep in case	Re-calibrate every 5 years	Certificate of Calibration from ISO/IEC 17025 accredited calibration laboratory

Table 23-2 Summary of Support Equipment Calibration And Maintenance			
Instrument	**Activity**	**Frequency**	**Documentation**
	4. Re-calibrate		
NIST Traceable Thermometer	Accuracy determined by established calibration laboratory using NIST traceable equipment and procedures	At purchase and then annually	Certificate of Calibration
Thermometers: 1. Glass and electronic 2. Dial thermometers 3. IR thermometer	Check at the temperature used, against a reference NIST certified thermometer	1. Annually for glass 2. Quarterly for electronic and IR thermometers	ID, Calibration factor and date of calibration on worksheet/log book Thermometer stickered with initials/ date of calibration
pH electrometers	Calibration: 1. pH buffer aliquots are used only once 2. Buffers used for calibration will bracket the pH of the media, reagent, or sample tested	Before use	Log book
pH probe	Maintenance: Per manufacturer's recommendations	As needed	Log book
Photometer	1. Keep cells clean 2. Service contract, Check wavelength settings with color standards	Annually	Certificate of Calibration Post service date on instrument
Automatic or digital type pipettes	Calibrate for accuracy and precision per SOP 110_0005	Weekly (or daily, if convenient)	Log book
Refrigerators, Freezers, and BOD incubator.	1. Thermometers are immersed in liquid. 2. The thermometers are graduated in increments of 1°C or less	Temperatures are recorded twice each day in use Digital Min/Max temp record for weekend/holidays	Worksheet/log book Refrigerators: 0°C to 6°C Freezers: ≤-10°C
DO electrometer	Calibrate as specified in SOP	Before use	Log book
DO probe	Maintenance as specified by manufacturer	As needed	Log book
Conductivity Meter	Maintenance as specified by manufacturer	When more than 5% drift	Log book

The water purification system and radiation monitoring devices are checked daily prior to use, per SOPs 110_0003 (Water System Testing) and 10_0010 (Radiation Monitor Operation).

23.2.2 Support Equipment Calibration

All support equipment (except for weights) is calibrated or verified at least annually over the entire range of use using NIST traceable references where available. The results obtained from the calibration of support equipment needs to meet requirements found in Tables 23-3, or (1) the equipment is removed from service until repaired, or (2) records are maintained of correction factors to correct all measurements. If correction factors are used this information is clearly marked on or near the equipment.

Support equipment such as balances, ovens, refrigerators, freezers, and water baths are verified with a NIST traceable reference, if available, each day prior to use, to ensure operation is within the expected range for the application for which the equipment is to be used.

Volumetric dispensing devices are checked for accuracy per SOP 110_0005 (Volumetric Ware Calibration) to meet TNI & ISO 17025 Standards criteria. See also Table 23-3 below.

Table 23-3 Calibration Verification Acceptance Criteria for Support Equipment				
Equipment	**Type of Calibration/ Number of Standards**	**Frequency**	**Acceptance Limits**	**Corrective Action**
Balances	Accuracy determined using A2LA-accredited NIST weights, which are verified every 5 years. Minimum of 2 weights bracketing the range of interest. Inspected and adjusted annually by a qualified service person.	Daily accuracy verification, prior to use Annual service	± 0.2% (TNI) Top-loading balance: ±2% or ±0.02g, whichever is greater Analytical balance: ±0.1% or ±0.5 mg, whichever is greater.	Clean, check level, insure lack of drafts, and that unit is warmed up, recheck. If fails, call service
Thermometer	Against NIST-traceable thermometer [Using a thermometer traceable to the SI through an NMI] [Performed at two temperatures that bracket the target temperatures when the spread exceeds 10°. Assume linearity between the two bracketing temperatures] [If only a single temperature is used, perform at the temperature of use]	Liquid in glass: Before first use and annually	± 1.2°C	Apply correction factors or replace thermometer
Minimum-Maximum Thermometers	Against NIST-traceable thermometer [if only a single temperature is used, at the temperature of use]	Electronic: Before first use and quarterly	± 2.0°C	Apply correction factors or replace thermometer
Infrared Temperature Guns	Against NIST-traceable thermometer [if only a single temperature is used, at the temperature of use]	Quarterly at appropriate temperature range for intended use	± 1.5°C	Repair/replace

Table 23-3 Calibration Verification Acceptance Criteria for Support Equipment				
Equipment	**Type of Calibration/ Number of Standards**	**Frequency**	**Acceptance Limits**	**Corrective Action**
Volumetric Dispensing Devices (Eppendorf ® pipette, automatic dilutor or dispensing devices)	One delivery by weight. Using DI water, dispense into tared vessel. Record weight with device ID number.	Weekly (or daily, if needed for convenience)	± 1% Per SOP 110_0005	Adjust/ Replace
Volumetric labware	Per SOP 110_0005	Class B: By lot before first use. Class A and B: Upon evidence of deterioration	Bias: Mean within ± 2% of nominal volume Precision: RSD ≤1% of nominal volume (based on 10 replicate measurements)	Replace
Non-volumetric labware [Applicable only when used for measuring initial sample volume and final extract/ digestates volume]	Per SOP 110_0005	By lot before first use or upon evidence of deterioration	Bias: Mean within ±3% of nominal volume Precision: RSD ≤3% of nominal volume (based on 10 replicate measurements)	Replace
Glass microliter syringe	Per SOP 110_0005	Upon receipt and upon evidence of deterioration	General Certificate of Bias & Precision upon receipt	Replace if deterioration is evident
Drying oven temperature check		Daily prior to and after use	Within ±5% of set temperature	Adjust

23.3 Analytical Equipment

23.3.1 Maintenance for Analytical Equipment

All equipment is properly maintained, inspected, and cleaned.

Maintenance of analytical instruments and other equipment may include regularly scheduled preventive maintenance or maintenance on an as-needed basis. See

Table 23-5 below. Instrument malfunction is documented in Maintenance logs, which become part of the laboratory's permanent records. A description of what was done to repair the malfunction and proof of return to control are also documented in the log. If repair was done by an outside source, invoice record is filed and reference to it made in the maintenance log; indicate proof of return to control by recording that a QC sample met criteria. Instruments and related maintenance procedures (which may be routine) are documented per the test SOPs.

Table 23-5 Analytical Equipment Maintenance

Instrument	Procedure	Frequency
AA (Graphite Furnace)	Clean lens and furnace head Replace windows Clean atomizer cell/furnace hood Nebulizer cleaned/dried Clean filters Change graphite tube/platform Empty waste container Check sample introduction probe	Daily As required Daily Weekly or as required Weekly As required Daily Daily
Mercury Analyzer	Check tubing for wear Fill rinse tank with 3% HCl Fill reductant bottle with Stannous Chloride	Daily Daily Daily
ICP	Check pump tubing Check liquid argon supply Check fluid level in waste container Check filters Clean or replace filters Check torch Check sample spray chamber for debris Clean and align nebulizer Replace pump tubing	Daily Daily Daily Weekly As required Daily As required As required Daily
ICPMS1	Replace tubing TUNE Clean cones	Daily Daily As required
ICPMS2	Replace tubing Check torch alignment TUNE Clean cones	Daily Daily Daily As required
UV-Vis Spectrophotometer	Clean ambient flow cell Precision check/alignment of flow cell Wavelength verification check	As required As required Annually (daily auto-check)
Auto Analyzers	Clean sampler Check all tubing Oil rollers/chains/side rails Clean optics and cells	As required As required As required As required

Table 23-5 Analytical Equipment Maintenance		
Instrument	**Procedure**	**Frequency**
Hewlett Packard GC/MS	Pump oil-level check Pump oil changing Analyzer bake-out Analyzer cleaning Resolution adjustment	Monthly Annually or as required As required As required As required
Gas Chromatograph	Compare standard response to previous day or since last initial calibration Check carrier gas flow rate in column Check temp. of detector, inlet, column oven Septum replacement Glass wool replacement Check system for gas leaks with SNOOP Check for loose/fray wires and insulation Bake injector/column Change/remove sections of guard column Replace connectors/liners Change/replace column(s)	Daily Daily via use of known compound retention Daily As required As required Each cylinder change as req'd Monthly As required As required As required As required
Electron Capture Detector (ECD)	Detector wipe test (Ni-63) Detector cleaning	Semi-annually As required
Flame Ionization Detector (FID)	Detector cleaning	As required
Hall 700A Detector Hall 1000 Detector	Electrolyte change Reactor tube/teflon connecting tube change Clean detector cell	As required by noise As required As required
Photoionization Detector (PID)	Change O-rings Clean lamp window	As required As required
HPLC	Change guard columns Change lamps Change pump seals Replace tubing Change fuses in power supply Filter all samples and eluents (auto-filtered) Change autosampler rotor/stator	As required As required As required As required As required Daily As required
Computers/Printers	Keyboard cleaning (air) Printer nozzle/head cleaning Platen cleaning	As required As required As required
Balances	Class "1" or "3" traceable weight check Clean pan and check if level External service	Daily, when used Daily Annually
Conductivity Meter	0.01 M KCl calibration Conductivity cell cleaning	As required As required
Turbidimeter	Check light bulb	Daily, when used

Table 23-5 Analytical Equipment Maintenance		
Instrument	**Procedure**	**Frequency**
	Service by qualified technician	Annual
Deionized/Distilled Water	Check conductivity System cleaning Replace cartridge & large mixed bed resins	Daily As required As required

Refrigerator/Freezer	Temperature monitoring Temperature adjustment Defrosting/cleaning	Daily As required As required
Vacuum Pumps/ Air Compressor	Drained Belts checked Lubricated	Weekly Monthly Semi-annually
pH/Specific Ion Meter	Calibration/check slope Clean electrode	Daily As required
BOD Incubator	Temperature monitoring	Daily
Centrifuge	Check brushes and bearings	Every 6 months or as needed
Water Baths	Temperature monitoring Water replaced	Daily when used As needed
Other	Per SOP	Per SOP

23.3.2 Instrument Calibration

Information on instrument calibration can be found in Appendix F (Chemistry)

Initial instrument calibration and continuing instrument calibration verification are an important part of ensuring data of known and documented quality. If more stringent calibration requirements are included in a mandated method or by regulation, those calibration requirements override any requirements outlined here or in laboratory SOPs (although SOPs should reflect method stipulations). Generally, procedures and criteria regarding instrument calibrations are provided in test methods.

Section 24

MEASUREMENT TRACEABILITY
(TNI V1:M2 – Section 5.6; ISO/IEC 17025/2005(E) - Clause 5.6)

Measurement quality assurance comes in part from traceability of standards to certified materials.

All equipment used affecting the quality of test results is calibrated prior to being put into service and on a continuing basis. These calibrations are traceable to national standards of measurement where available. When using external calibration services, traceability of measurement shall be assured by the use of calibration services from organizations that can demonstrate competence, measurement capability and traceability to the International System of Units (see Section 23 – "Calibration Requirements").

If traceability of measurements to SI units is not possible or not relevant, evidence for correlation of results through interlaboratory comparisons, proficiency testing, or independent analysis is provided.

24.1 Reference Standards

Reference standards are standards of the highest quality available at a given location, from which measurements are derived. Reference standards shall be calibrated before and after any adjustment.

The laboratory uses ASTM Class 1 or 3 weights for daily checks and the lab sends out their ASTM Class 1 weights for a calibration check every five years. It has been established historically (no change between indicated periodic calibrations) that their performance as reference standards has not been invalidated by daily use.

Reference standards, such as ASTM Class 1 or 3 weights, are calibrated by an entity that can provide traceability to national or international standards. The following reference standards are sent out to be calibrated to a national standard as indicated in Section 23 – "Calibration Requirements"

- Class 1 weights
- Class 3 weights
- NIST traceable reference thermometers

24.2 Reference Materials

Reference materials are substances that have concentrations that are sufficiently well established to be used for calibration or as a frame of reference.

Reference materials, where commercially available, are traceable to SI/ national standards of measurement, or to Certified Reference Materials, usually by a Certificate of Analysis.

Purchased reference materials require a Certificate of Analysis meeting ISO Guide 34 requirements, where available. If a reference material cannot be purchased with a valid Certificate of Analysis, it is verified by analysis and comparison to a certified reference material and/or demonstration of capability for characterization. Records for standards, reagents, and reference materials shall include lot numbers. Documentation for reagents and solvents shall be checked to ensure that the stated purity will meet the intended use, and the supporting records of the checks shall be filed electronically.

Internal reference materials, such as working standards or intermediate stock solutions, are checked as far as is technically and economically practical, in accordance with SOPs 20_0001 (Standards Tracking – VOA Dept.), 30_0003 (Standards Tracking – Metals Dept.), 40_0039 (Reagent & Standards Tracking – Wet Chem. Dept.), 50_0006 (Reagent & Standards Tracking – Org. Prep. Dept.), 60_0001 (Reagent & Standards Tracking – SVOA Dept.), 80_0013 (Reagent Review and Tracking) and 110_0003 (Deionized Water System Testing)

Additional working standards such as internal thermometers, etc. are checked using the frequency summarized in Table 23-3 in Section 23 – "Calibration Requirements" or in the test SOPs.

24.3 Transport and Storage of Reference Standards and Materials

The laboratory handles and transports reference standards and materials in a manner that protects the integrity of the materials. Reference standard and material integrity is protected by separation from incompatible materials and/or minimizing exposure to degrading environments or materials.

Reference standards and materials are stored according to manufacturer's recommendations, method SOP requirements and separately from samples, extracts and digestates, per SOPs listed above.

24.4 Labeling of Reference Standards, Reagents, and Reference Materials

The laboratory has procedures for purchase, receipt and storage of standards, reagents and reference materials. Purchase procedures are described in Section 9 – "Purchasing Services and Supplies".

Reagent quality is verified per SOPs listed above. The quality of water sources is monitored and documented per SOP 110_0003 and shall meet method specified requirements.

24.4.1 Stock Standards, Reagents, Reference Materials and Media

Records for all standards, reagents, reference materials, and media include:

- the manufacturer/vendor name (or traceability to purchased stocks or neat compounds)

- the manufacturer's Certificate of Analysis or purity (if supplied)
- the date of receipt
- recommended storage conditions

If the original container does not have an expiration date provided by the manufacturer or vendor it is not required to be labeled with an expiration date. If an expiration date is provided, it must be labeled with the expiration date.

In methods where the purity of reagents is not specified, analytical reagent grade is used. If the purity is specified, that is the minimum acceptable grade. Purity is verified and documented according to Section 9 – "Purchasing Services and Supplies".

24.4.2 Prepared Standards, Reagents, Reference Materials and Media

Records for standards, reagents, reference materials, and media preparation include:

- traceability to purchased stock or neat compounds
- reference to the method of preparation
- date of preparation
- an expiration date after which the material shall not be used
- preparer's initials (if prepared)

Refer to SOPs listed above.

All containers of prepared standards, reagents, or materials are labeled with a unique ID and an expiration date per SOPs listed above. The expiration date of the prepared standard shall not exceed the expiration date of the primary standard.

Prepared reagents are verified to meet the requirements of the test method per SOPs listed above. Verification can usually be achieved through the use of laboratory control standards.

Section 25

COLLECTION OF SAMPLES
(TNI V1:M2 – Section 5.7; ISO/IEC 17025/2005(E) - Clause 5.7)

When ESS Laboratory is not required to provide sampling services, the laboratory's responsibility in the sample collection process lies in supplying the sampler with the necessary coolers, reagent water, sample containers, preservatives, sample labels, custody seals, COC forms and packing materials required to properly preserve, pack, and ship samples to the laboratory.

When ESS Laboratory provides sampling and courier services, these procedures are described in the following SOPs:

10_0006	PCB Wipe Field Sampling Procedure
10_0007	Industrial Wastewater Sampling
10_0011	ISCO Maintenance
10_0012	Field Soil Sampling
10_0013	Groundwater Well Sampling
10_0016	Field pH Testing
10_0017	Sample Courier Service
10_0021	Drinking Water Sample Collection
10_0022	General Field Wipe Sampling Procedure

These SOPs include procedures for recording relevant data and operations relating to sampling that form part of the testing that is undertaken. These records include the sampling procedure used, the identification of the sampler, environmental conditions (if relevant) and diagrams or other equivalent means to identify the sampling location as necessary and, if appropriate, the statistics upon which the sampling procedures are based. These SOPs are available for use by the sampler at the location where sampling is undertaken.

Where the customer requires deviations, additions or exclusions from the documented sampling procedure, these shall be recorded in detail with the appropriate sampling data and shall be included in all documents containing test results, and shall be communicated to the appropriate personnel.

25.1 Sampling Containers

The laboratory offers clean sampling containers for use by clients. These containers, which may or may not contain preservative, are frequently purchased as such. Lots of pre-cleaned containers are only obtained from vendors who can supply certificates of compliance to USEPA OSWER directive #9240.0-05A (Specs/Guidance for Contaminant-free Sample Containers). In the event that ESS has to purchase containers without certificates of compliance, these containers are lot-checked for contamination and the check results are tracked per SOP 80_0013 (Supplies Tracking).

25.1.1 Preparing Container Orders

Containers (containing any required preservatives) are provided to the client upon request per SOP 10_0017 (Courier Service). Bottle orders are made by telephone, e-mail or via the ESS Lab website; in all cases a bottle order request form is completed per SOP 10_0017.

25.1.2 Sampling Containers, Preservation Requirements, Holding Times

Sampling container, preservation and holding time requirements can be found in SOP 10_0001, Attachment A, which is also available to clients on the ESS website as a pdf document.

If preservation or holding time requirements are not met, the procedures in Section 12 – "Control of Nonconforming Environmental Testing Work" are followed.

25.2 Sampling Plan

The laboratory uses sampling plans provided by clients or prepared in consultation with the client. The plan must include any factors that must be controlled to ensure the validity of the test. Sampling plans and written sampling procedures are used for sampling substances, materials or products for testing. The plan and procedures are made available at the sampling location.

The laboratory's procedures for dealing with nonconformances are used when the client requests any deviations from the sampling plan or sampling procedures. The requests are documented and included in the final test report.

25.3 Sampling Records

The following relevant sampling data are recorded: sampling procedure used, the date and time of sampling, the identification of the sampler, environmental conditions (if relevant), the sampling location, and any other pertinent information which may be necessary to protect the integrity of the test or calibration item, and to protect the interests of the laboratory and the customer.

Section 26

HANDLING SAMPLES AND TEST ITEMS
(TNI V1:M2 – Section 5.8 and Section 1.7 of Technical Modules TNI V1:M4; ISO/IEC 17025/2005(E)-Clause 5.8)

26.1 Sample Receipt

When samples are received at the laboratory, chain-of-custody is reviewed, condition is documented, samples (and bottles/vials) are given unique identifiers, and they are logged into the sample tracking system, in accordance with SOPs 10_0001 (Sample Receiving), 70_0006 (Bar Coding) and 70_0008 (Sample Login).

26.1.1 Chain of Custody

The chain of custody or sample submission sheets from the field are reviewed. This documentation is completed in the field and provides a written record of the handling of the samples from the time of collection until they are received at the laboratory. Section 25 – "Collection of Samples" outlines what information is needed on this record. The chain of custody form also provides information on what type of testing is being requested and can act as an order for laboratory services in the absence of a formal contract. A typical chain of custody form can be found in Figure 26-1 below and in SOP 10_0001. Chain of custody and any additional records (which may include special instructions, reporting limit requirements etc.) received at the time of sample submission are maintained by the laboratory. These are scanned by the sample receiver, filed as PDFs in an appropriate network directory and are available for use by analysts should testing need to begin before work has been formally logged into the LIMS. These scanned chains are also available for use in subcontracted record keeping.

26.1.1.1 Legal Chain of Custody

The laboratory has procedures (see above) for legal chain of custody services. If samples are noted as being used for legal/evidentiary purposes, the chain of custody followed by the laboratory ensures that pertinent regulatory requirements are met.

The legal COC protocol records shall establish an intact, continuous record of the physical possession, storage and disposal of used sample containers, collected samples, sample aliquots, and sample extracts or digestates, collectively referred to below as "samples". The COC records shall account for all time periods associated with the samples. For ease of discussion, the above-mentioned items shall be referred to as samples:

a) A sample is in someone's custody if:

i) It is in one's actual physical possession;
ii) It is in one's view, after being in one's physical possession;

iii) It has been in one's physical possession and then locked or sealed so that no one can tamper with it; and/or
iv) It is kept in a secure area, restricted to authorized personnel only.

b) The COC records shall identify all individuals who physically handled individual samples. Proof of custody is accomplished via the laboratory's bar-coding and LIMS.

c) Should it become necessary to subcontract any testing to an off-site facility (refer to Section 8), custody must continue to be maintained.

d) Normal practice is for a laboratory courier to deliver sampling containers in accordance with SOP 10_0017 (Sample Courier Service).

26.2 Sample Acceptance

Procedures for opening shipping containers and examining samples are provided in SOP 10_0001 (Sample Receiving).

When samples are received outside of normal business hours, the second shift sample receiver takes care of all samples that still need to be received; bar coding samples, scanning the COCs as PDFs, logging COCs into the LIMS (except where projects need to be set up) and placing the bar coded samples onto carts (in order) to be 2nd level reviewed by the end of the second shift. If necessary, the carts with non-volatile samples are stored in a "Walk-in" refrigerator and samples for volatiles analysis are stored in their appropriate fridges/freezers.

The laboratory has a sample acceptance policy that is followed by sample collection personnel and is posted in the sample receiving area and on the company website. It emphasizes the need for use of water-resistant ink, providing proper documentation (to include sample ID, location, date and time of collection, collector's name, preservation type, sample type and any special remarks about the sample), labeling of sample containers to include a unique sample ID, use of appropriate containers, adherence to holding times, and sample volume requirements. ESS has strict policies in effect that limit the acceptance of hazardous chemical samples without an accompanying Safety Data Sheet (SDS). No radioactive samples are accepted. In addition the laboratory has nonconformance/corrective action procedures to handle samples that don't meet the requirements above or show signs of damage, contamination or inadequate preservation. Data will be appropriately narrated where samples are reported that do not meet sample acceptance requirements.

The laboratory checks samples for the conditions above per SOP 10_0001, where appropriate, to evaluate sample acceptance. Criteria regarding preservation, holding time and sample volume requirements can be found in SOP 10_0001, Attachment A. If these conditions are not met, the client is contacted by the project manager prior to any further processing, then 1) the sample is rejected as agreed with the client, 2) the decision to proceed is documented and agreed upon

with the client, 3) the condition is noted on the Chain of Custody form and/or lab receipt documents, and 4) the data are qualified in the report.

26.2.1 Preservation Checks

The following preservation checks are performed and documented upon receipt:

26.2.1.1 *Thermal preservation:*

a) For temperature preservation of samples at 4°C, the acceptable range is from just above freezing to ≤6°C. Samples which need to be kept frozen are stored at ≤-10°C.

b) Samples that are delivered to the lab the same day as they are collected are likely not to have reached a fully chilled temperature. This is acceptable if the samples are received on ice and the chilling process has begun.

c) Record on the receipt form if ice is present and the temperature.

26.2.1.2 *Chlorine checks:*

d) Laboratories that receive samples from potable water supplies (including source water) that have a demonstrated history of acceptable preservation may check a sample from each client at a frequency of once per month if:

i) the laboratory can show that the received sample containers are from their laboratory;

ii) sufficient sodium thiosulfate was in each container before sample collection to neutralize at minimum 5 mg/l of chlorine for drinking water and 15 mg/l of chlorine for wastewater samples;

iii) one container from each batch of laboratory prepared containers or lot of purchased ready-to-use containers is checked to ensure efficacy of the sodium thiosulfate to 5 mg/l chlorine or 15 mg/l chlorine as appropriate and the check is documented;

iv) chlorine residual is checked in the field and actual concentration is documented with sample submission.

26.2.1.3 *Chemical Preservation:*

e) Chemical preservation should be checked at the time of sample receipt unless it is not technically acceptable to do so (e.g., VOC analyses; samples received after hours when sample receiver might be working alone) and this requirement will normally be followed. When other programs (e.g. TNI, MCP, RCP) permit, then procedures for checking sample preservation using readily available techniques (such as pH or chlorine) at the time of sample preparation or analysis, shall be implemented. Chemical preservation of samples for volatile organic compound analysis may be checked after

analysis. The sample receiving procedure is detailed in SOP 10_0001.

If any of the following conditions exist, chemical preservation must be rechecked in the laboratory:

i) Continued preservation of the sample is in question (e.g., the sample may not be compatible with the preservation); or

ii) Deterioration of the preservation is suspected.

26.2.2 Rush/Short Hold Time Samples

The laboratory ensures that the appropriate laboratory personnel are notified when samples are received with a quick turn-around time request, short hold times, or a short amount of hold time is remaining, per SOPs 10_0001 and 10_0002.

26.2.3 Radioactive Samples

The laboratory does not accept radioactive samples. The laboratory routinely tests samples for radioactivity per SOP 10_0001. Samples found to be radioactive samples will be isolated and arrangements made to return them to sender.

26.2.4 Non-routine Samples

Samples that require non-routine or additional sample preparation steps are accepted by pre-arrangement with the client.

26.2.5 On-Hold Samples

Samples may be stored in the Sample Receiving area refrigerator, pending client's instructions on when and how to proceed with testing.

26.3 Sample Identification

Samples, including subsamples, extracts and digestates, are uniquely identified in a permanent chronological record in the LIMS, per the aforementioned SOPs, to prevent mix-up and to document receipt of all sample containers.

Samples are assigned sequential numbers that reference more detailed information kept in the Project Number Login, per SOP 10_0001.

The following information is included in this log:

- Client or project name
- Container type
- Unique laboratory identification number
- Signature or initials of person making the entries
- Subcontracting information
- Turn Around Time

In addition, the following information is maintained and linked to the log-in record:

- Date and time of sampling linked to the date and time of laboratory receipt.
- Unique field identification number linked to the laboratory sample ID.
- Analyses requested (including applicable approved method numbers) linked to the laboratory sample ID, per COC.
- Cooler receipt information.
- Comments regarding rejection (if any).

All documentation received regarding the sample, such as memos or chain of custody, are scanned into an electronic project folder for permanent retention.

26.4 Sample Aliquots / Subsampling

In order for analysis results to be representative of the sample collected in the field, the laboratory has subsampling procedures. See SOP 10_0001 Attachment G.

26.5 Sample Storage

Storage conditions are monitored for any required criteria, verified, and the verification recorded in logbooks.

Samples that require thermal preservation are stored under refrigeration that is ±2°C of the specified preservation temperature unless regulatory or method specific criteria require something different. For samples with a specified storage temperature of 4°C, storage at a temperature above the freezing point of water to ≤6°C is acceptable.

Samples are held secure, as required. Samples are accessible only to laboratory personnel.

Samples are stored apart from standards, reagents, food or potentially contaminating sources and such, so that cross-contamination is minimized/eliminated. All portions of samples, including extracts, digestates, leachates, or any product of the sample is maintained according to the required conditions.

Samples with potentially high levels of volatile organics, cyanide or restricted (foreign) soil are stored in refrigerators/freezers designated for these purposes.

Refrigerator blanks are stored with samples in volatile sample refrigerators, and are analyzed weekly to check for possible cross-contamination.

26.6 Sample Disposal

Samples are retained a minimum of 30 days after completion of testing unless other arrangements have been made with the client; samples are then disposed of appropriately or returned to client (if requested).

Samples are disposed of according to Federal, State and local regulations. Procedures are described in SOP 10_0002 (Sample Storage) and 90_0002 (Hazardous Waste Contingency), for the disposal of samples, digestates, leachates, and extracts.

26.7 Sample Transport

Samples that are transported under the responsibility of the laboratory, where necessary, are done so safely and according to storage conditions. This includes moving bottles within the laboratory. Specific safety operations are addressed outside of this document.

Sample shipping procedures are described in SOP 10_0017 (Courier Service).

Figure 26-2 Sample Acceptance Policy

ESS Laboratory Sample Acceptance Policy

The following criteria are used by ESS Laboratory to define its sample acceptance policy for regulatory samples:

ESS Laboratory is an environmental analytical laboratory and as such is prepared to handle environmental samples. These include soils, sediments, ground waters, surface waters, and drinking waters. All other samples require notification prior to sending to the laboratory. ESS Laboratory will make provisions to accept caulk, oil, tissue, concrete and other types of matrices. ESS Laboratory will not receive radioactive samples, untreated sewage, samples containing body fluids, or acutely hazardous materials. If client is sending any type of chemical, it must be accompanied by a material safety data sheet.

Samples should be received in coolers on ice and clearly labeled. Tissue samples must be shipped and stored frozen at less than -10°C.

Samples must be received with paperwork (Chain of Custody – available in .pdf or .xls formats) detailing name of sample, date collected, time collected, number of bottles, and analyses required. Chain of Custody (COC) should also include client contact information and any special handling requirements. All samples must be relinquished to the laboratory and received by the laboratory and this information must be documented clearly and legibly on the COC in indelible ink.

Samples should be taken in appropriate containers with appropriate preservation. Refer to the ESS Guide to Sample Handling and Preparation table. Bottles will be furnished upon request.

Upon arrival at the laboratory, ESS will take the temperature of the cooler and record it on the COC and the cooler receipt form. The sample receiver will ensure that the samples are not radioactive and are in good condition (no leaks, air bubbles, broken caps, etc). Samples will be lined up and compared to chain of custody. The COC is signed, formally indicating receipt.

Samples will be assigned a unique barcode ID. A cooler receipt form will be generated and reviewed by the Customer Services Department. All deviations such as temperature, inadequate preservation, insufficient volumes and hold time issues will be recorded. The client will be notified and required to address all deviations before work is initiated on the samples. If the laboratory is required to preserve unpreserved samples, a notation will be made on the cooler receipt form. If the preservation is outside of regulations, the report will contain a statement recording this issue. All deviations outside of regulatory controls will be qualified in the report narrative.

Section 27

QUALITY ASSURANCE FOR ENVIRONMENTAL TESTING *(TNI V1:M1, V1:M2 - Section 5.9, V1:M4 - Section 1.7; ISO/IEC 17025/ 2005(E)-Clause 5.9)*

ESS Laboratory has procedures for monitoring the validity of the testing it performs. The qualities of test results are recorded in such a way that trends are detectable, and where practicable, are statistically evaluated. To evaluate the quality of test results, the laboratory uses certified reference materials, control charting, replicate or confirmational analyses, retesting of retained sample(s) (which may be at a dilution) and correlation of results for different characteristics of a sample.

In addition to procedures for calibration (Section 23 & Appendix F), the laboratory monitors quality control measurements such as blanks, laboratory control samples or blank spikes (LCS/BS), matrix spikes (MS), duplicates, surrogates and internal standards to assess precision and accuracy. Proficiency Testing samples are also analyzed to assess laboratory performance.

Quality control data are analyzed and, when found to be outside pre-defined criteria, action is taken to correct the problem and to prevent incorrect results from being reported. Data associated with quality control data outside of criteria and still deemed reportable will be qualified so the end user of the data may make a determination of the usability of the data - see Section 28 – "Reporting of Results".

27.1 Essential Quality Control Procedures

The quality control procedures specified in test methods are followed by laboratory personnel. The most stringent of control procedures is used in cases where multiple controls are offered. If it is not clear which are the most stringent, those mandated by test method or regulation are followed.

Acceptance criteria are commonly defined in the QC sections of the test method SOPs. For test methods that do not provide acceptance criteria for an essential quality control element or where no regulatory criteria exist, acceptance criteria are developed per SOP 110_0014 (Control Charts). In some instances, the client may set criteria. In any event, acceptance criteria are entered in the Element LIMS under the pertinent test code.

Written procedures to monitor routine quality controls including acceptance criteria are located in the test method SOPs, except where noted, and include such procedures as:

- Use of laboratory control samples and blanks to serve as positive and negative controls for chemistry methods.
- Use of laboratory control samples to monitor test variability of laboratory results;

- Use of calibrations, continuing calibrations, certified reference materials and/or PT samples to monitor accuracy of the test method;
- Measures to monitor test method capability, such as limit of detection, limit of quantitation, and/or range of test applicability, such as linearity;
- Use of regression analysis, internal/external standards, or statistical analysis to reduce raw data to final results;
- Use of reagents and standards of appropriate quality and use of second source materials as appropriate;
- Procedures to ensure the selectivity of the test method for its intended use; &
- Measures to assure constant and consistent test conditions, such as temperature, humidity, rotation speed, etc., when required by test method.

27.2 Internal Quality Control Practices

Analytical data generated with QC samples that fall within all prescribed acceptance limits indicate the test method is deemed to be in control.

QC samples that fall outside QC limits indicate the test method are deemed to be out of control (nonconforming) and that corrective action is required and/or that the data are qualified (see Section 12 – "Control of Nonconforming Environmental Testing Work" and Section 14 - "Corrective Actions").

Detailed QC procedures and QC limits are included in test method standard operating procedures (SOPs), or where unspecified in the SOPs, are detailed in e-mail directives pending formal addition to SOPs.

All QC measures are assessed and evaluated on an on-going basis, so that trends are detected and prompt corrective action may be scheduled, if needed.

27.2.1 General Controls

The following general controls are used:

27.2.1.1 Positive and Negative Controls such as:

a) Blanks (negative)
b) Laboratory control sample (positive)

27.2.1.2 Selectivity is assured through:

a) Absolute and relative retention times in chromatographic analyses (referenced in sops);
b) GC/MS (full scan or SIM) or two-column (dissimilar stationary phases) confirmation if composition of samples is not well characterized, as is the case when using non-specific detectors;

c) Use of acceptance criteria for mass-spectral tuning (found in test method SOPs); and

d) Use of the correct method according to its scope, assessed during method validation.

27.2.1.3 Consistency, Variability, Repeatability, and Accuracy are assured through:

a) Proper installation and operation of instruments according to manufacturer's recommendations or according to the processes used during method validation;

b) Monitoring and controlling environmental conditions (temperature, access, proximity to potential contaminants);

c) Selection and use of reagents and standards of appropriate quality (referenced in SOPs); and

d) Cleaning glassware appropriate to the level required by the analysis as demonstrated with method blanks, per glassware cleaning SOPs 30_0001 (metals) and 50_0001 (organic prep).

e) following sops and documenting any deviation, assessing for impact, and treating data appropriately;

f) Testing to define the variability and/or repeatability of the laboratory results, such as via replicates;

g) Use of measures to assure the accuracy of the test method, including calibration and/or continuing calibrations (detailed in Appendix F), use of certified reference materials, proficiency test samples, or other measures.

27.2.1.4 Test Method Capability (also see Section 22 – "Environmental Methods and Method Validation") is assured through:

a) Establishment of the limit of detection, where appropriate;

b) Establishment of the limit of quantitation or reporting level; and/or

c) Establishment of the range of applicability such as linearity.

27.2.1.5 Data reduction is assured to be accurate by:

a) Selection of appropriate formulae to reduce raw data to final results such as regression;

b) Following specific procedures for data reduction such as manual integration procedures; and

c) Periodic review of data reduction processes to assure applicability;

27.2.1.6 Sample Specific controls are used to evaluate the effect of sample matrix on the performance of the selected analytical method (not a measure of laboratory performance):

Examples:

- Matrix Spike and Matrix Spike Duplicate (MS/MSD)
- Surrogate Spikes
- Sample Duplicates

27.2.1.7 Tables summarizing the required elements of a quality control system (data quality objectives) by various regulatory bodies may be found in the pertinent test SOPs.

27.2.2 Specific Controls

27.2.2.1 Method Blanks

Method blanks are processed along with and under the same conditions as the associated samples to include all steps in the method. A method blank must be analyzed at a minimum of one per preparation batch. When no separate preparation method is used the batch is defined as the environmental samples that are analyzed with the same method and personnel, using the same lots of reagents, not to exceed the analysis of twenty environmental samples, not including method blanks, LCS, BS, matrix spikes and matrix duplicates. The matrix of the method blank must be similar to the associated samples and be free from any analytes of interest. Method blanks are not required for some analyses such as pH, conductivity, flashpoint, temperature.

Contaminated blanks are identified according to the acceptance limits in the test method SOPs or laboratory documentation.

The laboratory identifies a blank as contaminated when analyte results are greater than the reporting limit and greater than 1/10th the amount measured in any associated sample, or 1/10th the regulatory limit, whichever is greater; or where the contaminant affects the sample results, per test method requirements or client data quality objectives.

When a blank is determined to be contaminated, the cause must be investigated and measures taken to minimize or eliminate the problem.

Data that are unaffected by the blank contamination (non-detects or other analytes) are reported unqualified.

Sample data that are suspect due to the presence of a contaminated blank are reanalyzed, qualified, or voided.

27.2.2.2 Laboratory Control Samples (Blank Spikes)

Laboratory Control Samples (LCS; BS) are prepared from analyte free water or other clean matrix, and spiked with verified and known amounts of analytes for the purpose of establishing precision or bias measurements.

The matrix spike (Section 27.2.2.3 below) may be used in place of this control as long as the acceptance criteria are as stringent as for the LCS.

Alternatively, the LCS may consist of a media containing known and verified concentrations of analytes or as Certified Reference Material (CRM). All analyte concentrations shall be within the calibration range of the methods. The following shall be used in choosing components for the spike mixtures:

The components to be spiked shall be as specified by the mandated method or regulation or as requested by the client. In the absence of specified spiking components, the laboratory shall spike per the following:

a) for those components that interfere with an accurate assessment, such as spiking simultaneously with technical chlordane, toxaphene and PCBs, the spike shall be chosen that represents the chemistries and elution patterns of the components to be reported; and

b) for those methods that have extremely long lists of analytes, a representative number may be chosen. The analytes selected shall be representative of all analytes reported.

The following criteria shall be used for determining the minimum number of analytes to be spiked. However, the laboratory shall insure that all targeted components are included in the spike mixture over a two (2) year period:

Laboratory control samples are analyzed at a frequency mandated by method, regulation, or client request, whichever is more stringent. The standard frequency of LCS preparation and analysis is at least one per analytical batch or as otherwise stated in a laboratory SOP. Exceptions would be for those analytes where no spiking solution is available, such as pH, color, odor, temperature. When no separate preparation method is used, the batch is defined as the environmental samples that are analyzed with the same method and personnel, using the same lots of reagents, not to exceed the analysis of twenty environmental samples, not including method blanks, LCS, matrix spikes and matrix duplicates.

The analytes to be spiked in the LCS are specified in the test method SOP. In some cases a client may specify a list of analytes for spiking and the request is handled using the laboratory’s nonconformance procedures.

The results of laboratory control samples (LCS) are calculated in percent recovery or other appropriate statistical technique that allows comparison to established acceptance criteria. The laboratory documents the calculation in the pertinent test method SOP.

The individual LCS is compared to the acceptance criteria as published in the mandated test method, or where there are no established criteria,

the laboratory uses in-house established limits as described in SOP 110_0014.

The TNI Standard allows certain marginal exceedances for target analytes, as follows (these are also specified in the test SOPs):

Number of analytes in LCS	Number of allowed exceedances
> 90	5
71 – 90	4
51 – 70	3
31 – 50	2
11 – 30	1
< 11	0

When the acceptance criteria for the positive control are exceeded high (i.e., high bias) and there are associated samples that are non-detects, then those non-detects may be reported with data qualification; or when the acceptance criteria for the positive control are exceeded low (i.e., low bias), those sample results may be reported if they exceed a maximum regulatory limit/decision level, with data qualifying codes.

27.2.2.3 Matrix Spikes and Matrix Spike Duplicates

Matrix Spikes and Matrix Spike Duplicates (MS/MSD) are environmental samples fortified with a known amount of analyte to help assess the effect of the matrix on method performance.

The laboratory procedure for MS/MSD includes spiking appropriate analytes at appropriate concentrations, calculating percent recoveries and relative percent difference (RPD), and evaluating and reporting the results. The procedure can be found in the pertinent method SOP.

Where there are no established criteria, MS/MSD criteria are established in the same manner as that described above for LCS.

For MS/MSD results outside established criteria, corrective action is documented or the data are reported with appropriate data qualification; an inability to meet QC criteria may result from matrix interference and if this is the case, then it will be so narrated in the final report. Only data from the parent spiked sample is qualified.

27.2.2.4 Surrogate Spikes

Surrogate spikes are substances with chemical properties and behavior similar to the analytes of interest and are used to assess method performance in individual samples. Surrogates are added to all samples (in test methods where surrogate use is appropriate) prior to sample preparation or extraction.

Surrogate recovery results are compared to the acceptance criteria as published in the mandated test method. Where there are no established criteria, the laboratory follows the procedures described above in Section 27.2.2.2 to derive surrogate control limits.

For surrogate results outside established criteria, data are evaluated to determine the impact. Corrective actions are detailed in the respective SOPs.

27.3 Proficiency Test (PT) Samples or Interlaboratory Comparisons

27.3.1 Compliance to Accreditation Requirements

The laboratory analyzes at least two TNI-compliant PT samples per calendar year for each of the Fields of Proficiency Testing (FoPT) for which the laboratory is NELAC accredited. An exception is made for analytes where there is no PT available from any PTPA approved PT provider at least twice per year. In these cases the lab will run the PTs in the minimum time frame the PTs are available and not at all if they are not available.

The successive PTs are analyzed at least five months apart and no more than 7 months apart unless the PT is being used for corrective action to maintain or reinstate accreditation, in which case the dates of successive PT samples for the same accreditation FoPT is at least fifteen days apart.

27.3.2 PT Sample Handling, Analysis and Reporting

The laboratory does not share PT samples with other laboratories, does not communicate with other laboratories regarding current PT sample results, and does not attempt to obtain the assigned value of any PT sample from the PT provider.

Proficiency Testing samples are treated as typical samples in the normal production process where possible, including the same analysts, preparation, calibration, quality control and acceptance criteria, sequence of analytical steps, number of replicates, and sample log-in. PT samples are not analyzed multiple times unless routine environmental samples are analyzed multiple times. Where PT samples present special problems in the analysis process, they will be treated as laboratory samples where clients have special requests.

The type, composition, concentration and frequency of quality control samples analyzed with the PT samples are the same as with typical samples.

Prior to the closing date of a study, laboratory personnel do not:

- Subcontract analysis of a PT sample to another laboratory being run for accreditation purposes.
- Knowingly receive and analyze a PT for another laboratory being run for accreditation purposes.

- Communicate with an individual from another laboratory concerning the analysis of the PT sample.

- Attempt to find out the assigned value of a PT from the PT Provider.

A result for any PT study parameter which is at a concentration above or equal to the LOQ (defined in Appendix F) shall be reported as the resultant value.

A result for any PT study parameter which is at a concentration less than the LOQ shall be reported as less than the value of the LOQ.

When a PT sample assigned value falls below the range of the routine method, a low level procedure needs to be used. The laboratory's procedures for testing low level samples (including PT samples) are outlined in the pertinent laboratory SOPs. The laboratory reports PT study results to the PT provider, in the provider's specified format, on or before the study closing date. The frequency at which PT study results are reported to a regulatory body is determined by the agency in question. On or before the closing date of a study the laboratory authorizes the PT Provider to release the laboratory's final evaluation report directly to pertinent regulatory bodies.

The laboratory institutes corrective action procedures for failed PT samples following the guidelines in Section 14 – "Corrective Action".

Retention of PT records, including data necessary to reconstruct results, is similar to that maintained for regular environmental samples, as specified in test SOPs. In addition the lab maintains a copy of the online data entry summary when the PT results are submitted online.

27.4 Data Review

The laboratory reviews all data generated in the laboratory for compliance with method, laboratory and, where appropriate, client requirements, in accordance with SOPs 70_0004 (Work Order Management), 70_0005 (Levels III and IV Data Review) and 70_0007 (Data Entry and Data Reporting in Element LIMS):

Electronic preparation bench sheets, instrumental analysis run logs and the Element LIMS are used to record the information required for traceability of the analysis. These records include quality control measurements and acceptance criteria. Data are recorded on the bench sheets/run logs promptly at the time of analysis, per SOP 80_0040 (Logbooks). The reportable values are highlighted in a new XLS workbook by the first reviewer and the preparation bench sheet is added to it to produce a combined document.

Analysts (Level I review) review sample data and QC information at the time of the analysis and indicate necessary information by marking the run log. The analyst signs the run log (dating/time is done automatically by the software program) to indicate that they have performed the steps listed and that the analysis meets acceptance criteria or has exceptions that are noted in the comments column of the run log.

When the analyst has finished the primary analysis review, the combined record is then used by the appropriate personnel to enter the data into the LIMS.

Another person, either in the QA Dept. or in the originating laboratory dept. (Level II review), checks the combined record for the following items:

a) All required information has been recorded in the combined record.
b) QC acceptance criteria or exceptions are documented in the comments column of the run log.
c) Manual calculations are checked for accuracy.

When these checks have been completed, the second reviewer signs the combined record to show that the review has been performed.

When reporting data for methods requiring two column confirmation, project-specific reporting requirements are followed. If not available, method reporting requirements are followed. If these are not specified, report primary column results unless there is a scientifically valid and documented reason for not doing so, as specified in the test SOP and client agrees. These shall also be qualified in the test report and explained in the case narrative. Analyte presence is only indicated when confirmation is positive or cannot be discerned from interference.

The report is printed as a pdf and submitted to the approved signatories, who will normally be a QA Dept. data validator for final technical review (Level III review) and Admin. Dept. personnel for final administrative review (Level IV review). The final technical review includes verifying that the data entered on the worksheet has been appropriately transferred to the LIMS and that the data is coherent, that the QC results are acceptable, QC exceptions are appropriately reflected on the final report and that the results are in line with historical values, if known. Correlation of results for different characteristics of an item may also be considered.

The Level IV review is a final check of the work order to ensure that the three prior levels have been completed, any deviations have been noted in the project narrative, all sample analyses have been performed based on comparison with the COC, the final report was delivered to the client electronically or otherwise, and electronic data deliverables have been generated and submitted to the client as requested.

In addition, the Quality Manager or QA Officer shall review a minimum of 10% of all data packages for technical completeness and accuracy. This review (Level V review) is considered a part of overall data review and does not need to be completed before the data package is issued to the customer.

If electronic audit trail functions are available, they must be in use at all times, and associated data must be accessible. If the instrument does not have an audit trail, the laboratory must have procedures to record the integrity of the data. Refer to SOP 80_0040.

Section 28

REPORTING THE RESULTS
(TNI V1:M2 – Section 5.10; ISO/IEC 17025/2005(E) - Clause 5.10)

The result of each test performed is reported accurately, clearly, unambiguously, and objectively and complies with all specific instructions contained in the test method.

Laboratory results are reported in a test report that includes all the information requested by the client and necessary for the interpretation of the test results and all information required by the method used. Any information listed below in Section 28.1 which is not reported to the customer shall be readily available in the laboratory department/LIMS, which carried out the tests and/or calibrations.

Data are reported without qualification if they are greater than the lowest calibration standard, lower than the highest calibration standard, and without compromised sample or method integrity.

Test reports meeting the TNI/ISO 17025 standards are issued by electronic data transfer in PDF or, if requested, in spreadsheet format.

28.1 Test Reports

The report format has been designed to accommodate each type of test performed and to minimize the potential for misunderstanding or misuse.

Each test report generated contains the following information, unless dictated otherwise by contractual agreement:

a) A title, such as Certificate of Analysis;

b) The name and address of the laboratory, the location of the laboratory if different from the address; phone/fax number and web address;

c) Unique identification of the test report, such as a serial number, on each page and a pagination system that ensures that each page is recognized as part of the test report and a clear identification of the end of the report, such as 3 of 10;

d) The name, address of the client;

e) The project identification and location (if available);

f) The identification of the method used to detect and quantify the analytes of interest. Sample preparation procedures, if not included in the referenced analytical procedures, must also be referenced or described;

g) A description of, the condition of, and unambiguous identification of the sample(s) tested, including the client identification code;

h) The date of sample receipt when it is critical to the validity and application of the results, date and time of sample collection, dates the tests were performed, the time of sample preparation and analysis if the required holding time for either activity is less than or equal to 72 hours;

i) Reference to the sampling plan and procedures used by the laboratory where these are relevant to the validity or application of the results;

j) The test results, units of measurement, an indication of when results are reported on any basis other than as received (e.g. dry weight), failures identified by narrative and/or use of qualifiers (see SOP 70_0002 – Data Flagging).

k) The name, function, and signature or an equivalent electronic identification of the person authorizing the test report, and the date of issue;

l) Where relevant, a statement to the effect that the results relate only to the samples;

m) Any non-accredited tests or parameters shall be clearly identified as such to the client when claims of accreditation to regulatory standards are made in the analytical report or in the supporting electronic or hardcopy deliverables;

n) A statement that the report shall not be copied except in full without approval of the laboratory;

o) An Adobe® custom dynamic stamp stating "REVIEWED by ESS Laboratory at '*Time*' '*Date*' ";

p) Table of Contents, which may be generated electronically by the Adobe® software;

q) Date of issuance;

r) The date of sample extraction, if applicable to the analytical method performed, and the date of sample analysis.

28.2 Supplemental Test Report Information

When necessary for interpretation of the results or when requested for regulatory compliance, or when requested by the client, test reports include the following additional information (case narrative):

a) Deviations from, additions to, or exclusions from the test method, information on specific test conditions, such as environmental conditions, and any non-standard conditions that may have affected the quality of the results, and any information on the use and definitions of data qualifiers;

b) A statement of compliance/non-compliance when requirements of the management system are not met, including identification of test results that did

not meet the laboratory and regulatory sample acceptance requirements, such as holding time, preservation, etc.;

c) Where applicable and when requested by the client, a statement on the estimated uncertainty of the measurement; information on uncertainty is needed in test reports when it is relevant to the validity or application of the test results, when a customer's instruction so requires, or when the uncertainty affects compliance to a specification limit.

d) Where appropriate and needed, opinions and interpretations. When opinions and interpretations are included, the basis upon which the opinions and interpretations are documented. Opinions and interpretations are clearly marked as such in the test report case narrative.

e) Additional information which may be required by specific methods, regulatory agency or client (such as dates of extraction for test methods including extraction prodedures); and

f) Qualification of results with values outside the calibration range, as appropriate.

In addition to the items above, for test reports that contain the results of sampling, the following is provided when necessary for the interpretation of the results:

a) The date of sampling;

b) Unambiguous identification of the material sampled;

c) The locations of the sampling, including diagrams, sketches, or photographs;

d) A reference to the sampling plan and procedures used;

e) Details of any environmental conditions during sampling that may affect the interpretations of the test results;

f) Any standard or other specification for the sampling method or procedure, and deviations, additions to or exclusions from the specification concerned.

In addition to the requirements listed above, calibration certificates shall include the following, where necessary for the interpretation of calibration results:

28.3 Environmental Testing Obtained from Subcontractors

Test results obtained from tests performed by subcontractors are clearly identified on the test report by subcontractor name and/or accreditation number.

The subcontractors report their results in writing or electronically. A copy of the subcontractor's report, as received on their letterhead, is included in the test report.

28.4 Electronic Transmission of Results

All test results transmitted by telephone, fax, telex, e-mail, or other electronic means comply with the requirements of the TNI/ISO 17025 Standards and associated procedures protecting the confidentiality and proprietary rights of the client (see Section 22- "Environmental Methods and Method Validation").

28.4.1 Electronic Data Deliverables

The preparation and submission of electronic data deliverables in a prescribed format (e.g. SEDD, AECOM, CLP-Like) created using special software programs (Element LIMS, EDD Writer) is by contractual agreement and is designed to accommodate each type of test or calibration carried out and to minimize the possibility of misunderstanding or misuse.

28.5 Amendments to Test Reports

Material amendments (revisions) to a test report after it has been issued are made only in the form of another document or data transfer and must be approved by management. All supplemental reports meet all the requirements for the initial report and the requirements of this *Quality Manual*.

Amended test reports include the statement, "This report has been revised to……" in bold letters or an equivalent form of wording to assure they can be differentiated from other test reports.

When it is necessary to issue a complete new report, the new report is uniquely identified and contains a reference to the original that it replaces.

Appendix D

Laboratory Accreditation/Certification/Recognition

ESS Laboratory maintains the following certifications and accreditations with numerous state and national entities:

State/Federal Organization	Certificate Number
Connecticut DPH	PH-0750
Maine DEP	RI00002
Massachusetts DEP	M-RI002
New Hampshire DOH (NELAP Primary Accreditation Agency)	2424
New York State DOH	11313
Rhode Island DOH	LAI00179
New Jersey DEP	RI006
Pennsylvania DEP	68-01752
USDA (Foreign Soil Permit)	P330-18-00249

The certificates (with expiration dates) and parameter lists (which may differ) for each organization are filed in the QA Dept. files and may also be found in client reports, on the ESS Laboratory website and on the websites of the organizations identified above. Links to these organization websites are supplied in all clients' certificates of analysis. Certificates are on display in the ESS Laboratory conference room.

If accreditation is terminated or suspended, the laboratory will immediately cease to use the certificate number reference in any way and inform clients impacted by the change.

Appendix E

CONFLICT OF INTEREST AND UNDUE PRESSURE

It is the policy of ESS Laboratory to identify conflicts of interest involving the Laboratory and related parties, as well as to identify situations which may give rise to the appearance of a conflict of interest, and to address such conflicts and situations in a manner that will fully protect the integrity and reputation of the Laboratory, as well as related parties. All employees are expected to use good judgment, to adhere to high ethical standards, and to act in such a manner as to avoid any actual or potential conflict of interest. A conflict of interest occurs when the secondary personal, professional, or business interests of an employee conflict with the primary interests of the Laboratory.

When a secondary interest has inappropriate weight in a decision and distorts the pursuit of a primary interest, it is exerting undue influence.This policy is intended to supplement but not replace any applicable state and federal laws governing conflict of interest which are applicable to commercial organizations.

Such a policy works best when it is preventive and corrective rather than punitive. However, when a professional's judgment is actually distorted by the acceptance of a gift, the violation is no longer principally a conflict of interest but becomes a different kind of offense, one that may involve malpractice, scientific misconduct, or kickbacks.

Procedures:

- Upon or before hire or appointment and subsequently during annual performance review, each employee (manager, supervisor or analyst) shall disclose all direct or indirect financial interests that might benefit their private interest or may give the appearance of undue influence from outside parties thereby potentially resulting in a conflict of interest. This disclosure will be kept on file and will be updated as needed.

- Should there be any dispute as to whether a conflict of interest exists, the Director shall determine whether a conflict of interest exists for an employee, and shall determine the appropriate, fair and reasonable response.

- If the Director has reason to believe an individual has failed to disclose actual or potential conflicts of interest, the Director will inform the member and allow him/her to explain the alleged failure to disclose. If the Director still has reason to believe a conflict of interest exists after the alleged conflict is explained, the Director will take appropriate corrective action.

Principles for Identifying and Assessing Conflicts of Interest

The problem of conflict of interest is more complex than is often appreciated. As a result, both critics and defenders of conflict of interest policies sometimes misunderstand or misapply them.

A conflict of interest is not an actual occurrence of bias or a corrupt decision, but rather a set of circumstances that past experience and other evidence have shown poses a risk that primary interests may be compromised by secondary interests. Examples might be having financial interest in or working during off-hours for customer, competing or other companies, substance abuse etc. The existence of a conflict of interest does not imply that any individual is improperly motivated. To avoid these and similar misunderstandings and to provide guidance for formulating and applying such policies, a framework for assessing conflicts of interest is desirable.

Conflicts should be assessed by considering various factors that determine their likelihood and seriousness. Likelihood depends on the value of the secondary interest, the scope of the relationship between the professional and the secondary interest, and the extent of a professional's discretion. Seriousness depends on the value of the primary interest, the scope of the consequences that affect it, and the extent of accountability of the professionals. Conflict of interest policies should be evaluated by considering their effectiveness, transparency, accountability, and fairness.

Appendix F

Chemistry
(Sections 1.5 and 1.6 of Technical Module TNI V1:M4)

The lab is considered to have satisfied the requirements on analytical uncertainty by following recognized test methods and reporting instructions, in the absence of project specific instructions. Refer to Section 27.

F.1 Method Validation

Reference methods are validated by determining the LOD or LOQ, and precision and bias using the procedures outlined below.

Unless otherwise specified, the procedure for validating chemistry methods must include procedures for determining:

Establishment of SOPs

Limit of Detection (LOD) (must be in each quality system matrix to be used in the laboratory)

Limit of Quantitation/ Lower Limit of Quantitation (LOQ/LLOQ) - must be in each quality system matrix to be used in the laboratory

Evaluation of Precision and Accuracy (Bias)

Evaluation of Selectivity (see Section 27.2.1.2)

Demonstration of Capability

Calibration and calibration verification

Before any non-standard method is used in the laboratory, the laboratory determines the data quality indicators that must be used to ensure that the data are acceptable for the intended use. Based on the intended use, the laboratory establishes quality control acceptance criteria for precision, accuracy, selectivity (if applicable). Quality control procedures and acceptance criteria are consistent with those of similar standard methods or technologies, and must include the following:

i) Scope;

ii) Calibration and calibration verification;

iii) Interferences/Contamination, method/calibration blanks;

iv) Analyte identification;

v) Analyte quantitation;

vi) Selectivity;

vii) Sensitivity;

viii) Precision; and

ix) Bias.

Methods must be validated when modifications cause changes in stoichiometry, technology, mass tuning acceptance criteria, or quantitation ions to occur. Method modifications, as described in the Nov 20, 2007 USEPA Memorandum (incorporated here by reference) on method flexibility, are allowed.

a) Limit of Detection (LOD) (also see SOP 110_0013)

The Limit of Detection (LOD) is the laboratory's estimate of the minimum amount of an analyte in a given matrix that an analytical process can reliably detect in their facility (also known as Method Detection Limit, MDL)

LODs are not required for any component for which spiking solutions or quality control samples are not available. These include tests such as pH, temperature, BOD and specific conductance. If the laboratory is not reporting a value below the Limit of Quantitation, a Limit of Detection study is not required for many methods. The Method Detection Limit study is required for Clean Water Act methods

The laboratory will select methods with LODs that are expected to meet the intended data use.

LODs are determined in samples that represent the quality system matrices to be evaluated. All sample processing/preparation steps and all determinative steps are used to validate the method for all targeted analytes. The representative quality system matrix will be free from the target analytes of interest or interfering analytes that impact the LOD.

When the method or applicable regulation specifies a LOD study, only the specified method will be used. The laboratory documents the process used to derive the LOD and retains all the supporting data.

A Detection Limit (DL) is established based upon historical data or 40CFR Part 136 Appendix B (if required). The DL is used to determine the LOD for each analyte and matrix as well as for all preparatory and cleanup methods routinely used on samples.

After each DL determination, the laboratory establishes the LOD by spiking a quality system matrix at a concentration of at least 2 times but no greater than four times the DL (this procedure is based on the DoD QSM Standard requirement). This spike concentration establishes the LOD and the concentration at which the LOD shall be verified. It is specific to each suite of analyte, matrix, and method (including sample preparation/cleanup).

The "Definition and Procedure for the Determination of Method Detection Limit" revision 2, in 40 CFR part 136, Appendix B is followed for methods that fall under the Clean Water Act, as detailed in SOP 110_0013, Appendix C. For all other methods, as appropriate, the following requirements apply to the initial LOD establishment and to the LOD verifications:

Once the LOD has been determined, the validity of the LOD is verified by detection of each target analyte in a quality control sample of a representative quality system matrix. The concentration of the analytes in the sample will be no more than 3 times the derived LOD unless the test contains multiple analytes. In the latter case, the concentration of the target analytes will be no greater than 4 times the LOD, per the TNI 2009 Standard. This verification will be performed on each instrument that is used for the test.

The LOD, if required, shall be verified for each quality system matrix, technology, and analyte. However, not all possible combinations of preparation and cleanup techniques are required to have LOD/LOQ verifications. If LOD/LOQ verifications are not performed on all combinations, the laboratory must base the LOD/LOQ verifications on the worst case basis (preparation method with all applicable cleanup steps).

i) The apparent signal to noise (S/N) ratio at the LOD must be greater than zero and should normally be at least three; the results must meet all method requirements for analyte identification (e.g., ion abundance, second column confirmation, or pattern recognition). For data systems that do not provide a measure of noise, the signal produced by the verification sample should produce a result that is at least three standard deviations greater than the mean method blank concentration. This is initially estimated based on a minimum of four method blank analyses and later established with a minimum of 20 method blank results.

ii) If the LOD verification fails, then the laboratory must perform and pass two consecutive LOD verifications at a higher spike concentration and set the LOD at the higher concentration.

iii) The laboratory shall maintain documentation for all DL determinations and LOD verifications.

The LOD shall be verified annually. In situations where methods are setup and used on an infrequent basis, the laboratory may choose to perform LOD (and LOQ) verifications on a one per batch basis. All verification data will be in compliance, reported, and available for review.

LODs are performed/repeated:

- before reporting the LOD for a given analyte,
- any time there is a change that affects how the method is performed,
- when there is a change in instrumentation that affects the sensitivity of the analysis.

b) Limit of Quantitation (a/k/a Lower Limit of Quantitation)

The Limit of Quantitation (LOQ, LLOQ) is the minimum amount of a substance that can be reported with a specified degree of confidence.

If an LOD study is not performed, concentration values less than the Limit of Quantitation are not reported.

LOQs are not required for components or properties for which spiking solutions or QC samples are not available. These include tests such as pH, temperature, BOD and specific conductance

An LOQ study includes all sample processing and analysis steps in the analytical method. The study is performed for each analyte in each quality system matrix for which the test will be performed. The procedure is documented and all supporting data are retained.

The laboratory will verify the LOQ by the analysis of a QC sample containing the analytes of concern at a concentration of 1 to 2 times the derived (claimed) LOQ. The LOQ is considered verified if recovery of each analyte is within the laboratory's acceptance limits, or the client's data quality objectives. The LOQ must be greater than the LOD.

The LOQ will be verified annually for each quality system matrix, technology and analyte. However, the annual LOQ verification is not required if the LOD was determined or verified annually on that instrument.

c) Precision and Bias

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms.

Bias is the systematic error that contributes to the difference between the mean of a significant number of test results and the accepted reference value.

Precision and bias of a reference method is determined by using the Demonstration of Capability procedure (Section F.2 below).

Precision and bias using non-reference, modified reference or laboratory-developed methods are established using the procedure outlined as follows, and compared to the criteria established by the client (when requested), the method, or the laboratory.

Precision and bias are determined by processing samples through all phases of the method (sample preparation, cleanup, analysis, etc.) and are evaluated across the analytical calibration range of the method. This study is performed for all quality system matrices for which the test is to be used and the typical procedure is as follows:

1. Analyze in triplicate QC samples containing the analytes of concern at or near the limit of quantitation, at the upper-range of the calibration (upper 20%) and at a mid-range concentration.
2. Process these samples on different days as 3 sets of samples through the entire measurement system for each analyte of interest.
3. Each day, one QC sample at each concentration is analyzed.
4. A separate method blank shall be subjected to the analytical method along with the QC samples on each of the three days. (Note that the three samples at the LOQ concentration can demonstrate sensitivity as well).
5. For each analyst, calculate the mean recovery for each day, for each level over each day, and for all nine samples.
6. Calculate the relative standard deviation for each of the separate means obtained.
7. Compare the standard deviations for the different days and the standard deviations for the different concentrations.
8. If the different standard deviations are all statistically insignificant (e.g. F-test), then compare the overall mean and standard deviation with the established criteria from above.

d) Selectivity

Selectivity is the capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances.

The laboratory evaluates selectivity using the procedures described in Section 27.2.1.2 of this QA Manual and is defined further in the test method SOPs.

F.2 Demonstration of Capability

Demonstration of Capability (DOC): A procedure to establish the ability of the analyst to generate analytical results of acceptable accuracy and precision.

Before reporting any data with a given method, a satisfactory initial DOC is performed in accordance with F.2.(a) below and SOP 80_0016 (Training) Thereafter, each analyst demonstrates continuing proficiency through the procedures outlined in Ongoing Demonstration of Capability below.

a) Initial Demonstration of Capability (IDOC)

An IDOC is performed:

- Before using any method
- Each time there is a change in instrument type, personnel or method (or any change that could potentially affect the precision and bias, sensitivity or selectivity of the output), and

- If the laboratory or analysts has not performed the method in a preceding twelve-month period.

The IDOC(s) for each analyst is documented in the analysts' training files kept by the QA Dept. The document identifies the analyst(s) involved in preparation and/or analysis; matrix; analyte(s), class of analyte(s), or measured parameter(s); the method(s) performed; the laboratory-specific SOP used for analysis (including revision number); the date(s) of analysis; and a summary of the results used to calculate the mean recovery and standard deviations.

All raw data, preparation records, and calculations for each IDOC are retained and are available for review.

When methods specify procedures to be followed only those procedures will be used. If no procedures are specified, the laboratory uses its own procedure (per SOP 80_0016 and below). SOP 80_0016 is documented in the QA Dept. master SOP files and also in the relevant departmental files.

Process for Initial DOC:

a) A quality control sample is obtained from an outside source. If not available, the QC is prepared using stock standards that are prepared independently from those used in instrument calibration.

b) The analyte(s) is diluted in a volume of clean quality system matrix sufficient to prepare four aliquots at the concentration specified, or if unspecified, to a concentration of 1-4 times the limit of quantitation.

c) At least four aliquots are prepared and analyzed according to the test method either concurrently or over a period of days.

d) Using all of the results, calculate the mean recovery in the appropriate reporting units and the standard deviations of the population sample (in the same units) for each parameter of interest. When it is not possible to determine mean and standard deviations, such as for presence/absence and logarithmic values, the performance is assessed against established and documented criteria.

e) Compare the information from (d) above to the corresponding acceptance criteria for precision and accuracy in the test method (if applicable) or in laboratory-generated acceptance criteria (if mandatory criteria have not been established). If all parameters meet the acceptance criteria, the analysis of actual samples may begin. If any one of the parameters do not meet the acceptance criteria, the performance is unacceptable for that parameter. The acceptance criteria must be defined prior to the analyst performing the method.

f) When one or more of the tested parameters fail at least one of the acceptance criteria, the analyst must proceed according to 1) or 2) below.

    1. Locate and correct the source of the problem and repeat the test for all parameters of interest beginning with c) above.

2. Beginning with c) above, repeat the test for all parameters that failed to meet criteria.

Repeated failure, however, confirms a general problem with the measurement system. If this occurs, the source of the problem is located and corrected and the test repeated for all compounds of interest beginning with c).

b) Ongoing Demonstration of Capability

After the demonstration of capability is completed, on-going proficiency is maintained and demonstrated at least annually. Each analyst is expected to consistently meet the QC requirements of the method, the laboratory SOP, client requirements and/or the TNI Standard. Ongoing DOCS are documented in the analysts' training files kept by the QA Dept. and all records related to the demonstration are retained.

The laboratory uses the following procedure described in SOP 80.0016 and below to demonstrate ongoing DOC:

Process for Ongoing (a/k/a Continuing) DOC:

a) Acceptable performance of a blind sample (single blind to the analyst). Successful analysis of a blind performance sample on a similar method using the same technology (e.g., GC/MS volatiles by purge and trap for Methods 524.2, 624 or 5030/8260) would only require documentation for one of the tests.;

b) Another initial DOC;

c) At least four (4) consecutive (as listed chronologically in the LIMS database) laboratory control samples with acceptable levels of precision and accuracy. The laboratory shall determine the acceptable limits for precision and accuracy prior to analysis. The laboratory shall tabulate or be able to readily retrieve four (4) consecutive passing laboratory control samples (LCS) for each method for each analyst each year;

d) A documented process of analyst review using quality control (QC) samples. QC samples can be reviewed to identify patterns for individuals or groups of analysts and determine if corrective action or retraining is necessary; or

e) If a) through d) are not technically feasible, then analysis of real-world samples with results within predefined acceptance criteria (as defined by the laboratory or method) shall be performed.

F.3 Calibration

Section 23.2.2 includes information on calibration of support equipment. This Section covers calibration of analytical equipment.

Initial instrument calibration and continuing instrument calibration verification are an important part of ensuring data to be of known and documented quality. If more stringent calibration requirements are included in a mandated method or by regulation, those calibration requirements override any requirements outlined here or in laboratory SOPs. Generally, procedures and criteria regarding instrument calibrations are provided in test SOPs.

F.3.1 Initial Instrument Calibration

- Records:

  Initial instrument calibration includes calculations, integrations, acceptance criteria, and associated statistics referenced in the test method SOP. Sufficient raw data records are collected and retained to allow reconstruction of the initial instrument calibration. These include, at a minimum, calibration date, test method, instrument, analysis date, analyte names, analysts signature or initials, concentration and response, calibration curve or response factor, or unique equation or coefficient used to reduce instrument responses to concentration. Calibration date and expiration date (when recalibration is due) is documented for equipment requiring calibration, where practicable (see Section 23.1).

- Number of Standards and Concentrations:

  If the reference or mandated method does not specify the number of calibration standards to use, the minimum number is three for inorganic analyses and five for organic analyses, not including blanks or a zero standard, except as noted below. All reported analytes and surrogates shall be included in the initial calibration. Reported results for all analytes and surrogates shall be quantified using a multipoint calibration curve, except as noted above. Exclusion of calibration points without a scientifically valid technical justification is not permitted.

  For instrumentation where single point calibration is recommended by manufacturer's instructions, such as with some ICP and ICP/MS technologies (with a zero and single point calibration), the following apply:

  a) For single point plus zero blank calibrations, the zero point and the single point standard are analyzed prior to the analysis of samples, and the linear range of the instrument established by analyzing a series of standards, one of which is at the lowest quantitation level.

  b) Zero blank and single point calibration standards are analyzed with each analytical batch for methods where they are specified.

  c) A standard corresponding to the limit of quantitation is analyzed with each analytical batch and must meet established acceptance criteria when using single point plus zero blank calibrations.

  d) The linearity of single point plus zero blank calibrations is verified at a frequency established by the method or the manufacturer.

The lowest calibration standard is the lowest concentration for which quantitative results can be reported without qualification. The lowest calibration standard is at or below the Limit of Quantitation (LOQ) and is greater than the Limit of Detection. Results that are less than the LOQ are considered to have increased uncertainty, and are either reported with a qualifier code or explained in the case narrative.

The highest calibration standard is the highest concentration for which quantitative results can be reported. Data reported exceeding the highest calibration standard without dilutions (which must be done if sufficient sample volume and holding time permit) is considered to have increased uncertainty and are reported with a qualifier code or reanalyzed and explained in the case narrative. However, for metals analysis with a single point calibration, the laboratory may report a sample result above the quantitation range if the laboratory analyzes and passes a CCV that exceeds the sample concentration but is within the linear dynamic range.

- Evaluation, Verification and Corrective Action

  All initial instrument calibrations are verified with a standard obtained from a second source traceable to a national standard when commercially available. If a second source is not available, a standard prepared from a different lot (independently prepare from different source materials) may be used. Concentration of the second source shall be at or near the midpoint of the calibration range.

  Criteria for the acceptance of an initial instrument calibration is established (e.g., correlation coefficient or relative percent difference) and defined in the test SOP. The criteria used are appropriate to the calibration technique and must be at least as stringent as those for the continuing calibration verification (CCV).

  Where appropriate, the laboratory has manual integration procedures (SOP 110_0016 (Manual Integration Policy and Procedure) that are adhered to when evaluating calibration data.

  Any samples that are analyzed after an unacceptable initial calibration are re-analyzed or the data are reported with qualifiers, appropriate to the scope of the unacceptable condition (see Section 12 – "Control of Nonconforming Environmental Testing").

  Quantitation is always determined from the initial calibration unless the test method or applicable regulations require quantitation from the continuing instrument calibration verification.

  Corrective actions are performed when the initial calibration results are outside acceptance criteria. Calibration points are not dropped from the middle of the curve unless the cause is determined and documented. If the cause cannot be determined, the calibration curve is re-prepared. If the low or high calibration point is dropped from the curve, the working curve is adjusted and sample results outside the curve are qualified.

F.3.2 Continuing Instrument Calibration

- Records

  The calculations and associated statistics for continuing instrument calibration are included or referenced in the test method SOPs. The concentration of the CCV standard is greater than the low calibration standard and less than or equal to the midpoint of the calibration range. All CCVs must be analyzed and reported. If a CCV fails, reanalysis or corrective action must be taken.

  Sufficient raw data records are retained to allow reconstruction of the continuing instrument calibration verification. Continuing instrument calibration verification records connect the continuing verification date to the initial instrument calibration.

  Where appropriate, the laboratory has manual integration procedures, detailed in SOP 110_0016 that are adhered to when evaluating calibration data.

- Frequency

  Calibration shall be verified for each compound, element, or other discrete chemical species, except for multi-component analytes such as Aroclors, Chlordane, Total Petroleum Hydrocarbons, or Toxaphene, where a representative chemical, related substance or mixture can be used.

  Calibration verifications are performed:

  - At the beginning and end of each analytical batch. For methods employing internal standards, a single verification is performed at the beginning of the analytical batch, per the TNI Standard. Some methods have more frequent CCV requirements (see specific SOPs). Many inorganic methods require the CCV to be analyzed after every 10 samples.
  - Whenever it is expected that the analytical system may be out of calibration or might not meet verification acceptance criteria.
  - When the time period for calibration or the most recent calibration verification has expired.
  - For all analytical systems that have a calibration verification requirement. Requirements can be found in the method SOPs.
  - Before sample analysis, after every 10 field samples, and at the end of the analysis sequence, with the exception of CCVs for Pesticides multi-component analytes (i.e. Aroclors, Toxaphene, Chlordane, total petroleum hydrocarbons), where a representative chemical, related substance or mixture can be used.

- Evaluation, Verification and Corrective Actions

  The validity of the initial calibration is verified prior to sample analysis by use of a continuing instrument calibration verification (CCV) standard. CCV acceptance criteria are included in the test method SOPs.

Corrective action is initiated for CCV results that are outside of acceptance criteria (see Section 12 – "Control of Nonconforming Environmental Testing" and below).

F.3.3 Unacceptable Continuing Instrument Calibration Verifications

If routine corrective action for continuing instrument calibration verification fails to produce a second consecutive (immediate-must start within one hour; no samples can be run between the failed CCV and the two additional CCVs) calibration verification within acceptance criteria, then a new calibration is performed or acceptable performance is demonstrated after corrective action with two consecutive calibration verifications.

For any samples analyzed on a system with an unacceptable calibration, some results may be useable if qualified and under the following conditions:

a) If the acceptance criteria are exceeded high (high bias) and the associated samples are below detection, then those sample results that are non-detects may be reported as non-detects.

b) If the acceptance criteria are exceeded low (low bias) and there are samples that exceed the maximum regulatory limit, then those exceeding the regulatory limit may be reported.

Saturated Hydrocarbons and Alkylated MAH and PAH:

ESS Laboratory performs the forensic GCFID and GCMS analysis using the following procedures:

Soil Extraction: Samples are extracted by Microscale Solvent Extraction- MSE (EPA Method 3570 Modified):

Initial volume: 5g

Final volume 2 mL

Water Extractions: Samples are extracted by MSE (EPA Method 3511 Modified):

Initial volume: 35mL

Final Volume: 2mL

Saturated Hydrocarbons, Isoprenoids and Aliphatic Ranges (DRO and TPH): GC/FID analysis

Alkylated MAH and PAH: GC/MS analysis (Analytes evaluated from SIM with full scan also collected)

QC Criteria: Surrogates 50-120%, Blank Spike 60-140%

GC-FID CCV +/-20%D w/ 15% <25%D

GC-MS CCV +/- 25%D w/ Average <15%D

Soil samples are dried with sodium sulfate in glass vials, spiked with surrogate and extracted for 4 hours using method 3570-Mod. Once complete samples are filtered through sodium sulfate and concentrated to a final volume of 2mL. If high levels of contamination are present the final volume may be adjusted. The extract is spiked with internal standard and aliquots removed for GC-FID and GC-MS analysis.

Water samples have sodium chloride, surrogate and 2mLs of DCM added and are extracted for 4 hours using method 3511-Mod. Once complete a portion of the DCM is removed, spiked with internal standard and aliquots removed for GC-FID and GC-MS analysis.

For saturated hydrocarbons the extracts are analyzed by wide-range GC-FID using method 8015-Mod. This method provides gas chromatographic conditions for the detection of some volatile and all semi-volatile petroleum fractions including gasoline, kerosene, diesel fuel or No. 2 fuel oil (home heating oil), lubricating oil, No. 6 oils, and crude oil. In addition, the method can be used to identify pyrogenic materials such as coal tar, creosote, and pitch. Extracted samples are injected into a capillary column that is temperature programmed to facilitate separation of organic compounds. Detection and quantitation are based on FID detection response compared to calibration standards using the internal standard technique.

For alkylated MAH and PAH the extracts are analyzed by GCMS/SIM using method 8270-Mod. The GC column is temperature programmed to separate the analytes, which are then detected with a mass spectrometer (MS), connected to the gas chromatograph. Analytes eluted from the capillary column are introduced into the mass spectrometer by a direct connection. Identification of target analytes is accomplished by comparing their mass spectra with the electron impact (or electron impact-like) spectra of authentic standards. Quantitation is accomplished by comparing the response of a major (quantitation) ion relative to an internal standard using an initial calibration curve. In addition, a full scan run is collected simultaneously and can be provided for TIC identification.

The following are summaries of ESS Laboratory procedures with standard operating values. Volumes used and detection limits can change with difficult sample matrices and high moisture content.

MADEP EPH with PAHs:

ESS Laboratory performs the MADEP EPH analysis with the following parameters:

Soil Extractions: Sample are extracted by Microwave method 3546.

Initial volume: 25g

Final volume: 1ml

Water Extractions: Samples are extracted by Separatory Funnel method 3510.

Initial Volume: 1L

Final Volume: 1ml

Fractionation: 5 gram silica cartridges

Aliphatic range analysis: GC/FID analysis

Aromatic range and PAHs: GC/MS analysis following modified 8270 criteria per MADEP EPH method, using EPH surrogates and internal standards.

PAHs can be analyzed by GCMS-SIMs when lower detection limits are required.

Total Petroleum Hydrocarbon analysis from the EPH extract:

The sample is extracted by the MADEP EPH method. The extract is split into two sub-extracts. One sub-extract is analyzed by GC/FID for DRO C10-C28 and TPH in the C9-C36 range. (This range can be expanded to C40 or C44.) The remaining sub-extract is fractionated though a silica cartridge according to the MADEP EPH method and analyzed for Aliphatic and Aromatic hydrocarbons.

VOC Analysis, including MtBE:

Soils: Soils are prepared by method 5035 and analyzed by method 8260C. Method 5035 provides two procedures to prepare soil samples, a Low Level VOC analysis and a Mid to High Level VOC analysis using Methanol.

Low Level VOC analysis: The Low Level VOC analysis can produce low detection limits and is not suitable for samples with high concentrations of VOCs or difficult matrices that adsorb VOCs. Vials must be analyzed immediately or frozen with 48 hours of sampling for a 14 day hold time.

Methanol Analysis: For those samples with high concentrations of VOCs and difficult matrices, the methanol procedure is recommended. Vials must be stored <6C with a 14 day hold time.

ESS laboratory typically provides vials for both the Low Level VOC and Methanol analysis. It is recommended that only Methanol vials be submitted when detection limits from the Methanol vials are

low enough to meet data quality objectives. The methanol can sometimes produce a better extraction, especially for difficult matrices. Low Level vials should be submitted when low detection limits are needed. Low Level vials should always be submitted in duplicate accompanied by one methanol vial. Any analyte outside of the low level calibration range will need to be analyzed from the methanol vial.

Required containers:

Low Level VOC: 2 x 40 ml pre-weighed VOA vials with 5 ml if DI water and a stir bar.

Methanol: 1 x 40 ml pre-weighed VOA vial with 15ml of methanol.

% Solids: An additional jar should accompany the VOA vials for % solids analysis.

Waters are prepared according to method 5030 and analyzed according to method 8260C. ESS requests 3 x 40ml 1:1HCl preserved vials with zero headspace for each sample. Vials must be stored <6C with a 14 day hold time.

TAL Metals plus Tin

Metals in soil are digested by method 3050 and analyzed by methods 6000 and 7000. Mercury in soil is digested and analyzed by method 7471.

Metals in water are digested by method 3005. Mercury in water is digested and analyzed by method 7470.

Samples (waters and soils) are initially run by ICP method 6010. The lab may opt to analyze some elements by ICPMS or GFAA either to achieve lower detection limits or due to suspect matrix interferences.

Soil: (Elements not including Hg) – increasing weight for wet samples

Initial Volume: 2.5- 5 grams

Final Volume: 100ml

Soil Hg: – increasing weight for wet samples

Initial Volume: 0.6 to 2g

Final Volume: 40ml

Water (Elements not including Hg) : (or 100 to 10 for lower DLs)

Initial Volume: 50 ml

Final Volume: 25 ml

Water Hg:

Initial Volume: 20 ml

Final Volume: 40 ml

Semivolatile 8270D:

ESS Laboratory performs the 8270D analysis with the following parameters:

Soil Extractions: Sample are extracted by Microwave method 3546.

Initial volume: 15g

Final volume: 0.5ml

Water Extractions: Samples are extracted by Liquid/Liquid Extraction method 3520.

Initial Volume: 1L

Final Volume: 1ml

PCB 8082A:

ESS Laboratory performs the 8082A analysis with the following parameters:

Soil Extractions: Sample are extracted by Soxhlet method 3540.

Initial volume: 20g

Final volume: 10ml

Water Extractions: Samples are extracted by Separatory Funnel method 3510.

Initial Volume: 1L

Final Volume: 1ml

Cleanups: All sample extracts are acid washed. Extracts are copper cleaned when sulfur interferes with chromatography.

Pesticide 8081A:

ESS Laboratory performs the 8081A analysis with the following parameters:

Soil Extractions: Sample are extracted by Microwave method 3546.

Initial volume: 20g

Final volume: 5ml

Water Extractions: Samples are extracted by Separatory Funnel method 3510.

Initial Volume: 1L

Final Volume: 5ml

Cleanup: All sample extracts are Carbopreped.

Herbicide 8151A:

ESS Laboratory performs the 8151A analysis with the following parameters:

Soil Extractions: Sample are extracted by Microwave method 3546.

Initial volume: 10g

Final volume: 4ml

Water Extractions: Samples are extracted by Separatory Funnel.

Initial Volume: 500ml

Final Volume: 4ml

Micro-extractions (When low reporting limits not needed)

Initial Volume: 40ml

Final Volume: 4ml

Cyanide, Free method 9014

Soils: Colorimetric analysis of a water leach

Waters: Colorimetric Analysis of water.

Total Cyanide method 9014

Soil Extractions: Midi-distillation followed by manual colorimetric analysis

Initial volume: 1ml

Final volume: 5ml

Water Extractions: Midi-distillation followed by manual colorimetric analysis

Initial Volume: 50ml

Final Volume: 50ml

Appendix E

Historical Documents

To His Excellency Sir Henry Moore, Bar.t

Captain General and Governour in Chief,
In and Over His Majesty's Province of
NEW YORK
and the Territories depending thereon in America,
Chancellor and Vice Admiral of the same.

This Plan
of the City of New York and its Environs,
Survey'd and Laid down
In most Humbly Dedicated by His Excellency's
Most Obed.t Humble Servant
B. Ratzer
Lieut.t in His Majesty's 60.th or Royal American Reg.t

GAS HOLDERS

Single and Telescopic, with Cast or Wrought Iron Guide Frames.

Specifications and Estimates Furnished.

plied through a general distribution system has failed in some particular to meet the expectations of its friends.

It may be at once admitted that no gas can be manufactured that can be distributed over a wide area and sold heat unit for heat unit, at a price less than three times that at which Pittsburgh and Allegheny have been supplied with natural gas. Such a price would be prohibitory for general manufacturing purposes in a country where coal is as cheap as in America, and if the price of coal advance, the cost of fuel gas must necessarily advance with it.

A few years ago, Mr. Faben made an assertion in connection with fuel gas that had a sound of heresy and cowardice to believers in fuel gas, but which at this day reads like a prophecy. Yet there was not at the time Mr. Faben made his memorable assertion evidence sufficient to support him in it. If he has proven the true prophet, it is more by accident than by reason of any special foresight.

With the fading of the schemes of the fuel gas men, and the hopes of those of us who looked to them for the solution of the domestic heating problem, there is a growth in the demand for illuminating gas for other purposes than illumination that is most gratifying to the gas manager, to the housekeeper and to the user of small power motors.

For cooking, the generation of power and intermittent heating, gas to day has no equal, and illuminating gas is sold in most cities in this country at a price that makes it the cheapest fuel for this class of work.

As the supply of natural gas gives out, there will be a growth in the use of manufactured gas in the towns now using the natural product that will be most gratifying to the holders of the stock of the local gas companies. While it will not be nearly so cheap as natural gas at 15 cents per 1,000 cubic feet, it will be cheaper than solid fuel, and its convenience, backed by its economy, will insure the rapid extension of its application.

Had natural gas been used with economy, a reasonable price asked for it, and its use confined to domestic purposes and light manufacturing, the supply would have lasted many years, and probably the Pittsburgh supply would have lasted a generation. But it would have been un-American to have economized any gift of nature. We used natural gas in a good old American way, just as we have used the buffalo, and are using the pine forests of the northwest, of Georgia and Alabama. And the gas went as has gone the buffalo, and as are going the pine forests. Truly America is a great country, and we Americans will continue a great people, no matter what it costs us or our posterity.

BROOKLYN FIDGITS.

J. Edward Addicks and his magic wand still continue to occupy the attention of those most interested in the future gas supply in Brooklyn. Whether or not Mr. Addicks will find it possible to accomplish all that he has set before him in this undertaking time alone will demonstrate. Natural conditions and the physical status of several of the Brooklyn companies make the present a more than propitious time for the consummation of a grand consolidation. No matter what the measure of Mr. Addicks' Brooklyn success, it cannot be hereafter said of him that he has not pretty generally given voice to his intentions and expectations. One almost might be permitted to say that Mr. Addicks has hunted the control of the Brooklyn companies with a brass band, and it is now being announced that this gentleman openly states that he has "no doubt whatever of carrying out all that he has thought to do."

Messrs. Rockefeller and Rogers, of the Standard Oil Co. have recently resigned their positions as directors in the Metropolitan Company. It will be remembered that the Metropolitan has for some years purchased its supply from the Fulton-Municipal, the latter company being, it is generally understood, closely affiliated with the Standard-Rockefeller-Rogers interests, and it is rumored that the Standard people propose taking an active hand in the struggle, report going so far as to state that Messrs. Rockefeller and Rogers have decided to launch a syndicate of their own. Meanwhile the Brooklyn United Gas Company has been incorporated under Addicks auspices, with the object, it is said, to absorb first the old Brooklyn Gas Light Company, and its liberal charter purposes gives it the necessary elasticity to include other companies from time to time as others may put themselves in line for such action. We also understand that Mr. Addicks has formed still another company called the Beckton Construction Company, (so named probably after the great central station operated by the London, England, Gas Light and Coke Company). The avowed intention of this company is to build, equip and maintain in or adjacent to the city of Brooklyn a most gigantic gas works, having a capacity sufficient to supply the present needs of that city and, when required, a much larger territory. Friendly or unfriendly critics of Mr. Addicks must at least give that gentleman credit for contemplating operations on a majestic scale and with an assurance in demeanor that would indicate not only his belief in complete ultimate success, but his own financial and executive ability to carry out. Several men closely associated and large holders in Brooklyn gas stocks maintain silence, while others intimate that a decidedly interesting game of "blind man's buff" is being played in the "City of Churches" with the prospect of a general surprise in the end.

OBITUARY.

DERRICK LANE.

Mr. Derrick Lane, treasurer of the Troy (N. Y.) Gas Co., died on December 14 at his home in that city after a long illness. Mr. Lane was 65 years of age and was a descendant of one of the oldest families in the city. He was a graduate of Union College in the class of '47, and was admitted to the bar in 1857. From 1866 he had been trustee of the Troy Savings Bank and president of that institution since 1886. He was chamberlain of the city from 1867 to 1871, and has been long connected with the Troy Gas Light and Troy Gas Companies. Mr. Lane is survived by a wife, four sons and two daughters.

GEORGE J. M'GOURKEY.

The death in this city at his residence of Mr. George J. McGourkey, ex-president of the American Meter Company, occurred on December 14. Mr. McGourkey refused a re-election to the presidency of the company, with which he has been so long connected, at its recent annual meeting, but he continued to serve as a member of the Board of Directors.

WILLIAM LILLEY.

Mr. William Lilley, for many years superintendent of the Ashtabula (O.) Gas Light Co., died at his home in that city on the evening of December 16 at the age of 45 years. He leaves a wife and several children. A sad feature arising from is death is that his wife, who was devotedly attached to him, became insane soon after he breathed his last and all efforts to restore her reason have up to this writing been futile.

FINANCIAL

WALL STREET, Jan. 14, 1893.

The new year has not had an active opening. It has however had a steady opening and all the active gas and electric stocks close at advances since our last issue. A noticeable feature since the opening of the year has been the decided increase in interest in gas stocks on Wall street where the belief is gaining ground rapidly that electric competition is not a factor that needs to be taken into immediate consideration. Aside from the stocks dealt in on the exchange, there is no little interest being taken by Wall street houses in other gas stocks. A notable instance is the Equity Gas Light Co., of Williamsburg. The Equity Co., has been purchased by a New York syndicate. It so far has had a very hard fight and up to date has been successfully delayed from supplying gas to consumers by the Williamsburgh Gas Light Co., in which the Standard Oil interests have practical control. The Equity, however seems to have started out on new lines which contemplate the establishment of an immense plant at Ravenswood, Long Island, to supply gas to outside companies. The identity of the members of the syndicate is so far concealed, though the Rockefeller interests are credited by Wall street with being very largely interested. John Devlin the former president of the company has resigned and the syndicate has put B. I. H. Trask of this city to the presidency, and Charles A. Knittle is the new secretary. Both these men, it will be remembered, were connected with the East River Gas Co., and Mr. Trask was largely responsible for the sale of that Company to a syndicate represented by Hollins & Co. The directors for the new company are seven in number—B. I. H. Trask, Isaac L. Egbert, Franklin Everhart, Charles A. Knittle, Edward Dodd, George W. Pinchback, Henry McInerney, and Aaron Peck. Some of the members of the old board, which numbered thirteen, will serve until the next meeting on Monday when the new board will take hold. The Ravenswood scheme, it will be remembered, is to tunnel the East River, and to supply the whole of Manhattan Island with gas. So far as is known, it is not proposed to lay opposite mains to the companies now in operation but will either control these companies by purchasing a majority of the stock or contract to supply the companies with gas at a lower price than it can be manufactured in the city. The Equity Gas Light Co., has contracts with the Equity Construction Co., of New Jersey to build its plant and lay its mains. It is understood that the syndicate has paid the construction company $400,000 for its contracts and has paid over $300,000 for a controlling interest in the Gas Light stock.

The news of the Equity's plans have had no depressing effect upon New York gas stocks. The Consolidated, in fact, has been decidedly well held, closing at an advance from our previous quotations. The latter company, it is officially announced, has no negotiations pending either with the Equity or any other company. When President James W. Smith was questioned as to whether the Equity company had already made overtures for an arrangement, he said: "There are no negotiations pending with the Equity company. There is a desire and there may be expectations, but we cannot keep track of such matters." From another source it is learned that the Consolidated company's interests would be materially benefited if it could get a larger supply of gas. The part of the city situated west of Central Park and north of Fifty-ninth street is, according to residents, very poorly supplied and a petition is in circulation and has received many signatures asking the State Legislature to appoint an investigating committee. The specific complaints are that the force of gas in the mains has been lessened to such a degree that not more than 75 per cent. of the supply of former years is available, and within the last three weeks a number of dwellings have been without gaslight.

News comes from Boston that the Metropolitan Gas Light Co., of Brooklyn, has been purchased by J. Edwards Addicks. The terms are not named, but it is known that the price is high. Last week Felix Campbell bid 151 for two-thirds of the stock, and Mr. Addicks bid 155 for a control. Wall street brokers supposed to represent R. A. C. Smith and his syndicate, are reported to have bid 162, however, so it is evident that Mr. Addicks' control has cost him a good round figure. Mr. Addicks' purchase is for the account of his construction company, known as the Brooklyn United Gas Company for which Clarke, Ward & Co. recently raised $1,700,000 in this city and $700,000 in Boston, as told in our last issue. Mr. Addicks has evidently a big job on hand if he intends to control the Brooklyn companies, and will need more than the $2,400,000 already raised. He has now control of the Brooklyn Gas Light Co. and the Metropolitan. But there are eight companies in Brooklyn. The Citizens Co. is controlled by Mr. Werdenfeld, who is opposed to the Boston gas magnate. The Fulton Municipal and the Williamsburgh are controlled by the Standard Oil interests, who have publicly declared their opposition to Mr. Addicks. The People's and the Nassau companies are opposed to Mr. Addicks because he foiled a nearly completed plan for a consolidation with the Brooklyn when he raided the stock of the latter company and as the Standard Oil interests are supposed to have gained control of the Equity, that company, too, may be beyond Mr. Addicks' reach. It is claimed that the high price paid for the Metropolitan is immaterial to Mr. Addicks, as that company was absolutely necessary to his scheme of forcing consolidation with the other companies, and had to be purchased at any cost.

Chicago gas during the past fortnight has recovered from the raid made when the Wormsers' pool was dissolved. Laclede gas has also ruled firmer. Sales by the Laclede company increased 10 per cent. for the month of December over the corresponding month in 1891. The net earnings increased about 20 per cent. for December and 20 per cent. for the year 1892.

The general stock market seems to be getting into sound condition again. It is believed that the unseasonable gold export movement has ceased, and now that the January interest and dividend disbursements have been made, the money market has resumed its easy tone. The chief cause of nervousness is the Silver Purchase bill, which is under consideration by Congress, and if the compulsory purchase clause of that bill be repealed, it is the conservative Wall street opinion that foreign confidence will immediately be restored in our currency, and in turn in our securities, and that the market for international specialties at least will undergo a big improvement.

Following are closing prices for active electric and gas stocks:

	Prices Wednesday.	Range Sales 1893.	Range Sales 1892.
Chicago Gas.....	88½@ 89½	85¼@ 90	71¼@ 99½
Consolidated Gas.....	125 @125¼	124½@125¼	102 @128
General Electric Co....	113½@113¾	111 @113¾	104½@119½
Citizens' Gas (Brooklyn)	112 @113½	.....	94½@114½
Edison Electric Illum..	118¼@119½	114½@117	79¾@115½
Laclede Gas	23¼@ 24½	23¼@ 23¾	17¼@ 27¼
Laclede preferred	69 @ 71	. ....	57½@ 74½

The closing quotations at leading brokers' offices of inactive gas stocks show marked advances. They follow:

Gas Companies.	Bid.	Asked.	Gas Companies.	Bid.	Asked.
Brooklyn Gas Light.	135	139	Williamsburgh..... .	150	.....
Jersey City & Hoboken	180	.....	Bonds, 6s	108	111
Metropolitan—Bonds..	110	.....	Metropolitan (B'klyn...	155	.....
Mutual (N. Y.)	142	.....	Municipal—Bonds), 7s..	103	.....
Bonds, 6s.....	100	102	Fulton Municipal. ..	150	155
Nassau (Brooklyn)	150	.....	Bonds, 6s.....	103	.....
Scrip.....	100	.....	Equitable.....	185	190
People's (Brooklyn) ...	105	108	Bonds, 6s.....	103	.....

The Oneida (N. Y.) Gas Light Co. paid a 3 per cent. semi-annual dividend on January 10th.

The Boston (Mass.) *Herald* of recent date has the following to say concerning Mr. Addicks' Brooklyn enterprise: "The Beckton Construction Company, limited, of Pennsylvania, is the name of the finance company organized by Mr. J. Edwards Addicks to acquire the eight gas plants of Brooklyn and consolidate them under the title of the Brooklyn United Gas Company. Of the companies Mr. Addicks has control of one, the old Brooklyn company, and knows about what can be done with others. The only known officer of the construction company is Mr. Addicks, the treasurer. The capital stock is $5,000,000,

(*Continued on page 36.*)

J. EDWARDS ADDICKS - Industrialist and Capitalist obtained wealth from Gas Co. financing and building gas works. Four unsuccessful Senate campaigns in Delaware

SHORT RUNS

Clinton Gas Light & Coke Co.,
Clinton, Ia., May 12, 1892.

May it always be as progressive in the future as it has been in the past. The rapid advancement of the gas interest in the past few years has been largely due to such journals as PROGRESSIVE AGE.

S. M. Highlands, Superintendent.

A change of charter is proposed by the Willimantic (Conn.) Gas Co.

It is reported that the Nyack (N. Y.) Gas Works have been sold to Howard M. Storms.

F. W. Cheney and others have applied to the Connecticut legislature for the incorporation of the South Manchester Light, Power & Tramway Co.

The firm of Tufts Bros., Meter Company of Boston has recently been established. The firm is composed of Messrs. Eugene Tufts and Joseph P. Tufts.

Extensive improvements will be made at the works of the Sioux City Gas & Electric Light Co., at Sioux City, Iowa, commencing in the early spring.

A considerable number of improvements have been made in the Rome (Ga.) gas plant and it is expected that further additions will be made in that works.

Charles A. Williams has made application to the Connecticut legislature for authority to organize and operate a gas company in New London, Conn.

F. M. Manning has applied to the Connecticut Legislature for an electric light and gas company to operate in Mystic, Mystic River and Mystic Bridge, Conn.

We are in receipt of a very attractive catalogue issued by the Favorite Stove & Range Co., of Piqua, Ohio, embracing a very complete line of "Favorite" gas ranges.

The Gas Light Co., of Rockville, Conn., have recently fitted up in an elaborate way a room in that town wherein to display a variety of gas stoves and gas consuming devices.

The Consumers' Gas Co. of Reading, Pa., begun with the new year the occupancy of a handsome office in the new building of the Mutual Fire Insurance Co. in Reading.

The Worcester (Mass.) Gas Light Company believes in printer's ink. Our thanks are extended to them for two very much condensed, yet very useful, calendars covering the year 1893.

Beginning with January 1 the price of gas charged at Mattoon, Ill., has been reduced to $1 per thousand feet. It will be remembered that the "Rew" process is in operation at Mattoon.

Major John W. Mish has just been re-elected secretary and treasurer of the Lebanon (Pa.) Gas Co. for the thirty-eighth time. We congratulate the gas company. No further words are necessary.

The La Porte (Ind.) Herald states that parties have secured an option on the La Porte Gas Works. The consideration is stated to be $40,000. It is said that the new purchaser will expend $15,000 in improvements.

The Helena (Mon.) Gas Co. report great progress in the introduction of gas stoves. The secretary of that company states that fully seventy-five houses in Helena use gas exclusively for heating and cooking purposes.

Mr. James Gardner, Jr., of Pittsburgh, Pa., the well known manufacturer of fire clay goods for gas works, believes in sending out as a reminder that he is still doing business at the old stand a useful as well as ornamental reminder in the shape of a russia leather memorandum book of good quality and not burdened with excessive advertising.

Nearly a year has run by since the expiration of the contract between the city of Newark and the gas companies of that city, the companies working under the old contract. It is thought that a new contract will soon be signed.

There is talk of removing the plant of Marlboro (Mass.) Gas Light Co. to another section of the town, so as to enable the city authorities to run a street parallel to Main along the business portion, and about three hundred feet therefrom.

The Equity Gas Co., of Williamsburgh, N. Y., has been purchased by New York capitalists, and rumor states that the new purchasers are in close touch with the East River Gas Co.'s undertaking. It is stated that $300,000 was paid for the control of the voting stock.

Among Brooklyn notes it may be worthy of mention that the Citizens' Gas Light Company operating in our sister city has under consideration the expenditure of $500,000 to $1,000,000 in greatly enlarging and extending its plant, particularly its distribution system.

Some time ago the authorities of Tacoma, Wash., received an offer from C. B. Wright, owner of the water and gas works in that city, for the sale of the above mentioned water and gas works to the municipality for $2,100,000. The city refuses to give more than $1,500,000.

The common council of Philadelphia held a meeting on December 27 and passed an ordinance appropriating $7,778,239.88 to the various bureaus of the department of public works, of which $3,014,968 goes to the bureau of gas lighting to be used for improving the supply of gas.

The town of Little Falls, Minn., is now being supplied with illuminating gas for the first time in its history, gas having been turned on in that city on the evening of December 27th. Little Falls has a population of about 2,500. It is understood that it is a naphtha plant.

Jacob Weinman, of Pittsburgh, Pa., recently entered suit against the Pittsburgh Gas Co. to obtain damages for alleged injury done to his farm in Penn township. The plaintiff claims the defendant company laid a gas main through his lands and damaged them to the extent of $5,000.

The gas war inaugurated several weeks ago between the municipal authorities and the Alton (Ill.) Gas & Electric Light Co. over the subject of rates was terminated on the 3d inst. No agreement, we understand, has been reached. The lights were voluntarily turned on, working under the old contract.

At the regular meeting of the common council of Malden, Mass., council heard the report of the joint standing committee on municipal lighting, in which it was stated that it was not suitable to establish a municipal gas lighting plant. The report was referred to the next city government in concurrence.

As heretofore reported an effort is being made to secure a foothold for a new gas company at Jamestown, N. Y. We are informed by a local correspondent living in that town that there is a strong prejudice against the Pennsylvania Gas Company, and that in all probability the city fathers will grant a franchise.

The Board of Aldermen of Kansas City, Mo., have decided not to erect a gasoline plant at present. The city has 1,100 gasoline lights now maintained under a contract with F. K. Hoover, amounting to upwards of $21,000. It is thought that an effort will be made by the city within a short time to purchase Mr. Hoover's plant and operate it by the municipality.

Mr. Thomas W. Cole, Superintendent of the Altoona (Pa.) Gas Company, has resigned that position, to take effect January 1, 1893. His successor will be Mr. George H. Harper, of Kansas City, at present engineer in charge of the gas and electric light plants of the United Gas Improvement Company of that place. It is Mr. Cole's intention to engage in business for himself.

The Equity Gas Light Co. and the Equity Gas Works Construction Co., of Brooklyn, N. Y., mention of which has previously been made in these columns, have filed a demurrer to the action brought against them to enjoin the laying of pipes in the Eastern District on the ground that the facts stated by the complaint were insufficient to constitute a cause of action. The demurrer was argued at the General Term of the City Court on December 27 before Chief Judge Clement and Judge Van Wyck. W. J. Curtis appeared for the defendants and William C. DeWitt and Jesse Johnson for the plaintiff. Decision was reserved.

WATER NOTES

I have subscribed to and read with much interest and profit your valuable journal, PROGRESSIVE AGE, *from its first issue, and am more and more pleased with it. The interests it represents cannot fail to appreciate its steady improvement.—D. M. Clark, Secretary and Treasurer Elyria, O., Gas and Water Company.*

Works are projected at Highland, N. Y. Address A. D. Lent.

It is reported that works will be built at Elberton, Wash., in the Spring.

It is said that works will be built at Alabaster, Mich., in the Spring.

Estimates place the cost of building a second plant at Niles, Mich., at $30,000.

The York (Me.) Aqueduct Co. has been incorporated, with a capital stock of $100,000.

The people of Girard, Pa., have voted for the issuance of $19,000 of bonds for works.

The Collingdale (Pa.) Water Co. has been incorporated with a capital stock of $1,000.

The people of Mahanoy City, Pa., have voted in favor of having water works to cost $98,000.

It is reported that the water-works question is being freely discussed at New Cumberland, O.

What elegant weather this is for the men who mend water pipes—that is to say, profitable weather.

A proposition to leave out the water works is being considered by the city council of Sherman, Tex.

A certain party of Birmingham will build a 40 by 60-foot stand-pipe at Huntsville, Ala., to cost $7,138.

There is talk of going to King's Station to obtain a supply of water for Saratoga Springs, N. Y.

The new system of water works for Northville, Mich., is now practically completed. Cost, $36,000.

The Manufacturers' Water Co. has been incorporated at Ballard, Wash., with a capital stock of $12,000.

The people of Pine Grove, Pa., at their spring election will vote on incurring a debt of $26,000 for works.

The Ingleside (Pa.) Water Co. has been incorporated with a capital stock of $2,000. Geo. M. Hill, is treasurer.

Certain parties of this city have secured the contract to supply the cast-iron pipe for the water works of Lowell, Mass.

The Hazel Water Company has been incorporated at Mauch Chunk, Pa., with a capital stock of $5,000. Daniel G. Baird is treasurer.

Report comes to us that a certain party has applied to the authorities of Rockport, Mass., who proposes to supply the town with water works.

It is said that the authorities of Whatcom, Wash., have voted to buy the private works for $147,000 and to spend $103,000 for improvements.

Certain parties of Waterford have been awarded the contract for supplying Syracuse, N. Y., with valves and hydrants for this year for $42,185.

An election will be held at Fort Valley, Ga., at which the people will vote on the question of issuing $25,000 of bonds for water works and sewers.

The private works at Corvallis, Ore., have been purchased by the city for $28,000. Plans have been prepared for improvements to cost between $25,000 and $30,000.

The village trustees of West Troy, N. Y., held a meeting and adopted a resolution directing the village board of health to take action against the West Troy Water Works Co. for furnishing impure water and maintaining a nuisance. For some time past the water has been taken from the Mohawk and is said to be unfit for use.

Franchises have been granted by the town board to two water companies to operate in Babylon, L. I. The companies will be known as the Babylon Water Co., with a capital stock of $25,000, and the Amityville Water Co., capital stock $25,000. The companies propose to lay mains and supply water for fire purposes and to private residences.

The city council of El Paso, Tex., held a meeting at which the ordinances prepared by the city attorney were presented and carried—the first repealing the $75,000 of water bonds issued last January, and the second repealing the $50,000 of city bonds, which also remain in the hands of the city. The third paper provided for the issuance of $205,000 of water bonds, which are to mature in thirty years and bear six per cent. interest, payable semi-monthly.

A burst water-main caused a flood in the down-town district at Chicago a few days ago which destroyed many thousand dollars' worth of property and endangered several lives. The main is three feet in diameter and burst at the northwest corner of Fifth Avenue and Charles Place at 7:15 o'clock in the morning and flooded the basements of all business houses and dwellings within a radius of three blocks. Water rose in some buildings to a depth of nine feet, and was not pumped out for six hours. The damage is said to be $70,000.

Frank M. Hoyt, Charles Quarles and F. T. Smith have incorporated at Madison, Wis., under the name of the Wisconsin Water Company, with a capital stock of $100,000. It is said that the company is an offshoot of the Hygeia Pipe Line Company, which proposes to pipe Waukesha water to Chicago. And it is also said that that the company was organized to assist the Hygeia Company in getting its pipes to Waukesha, and that measures to this effect will be brought before the legislature this Winter. The operation of the company, it is reported, will be confined to Wisconsin.

The presence of organic impurity in water can be detected by dissolving some loaf sugar in it and then, after putting in a tight stopper, allowing it to stand in a warm, well-lighted room for a few days. If it becomes turbid there are certainly organic impurities in it; if it remains clear, it is safe and pure to drink. To test the presence of earthy matters take litmus paper dipped in vinegar, and if on immersion, the paper returns to its true shade, the water does not contain earthy matter or alkali. If a few drops of syrup be added to the water containing any earthy matter, it will turn green.—*Fire and Water.*

FINANCIAL.

(*Continued from page 31.*)

one-half preferred and the rest common. Mr. Addicks takes the common stock, and Messrs. Clark, Ward & Co. have sold the preferred, about $800,000 in Boston, and the rest in New York. New York has paid the first 25 per cent., and Boston will pay at once. The remaining instalments will be called 25 per cent. monthly. Certificates of stock will be issued later. This finance company is to own the assets of the Brooklyn United Company, and the preferred stock will have a first lien on said assets until the holders receive 100 per cent. of their subscription in cash or an acceptable equivalent. After that it will share alike with the common stock. The Brooklyn United Company has only a nominal capital now, but will be capitalized and issue collateral bonds later, when enough properties have been acquired, so that their stocks will furnish collateral, as the stocks of the various gas companies did for Boston united gas bonds. The Brooklyn gas companies are at present capitalized for about $3,000,000 bonds and $10,000,000 stock. The earnings are about $1,300,000, and could probably be made to earn 5 per cent. on $30,000,000 with ease by economies of administration and the manufacture of water gas. Mr. Addicks' ultimate plans embrace consolidation of the New York city as well as Brooklyn gas plants, and if they are executed both cities will be supplied from a common source. To acquire and reorganize the New York city gas plants will require a larger concern than the Beckton Construction Company. That company, by the by, is named after the great London works, the greatest in the world."

FINANCIAL

WALL STREET, Feb. 14, 1893.

The stock market has ruled quiet since our last review, and the gas and electric properties dealt in on the Stock Exchange have naturally shared in the general dullness. On the street, also, the chief feature has been dullness, and quotations for gas stocks at leading brokers' offices indicate few changes when compared with those of a fortnight ago. In a word, the entire market is in the hands of professionals and is dull, for the reason that outside speculators and investors have been frightened away by the noise made over the currency problem. There is no actual fear that the country will be forced to a silver basis. The trouble seems rather that each speculator thinks his neighbor may regard the Treasury's condition as sufficiently weak to encourage bear attacks on the entire list, and he has come to the conclusion that the safer policy is to leave the market alone until the recognition of the threatening evils has so aroused public opinion that the Silver Law will be repealed.

The Industrials, however, have fully held their own in the volume of speculation, and there is no indication of the "bursting of the bubble" that some of the old-time Wall Street operators claim will result from the invasion of the new class of securities on the territory of railroad shares. They will acknowledge no merit in any Industrial, and when there is a response to an increase of dividend or other stimulating influence, the advance is dubbed a piece of manipulation. On the other hand, should there be reason for a sharp movement in the other direction, there is an immediate demand for striking them off the list on the score of "protecting the public." The truth of the matter is, that some of the older market operators are jealous of the new class of securities that they cannot control, and are endeavoring to force them into disfavor by every means in their power, particularly in the direction of discriminating against them as collateral for loans and inducing their banking friends to do the same. If there has been manipulation in industrials, it certainly has not yet reached the stage where it surpasses some of the manipulation of railroad properties—Erie, Northern Pacific, Manhattan, for instance—about which there is never a demand to have them stricken from the Stock Exchange list. It is evident, however, that as far as the outside speculative and investment public are concerned, the Industrials have come to stay and will be dealt in on the New York Stock Exchange when their enemies are dead and forgotten. The fact remains, as pointed out recently by a successful operator in the Industrial list, that more money has been made in that list during the past year than in any other class of stocks. It is the Industrials that have shown the big advances. In Chicago Gas, for instance, the bull pool cleared something like a million dollars; in National Cordage something like $1,300,000 was made; Sugar Trust certificates advanced from 85 to 130 and so on. Some of the Industrials are making big profits, some of them more than they dare to pay, and the result will be the division of profits in the form of watered stock, in which they will simply be following such successful examples as Western Union Telegraph, the coal roads, New York Central, and others.

Mr. Addicks continues to attract much interest in Wall Street, but so far as the Brooklyn companies are concerned investment buying is at a stand, and will most probably continue so until the Boston capitalists show exactly what he intends doing, or to be more exact what he is able to do, against such a strong antagonist as the Standard Oil Company. The only noticeable movement in prices of Brooklyn gas stocks has been a little flurry in the negotiable receipts of the Equity Company, which have advanced from 52 to 65, and the reason for the advance, it seems, was buying by two Wall Street bankers for Mr. Addicks' account. Whether the latter gentleman has secured control of a voting majority of the stock remains to be seen. If so, he has secured a decided advantage in his fight for the control of the Brooklyn companies. The Standard Oil Company is Mr. Addicks' opponent in Brooklyn, and the Williamsburgh Gas Light Company is one of the Standard's best paying companies, having practically a monopoly of the Eastern District business. For fifteen years the Equity Co. has been threatening the Williamsburgh, but has been prevented from going into business by litigation, which was continued until, a short time ago, it passed into the hands of a syndicate which is friendly to the Standard if it is not controlled out and out by the Standard. It was then supposed that the matter had been arranged and some carelessness in keeping the stock together was shown. This suggested to Mr. Addicks that he could get control, and thus carry the fight into the enemy's own camp.

When Mr. Addicks first announced his intention of securing the consolidation of the Brooklyn gas companies it will be remembered that he had organized a syndicate of New York and Boston capitalists to do it with $2,000,000. He found, however, that he had a larger order on hand than he could fill and there has been a change in his plans. He has now issued the prospectus of a company of which he is treasurer. It is known as the Beckton Construction Co., limited, and has a capital of $5,000,000. The prospectus, as an example of theoretical financiering, is pretty, and shows, on paper, that there are millions to be made out of Brooklyn gas, but as he has as yet secured no options in the stock of several of the companies he proposes to buy, the practical operation of his plans may be looked for with interest. Mr. Addicks presents his plans as follows:

Beckton Construction Company, limited, capital	$5,000,000
Purchases and consolidates the seven old companies of Brooklyn, with their stock, amounting to	12,000,000
Bonds amounting to	3,000,000
Total of bonds and stocks of purchased gas companies	15,000,000
A consolidated gas company is organized with:	
Bonds	15,000,000
Stock	20,000,000
Total bonds and stock of Consolidated Gas Co.	35,000,000
The Beckton Construction Co., limited, sells Old Gas companies to the Consolidated Gas companies for the entire issue of stocks and bonds	
The Beckton Consolidated Co., Limited, pays for the Old Gas with the cash received for its stock and bonds of the Consolidated Gas Co.	10,000,000
Stock	5,000,000
Leaving for the subscribers to the Beckton Construction Co., "Limited," stock, bonds of the Consolidated Gas Co.	5,000,000
Stock of Consolidated Gas Co.	15,000,000
Subscribers to the stock of the Beckton Construction Co., Limited, receive for each $12,000 cash, payable as follows: At time of subscribing $7,000: March 1, April 1, $2,500.	
Bonds of the Consolidated Gas Co., 5 per cent. gold	10,000
Stock of the Consolidated Gas Co.	30,000
Net earnings, 1892	1,300,000
To pay interest on bonds of Consolidated Gas Co.	750,000
Total	550,000
Leaves available for dividends equal to 2¼ per cent. upon stock that cost subscribers 6⅔ per cent.	

With the regular rate of increase in consumption 6 per cent. dividends can be earned within three years.

Indianapolis reports that a Chicago syndicate has obtained options on the natural gas plants at Crawfordsville, Lebanon, Thornton and Darlington, and that the same party is preparing to purchase the plants at Kokomo, Anderson, Muncie, Elwood, Marion and other cities. The Chester Pipe & Tube Co., of Chester, Penn., has not yet consented to dispose of its interests in the four first named plants.

The closing quotations at leading brokers' offices of inactive gas stocks show few and unimportant changes since our last. They follow:

Gas Companies.	Bid.	Asked.	Gas Companies.	Bid.	Asked.
Brooklyn Gas Light.	138	139	Williamsburgh	157	.....
Jersey City & Hoboken	180	.....	Bonds, 6s	108	111

PROGRESSIVE AGE

GAS-ELECTRICITY-WATER.

Vol. XI. NEW YORK, MARCH 15, 1893. No. 6

PUBLISHED SEMI-MONTHLY AT 280 BROADWAY, NEW YORK.
BY THE PROGRESSIVE AGE PUBLISHING CO.
E. C. BROWN, - - - - - - - - - PRESIDENT AND EDITOR.
[Entered at the New York Post Office as second-class matter.]

PUBLISHER'S ANNOUNCEMENT.

TO SUBSCRIBERS.—Subscription price for United States and Canada, $2 per year in advance (postage paid). Foreign subscribers will add postage. Remittances should be made by P. O. Money Order, Draft or Registered Letter, to order PROGRESSIVE AGE PUBLISHING CO. Sample copies sent free on application.

TO CORRESPONDENTS.—Desiring to make this journal a medium for the diffusion of general information upon scientific and mechanical topics relating to manufacturers, we invite communications from any of our readers who may wish to make inquiries, announce fresh facts of interest, or advance new opinions upon any subject pertaining to the legitimate scope of our columns.

IN EUROPE.—Parties desiring to subscribe for this journal may send their subscriptions to John Allen, 2 Crane Court, Fleet Street, London, where files of the PROGRESSIVE AGE may be seen regularly.

The circulation of this journal exceeds the combined circulation of all other papers devoted to the gas interests of this country.

OUR MAP OF NEW YORK CITY.

We have been at considerable pains to make the map of New York City and vicinity, published with this issue, represent with accuracy the location of the different gas works on and immediately surrounding Manhattan Island. It may be relied upon as accurate.

A careful study of it, in connection with our comments below, will give the gas engineer as perfect a knowledge of existing conditions in the great industry of gas manufacture and supply in our "Greater New York" as could be obtained without that intimate acquaintance with the locations of centres of population and industry, topography, subsoil formation and construction, possible only to the men engaged in the business in the territory represented.

Naturally first in interest, as first in importance among the gas companies in or about New York City, is the great Consolidated, having an annual output of 8,000,000,000 cubic feet; and a largest daily output of nearly 40,000,000 feet. The Consolidated's principal works will be found at 21st street, where they have a very large Tessie du Motay plant, as well as a Double Superheater Lowe plant of 6,000,000 or 7,000,000 cubic feet daily capacity.

It will be remembered that the Consolidated was formed through the union of a number of companies, including the Municipal, the New York and the Manhattan.

The Consolidated's station at 14th street and Avenue B is the large coal gas station of the old Manhattan Company. At its other works the Consolidated Company has Tessie du Motay plant.

The extent of territory that the Consolidated Company covers can be inferred from the fact that its holder at the upper end of Manhattan Island is twelve miles from the Battery; and that it supplies gas to the northward of that holder, as well as to the Battery itself.

The next company in importance on Manhattan Island is the Equitable, with a sendout annually of 1,500,000 cubic feet. The Equitable has but one manufacturing station, at 41st street and East river, where gas is made on the well-known Equitable principle. It will be noticed that the Equitable has an outlying holder at 59th street and 10th avenue.

The New York Mutual Company, with its manufacturing station at 11th and Pitt streets and East river, has the next largest output among the New York companies—900,000,000 cubic feet per annum. The Mutual's manufacturing and storage plant is all at the location just referred to.

Following the Mutual in importance is the Standard Gas Light Company, with an output of 700,000,000 cubic feet per annum; a manufacturing station at 116th street and East river, and storage station at 124th street and 10th avenue, at 104th street and Avenue A, at 33d street and 1st avenue, and at 19th street and Avenue A.

These are all the companies operating on Manhattan Island, and their operations are confined to the Island, except that the Standard Company has a main laid across the Harlem river, and is penetrating into the district of the Central Gas Light Company.

The Central works are located on Long Island sound, at Port Morris, and supply the territory adjacent thereto as far west as the Harlem river. They send out 170,000,000 a year.

The Northern Company, with an output of 70,000,000 cubic feet, is located on Boston road, to the northeast of the Central works about two miles. It is on the Bronx river.

Off of Manhattan Island the most important works on our map is that of the Fulton Municipal Company, with a sendout of 938,000,000, and supplying a large part of Brooklyn. Their works are located at Degraw and Nevins streets.

The next Brooklyn company in importance is the Brooklyn Gas Light Company, with an output of 475,000,000 cubic feet, and works situated on East river and Hudson avenue.

The Williamsburgh Gas Company, with an output of 450,000,000 cubic feet, and works located on East river and Kent street, is the next in importance in the Brooklyn companies.

This is followed by the Nassau, with an output of 430,000,000 cubic feet, and works located at Wallabout bay.

The Citizens' Company has an output of 400,000,000 cubic feet and works located southwest of the Fulton Municipal plant on 5th and Hoyt streets, nearly adjacent to the Metropolitan Company, which has an output of 325,000,000 cubic feet.

The People's Company is seventh in the Brooklyn list, with an output of 300,000,000 cubic feet; and is followed by the Greenpoint company, with an output of 69,000,000 cubic feet.

Just now a very interesting feature in the gas situation of New York is the East River Gas Light Company, of Long Island City. Though it has so far put out but 52,000,000 cubic feet a year, it is now very largely extending its works, putting in Lowe apparatus for the manufacture of high candle power gas, and is tunneling the East river from Webster avenue, Long Island City, to East 71st street, New York city. It is understood that the East River Gas Company proposes to sell gas to New York distributing companies, if possible to make satisfactory arrangements, or otherwise, to go into competition with the present New York companies.

The Equity Gas Co. is just completing a Lowe water gas works at Maspeth and Morgan avenues. So far it has not sold gas. The magnitude of the gas business in "Greater New York" will be understood from the above figures. The total output, as shown by the above figures, is 14,779,000,000 cubic feet per annum. The present growth is rapid. What the future may hold in the direction of consolidation no man can foresee; but there can be but little doubt that the time will come when consolidation and one management will result in an improvement in the gas situation of New York and vicinity.

MUNICIPAL OWNERSHIP OF GAS IN THE UNITED STATES.

The first engineering question essayed by Prof. Bemis in his 1891 monograph is Leakage, and with his opening paragraph on this branch of his subject begins the list of his misstatements. It will trouble the professor to explain the connection asserted by him to exist between holder capacity and leakage. We have yet to learn that there is any such connection, yet we read from the professor's book that "leakage beyond ten per cent" is due, among other causes, to lack of "sufficient holders."

A recent experience with a broken holder in Richmond appears to be in part responsible for this error of Prof. Bemis. Some serious leaks developed at a time when the demand for gas would not permit of immediate repairs, and gas was lost. Apparently from this the above erroneous conclusion is drawn.

On page 21, in reference to the fact that the gas company at Hamilton sells gas at 95 cents, while the city's gas is sold at $1, we read that "the pressure must be so great to carry the gas through the small mains" (of the company) that it leads many people to believe that "the city gas is really cheaper."

Here again we are at a loss to see the connection. Why gas should be worth less, or cost more per 1,000 cubic feet, the price remaining the same, from having been put through small mains at high pressure can only be explained by the professor's erroneous assumption that under such condition "meters will record an unduly large amount of gas."

We have come to read with patience the attacks on the gas meter of the flippant reporter, and the alleged humorous contributor to the weekly papers, but it is impossible to repress an expression of disappointment on reading the same old charge of over-registration, as the result of increased pressure, in the work of a man of reputation and position. Professor Bemis should know that a meter records the gas that passes through it, and that the registration varies only as the amount varies, except that excessive pressure will result in the passage of a portion of the gas unregistered. The movement of the meter hands is under the control of the man using the gas, and entirely out of the control of the manufacturer of the gas. If the former uses bad burners, or permits them to become clogged, or to blow, he will not get the highest attainable efficiency from the gas he uses; but he will not be called upon by the gas company to pay for more than he uses. The meter will not record "an unduly large amount of gas."

Professor Bemis' most important misstatement, considered in its bearing on the question at issue, occurs on page 41 of his monograph. He states, referring to the gas plant of the city of Philadelphia: "It appears from the report of the gas department of 1890 that $817,667.48 have been spent in the last four years for improvements and extensions. By comparing the work accomplished with this money with the entire plant, it appears that this expenditure *has increased the capacity of the works in every way fully 25 per cent.* Then $817,667.48 must be one-fifth the present value of the works, exclusive of land." The italics are ours. We will first consider his statement of alleged facts. According to the report quoted by Professor Bemis, the total holder capacity of the Philadelphia Gas Works was, at the date of the report, 14,008,000 cubic feet. This is an increase of about 22.9 per cent. for the four years; not enough at variance with the professor's figures for any serious contention, but quite enough to indicate the looseness of his method of figuring.

According to the reports of the Gas Bureau of Philadelphia, there was an increase in the number of meters set, from December, 1886, to December, 1890, of (20,006 ÷ 113,283) = 17.6 per cent.

The largest daily make of gas in 1886 was 12,932,000 cubic feet, therefore, the generating capacity (retorts) must have been equal to the production of at least 12,932,000 cubic feet in one day. In 1888 the largest daily make was 13,191,000; and Director Wagner writes that to make this gas with the apparatus at hand, "required very careful management and a fortunate combination of circumstances not often occurring." From that date to December, 1890, there was added a generating capacity of 1,700,000 cubic feet per day.

13,191,000 + 1,700,000 = 14,891,000, the possible daily make in 1890, if *all* the new retorts be accepted as available every day. 14,891,000 — 12,932,000 = 1,959,000, or an increase in the four years of 15.1 per cent.

We read in the 1887 Report, page 22, of the erection of a purifying plant of 1,000,000 cubic feet daily capacity. There was also added to the purifying capacity of the Philadelphia gas plant during the four years referred to by Prof. Bemis one set of boxes 24′ × 36′ each, with a capacity of 1,500,000 cubic feet per day (24 × 36 ÷ .6 = 1,440). In 1886 over 12,900,000 cubic feet were purified in one day. The addition to the purifiers was then (2,500,000 ÷ 12,900,000) 19.4 per cent. for they ears 1887, 1888, 1889 and 1890.

To summarize:

Prof. Bemis' statement of increase in "the capacity of the works in every way" was "fully 25 per cent."

The facts are—

	Per Cent.
Increase in holder capacity	22.9
Increase in consumers' meters	17.6
Increase in retort capacity	15.1
Increase in purifier capacity	19.4

WALL STREET, March 14, 1893.

There has been a further decline in the stock market since our last review. Mr. Cleveland has as yet given no indication of his intentions in regard to the currency question, and bear operators have taken advantage of the general uncertainty to manipulate money rates and thus frighten "bull" speculators. Industrials have naturally shared in the general depression, and in some instances where they have been the active stocks of the market, they have suffered a decline more severe than the railway stocks that have been in partial neglect. The most severe decline, as far as gas and electric stocks are concerned, has been in General Electric, which fell about seven points, and then slightly recovered. The decline was accompanied by rumor of an unfavorable financial condition of the company, and of a consequent probable reduction in the dividend rate from 8 per cent. to 7 and even 6 per cent. It is likely, however, that the rumors were the result of the decline and not the decline the result of the rumors. A director of the company who represents a very important interest in the financial community says he has no knowledge of any impending unfavorable developments. People in a position to know the position of the company express the belief, however, that while it has been doing a prosperous business, the dividend rate has been larger than circumstances warranted. The General Electric earns its dividend, but, they say, does not appear to earn it fully in cash. Another sharp decline has been in Consolidated Gas, which has declined over 5 per cent. Chicago Gas has been well maintained, but aside from the Williamsburg Company's stock, which has advanced 5 per cent., there has been some irregularity in prices of the local gas companies' securities, some of which have yielded two or three points.

Wall Street's interest in gas stocks has, it is safe to say, never been greater than at present. It is understood that several large purchases are about to be consummated by New York syndicates and for the purchase of the Milwaukee Gas Co. by Emerson McMillin & Co. and associates of this city. The latter sale was the result of several weeks of negotiation, and the purchase comprised 22,000 shares out of a total of 26,735 shares. The syndicate will be known as the Western Gas Investment Co., a corporation organized under the laws of this State with $4,000,000 capital, which will issue $3,500,000 five per cent. bonds. The company has negotiations for other water gas properties under way. Among those interested are: E. W. Clark & Co., of Philadelphia; Maitland, Phelps & Co.; J. & W. Seligman Co., F. W. Montgomery and Vermilye & Co., of this city; A. J. Davis, of Syracuse, and several English capitalists. These parties have subscribed to all the stock in the new company, with the exception of $1,000,000, which has been taken by capitalists in Milwaukee. The terms of the subscription are that with every $10,000 block a bonus of $5,000 is given, and the purchasing syndicate expects to make a large profit on the deal. A part of the stock and bonds will be reserved in the treasury and sold later on for extensions. The original owners of the Milwaukee Co. received an equivalent of $125 for their holdings. It is understood that no change will be made in the executive management of the property, and the net earnings of the current year are estimated at $325,000.

A Wall Street gentleman well qualified to speak on the subject stated that in his opinion gas syndicates are destined to be as great a rage as the brewery syndicates of a few years ago ever were. English and German capitalists have become much interested in them now that the fact has become demonstrated that electric light is an ally rather than an enemy of the gas industry.

For the moment Mr. Addicks seems to have fallen into a waiting mood as far as Wall Street and his Brooklyn enterprise are concerned, and the Brooklyn stocks that he is interested or expects to be interested in have eased off somewhat, while the others have as a rule been well maintained. The Williamsburg company have advanced 5 per cent., while the Equity has declined a like amount. What will be the result of Mr. Addicks' deliberation is of course a matter of conjecture, for he is not a man particularly given to proclaiming just what his next movement will be. The plant of the Equity company is to be increased so that instead of 1,800,000 feet a day it will (when finished) be able to produce 4,000,000. The increased product, it is said, is to be sold to the East River company of Long Island City.

The strength in Chicago gas is due to buying on the belief that the stockholders will get a good deal more than 6 per cent. in dividends this year, as the World's Fair is expected to make the business of the company during the summer months even better than it has been during the recent winter months, when earnings are alleged to have been at the rate of 11 to 12 per cent.

Following are closing prices for active electric and gas stocks:

	Prices Saturday.	Range Sales 1893.	Range Sales 1892.
Chicago Gas	88¼ @ 89	85½@ 94½	71¼@ 99¾
Consolidated Gas	124 @...	123¼@144	102 @128
General Electric Co.	101½@...	99⅝@114¼	104½@119¾
Citizens' Gas (Brooklyn)	....	106 @109	94½@114½
Edison Electric Illum.	121¼@122	114½@131	79¾@115½
Laclede Gas	21½@ ..	20¾@ 26	17¼@ 27¼
Laclede preferred	71¼@...	71 @ 74¼	57½@ 74½

The closing quotations at leading brokers' offices of inactive gas stocks are appended. A noteworthy advance is in the Williamsburgh.

DON'T WANT SANITARY GAS.

The following article taken from the Wilkes-Barre (Pa.) *Record*, may not be interesting reading for the advocates of "sanitary gas," but it bears out the position taken by the AGE on the subject and is therefore worthy of perusal:

The expressed convictions of the *Record* that the borough council was doing the citizens of the West Side an injustice by granting the exclusive right for furnishing gas to Kingston to a company for the sole reason that they claimed to manufacture a harmless gas has at last been completely vindicated.

The Consumers' Gas Co., of Wilkes-Barre, has refused to accept the plant or gas of the "Sanitary" Company after a large and expensive plant had been erected and a thorough trial given the product. Now the new company must go to work and erect an entirely new plant and will furnish the ordinary illuminating gas.

The *Record*, while the matter was before the council, took occasion to ridicule the claims of the gushy young man who appeared here in the interest of the company as preposterous and impossible, but the council seemed entirely carried away by his eloquence and voted for "sanitary gas."

Now the matter has come to just where the *Record* said it would—the West Side has no gas of any kind, sanitary or unsanitary, and no immediate prospect of any. If the council had gone on and admitted both companies applying, the actual flesh and blood company which was thrown out and the "on paper" company which was given everything, the West Side town would before now have been piped from Wyoming and Edwardsville, and real gas furnished consumers. People who were present at the council meeting at which the franchise was given will recall with a smile the speech of the young but aggressive member of the body, who brought the matter favorably before the council for action. The "burning" eloquence of the man from Jersey had done its work and sunk deep into the breast of the young man. As he rose to address the body, his chest heaved, his eyes flashed and his voice trembled, as with Demosthenean eloquence he ripped out: "Gentlemen, we have found what we have been looking for—a harmless illuminant; one that can be breathed instead of air, drunk instead of milk, eaten instead of soup, and will burn with twice the brilliancy of electricity. I move you, gentlemen, that we invite its coming by giving the asked for franchise."

And the rest of the councilmen followed him like sheep through a hole in the fence.

Then the few men in the room who knew anything of the requirements and composition of real illuminating gas, and could appreciate the humorous element in the childlike credulity of the borough fathers, went out into the darksome street and leaned against trees and smiled, and they are smiling yet.

And the West Side is without gas.

The Georgetown (D. C.) Gas Light Co. intends making numerous improvements in its plant during the coming season. This company recently asked the commissioners of the district for permission to lay a six-inch pipe from its works to connect with the mains of the Washington Gas Light Company for the purpose of supplying such an amount of gas as may be required for use in Georgetown in excess of production. It is said the commissioners appreciate the importance of having the connection established between the two companies, in view of possible accident occurring to either of the works.

The Ottawa (Canada) Gas Co. and Ottawa Electric (arc) Light Co. have been purchased by an English syndicate with headquarters at Montreal. It is said the buyers are the same people behind the bill now in the Canadian parliament to secure powers to buy up and consolidate all the gas and electric companies in Canada. The combined capital of the two companies named is $650,000. The purchasers have acquired about $500,000 of these holdings. The Ottawa Gas Co. owns a most valuable franchise, having by their charter perpetual right to tear up the streets to put in pipes or repair the same. No matter how the streets may be paved or macadamized, the privilege is just the same, the only condition attached being that the company is supposed to put the street in the same repair as when they broke it up. They hold a perfect monopoly in their particular line. The Ottawa Electric Light Co. is another corporation possessed of valuable privileges and own their own water power, beside a magnificent plant at the Chaudiere, all of which, by a control of stock will go to the new owners. It is understood that extensive improvements will be made in the plant, and distributing service of the gas company.

There is every indication of a lively time in the near future over gas matters in Detroit. The Detroit Gas Company recently asked permission of the authorities to lay mains in certain streets of Detroit. Like many other cities Detroit has some choice, and highly worshipped asphalt pavements, which the citizens dislike seeing disturbed, and certain aldermen are inclined to place stumbling blocks in the way of the company's progress; for years it has been whispered among the knowing ones that the Detroit Gas Company had no right in the city of Detroit; strange to say no one has ever been able to catch a glimpse of the company's charter until a few days ago, when an enterprising newspaper in that city succeeded in bringing the franchise to light, from which it appears that in 1861 the city granted right to a "gas manufactory" and to supply its product for private and public purposes exclusively for the period of ten years. Strangely enough nothing in the document limits the corporate life of the company, or to what time it shall have the right to use the streets. The attorney for the gas company states that it is the intention of his client to claim practically perpetual rights, or at least during the corporate life of the Detroit company, which will not cease until 1901. That a red hot fight in Detroit gas affairs is about opening cannot be doubted by any one at all familiar with the situation.

Buffalo is threatened with another gas company as has already been mentioned in these columns, but probably the most serious attack on the exisiting gas interests of that city is the following resolution introduced in the board of aldermen on the 13th ult.: "*Whereas*, The city of Cleveland has recently passed an ordinance fixing the price to be paid by consumers of illuminating gas of 18-candle power at 80 cents per thousand cubic feet, and also requiring the several gas companies of the city to pay into the city treasury 6¼ per cent. of their gross earnings, said rates to remain so fixed for a term of ten years, and *Whereas*, The city of Buffalo is nearly as well situated for the manufacture of cheap gas as is Cleveland; therefore, "*Resolved*, That it is the sense of this board that a good quality of illuminating gas should be furnished to consumers in Buffalo at a rate not exceeding $1 per thousand cubic feet, and if fixed for a term of years such rate should be considerably less. *Resolved*, That the corporation counsel be and he is hereby directed to report to this board whether the common council of the city of Buffalo has the power to fix the price and prescribe the terms and conditions under which the several gas companies of the city shall furnish gas to private consumers." The resolution passed without any opposition. Buffalo has three artificial gas companies at the present time, and two concerns supplying natural gas delivered in pipes from the Canadian side. The wells in this territory are said to be rapidly diminishing, and the time is not far distant when Buffalo may reasonably look forward to five artificial gas plants, not to count the prospective competitor now knocking at her doors.

It is rumored that a bill will be introduced in the next municipal assembly in Missouri granting to Philadelphia, New York and Chicago capitalists a franchise to supply gas in St. Louis. One of the features of the new company's application will be gas at 75 cents per thousand cubic feet. We doubt very much if a new company could find an entrance in the city of St. Louis so long as the present interests are held in the present hands. St. Louisians are a particularly clannish lot of business people, and much of the stock of the Laclede Company is held locally. The same with the street railroads, electric lighting and other municipal interests of the city, so that when one interest is attacked it is sure to arouse the antagonistic spirit of the others, so that all the parties in interest get together and bring the most powerful influence to bear on any project looking to the undermining of any one of those common interests.

The Wheeling (W. Va.) board of gas trustees has submitted its annual report for 1892 to the city. In view of the extraordinary expanse of construction of the electric light plant, interest and principal of bonds, etc., the statement is a very favorable one:

RECEIPTS.

The Equity Gas Light Company of the Eastern District (Brooklyn) has reduced the price of gas to $1 a thousand cubic feet. Within a short time canvassers have been sent out and they have been actively engaged in securing customers for the newly completed company. The works of the Equity Gas Light Company were turned over to the present owners about two weeks ago by the Equity Gas Works Construction Company. Preliminary to turning over the plant it was thoroughly tested and was pronounced to be according to contract. The company has at the present time pipe laid on Grand street, Broadway and Flushing avenue, which is the heart of the district of the Williamsburgh Gas Company. In all the company has something over five miles of pipe laid. The regular price of gas in the city at the present time is $1.25 a thousand cubic feet. The Equity company has all along maintained that there would be no cut in the price of gas, but that they would offer better gas as an inducement for the customers of the Williamsburgh Company to leave that company. Secretary Blodgett, of the Williamsburgh company, was recently seen by a press representative, but he refused to state what steps his company would take in the matter. The injunction which the Williamsburgh Company has secured against the Equity company restraining the latter from laying more pipes is at present before the General Term of the Supreme Court. Mr. Blodgett said a few days since that it would be pushed to the end. The Citizens' and the Fulton Municipal companies in the Western District will begin the work of extending their plants in the districts of the Brooklyn and the Metropolitan companies, both of

Galva, Ill., will soon be electrically illuminated.

Electric lighting is soon to be put in at Clyde, Ohio.

An electric light plant is to be put in at Massillon, Ohio.

An electric light plant will soon be put in at Ridgefield, Conn.

It is reported that an electric light plant will probably be put in at Ripon, Wis.

The people of Margaretville, N. Y., are desirous of having electric street lighting.

The Paxton (Ill.) Electric Co. has increased its capital stock from $24,000 to $40,000.

An appropriation of $1,100 has been made for electric street lighting for Holly, N. Y.

A private party contemplates putting in an electric light plant at St. Johnsville, N. Y.

The people of Watertown, N. Y., at a recent election, voted to have an electric light plant put in.

A private party hopes to have an electric light plant in operation at Freeport, Ill., within three months.

The contract for lighting the streets of Columbus, Ga., has been awarded to the Electric Light Company.

At a recent election, the people of Paris, Tenn., voted in favor of the proposition for electric street lighting.

The De Pere (Wis.) Electric Light & Power Company has been incorporated with a capital stock of $20,000.

The citizens of Chesapeake City and North East, Md., have the electric lighting question under consideration.

The people of Red Cloud, Neb., have voted in favor of issuing $6,000 in bonds for an electric lighting system.

The Peninsula Light, Power & Heat Co., of Grand Rapids, Mich., has been formed with a capital stock of $20,000.

The people of Falmouth, Ky., are agitating the question of establishing an electric light plant for street lighting.

The plant of the Electric Light Company at McKeesport was recently destroyed by fire; estimated loss, $100,000.

Report has it that capitalists have organized an electric light company at Four Joliet, Ill., and will put in a plant.

Flandreau, Dak., will ere long be electrically illuminated. An electric light plant will be put in during the coming summer.

The authorities of New London, Ohio, have awarded a contract for an electric light plant to the Howe Construction Co., of Newark.

Bonds to the amount of $50,000 will be issued by the authorities of North Attleboro, Mass., to pay for the erection of an electric light plant.

The work of stringing wires at Tucson, Ariz., preparatory to the turning on of the electric current for street lighting has been completed.

A petition has been presented by the residents of Cary Hill, Mass., asking for electric lights. They have already raised $400 for the erection of poles.

An increase has been made in the capital stock of the Del Norte (Col.) Electric Light & Power Co. to $25,000. The company was organized in January, 1892.

An election will be held at Anna, Ill., at which a proposition to authorize the issuance of $1,000 of bonds to light the town with electricity will be voted upon.

Joseph R. Beckerdike, Tracey D. Hull and Benton Johnson have incorporated the Crescent Electric Light, Heat & Power Company at Chicago, Ill. Capital stock, $100,000.

The Lewiston (Mon.) Electric Light & Power Company has been formed with a capital stock of $10,000. The company proposes to erect and operate an electric light plant.

A franchise has been granted to the Power City Illuminating Company with privilege to string wires and erect poles for an electric lighting system for Niagara Falls, N. Y.

Hannibal, Mo., owns and operates its own incandescent electric light plant. The city began supplying light about March 1, and have in about 400 lights with prospects of another hundred.

The Mount Vernon (N. Y.) Electric Light & Power Company's plant was recently destroyed by fire. All the engines and dynamos were ruined. Loss $12,000, partly covered by insurance.

The Cleveland (Ohio) General Electric Co. will build a power house on Canal street; 10,000 horse-power machinery will be put in, and more than half a million dollars will be invested in the plant.

The people of West Peabody, Mass., who reside on West, Pine, Locust, Broad and Newbury streets want the electric light company operating in Peabody to extend their lines to that portion of the town.

The Bound Brook (N. J.) Electric Light, Heat & Power Company has been formed with a capital stock of $5,000. The incorporators are: C. P. Sebrig, North Plainfield; L. J. Amerbacher, Newark; F. H. Cook, Bound Brook.

The consolidation of the Edison Electric Light and the Water Power Electric Light companies of Des Moines, Ia., has been effected. The company will be known as the Des Moines Electric Company. Capital stock $1,000,000. Fred Goode was elected president and J. A. Colby secretary.

The Humboldt Light & Power Company has been formed at Eureka, Col. The capital stock of the company is set at $50,000, divided into 1,000 shares at $50 per share. The directors are James Strong, of San Francisco; Josiah Bell, J. M. Melundy, S. A. Vance and W. V. Lockwood.

Noah L. Cochen, president of the State Electrical Light & Power Co., has made a proposition to the board of aldermen of Brooklyn, N. Y., offering $10,000 for a franchise to do business in Brooklyn. He says if the franchise is granted he will furnish electric light for 20 cents less per lamp than the city is now paying.

H. R. Leavens, T. S. Coolidge, M. O. Brown, and E. B. and O. S. Potter, of Glens Falls, N. Y., have a scheme on foot to build a dam across the Hudson river 30 feet high, put in an electric plant, and supply the villages of Glens Falls, Sandy Hill, Fort Edward, Ganesvoort, Fort Ann, Saratoga and other neighboring places with electricity for power and lighting.

The cause of the blackening of incandescent lamp bulbs has been the subject of considerable investigation by electricians. Various theories have been advanced, but all have been more or less unsatisfactory. M. Bainville, manager of a large incandescent lamp factory in France, advances a new theory to explain the phenomenon. He suggests that the oxygen contained in the filament is responsible for the blackening. This forms carbonic oxide, which, when it comes in contact with the relatively cold wall of the bulb, splits up, the carbon being deposited on the glass and the oxygen set free to repeat the operation.

The annual report of the gas inspector for Allegheny county, Pa., shows that there was used in his district last year 1,100,274,000 cubic feet of illuminating gas by 20,165 meters. The report states that the candle power of the gas furnished is 33⅓ per cent. above legal requirements. Of the 2,490 meters inspected only two were rejected.

Judge Clement, of the Brooklyn City Court, has handed down a decision unfavorable to the defendant in the case of The People vs. The Equity Construction Company. The latter it will be remembered engaged to build the plant for the Equity Gas Light Company. As the decision is against the Construction Company and the Court of Appeals of the State has rendered a decision favorable to the validity of the charter under which the Equity maintains its works, it is not thought that the plant can be prevented from manufacturing or continuing to supply gas in the territory covered by its franchise.

Google

WALL STREET, April 29, 1893.

With the strained condition of the currency question the general stock list has shown signs of pronounced liquidation since our last review, and gas and electric securities have naturally shared in the general decline. Last week it was reported that the government had decided to pay the silver certificate issued under the Sherman law of 1890 in silver as soon as the $100,000 gold reserve had been entrenched upon. On Thursday a diplomatic statement was given to the press association by the Secretary of the Treasury, Mr. Carlisle, showing that the government legally had the right to take such action. The publication of this statement in the newspapers the next day had the effect of demoralizing the stock market and forcing large engagements of gold for export on the supposition that the government was about to establish a silver basis for part of its currency. The effect of this supposition was so great that President Cleveland deemed it prudent to furnish to the newspapers for publication a statement denying that the administration had contemplated refusing gold or silver certificates. This in connection with the action of banks in various cities in exchanging gold for legal tender created a favorable tone, and the feeling toward the close of the month was more confident.

Gas securities that are dealt in at broker's offices and are not listed on the Stock Exchange declined quite as much as the regular stock market. This was particularly the case in regard to Brooklyn companies where the breaking out of an old fashioned gas war has unsettled matters. Gangs of men in the employ of the Fulton Municipal Gas Light Co. began last week to open the streets in the district heretofore constituting the exclusive field of Mr. Addicks' Metropolitan Co. a twelve inch main being laid in the heart of the district. The Municipal Co. has 24 miles of pipe on hand and is working with such an energy that it will not be long before the pipe is all underground. The Citizens' Co., of Brooklyn, has also mains on hand with which to enlarge the capacity of its works to 3,000,000 feet per day. So it seems fair to assume that it will not be long before it enters the territory of Mr. Addicks' Brooklyn company. These developments mean that the Boston financier is going to have a hard fight, and the reason the Fulton Municipal people have not started it sooner is because they were waiting for their election so that the officers could see how they stood with their own stockholders. The result of the election completely confirmed their policy and they began work immediately. It appears that the Standard Oil interests have forced dollar gas in Boston, and the consequences following from the first result of a personal controversy may be far reaching, for the logical outcome would seem to be cheaper gas in Brooklyn as well as Brookline. It is thought that the edict of dollar gas which has gone forth from the gas commission to the Boston Gas Light Co., may mean the suspension of dividends upon Bay State stock, but it does not necessarily mean suspension of payment upon its income bonds.

Chicago gas shows a sharp decline from quotations current a fortnight ago. It is reported that insiders have been gradually getting out of the stock preparatory to becoming connected with other enterprises The only project that has been floated, and which might be construed as having any bearing on the withdrawal of support from Chicago gas, was the Indiana National & Illuminating Gas Co., which has been brought out by J. H. Benedict, Jr.

An annual dividend of 6 per cent. has been declared by the Chucatunda Gas Light Co., of Amsterdam, N. Y.

A financial article in one of the Boston papers gives this interesting story: "It is said that an effort is being made to put through the original scheme to buy up all the gas plants of the leading American cities, for which $50,000,000 of English and native capital was subscribed, but which fell through on account of the Baring failure." Fifty millions is a good deal of ready cash but hardly enough to buy up "all the gas plants of the leading American cities." It could make a very respectable beginning with that sum in New York City but "the syndicate" would have to go down much deeper into its trousers pocket before it could acquire a decent holding in this town alone; for example, the Consolidated Co., with about $40,000,000 capital and its stock selling at 1.25 @ 1.30.

One of the very latest cheap gas processes to come to our notice is styled the Miller-Zizzag. The principal claim of this method is stated by one of the promoters in his talk to a "syndicate" as "by this process we can furnish as good a fuel gas as the natural gas for half the money." Presumably he means half the cost of natural gas. We should be willing to wager something that the process will have a "zizzag" road to travel.

OFFICE OF THE UNITED GAS IMPROVEMENT CO.,
DREXEL BUILDING, PHILADELPHIA, April 20, 1893.

The annual meeting of the stockholders of the United Gas Improvement Co. will be held at the company's office, Drexel Building, Philadelphia, on Monday, May 1, at 12 o'clock noon, when an election will be held for a president and six (6) directors to serve for the ensuing year, and such other business transactions as may be brought before the meeting.

The stock transfer books will be closed from 3 P.M., Tuesday, April 25, until 10 A.M., Tuesday, May 2.

EDWARD C. LEE, Treasurer.

(*Continued from Page* 164.)

rolling by pieces of 4"×4". The entire wooden structure was securely bolted together.

The standard piles were for raising and permanently supporting the pipe, and the brace piles and the diagonal braces were to withstand any side thrust caused by sliding of the marsh.

One of the difficult features of this piece of work was the bracing of the right angle in the main, at the corner of Santa Clara avenue and De Haro street. This was accomplished by driving ten piles around the T at the corner, and by a system of diagonal braces. To prevent the pipe from drawing apart, iron bands were bolted around it at the corner, and these bands were connected on each side by rods with turn buckles.

After the pipe was raised and supported, the 12"×12" caps were removed and the tops of the standard piles were sawed off below the grade of the street. As the street was filled, the pile structure stood the strain of the street settling, but there was little or no lateral thrust, as the clay under the marsh was nearly level at this point, and the fill did not slide.

This piece of work was not subject to any of the unfavorable conditions that so seriously affected the first part of the work. In fact, the method employed to raise the first section would have been successful in raising the second section; but it is doubtful if any wooden structure would have withstood successfully the various forces exerted to overthrow it, at the crossing of Santa Clara avenue and Arkansas street.

Google

FINANCIAL

WALL STREET, May 31, 1893.

On the Stock Exchange the dealings in gas and electric securities since our last review have been light, though values indicate further recoveries from the demoralization in industrial stocks that was current early in the month. A special feature has been the activity and the sharp and sustained advance in Consolidated Gas resulting from the declaration of a 2 per cent. quarterly dividend, placing, it is believed, the stock permanently on an 8 per cent. basis. Chicago Gas, which broke to 59 from 83¾ during the panic in the industrials, has recovered to 75. General Electric stock on the other hand has suffered a sharp decline as a result of rumors affecting the company's credit. During the excitement to the industrial group this stock broke from 97⅞ to 58, and then recovered to 76. Last week the news became public that the company had sold its holdings of the stock of the Edison Illuminating Company, and the sale was accepted as an indication that General Electric was in need of ready money. The Illuminating Company has been paying the General Electric Company 6 per cent. dividends. An officer of the General Electric Company furnished the PROGRESSIVE AGE with a carefully compiled statement denying that the company is in financial straits. "The company has realized," the statement in question says, "that a determined attack is being made apparently on its credit, and to place itself therefore on a basis financially beyond the possibilities of harm it has adopted the policy of increasing its cash resources by the sale of such portion of the security of local companies now in its treasury as can be easily and profitably made. So far the company has sold $2,000,000 of these, and, as was stated in its annual report, proposes to sell others from time to time through some of the many channels open to it. It has in its treasury at very low valuation about $7,000,000 more of good local company securities. Negotiations for the sale of many of these at prices above inventory prices are progressing. The company sold during the year 1892 more than $5,000,000 of such securities. The acquisition and sales of royalty and other bonds an securities have always formed a secure and profitable part of its business. The company has now on hand besides the proceeds of the sales just made, $1,500,000 in cash."

The purchasers of the stock of the Edison Illuminating Co., of New York, from the General Electric Company are Kuhn, Loeb & Co., on behalf of European associates. The transaction is simply another instance of the interest that is being taken in gas and electric stocks by European investors. The price paid was a shade above 105. With their other purchases of Edison Illuminating, Kuhn, Loeb & Co.'s customers have sufficient stock to give them control, though it is understood that no change in management is contemplated. That the management is good is shown by the following comparative report of earnings for April and for the four months ending with April:

	1891.	1892.	1893.
Gross earnings	$45,812	$75,404	$102,093
Operating expenses	24,987	34,078	56 153
Net earnings	$20,824	$41,326	$45,940
Accrued interest on bonds	8,333	9,375	18,541
Gross earnings (4 months)	206,598	311,830	431,058
Net earnings (4 months)	103,737	161,894	210,717
Accrued interest on bonds	33,333	37,500	58,833

There has during the past fortnight been a very sharp break in the values of Brooklyn Gas stocks, according to the prices quoted by leading brokers to-day. Bids for Fulton Municipal have been reduced 7 points to 135, for the Nassau & Williamsburgh 20 points to 150 and 130 respectively, and the Metropolitan 10 points to 115. The decline has resulted on account of the "gas war," for which Brooklyn seemed to have become justly famous. The decline has affected by sympathy prices of companies that are not immediately concerned. Last week the Fulton Municipal Gas Co. began serving several hundred consumers in the Ninth and Twenty-second wards, which is known in the gas world as Mr. Addicks' Metropolitan Company's district. There is reason to believe that the competition will extend until a general war is raging and the result will naturally be the cutting of rates when the competition becomes so keen as to warrant such a step. The Fulton Municipal on a contract which could be terminated on six months' notice, sold at wholesale to the Metropolitan Company all the gas which was then distributed to consumers in the Metropolitan district. It is reported that the price paid was less than 60 cents per 1,000 feet. The Metropolitan people thought there was more money in manufacturing gas than in buying it, however, and they had the old works renovated and an improved process of manufacture substituted. That the fight of the Fulton Municipal people is against Mr. Addicks as against their old customers is shown by the fact that the Citizens Company has applied to the department of city works for permission to lay several miles of gas mains in the Brooklyn Company's district. It has not yet been successful. The Brooklyn Gas Light Co. is controlled by Mr. Addicks.

Beyond the increase in the Consolidated Gas Co. the New York companies have been without special features, and values indicate few changes of moment.

There have been no new offerings of gas stock or bonds for subscription since our last review, the continued unsettled condition of financial affairs rendering it out of the question to place the securities on a satisfactory basis.

The closing quotations at leading brokers' offices of inactive gas stocks are appended.

* Ex. Dividend.

The Washington (D. C.) Gas Light Co. is said to have a desire to purchase a controlling interest in the Georgetown (D. C.) Gas Light Co.

DIVIDENDS, ETC.

OFFICE OF THE AMERICAN GAS COMPANY.

222 SOUTH THIRD STREET,
PHILADELPHIA, PA., May 25, 1893.

The Board of Directors of the American Gas Company have this day declared a semi-annual dividend of 3 per cent., or $3. per share on the capital stock of the company, payable on and after June 1, 1893

MORRIS W. STROUD, Treasurer.

It is seldom our pleasure to see a more elaborate catalogue or a better illustrated and carefully prepared volume than that being sent out by the Berlin Iron Bridge Co. of East Berlin, Conn. Was it not that the matter depicts the practical affairs of every day life one could look upon this book as an artistic memento. The cuts show the various factories, shops and buildings that have been constructed by the Berlin Company and cover an almost endless variety of construction all for establishments that stand very high in the manufacturing world and acknowledged to produce the very best of products. It is a real pleasure to note the appearance among the illustrations contained therein, a considerable number of gas company buildings which may be taken as indicative of the growing disposition on the part of these companies to erect the most modern, and at same time the most desirable, class of structures.

FINANCIAL

WALL STREET, July 14, 1893.

Neither as a medium of speculation nor as a source of investment have gas or electric stocks shown any prominence on Wall Street since our last review. They have one distinctive feature however, viz., they have not sympathized to any marked extent with the general demoralization in prices that has shown itself in other branches of the general financial market. At this writing, for instance, Chicago Gas, which is the leader of the gas stocks, is in the vicinity of 66, comparing with 68, the quotation when we last wrote. St. Paul, which is the accepted leader of the railroad list, has declined to 61¼ from 69½ on July 1.

Brooklyn Gas stocks have been in complete neglect and the quotations to a considerable extent are nominal. There are no new signs of the promised "gas war." The Citizens' Gas Co., which passed its January dividend, has declared one for 2 per cent. payable August 2. Mr. Addicks, last week, paid a flying visit to Brooklyn and that gave rise to the rumor that he is making arrangements preliminary to a bid for the Fulton Municipal Co. It has been impossible, however, to find any reliable basis for the rumor.

The firmness in Chicago Gas was in the face of a generally demoralized financial situation and also in the face of renewed rumors of opposition. The rumors are to the effect that the Watson gas ordinance, which was defeated in the old council two months ago, is to come up again at an early date. The rumors further state that there is a good deal of money behind the Watson scheme. It is supposed to be backed by the Hyde Park Mutual Fuel Gas Co. which supplies gas south of Thirty-ninth street and has been unable to obtain a franchise in the city proper. "It is," according to a Chicago special, "the threatening peril of Chicago Gas, compelling the latter to keep the council continually in its pay to prevent a new and powerful rival. L. Z. Leiter and Marshall Field are stockholders in the Mutual Fuel Co."

The decline in General Electric is more apparent than real inasmuch as it is now selling ex-dividend. In view of the recently published statements to the effect that the United Electric Security Company and the Electric Corporation are a part of the General Electric Company, we are informed by an executive officer of the General Electric Company that neither corporation is financially related to the General Electric Company with the exception that the latter company runs a little of the common stock of the Electric Corporation. The companies work together to a greater or less degree for their mutual profit. The General Electric obtains the business of the equipping plants and one of the security corporations furnishes the money to pay the bills, taking the securities of the various enterprises in payment therefor. The Electric Corporation, which is duly formed, deals only in first-class mortgage bonds. Assessments of 20 per cent. each were called in March and May. The United Electric Security Co., which deals in all classes of securities, has issued nine series of bonds of $1,000,000 each. The last was put out April 26 and was based on securities held by the General Electric Company at the time its annual report was made, thereby reducing such holdings to the extent of the issue. It is said that a third stock assessment of the Electric Corporation will be called this month, in which case the General Electric will be enabled to release certain of its stock and bad collateral.

The dullness in the gas and electric market is simply in sympathy with the nervous feeling among investors generally. The difference is that there is no "short" selling of gas stocks carried on to any extent. Holders of these properties know they have value for their money and are not frightened by currency scares and exaggerated reports of financial difficulties to dispose of their properties. The general stock market is certainly in a most nervous condition and many of the most conservative houses would not be surprised if a regular panic were to ensue. Notwithstanding the concerted action of the banks in issuing clearing house certificates and the timely action of President Cleveland in calling an extra session to consider the currency question, money is tight and many solid mercantile houses are known to be in difficulties. In order to obtain ready money, stocks are being sacrificed and prices on the Stock Exchange each day become lower. It was expected that after the "July settlements," financial affairs would gradually work into better shape and that the Stock Exchange would reflect the improvement. So far, however, the expectations have not been fulfilled.

It is hardly necessary to state that there have during the past fortnight been no steps reported in Wall Street in the direction of floating new gas enterprises.

The closing quotations at leading brokers' offices of inactive gas stocks are appended.

The New Bedford (Mass.) Gas and Edison Light Co. has declared a dividend of $1.50 per share.

The Brookline (Mass.) Gas Light Co. has declared a semi-annual dividend of 2 per cent., payable July 15. This is a reduction of 1 per cent. from the last dividend and 1½ per cent. from former dividends necessitated by the large amount of construction work which the company has been and is now prosecuting.

The Mt. Sterling (Ky.) Gas Co. and the Mt. Sterling Electric Lighting Co. have effected a consolidation to take effect July 15.

Parties at Champaign, Ill., have a plan on foot with the object of organizing and conducting a fuel gas plant to operate in that town.

In pursuance of the mandates in the Lyford bill passed by the Massachusetts Legislature at its last session the Bay State Gas Co. has filed in the Supreme Judicial Court of Massachusetts a certificate asking for three commissioners to determine the value of the property of the company as provided for by the said act.

A franchise has been granted by the city of Brazil, Ind., to W. S. Carpenter and J. D. Sourwine. The franchise provides for the erection of a fuel gas plant under a forty years' franchise. The price to be charged shall be 50 cents per thousand cubic feet for fuel and $1 per thousand cubic feet for illuminating gas, the latter to be not less than 16 candle power.

The council of St. Joseph, Mo., have passed the ordinance asked for by the St. Joseph Light & Fuel Co., to enable it to engage in the supply of carburetted water gas. A provision of the charter provided that the public buildings of St. Joseph are to be lighted by the company free of charge; the price to be charged to consumers is $1 per thousand cubic feet.

An application by the directors of the Elmira (N. Y.) Gas & Illuminating Co. and of the Elmira Illuminating Co. for a voluntary dissolution and the appointment of a receiver has been made before Justice Smith, of the Supreme Court, and Mr. Reuben Leland, of Elmira, has been appointed temporary receiver for both companies under bonds of $25,000 in each case.

FINANCIAL

WALL STREET, July 31, 1893.

Speculative gas and electric stocks during the last fortnight have simply joined in the demoralization amounting almost to panic that has been the feature of the general stock market. They withstood the on slaught better than the general list, but holders on margins were finally compelled to give up the struggle against adverse monetary conditions. The weakness in the market at the present time has come from the west, where shares of every description have had to be sacrificed to obtain ready money that banks have found it impossible to furnish. Firms of the very highest standing have been unable to place their paper even when offering liberal inducements, and as a result their firms and individual members of their firms have been forced to go to the big auction market—the Stock Exchange—and sell stocks for whatever they would bring. It was quite natural, therefore, that stocks particularly identified with the west should feel the strain the greatest and Chicago Gas in industrial shares and the Grangers on the railroad list were naturally the greatest sufferers. Chicago Gas has experienced a decline of more than 20 points, while Consolidated Gas, a distinctively eastern property, has only declined 11 points. General Electric has declined about 22 points. As an evidence that news affecting special stocks has had little bearing on prices it may be noted that the decline in General Electric was in the face of a preliminary injunction granted at Milwaukee July 20 by Judge Seaman in the United States District Court against the Oconto Manufacturing Company restraining that company from making the Edison incandescent lamp. This decision upholds the validity of the Edison patents controlled by the General Electric Company. The Oconto concern represented the combined interests that have been fighting the Edison patents and introduced the "Goebel defense," claiming that Henry Goebel, a German watchmaker in New York, invented the lamp as early as 1854. This defense had been introduced in a suit against the Beacon Vacuum Lamp Company in Boston which was decided in favor of Edison by Judge Colt last year. The latest decision therefore fully sustains Judge Colt and is important.

For the month of June the net earnings of the Laclede Gas Co. (St. Louis) were $45,410 against $36,782 in June last year. For the first six months of this year the earnings are $373,788 against $316,330 during the corresponding months in 1892.

Gas stocks that are not dealt in on the Stock Exchange have stood the strain better, particularly the Brooklyn properties. In other words they are not such an available collateral in case of stringency and consequently are not forced for sale. An important development since our last review has been the knowledge contained in the news that W. J. Logan, W. H. H. Childs, George P. Sheldon and Henry Meyer have succeeded William Rockefeller, H. H. Rogers, Benjamin Brewster and John Willetts in the directory of the Williamsburgh Co. In other words the company has cut loose from the Standard Oil Co. As a rule the responsibility for the change, which was accomplished by proxies sent to the management, is placed upon the shoulders of Secretary Charles W. Blodgett and Mr. Blodgett's position in Mr. Addicks' Brooklyn Gas Co. gives color to the matter. On the other hand President Steers is credited with being at the bottom of the change. It is stated that the new directors are not identified with Mr. Addicks. An election of directors in the Beckton Construction Company has taken place and it is reported that Mr. Addicks has secured better backing than ever. The present financial stringency, it is also said, has not affected Mr. Addicks' loans on his purchased gas companies stock, for they are time loans and have yet some time to run. Interests friendly to Mr. Addicks' state that a compromise on Brooklyn gas matters is probable, but Mr. Addicks' opponents emphatically deny that such is the case.

It is hardly necessary to state that no attempt is being made to place new gas properties during the panicky times that are now current. To say that the times are panicky is no exaggeration. As far as the general situation is concerned the condition is quite as bad if not worse than the Baring panic of 1890, though Wall Street's list of disasters has not been so great. That panic was a quick one. This has been a slow and steady one, and its progress has been so gradual that it has given financial houses and merchants an opportunity to sacrifice their property and still keep on the solvent list. Wall Street prices are about the best indication that can be afforded of the country's general condition, as the following compilation will show at a glance how bad the condition actually is. The figures compare prices of two panic years.

STOCKS.	Highest 1890.	Lowest during Baring Panic, Nov., '90.	This year (highest).	Lowest prices July 28, '93.
Atchison	50⅛	23½	36¼	12¼
Canada Southern	61⅛	42	58¼	37
Northwest	117	98	116⅜	84¾
C., B. & Q.	111⅜	80	103⅜	69¼
St. Paul	79¾	44	85½	46½
Rock Island	98¾	61½	89⅜	53
C. C. C. & St. L.	80¼	53	80½	25½
D., L. & W.	149½	123¾	136½	130
Denver pfd.	61½	45	57¼	23
Lake Shore	114½	101	134½	107½
L. & N.	92½	65½	77⅜	48¾
Manhattan	117	92	174¼	100
Missouri Pacific	79¼	58	80	17¾
New England	52¼	28	52¼	18⅜
New York Central	111	95¼	111½	92¾
North American	47½	7	11⅜	5
Northern Pacific pfd.	86	55	50¾	19¼
Reading	48½	26¼	53¼	12¼
Texas	24½	12	11	5
Wabash pfd.	31½	15	28¼	9¾
Western Union	87	71¾	101	67½

It is not surprising, when the above figures are taken into consideration, that there is a large amount of investment buying for cash going on in the face of the general demoralization.

The closing quotations at leading brokers' offices of inactive gas stocks are appended.

City Councilman Anderson, of St. Louis, Mo., is doing a good deal of talking in the St. Louis papers and giving at length his ideas for the improvement and lowering of the price of gas in that city. A bill has been introduced into the city council providing for the granting by the city of a franchise to a company that would supply gas at 80 cents per thousand for illuminating and 50 cents for fuel purposes. The *Republic* newspaper in a recent issue contains the following: "There has been, however, independently of the plans of the city council, much private talk of the formation at once of a company which will stand ready to pledge itself to supply the city with the best gas at 80 cents and with the same gas for fuel at 40 cents per 1,000. 'The capital for the new company can be raised in a day, provided a charter can be obtained'; so said Mr. Frederic Egner yesterday. Mr. Egner is a gas engineer of great experience. Previous to 1891 he was for over eight years engineer and superintendent of the Laclede Gas Light Co. He has been chief engineer of the Standard Gas Light Co., of New York, and was for years engineer and superintendent of the City Gas Light Co., of Norfolk, Va. Mr. Egner is most positive as to the feasibility of forming at once a company with a capital of three and a half millions of dollars, which he says would be ample. A prominent New York capitalist desires, Mr. Egner says, to take a very large amount, if not the entire stock, but the wish of those interested is to make the company a home enterprise. All that is needed is that the city should give a franchise and permission to lay the pipes. If gas can be made so much cheaper some will ask: Why does not the Laclede Company undertake the task? Mr. Egner says it is 'simply because the Laclede, which absorbed the St. Louis Gas Light Co. and the Water Gas Co., has an enormous capitalization to provide for, and to a great extent an antiquated and unsatisfactory plant. In many parts of the city it is claimed its mains are far too small.' Mr. Egner asserts, 'and a new company with a modern plant of the best description could sell gas at a substantial profit where the Laclede Company, getting the same prices, would be losing.'"

FINANCIAL

WALL STREET, August 31, 1893.

Since our last review all Wall Street interests have been centered on the progress of the legislation looking toward the repeal of the silver purchasing clause of the Sherman bill. For some time before the voteon Monday it was known by Wall Street almost to a certainty that the House would vote for repeal, and, as a result, the general market ruled firm and the announcement of actual action by the House had comparatively little outward influence. Investors have continued their policy of buying stocks outright in small lots for cash and this has had an important influence in the way of curtailing the operations of the bear party by limiting the amount of shares available for formal delivery. Consequently while the market has had a firm tone it has been narrow and entirely in the hands of the professional traders.

As far as gas and electric properties are concerned the only unfavorable feature has been the heavy realizing sales of General Electric on Boston account. There has been some change in the details of the plan for taking up the floating debt of the company from those outlined in our last issue. The trust will be styled "The Street Railway and Illuminating Properties." The stock of the trust will be nine million dollars. One-half will be cumulative six per cent. stock with a preference applying to principal and dividends. The trust will comprise $12,000,000 to $13,000,000 notes receivable, and interest bearing stocks and bonds from the General Electric treasury. These are bought for $4,500,000 less ten per cent. (or $450,000), which goes to the underwriters, the company receiving $4,050,000 net from the transaction. It is calculated that the securities in the trust will yield an income in interest and dividends of more than $400,000 per year. The preferred dividend will call for $270,000 leaving a balance for the common stock. As the notes and other securities are liquidated, the proceeds will be applied to cancellation of the principal of the preferred stock to be drawn for payment at a premium. When the preferred stock has been canceled, the remaining assets will stand to the credit of the common stock.

New York and Brooklyn gas stocks have remained quiet and without important change in value. It is expected, however, that renewed activity will be shown in a short time, as a number of influences seem to be on the point of development, at least as far as Brooklyn is concerned. The Fulton Municipal in the latter city has, of late, been doing exceedingly well in the district of the Metropolitan Company and has laid its mains throughout nearly the entire district. The Fulton Municipal which, it should be remembered, is backed by the Standard Oil Company is likely to make it interesting for the Williamsburgh Gas Company before the Fall months have advanced very far. Three forces of men have been put to work in the fattest part of the Williamsburgh Company's districts tearing up the streets and laying mains as fast as they can. When the Fulton Municipal forced peace to be declared after the gas war ten years or so ago, it had long arms of pipes reaching out into almost every section of the city. During that gas war it made it a rule to attack the other companies only in the best parts of their districts, and to do that it was necessary to have these long arms extending everywhere. Just as soon as enough main has been laid to enable the company to serve gas to a few customers, connections will be made with these old mains which have been lying almost useless for years and then active competition with the Williamsburgh Company will begin.

The causes which have led up to this change of feeling between the Fulton Municipal and the Williamsburgh companies is in itself interesting. The latter company was not very long ago controlled by the same men who controlled the Fulton Company. They form what has always been known in the local gas industry as the Standard Oil interest, William Rockafeller, H. H. Rogers, and Benjamin Brewster being the principal ones. Then it came time for the annual election of the Williamsburgh Company and the proxies of the various stockholders were sent in large numbers to the offices of the company. The day for the election came along and it was supposed by every one with the exception of two of the prominent officers of the company and a few men outside the company, who are heavily interested in Brooklyn gas affairs, that the result of the election would be the same board as before. Instead a new board was put in and the control of the company changed hands. President Steers of the Williamsburgh Company at once disclaimed all knowledge of the little game which was worked upon the confidence of the stockholders, but later developments aroused suspicions otherwise.

The Fulton Municipal Company put things together and came to the conclusion that the same man who had succeeded in securing enough stock of the Brooklyn and the Metropolitan Companies was the one who had caused the change in the Williamsburgh—Mr. J. Edward Addicks, of Boston. So they set out to fight him. In its fight against the Metropolitan Company the directors of the Fulton Company assert that they have had greater success by far than they had any right to anticipate. Already several miles of pipe have been laid in the Ninth, Eighth and Twenty-second wards and the competition for custom is waxing hot The Citizens' Company, which is allied with the Fulton Municipal Company in its antagonism to Mr. Addicks and his methods, secured some time ago permits to enter the Brooklyn Gas Company's district and lay pipes to supply the First, Fourth, Fifth and Second wards, but owing to the financial stringency the work has been delayed. The Fulton Municipal Co. was fortunately supplied with money of its own earnings when its fight with the other companies was begun, so it has not been compelled to delay work.

HARTFORD, CONN., Aug. 18, 1893.

Editor PROGRESSIVE AGE:

As an investor always seeking desirable securities in which to make safe disposition of surplus funds, I wish to express my thanks for the very excellent financial articles that appear in your readable paper. I have cause to be largely governed by the hints thrown out by you in my purchases of gas securities. I wish to ask your opinion about Chicago Gas. I have a good block of stock of this enterprise, much of which was purchased and put away around 60. Would you advise me to part with it when I can do so at no sacrifice, or do you believe it will pay me to hold on? I have seen the price quoted about 88 since I made my investment therein, but since that time I have often thought I should have done well to have taken the profit. J. H. S.

[Our correspondent is evidently influenced by the general situation. He believed in Chicago Gas at 60, but the influence due to lack of confidence has unsettled his mind somewhat. We would say that in our judgment Chicago Gas is cheap, very cheap around 60. Our friend will remember that this company operates in one of the greatest of modern cities, a city that is very rapidly growing in both population and wealth. That it is practically in control of the lighting business now and for the future in Chicago. Its affairs are ably administered by a directorate that understands the gas business and is sensibly appreciative of the future of gas supply. It may be deemed wisdom on the part of the officers of the Chicago Gas Trust to pass the next dividend. If so, while this will doubtless have its influence temporarily on the market value of the stock, its permanent worth will not be injured through the stoppage of one or even more dividends. If our reader has bought this stock as an investment and not for purely speculative purposes we should advise him to keep his holdings for the dividends that are sure to follow bye and bye.—EDITOR, PROGRESSIVE AGE.]

FINANCIAL

WALL STREET, Sept. 30, 1893.

The improved feeling noted in our last review has received somewhat of a check on account of the Senate's delay in voting on the Sherman Law Repeal Bill. Traders, both large and small, show no disposition to act until they receive assurances that the Senate will soon act, and in the mean time the market shows the effect of the dullness in business in the form of a gradual shrinkage of values. There has been no indication of a general liquidation, and the market shows few signs of any material short lines having been put out. In other words the bears, while indulging in their usual pessimistic talk, show a decided disposition to preach rather than practice. The general financial situation seems in good shape; money has become easy; each week's bank statement indicates a large addition to the reserves and the banks have already canceled about one-third of the outstanding clearing house certificates.

Gas and electric properties have simply joined in the general depression.

General Electric has been attacked on various rumors. President Coffin of the company is our authority for the statement that there is no truth whatever in the report circulated here and in Boston that there is a disruption in the syndicate recently formed. Mr. Coffin said the money has all been paid in.

Brooklyn gas properties as a rule have proven an exception to the general depression although transactions in them as far as reported have been few and far between. There has, nevertheless, been an amount of nervousness shown which would seem to indicate that the quotations have been maintained not so much on account of firm bids as on account of the absence of firm bids and the indisposition of holders to make sales at sacrifices. The cause of the nervousness is the rumor, a vague one it is true, of a new and mysterious company with capital and experience enough in its directory to give battle to all existing companies. The company has as yet not been incorporated and indeed its proposed name is not definitely known, though the rumor that is current about the new concern gives its name as the Majestic Gas Co., of Kings County. Another detail that the rumor professes to give and which cannot as yet be traced to any responsible source is that the Standard Oil people are to furnish the brains and capital and that General Jourdan is to be the head of the affair. Some color is lent to this statement by the fact that there has recently been a conference between General Jourdan and B. I. H. Trask, the latter being the principal owner of the Equity Co. If it be true that the Standard Oil people are at the back of the new company its first object of attack, it is argued, will be the territory of the Williamsburgh Gas Light Co. on account of the precipitate departure the Standard people were forced to take at the recent election of the Williamsburgh Co. The Majesty Co. can, it is argued, lease on most advantageous terms the mains of the Fulton Municipal Co. in the Eastern District of Brooklyn, and would quickly be able to wage a little war. It is more than probable that the entire report is untrue as far as the Majestic Co. is concerned, though there appears little doubt in usually well-informed circles that the Standard Oil people have decided to punish the Williamsburgh Co. General Jourdan makes an explicit denial of the story as far as it concerns himself. He had, he said, heard nothing of the new enterprise, was certainly not interested in it and never expected to be interested in any such scheme.

Following are closing prices for active electric and gas stocks:

	Closed Tuesday.	Range Sales 1893.	Range Sales 1892.
Chicago Gas	54⅛@54½	39 @ 94½	71⅛@ 99¼
Consolidated Gas	124½@126	108 @144	102 @128
General Electric Co.	41¼@41½	30 @114¼	104½@119⅜
Citizens' Gas (Brooklyn)	.....@....	99⅝@109	94½@114½
Edison Electric Illum.	90 @	71½@181	79¼@115½
Laclede Gas	14½@ 15	9½@ 26	17⅛@ 27½
Laclede preferred	58 @ 62	48 @ 74½	57½@ 74½

The closing quotations at leading brokers' offices of inactive gas stocks are appended:

Gas Companies.	Bid.	Asked.	Gas Companies.	Bid.	Asked.
Brooklyn Gas Light	.....	110	Williamsburgh	120	.....
Jersey City & Hoboken	180	.....	Bonds, 6s	100	102
Metropolitan—Bonds	105	.....	Metropolitan (B'klyn)	.....	120
Mutual (N. Y.)	139	148	Fulton Municipal	128	.....
Nassau (Brooklyn)	140	150	Bonds, 6s	105	.....
Scrip	.....	100	Equitable	168	175
People's (Brooklyn)	.....	85	Bonds, 6s	100	.....

It is reported that the Bay State Gas Company, of Boston, Mass., has sufficient funds to pay full interest on income bonds on Nov. 1.

While on the witness stand Mr. F. P. Addicks, treasurer of the Bay State Gas Company, stated, in reply to an inquiry as to the net earnings of the Bay State Company for the year ending June 1, 1893, that the same were $503,598.97.

Detroit Gas Company 5 per cent. bonds sold in this city a few days since at 15 cash and the following day at 20 regular, the last previous sale being on July 6 at 85. The reason given for the decline is that bonds are being sold out in a loan. The company is not in default. On the contrary it more than earns all interest charges. It is, however, undergoing a fight with the city of Detroit, which some think may be the real cause of the present selling.

The net bonded debt of the Chicago Gas Company after the new bonds are issued, will be $30,846,000, which, added to the stock outstanding, $24,885,800, will make a total capitalization of $55,231,800, and the interest charges hereafter will be about $1,500,000, against $1,087,508 in 1892. To pay 6 per cent. on Chicago Gas it will require $128,304 more than was earned in 1892, but net earnings have increased largely every year. On Jan. 1 next the price of gas will be reduced from $1.20 to $1.15.

The Grand Island (Neb.) Light & Fuel Company, we are informed by Mr. James Murray, superintendent, has decided on making material reduction in the price of gas. The gross price per thousand feet has been fixed at $2.50 with discount on all bills paid on or before the 10th of each month as follows: Under 2,000 cubic feet, 10 per cent.; between 2,000 and 5,000 cubic feet, 15 per cent.; 5,000 to 15,000 cubic feet, 20 per cent.; 15,000 to 40,000 cubic feet, 24 per cent.; 40,000 cubic feet and upwards, 30 per cent. On all gas used for fuel purposes, when consumers for the month shall equal 1,000 cubic feet, 36 per cent. discount.

The following comparative statements of the Laclede Gas Light Company have just appeared:

For month of July.

1892.	1893.
Net earnings, $34,783.64	$38,750.25

For seven months ending July 31st.

1892.	1893.
Net earnings, $351,314.61	$412,539.07

Increase gain for July, 11.38 per cent.
" " " 6 mos., 17.42 " "

VALUABLE GAS INTEREST FOR SALE.

The undersigned will sell to the extent of $20,000 to $50,000, in sums to suit purchaser, an interest in a growing gas business, now netting 8 per cent.; increase this year will give net earnings of over 12 per cent. Money wanted for extensions to cover valuable territory. A magnificent opening for a party desiring a permanent occupation and investment in one of the most pleasant residence locations in California. Banks and business firms as references.

Address for particulars and statement,

LOS ANGELES SAFE DEPOSIT AND TRUST COMPANY,
Stimson Block, cor. Third and Spring Sts.,
LOS ANGELES, CAL.

not less than four holes on top. If small appliances are included, like boiling stoves, the number would probably reach 600. The Cicero Company has disconnected about 40 gas machines, and has set over 800 meters. The company is now entering upon a gas grate campaign and has already set about 50 gas grates, most of them asbestos type. They are also trying to do something with gas heating stoves. During July and August over 75 per cent. of the gas output was sold for fuel purposes. The company is by no means neglecting the lighting business, but is constantly adding light consumers. The opposition electric companies established long before gas was put in are feeling the effect of the new gas company greatly. The price charged is $1.25 net for fuel gas and $1.50 net for illuminating gas.

In our issue of the 15th ult. among the "Short Runs" appeared an item in regard to the city lighting at Lawrence, Mass. We have been informed that the information contained therein is not in all respects entirely accurate. A reading of the article would convey the impression that the public lighting of Lawrence was most unsatisfactory to the citizens; that the service was poor and the price charged excessive. The matter being one of considerable importance, we have made an investigation with a view of getting at the facts, and we are now able to state that the gas company operating the electric lighting plant and furnishing the city of Lawrence with street lights, is running full arc lights—2,000 c. p.—running every night till 12.30 and during the winter months starting up again in the morning while the mill help is going into work, and for this service have been receiving only $100 per year per arc. Considering the distance from the coal mines this price is very reasonable, particularly when we remember that the price at Lowell has been 40 to 37½c., Boston 40c., Charlestown 40c., Haverhill 45c., Lynn 46c., Salem 45c.; these prices being per day, of course. The city of Lawrence has spent very little money for street lighting, not half as much per mile of street as the neighboring cities, and this is where the dissatisfaction comes in. In other words, the dissatisfaction noted in the local papers arises, we are informed, from so little money being spent in street lighting, and not on account of the price charged for the service. Of course this point was hardly grasped by some of the newly elected councilmen, but the facts are as now given. This is shown quite clearly by the census return, which gives the cost of street lighting per head of population in the various cities.

The following gives this item for Lawrence and several similar cities:

City.	Cost of street lighting to each head of population for each lamp.
Lawrence	34c.
Lowell	73c.
Boston	$1.24
Worcester	94c.
Fall River	37c.
Lynn	66c.

Again, the cost per capita for 278 cities in the United States is 60 cents. These figures, we believe, will emphasize the point that Lawrence is paying very little for street lighting.

There have been many rumors of late, says the Boston *News Bureau* of a union of the Brookline and Bay State gas interests, but they cannot be confirmed. It is understood that the Brookline company made its contracts upon the basis of the contractors accepting bonds for payment, which arrangement in the recent stringency has made a considerable hardship. It has not been easy work of late to dig up Roxbury pudding stone with unsalable Brookline gas bonds. The Standard Oil interest believed it was going to make short work of all the Boston gas companies and drive the Boston people out of Brooklyn, N. Y., and pick up the wrecks at Standard Oil valuations in both Boston and Brooklyn. But nobody has yet failed, the Standard Oil Co. has made no progress in Brooklyn, N. Y., and it has only succeeded in Boston in making a bad investment and reducing the price of gas to the lowest point of any leading city in the United States. It is therefore natural that there should be a little "tired feeling" in some quarters. The growth of the gas interests in the Back Bay and Roxbury districts is about 7 per cent. per annum, and the Brookline Co. has not yet secured for its business one-half of the annual increase, in fact, it has taken orders for meters for less than 3 per cent. of the gas consumed in that district, and as the company is not yet equipped to furnish the quality of light furnished by the Boston Gas Light Co., the consumers are returning to the older company after giving the new company a trial. Of course dividends on Bay State gas under dollar gas are out of the question save from some years' growth in consumption. Mr. F. P. Addicks, treasurer of the Bay State Company, in his testimony before the gas commission, at Boston, is reported to have stated that gas in the holders costs his companies .37½.

The following piteous appeal appears in an editorial of the Hamilton *Republican*. It will be remembered that city embarked in a municipal gas works a few years ago. The *Republican's* appeal runs: "How well the citizens of Hamilton could serve a double purpose by giving their united support and patronage to the city gas works? By increasing the output of the gas works, the cost of the production of gas is cheapened, the earnings are increased, all of which goes to the credit of the citizens of Hamilton. If the citizens ever hope to obtain cheaper gas they must resolve to patronize exclusively the city's plant. At the same time the city itself should do all in its power to furnish the best light possible and to meet every wish of its patrons. The demand from many of the merchants to day and the only excuse they offer for patronizing a private gas company is that the city cannot furnish electric light. Electric light is then the need of the hour. It is not only needed as a public convenience but it is needed as a means of increasing the usefulness of the city gas works. The gas works is now furnishing gas to the city at the rate of 40 cents per thousand. By means of an electric light plant, providing the city pays a sufficient revenue to cover the cost of the manufacture of electric light, the price of gas for private consumption can in all probability be reduced. The city cannot afford to delay in this matter, for the very reason that the public demands electric light. The private company now seeking to make a contract with the city stands ready at the present time to supply that need. If the sale of bonds is all that stands in the road, we venture that by the time those bonds are ready to be put on the market, the money market will be so easy that they will command a premium. Let the council and gas trustees

meet in conference and arrange for estimates and make a showing to the people of Hamilton, of not only the cost of erecting an electric light station, but also the cost of manufacturing electric light."

The City & County Gas Company, of Chicago, Ill., capital stock $30,000,000, has been licensed by the secretary of state of Illinois with Henry C. Rew, Nelson A. McClary, Charles D. Hauk and E. E. Morrell as incorporators. Mention of this undertaking has been made in these columns and from private information recently received by us we are disposed to regard the City & County Gas Company for Chicago as a very likely competitor of the Chicago Gas Trust. With few exceptions we find the Chicago local papers disposed to regard the new scheme in a favorable way, although we are informed that the corporation council of Chicago does not favor the idea of giving the city one-third of the stock of the new company as proposed. Instead, he says he thinks a better and more satisfactory basis would be a clause providing that the city should receive semi-annually 33⅓ per cent. of the profits made by the company. The state, he says, receives a percentage of the gross earnings of the Illinois Central Railroad Company, and that some such idea could be incorporated into this proposition if the National Gas & Water Company would accept the change. To this H. C. Rew, the president, said to a reporter "Such a proposition would suit our company fully as well, if not better than the one we are making, but is it not open to the objection that was urged to our first plan, viz., that it would leave the company in shape to sell out to the present trust, while on the other basis it gives the city the control which, from the investigation I have made, seems to be the desideratum. However, our proposition is not unalterable, but will go in as a basis to work on." It will be remembered that the new gas company proposes to issue $10,000,000 of its $30,000,000 of capital stock to the city and claims to be able to make and sell illuminating gas at a cost of 80 cents or less per 1,000 feet to the consumer, by the use of the inventions and appliances of the National Gas & Water Company, which has a large plant in operation in Cicero. The incorporators are the same persons interested in and controlling the National Gas & Water Company and the Cicero plant.

George Olney, of this city, who is more or less known as a builder of gas plants, is said to have acquired a franchise for a new gas works at West Springfield, Mass. Certain local people at West Springfield have held, for some years, a sort of franchise for gas in that town. The reason these parties have never taken active steps to organize and build works is that the town is very much scattered and the population small, viz., about 5,000. It seems according to the Springfield *Union* which says: "The first intimation that any one in West Springfield had that such a scheme was on foot was given to K. Arthur Dearden, who about a week ago was approached by a gentleman calling himself George Olney and presenting credentials which showed him to be the agent of the Mutual Gas Light Company of New York. Mr. Dearden had been recommended to him as one who was thoroughly conversant with affairs in West Springfield and Mr. Olney at once stated his business. Briefly, it was to look over the town and if circumstances were favorable secure the right to construct a suitable gas plant for the town's use. Mr. Dearden took his team and drove him around the village and later made another trip. Mr. Olney was well satisfied with the outlook and wishing to consult others upon the advisability of the plan, Mr. Dearden introduced him to J. L. Worthy, who some ten years ago started a similar scheme, but which has been allowed to lapse. Mr. Worthy also considered the plan favorably and then Mr. Dearden introduced the visitor to the selectmen of the town. The plan was informally discussed and as the officials were in favor of granting the company the right, Mr. Olney consulted the company's attorney, Mayor Kendrick, and the required papers were drawn up. This was on Monday. Yesterday morning the selectmen held a regular meeting and as the company did not require the town to expend a dollar, they decided to grant the petition, and Mr. Olney returned to New York with the franchise in his pocket. His next effort will be to effect an organization of his company in this state, and to get permission from the state gas commissioners to construct the works, after which work will be begun. It is thought that these matters can be settled so that the construction of the plant can be begun inside of two weeks, and if everything works well the works will be finished in sixty days. The gas house will be located on the line of the Boston and Albany near Worthy's grist mill—one of the most convenient and profitable sites that could be selected. Thence mains will be run both to West Springfield proper and to Mittineague, gas being supplied for both illuminating and heating purposes. The company will have a capital stock of $60,000, and after the works are complete local men may become interested, but at present the New York company will furnish all of the capital. Already the company has two plants in Brooklyn, one in Huntington, L. I., one in Bound Brook, N. J., and another in Connecticut, so it ought to thoroughly understand the construction of the plant and give West Springfield such a one as is required. The venture ought to prove profitable in the end, although it may not at first, as the town is steadily growing, and there are already 125 or more houses piped for gas. Last year sixty new houses were erected, and the actual increase in property valuation was about $200,000. So it would seem that the town was ready for the introduction of the system." We hope Mr. Olney will fare better in this enterprise than those engineered by him at Huntington and Bay Shore, Long Island. The same is to be hoped for any local people who may chance to be interested. The Mutual Gas Company, of New York, is a new title to us. It certainly cannot be the New York Mutual Gas Company, for the interests of the last named company are confined to local affairs exclusively.

The Williamsburgh (Brooklyn, N. Y.) Gas Light Co. is now serving gas in the district of the city which has heretofore been provided with that almost indispensable commodity by the People's Company. That move is not intended so much an attack upon the latter company as it is upon the Fulton Municipal Co., of which General James Jourdan is president. For a more perfect understanding of the reason why it will hurt the Fulton Municipal Company it is necessary to give a little history concerning the gas companies in that city. Some ten years ago they were all at loggerheads, and General Jourdan's Company, which had an exceedingly comprehensive charter, went free lancing all over the city. One after another the other companies succumbed to its attacks and were glad to make almost any terms they could. The Citizens', the Brooklyn, the Metropolitan, the People's and the Williamsburgh all made settlements which resulted in large sums of money being turned into the Fulton Municipal coffers on one pretext or another. In return contracts were signed or agreements of some kind made by which the Fulton Company was to cease its invasions and leave the other companies in peace and quietness. Since that time, up to about a year and a half ago, there were no clouds of war in the gas sky. Then Mr. Addicks swooped down from his Boston headquarters upon the local gas forces, and was successful in securing control of the Brooklyn Company. Soon after he made another raid, and the Metropolitan Company became his property. Recently there was an election of directors in the Williamsburgh Company, and in some way, which is understood by very few, the board was changed and with it the policy of the company. When the Fulton Municipal Company halted in its attacks it had reached very nearly, it is said, the limit which its backers had agreed to spend in the fight, and could not have continued it successfully more than a short time. Then it was that a cool game of bluff was begun. The Williamsburgh Company thought it had enough of the fight and wanted a compromise. The Fulton Company, with a depleted treasury, but a bold front, stood off. The Williamsburgh directors were most anxious to make terms. John T. Willets, vice-president, was then in control of the company, the president being sick. Finally the Fulton Company made its own terms. It would lease to the Williamsburgh company its Tesse du Motay system of making gas at a monthly rental of $3,000. This is the first that this has been made public, and Williamsburgh stockholders and Fulton Municipal stockholders will probably be equally surprised. In addition to this several of the Fulton Municipal officials were presented with stock of the Williamsburgh Company, amounting, it is said, to one-third of the capital. With that stock they were elected soon after to the directory of the Williamsburgh Company. They were the men who were recently voted out of office. There are probably very few persons outside of the directors of the two companies who ever knew the true inwardness of the deal between the Fulton and the Williamsburgh Companies. The change in the directory of the Williamsburgh Company was at first taken as an evidence of Mr. Addicks' far-reaching ability to win support. That has since been denied, but is still firmly believed by many well informed gas men. Since the new board has been in power the attitude of the Williamsburgh Company has changed from one of great friendliness to that of active antagonism. The chip which it has been wearing upon its cor-

Digitized by Google

poration shoulders is connected closely with the tax of $3,000 a month for the Tesse du Motay system of making gas. The Williamsburgh Company have no use for it and never used it in any way, but it paid its rental just the same. When the price of gas was reduced to $1.60 a thousand the rental was decreased, and again it was reduced to $1.50 the rental was made $12,000 a year. When the last reduction took place and the price was fixed at $1.25, another reduction was asked. Just at that time it looked very much as if the long hoped for consolidation of gas interests would be effected, and the Williamsburgh Company was asked not to make any fuss and all would soon be adjusted. Adjustment fell through with the schemes for consolidation, but with the beginning of 1893 the Williamsburgh Company ceased to pay tribute to the Fulton Company. In April the Williamsburgh ceased to buy naphtha from the Standard Oil Company. Correspondence followed, which culminated on August 7 in the asking of a single direct and pertinent question of the Fulton Company directors. No written answer was made, but in a few days a gang of men were opening streets in Williamsburgh to lay pipes for the Fulton Company. This was exactly what was wanted by the Williamsburgh Company and before General Jourdan's company could begin serving gas they were being hit pretty hard in the People's district. When peace was declared ten years ago the terms the People's Company made were that it should cease to make gas, but should buy all it used from the Fulton Company. Every customer the Williamsburgh Company obtains decreases the Fulton Company's output, and according to a statement made the People's Company will lose nothing, because the Fulton people have contracted to protect them. On the other hand, officials of the Fulton Company say there is no such agreement. In such a case the People's Company will be the battleground and the stockholders of that company the greatest sufferers. Both of the competing companies, while not yet actually cutting rates, are offering inducements of various kinds to secure customers. Whether there will be any great reduction the future alone can show. The Fulton Municipal Company still uses the system for making gas that it did ten years ago, only it is improved in many ways. The Williamsburgh Company has the Loomis system now in complete operation, and claim that it is the best and cheapest. The Fulton Municipal has now about a mile and a half of mains in the Williamsburgh territory. The latter company has extended its system a mile into the People's district. It has ten miles of mains on hand which it intends to use.

The thirty days allowed the Detroit (Mich.) Gas Company in which to accept or reject the ordinance passed by the council fixing the price of illuminating gas at 80 cents a thousand expired some time since, at which time the directors of the company, representing all the gas interests involved in the controversy, met at the office of the company in Detroit and formulated a letter addressed to the council. In this communication to council, giving notice of their decision, the directors first recite the connection of the present company with the controversy. The directors allege that they lost of annual revenue no less than $60,000 by reducing the price of gas to $1.25 per thousand and $20,000 more by improving the quality of the product from fourteen to eighteen candle power on the east side of the city and from eighteen to twenty-one candle power on the west side. The directors declare that they contemplated very extensive improvements but were prevented from carrying their designs into effect by "the unreasonable and we think unjust treatment which the company has received at the hands of the city authorities. This company's plans contemplated the expenditure during this year of fully a million of dollars in this city, if it had been permitted to prosecute its business, as in law and justice it was entitled to do, and fully three-fourths of that amount would have been paid in wages to laborers employed upon the work." The present owners of the company, the communication relates, consulted high authority as to the value of the franchises and plant. The gentlemen are assured that they have the right "to do a gas business in this city under existing grants and ordinances for many years to come." They were told that the plants for making artificial gas could not be duplicated for less than $2,000,000. "While a very much greater sum than that was paid, still, for the purposes of this argument, we will concede that figure as a fair basis upon which to discuss the question of the reasonableness of the ordinance of August 15." It does not concede that any new grants or franchises so-called, are required by it or are necessary to enable it to continue doing business. Only because the passage of the ordinance conveys to the public the impression that the company is not acting in a fair and reasonable manner toward its customers does it desire to lay before the public what it thinks are conclusive arguments against the reasonableness of the ordinance. The company argues that the donation of the franchise, fifteen years, is too short for the reason that during that time the company would be unable to meet the loss of property that must result when the franchise expires and the plant is rendered worthless. In its communication the company states as follows: "The net price of 80 cents per thousand cubic feet fixed by the ordinance is unreasonable," the company declares, "and no gas company can furnish gas of 18 candle power at that price to the citizens of Detroit." Taking the figures used by the framers of the ordinance of Aug. 15 in their computations the company declares that before any concern could pay an ordinarily reasonable dividend on two million dollars it would have to manufacture and sell in the city of Detroit not less than one and one-quarter billions of cubic feet of gas, being about five times the present amount at the price fixed by the ordinance. The company, computing from data other than that used by the city, declares that the cost of making gas is 67 cents per thousand feet in this city, which "would require a consumption of one billion seven hundred and fifty million cubic feet annually, or more than seven times the present consumption, to pay what is conceded to be a fair dividend on say two million dollars invested, an amount of consumption which will in all human probability never be reached in Detroit." The company notes the universal use of electricity as a means of lighting as an adverse feature of the situation. Alderman Beck, chairman of the special committee on the gas question, gives his views on the company's non acceptance of the new ordinance, stating as follows: "There are one or two things I want to say in reply to the gas company's two-column argument. They compare Cleveland and Detroit, and speak about the 600,000,000 output there as compared with the 230,000,000 output here. Now, they forget to mention the fact that there are two companies in Cleveland, and the 600,000,000 output is what the two companies together sell. That one company actually sells much less gas than the Detroit company does, viz., less than 200,000,000. And yet this smaller company, as well as the larger one, sells gas at eighty cents straight, and pays 6½ per cent. of its gross receipts to the city. And these terms, it must be remembered, were proposed by the companies themselves and accepted by the city. Now, the ordinance which the Detroit company have declined to accept, was more liberal than the Cleveland ordinance. In Cleveland the companies must lay mains wherever ordered by the Common Council. In our ordinance it was provided that extensions might be ordered by the council if consumers to the extent of one to every 100 feet of required extension were secured. The Cleveland companies are required to pay 6½ per cent. of gross receipts, while the Detroit ordinance only required 5 per cent. The Cleveland ordinance fixes the price for only ten years, when the council again has the right to make a reduction. The Detroit ordinance fixed the price for fifteen years, during which time the council would have no control over it. Now the gas company says that the council committee conceded that the difference in the price of coal between Detroit and Cleveland would amount to four cents a thousand feet. But the company did not mention what the committee further ascertained, that the difference in the price of coke and other residuals in Detroit would counterbalance the difference in the price of coal between Detroit and Cleveland. I want also to call your attention to a part of our conference with Gen. Meyer in Cleveland. One of the aldermen recited the claim of the Detroit company that the fact that they only produced about 230,000,000 feet of gas per year did not make a comparison with Cleveland, where more gas is manufactured, a fair one. Gen. Meyer said: 'When I started in on this case (the Cleveland case), I went upon the proposition, and did it honestly, that with an output of 800,000,000 or 900,000,000 feet per year, they could afford to furnish the gas at a much lower rate than a concern with an output of only 200,000,000. But the testimony of their experts was to the effect that when the output of the company reached 100,000,000, from that time there was no difference whatever. The best experts in this country testified to that. The smaller company here—the one on the west side of the river—does not sell as much gas as your company in Detroit, yet they sell it at the same rates as the large company, eighty cents. The testimony in the case was clear and without a single exception to the effect that when the consumption reached 100,000,000, there is no more difference. I was particular to ask this of every witness, so as to prevent the smaller company afterward from taking advantage of the position that your company is evidently taking up now.'"

SHORT RUNS

GAS, ELECTRIC AND WATER ASSOCIATIONS

AMERICAN GAS LIGHT ASSOCIATION.

ANNUAL MEETINGS.—Third Wednesday of October of each year. Next meeting will be held in Chicago. Officers for the current year: Pres't., A. E. Boardman, Macon, Ga.; Secretary and Treasurer, A. B. Slater, Jr., Providence, R. I.

THE MICHIGAN GAS ASSOCIATION.

ANNUAL MEETINGS.—Third Wednesday in February. President, S. Dean Owosso; Vice-President, Thomas D. Gilbert, Grand Rapids; Secretary and Treasurer Henry H. Hyde, Saginaw

NEW ENGLAND GAS ASSOCIATION.

ANNUAL MEETINGS.—Third Wednesday in February, in Boston. President William A. Wood, Boston, Mass.; Secretary and Treasurer, Chas. F. Prichard, Lynn Mass.

OHIO GAS LIGHT ASSOCIATION.

ANNUAL MEETINGS.—Third Wednesday in March. Next meeting Columbus. President, Irvin Butterworth, Columbus; Vice-President, J. W. R. Cline, Springfield; Secretary and Treasurer, A. P. Lathrop, Columbus.

WESTERN GAS ASSOCIATION.

ANNUAL MEETINGS.—Third Wednesday in May, Chicago. Officers for current year: E. H. Jenkins, President, St. Louis: A. W. Littleton, Secretary and Treasurer, Quincy, Ill.

PACIFIC COAST GAS ASSOCIATION.

ANNUAL MEETINGS.—Second Tuesday in July. Next meeting Sacramento. President, J. H. Crockett, San Francisco; Vice-President, J. L. Hallett, Portland. Secretary and Treasurer, J. A. Britton, Oakland, Cal.

THE GUILD OF GAS MANAGERS OF NEW ENGLAND.

ANNUAL MEETINGS.—Second Saturday in March, held in Boston. President Henry B. Leach, Taunton, Mass.; Secretary, Andrew K. Quinn, Newport, R. I.

AMERICAN WATER WORKS ASSOCIATION.

ANNUAL MEETINGS.—Next will be held in Minneapolis, Minn., 1894. Officers: James P. Donohue, President, Davenport, Ia.; Peter Milne, Secretary and Treasurer, New York.

NATIONAL ELECTRIC LIGHT ASSOCIATION.

SEMI-ANNUAL MEETINGS.—Time and place of next meeting not decided upon. President, E. A. Armstrong, Camden, N. J., Secretary, Geo. F. Porter, New York.

We understand that the Kansas City (Mo.) Gas Co. is experiencing a good deal of trouble with its mains due to electrolysis.

The People's Light & Construction Co. has been organized at Davenport, Iowa, and a franchise granted it for the operation of gas works in that city.

A contract is pending between the city of Minneapolis, Minn., and the Northwestern Globe Gas Light Co. for 2,000 gasoline lamps for outlying district lighting at Minneapolis. Price $14 per lamp per year.

Lindley Allen, of Alexandria, has brought suit against the Indianapolis (Ind.) Gas Co. for $10,000 damages. He claims that while his child was ill of diphtheria the company cut off the gas, which caused the death of the child.

The Charleston (S. C.) Gas Co. is making many improvements in their plant. A new three lift holder and much new 16-inch main pipe are among the betterments. The late cyclone produced between $12,000 and $15,000 damage to various parts of their plant.

The village trustees of Lansingburgh, N. Y., held a meeting a few days since at which the gas committee recommended that a contract be entered into with the Globe Gas Light Co., of Jersey City, for one year at $20.75 per light, a slight increase over last year, and it was so resolved.

The Port Huron (Mich.) Gas Light Co., it is said, will add a fuel gas plant to its illuminating works. It will be remembered that a new organization having an "Archer" plant will soon be ready to begin the supply of fuel gas in Port Huron, the new company's works now being about completed.

The Wheeling (W. Va.) Gas Co. is in a pickle owing to insufficient revenues, and there is just a hint that the price of gas may be raised in order to increase the income. Opinion is divided as to whether increase in price of gas should be made or a general tax levy issued to pay for electric lighting.

The Brookline (Mass.) Gas Light Co. held its annual meeting on the 27th ult. and elected the following named directors for the ensuing year: Robert Amory, F. W. Lawrence, Lucius B. Marsh, H. H. Rogers and Sidney Chase. Mr. Chase is of the firm of Chase & Barstow and takes the place of John C. Inches.

The penny-in-the-slot gas meters in Liverpool now number 8,000. The success of this ingenious contrivance has led to its introduction into London, Birmingham, Manchester, and elsewhere. The latest town to adopt it is Leeds. One penny in the slot at Leeds is to give 25 cubic feet of gas, or six hours' light with a No. 4 burner.

Mr. Emerson McMillin again set foot on his native shores on the 7th inst. after an absence of several months in Europe. Mr. McMillin traveled far, saw many new scenes, and if his appearance goes for anything he has thoroughly enjoyed every hour of every day since he sailed away from home. The day of his home coming found him ready and anxious to take up the threads of his many enterprises with the old time vigor and push.

Many improvements are under way at the works of the Macomb (Ill.) Gas & Electric Light Co. The hitherto separated electric light plant and the gas works are being brought together. An incandescent electric light plant will also be added, together with an entirely new power plant. As soon as this part of the work has been completed the company will overhaul the gas generating plant and introduce water gas. Probably a reduction in price will also follow.

Stockholders of the Woonsocket (R. I.) Gas Co. held their annual meeting on the 3d inst. and elected the following officers for the ensuing year: President, Joseph E. Cole; secretary and treasurer, R. G. Randall. Directors: Henry C. Kimball, John W. Ellis, Henry F. Lippitt, George M. Welles, Joseph E. Cole, James P. Ray, Frank Harris, Gilbert Darling, Joseph B. Aldrich. The treasurer's report showed increased business for the past year. The regular six per cent. semi-annual dividend is now payable.

The East River Gas Co. is pushing work on the street mains for that company's gas supply in the city of New York. Considerably over 100 miles of 6 inch and 8 inch mains are on the avenues and streets of the city, the larger size being used on avenues and the latter on intersecting thoroughfares. The running of services has also been begun. It certainly begins to look as though the Long Island enterprise would commence gas supply in New York long before the time set by many who were active in this undertaking.

The citizens of Philadelphia, Pa., seem to be in great earnest in an effort to secure a lower gas rate than now prevails in that city and for the most part the local press seems to be thoroughly in accord with the movement. The people want "dollar gas" and it seems probable that the rate may be fixed at that figure ere long. If so it is possible that the upshot of the whole matter will be the purchase on the part of the city of the Philadelphia Gas Improvement Co.'s plant, from which the city has been buying very largely during the past few years.

The gas situation in Brooklyn, N. Y., seems to be in *statu quo*. The floating straws here and there no doubt give some reasonable evidence of an early war of rates, but this has been the rumor for some time. However, the lines appear to be tightening. Gangs of men are pushing pipe laying on the part of the Williamsburg Company in the Fulton Municipal Company's district, while the Fulton Municipal Company is engaged in a like undertaking in the district of the Williamsburg Company. It is said, but we cannot guarantee the report, that the several companies involved are making concessions to induce changes of consumers from one company to the other. It is but fair to state that these assertions are denied by those in interest.

The people of Belgium on May 1, 1893, put their clocks back seventeen minutes to conform to the time of the Greenwich, N. F., meridian. A Belgian who used to seek his couch punctually at 8 P.M. Belgian time now hops into bed at 8 P.M. Greenwich time. But 8 P.M. Greenwich time is 8.17 P.M. Belgian time; so that the Belgian really goes to bed seventeen minutes later than he did before. The change of clocks made no difference to the sun and, as a result, the gas bill of the nation has increased $1,000,000 in fifteen months, the nation sitting up so much later at night. When the truth is known there will doubtless be a movement for going back to the old time, in the interest of economy. The gas companies, it is said, will forcibly resist and are suspected of being at the bottom of the time-changing business, not only in Belgium but elsewhere.

FINANCIAL

WALL STREET, October 31, 1893.

The repeal of the silver purchasing clause of the Sherman law, promised by the action of the Senate, has had the same effect on the general stock market as did the passage of the repeal bill by the House some weeks ago. There has been a general boom in values, and the entire market has assumed a marked feeling of confidence. Chicago Gas shows a gain of about 6 points since our last review was penned, while General Electric has had an advance of 4 points recorded.

Confidence has been shown equally by the securities that have only a private market as by those that are dealt in on the New York Stock Exchange. This is particularly the case with the Brooklyn properties. This was due largely to the rumor that the Equity Gas Light Company was to be placed in the hands of a receiver. The rumor was vigorously denied. At present B. L. H. Trask owns a controlling interest in the $2,000,000 of stock and the $1,000,000 of the bonds of the company. The interest upon its bonds has always been met with promptness until last July, when the payments upon the coupons were suspended. Under the law governing the case it had 90 days in which to make payments. During that 90 days a committee was appointed to look out for the interests of bondholders other than Mr. Trask. Judgments were secured on August 1 against the Equity Company for interest due on some bonds. Within the last few weeks there was an effort made to sell the Equity Co. to the Fulton Municipal Co., and officials from the latter corporation visited the Equity works on Newtown Creek and after careful investigation concluded that the price asked was too high.

The advance in General Electric was the result of a definite announcement by the board of directors concerning the sale of its treasury securities, which, it is declared, have a nominal value of twelve million dollars. These securities have been sold to a syndicate for an amount understood to be four million dollars, and this money will be used to take up the floating debt. Under the terms of the sales to the syndicate, however, it was agreed that an opportunity should be given to stockholders to subscribe to the purchase price as accepted by the syndicate and this opportunity is set forth in a circular just issued. The delay in its issue is explained on the ground that the syndicate waited for better general financial conditions, so that the stockholders, to whom the offer of the subscription is now made, should have no ground for complaint. According to the circular a security company has been formed to be known as the Street Railway & Illuminating properties, with the General Electric securities in its treasury. Against these are issued 45,000 shares of preferred stock of the new company and 45,000 shares of common stock. The twelve million securities are bonds and stocks of local street railways and illuminating companies which the General Electric Company has received in payment for plants and royalties. Many of these securities are paying dividends, and the syndicate estimates that these dividends will be equal to a six per cent. dividend on the $4,500,000 preferred stock by the new company, or $270,000 and "substantial sums on the common stock." The syndicate consists of well-known men, namely, Samuel Spencer, Chas. E. Cutting, Edwin Packard, C. S. Tuckerman and Frank G. Webster. It is hoped that when better times come the securities can be sold for enough to redeem the preferred stock and leave something to be divided among the common stockholders. The shares of the Street Railway & Illuminating properties are offered to the General Electric stockholders in blocks, each to consist of one common and one preferred share. The price for each block will be $100, and all stockholders of record at the close of business Oct. 27 holding eight shares are permitted to subscribe for one such block. The payments are to be made in installments: 30 per cent. Nov. 15; 40 per cent. Dec. 15, and 30 per cent. Jan. 15. The circular contains the list of securities that have been purchased.

Following are closing prices for active electric and gas stocks:

A new ordinance has been introduced in the Kalamazoo, Mich., City Council whereby it is provided that the Kalamazoo Gas Light Co. shall sell gas at $1 per thousand cubic feet and pay to the city 5 per cent. of the gas company's receipts.

The works of the Nassau Gas Co., in Brooklyn, N. Y., sustained considerable damage by an explosion which occurred on the morning of the 18th inst., followed by a fire which resulted in damage estimated at about $3,000. Fortunately no one was seriously injured.

At a recent meeting of the directors of the Portsmouth (Va.) Gas Co. it was decided to reduce the price of gas for the purpose of materially encouraging the introduction of gas stoves. Our informant, however, fails to state the figure at which gas will be sold in that city hereafter.

In a notice concerning the contracts and operation of the Economical Gas Apparatus Construction Co., of Toronto, which appeared in our last number, the type made us say that with the use of but 30.42 lbs. of coal per thousand was the result attained at Toronto with the Merrifield-Westcott-Pearson apparatus. The 30.42 lbs. of coal covers only the generator fuel, which is certainly a more than satisfactory result at the present time. Any gas maker will, of course, understand that the former statement was incorrect, in view of the fact that it is impossible to get more out of a thing than is in it.

WANTED.

A gentleman who has for the last 10 years had charge and the general management, including collections, office work and construction, of a coal gas works and a water works plant in a town of 8,000, would like position as superintendent of either a gas or water works in a larger city. Would prefer a water works plant. Best of reference given. Address "Gas and Water," care PROGRESSIVE AGE.

POSITION WANTED.

A young man of technical education, five years' experience and thoroughly acquainted with the gas business in all details, desires another situation as Superintendent or Manager. Address METER, care PROGRESSIVE AGE.

OIL PLANT EXPLODES; TWENTY MEN BURNED

Part of the Pratt Works of Standard Oil Company Destroyed in Williamsburg.

WATERFRONT IS SHAKEN

Workmen Rush from the Building with Their Clothing Ablaze — Hard Work to Save Big Tanks.

The water front of Williamsburg was shaken by a violent explosion at 9 o'clock yesterday morning, followed by half a dozen others, from the Pratt plant of the Standard Oil Company, which occupies a water front block between North Twelfth and North Thirteenth Streets. Before the fire which followed had been put out twenty employes of the company, working in the canning and filling department, had been removed from the building badly burned, and two hours of desperate fire fighting had been put in to prevent the spread of the flames, which threatened not only the rest of the plant but the crowded factory section which surrounds it.

While it is known that a score of men were hurt, some of them were removed to nearby homes, and the police were unable to get their names. In all cases the injuries sustained were the same, a bad burning about the head, shoulders, arms and hands, and upper body. Here is a list of those who were known to have been injured:

CALDWELL, ROBERT, 61 Heyward Street.
DANIELS, CHARLES, 186 North Tenth Street.
DAVIS, WILLIAM, 597 Manhattan Avenue.
MALONE, THOMAS, 301 Eckford Street.
O'CONNOR, DANIEL, 78 North Tenth Street.
PETERS, CONRAD, 1,068 Myrtle Avenue.
PITRI, R., 1,068 Myrtle Avenue.
RASCH, JACOB, 208 Wyckoff Avenue.
WENTZ, GEORGE, 110 North Eighth Street.

The canning and filling department, where the fire occurred, is the most dangerous building in the plant. Only a year ago it was burned to the ground. The present structure is a brick building about 200 feet long, situated for greater safety on the water front, where it is most removed from the rest of the plant. The work that is done there is the filling and soldering of cans of oil for shipment. The oil comes into the shed through pipes and is put in cans, most of them of five gallons capacity, which are then soldered down. It is supposed that the fire was caused by a hot soldering iron dropping into a can of oil.

Seventy-five Men Trapped.

The explosion which alarmed the neighborhood came at a time when there were seventy-five men at work in the canning building. Almost immediately a burst of flame shattered the windows on the water front side. The men at once realized that the always dreaded and always expected fire was again on them.

Scarcely had the half-dazed crowd of men begun to fight their way out of the burning building, most of them with their oil-soaked clothes afire, when the hands in the other parts of the plant dropped their tasks and came to the rescue. In a jiffy the emergency hoses were coupled to the plugs and streams of water were poured on the men, most of whom were almost blinded by the flames and dizzy from the fumes of combustion. Those who did not have presence of mind enough to roll on the rain-soaked ground to put out the flames which enveloped them were seized and wrapped in coats or had their burning clothing torn from them.

When the city fire fighters arrived, Battalion Chief Houck turned in a second alarm, and when Chief Lally appeared he made it a third. In answer to this came Deputy Fire Commissioner O'Keefe and Police Inspector Holohan, with Deputy Police Commissioner Reynolds. While the men from the Fire Department attacked the flames from all sides, the fireboats David A. Boody, Seth Low, and New Yorker worked from the river.

Ambulances from the Williamsburg and the Eastern District Hospitals arrived, and the surgeons improvised a ward in a building across the street and treated the injured men as fast as they were brought to them. Five of the most seriously injured were rushed to the hospitals. Some of the men were taken to near-by drug stores to have their burns dressed, and others were taken home by friends.

By this time the canning building was a huge caldron, out of which a solid body of flame roared upward. The mass of black smoke and soot which accompanies the burning of oil poured out onto the river, and added to the gloom of the overcast morning. The firemen resorted to the usual tactics in fight an oil fire.

A Hard Blaze to Fight.

As it was not only useless but dangerous to pour a stream on it, as this would only scatter the oil and spread the blaze, the firemen confined their efforts to keeping the fire to the building where it started. If it spread to the six immense tanks of refined oil near by or to the storing sheds, where thousands of gallons of naphtha and gasoline were kept, explosions were threatened which might have wiped out not only the entire plant, but all the fire fighters as well.

While the blaze itself was left to burn freely constant streams of water from every available source were kept playing on the oil tanks and the rest of the buildings. Several tank steamers and barges were anchored in the creek, which runs along the north side of the plant. These were all ordered out onto the river for safety, and the fireboats proceeded up the creek, where some of the buildings which they were trying to save could be reached to greater advantage.

Across the narrow street to the south of the Standard Oil plant are the Williamsburg works of the Brooklyn Union Gas Company. One wall of the canning department abuts on this street, and the gas company had its men out ready for instant work if any of the sparks carried across.

After an hour and a half of unceasing vigilance in preventing the flames from spreading, they had burned themselves out sufficiently to allow of a direct attack being made on the canning building itself, and the water was turned into it. This made short work of the blaze, and a squad of firemen was rushed in at the first possible moment to see whether any of the employes had been unable to make their escape. No one was found. The building was completely burned out, only the brick walls and a few charred edges of roof beams remaining. The flames had also made a slight impression on the 400-foot pier which projects out into the East River. The damage was estimated at $40,000.

A few hours after the fire had been put out, the remainder of the plant was again in active working condition, the men seeming to think nothing about the experience they had gone through. The general feeling was summed up by one veteran when he said:

"There's no danger working in an oil plant if you're fire-proof. I've been baked twice and I'm here yet."

THE BROOKLYN UNION GAS CO.

WILLIAMSBURGH WORKS

SCALE 1"=120 Ft.

July 27, 1921.

2-G-130

APPROVED RESOLUTION NO. 41

BOARD OF ESTIMATE AND APPORTIONMENT

CITY OF NEW YORK

Joint application of

STANDARD OIL COMPANY OF NEW YORK, INC.

and

SOCONY VACUUM CORPORATION

for permission to install, maintain and use a pipe over and across North 11th Street, at a point about 669 feet west of Kent Avenue, and over and across North 12th Street, at a point about 697 feet west of Kent Avenue, Borough of Brooklyn.

See Minutes, January 15, 1932; May 6, 1932.

WHEREAS,

The Standard Oil Company of New York, Inc. and Socony-Vacuum Corporation, have presented a joint petition dated December 23, 1931 to the Board of Estimate and Apportionment requesting permission to install, maintain and use a 6 inch pipe over and across North 11th and North 12th Streets, in the Borough of Brooklyn, at points respectively 669 feet 9½ inches and 697 feet west of the westerly line of Kent Avenue, and 19 feet 3 inches above the street surface of North 11th Street and 16 feet 1½ inches above the street surface of North 12th Street, said pipe to be used to convey steam between the plants of the petitioners situated on the southerly side of North 11th Street and the northerly side of North 12th Street, the pipe to pass overhead across the property of the Brooklyn Union Gas Company, situated on the block between North 11th and North 12th Streets, Kent Avenue and the East River, now, therefore, be it

RESOLVED,

That the consent of the Corporation of the City of New York be and the same is hereby given to the Standard Oil Company of New York, Inc. and the Socony-

Vacuum Corporation, to install, maintain and use a 6 inch pipe over and across North 11th Street, at a point 669 feet 9⅝ inches west of the westerly line of Kent Avenue and over and across North 12th Street, at a point 697 feet west of the westerly line of Kent Avenue with a clearance of 19 feet 3 inches above the street surface of North 11th Street and 16 feet 1⅝ inches above the street surface of North 12th Street, the pipe to pass over the block between North 11th and North 12th Streets, occupied by the Brooklyn Union Gas Company with the consent of that Company, the pipe to be used for the conveyance of steam between the plants of the grantees for their sole and exclusive benefit, the pipe to be as shown upon a plan entitled:

"Plan showing location of Proposed Overhead Steam Pipe Line to be constructed in North 11th and North 12th Streets, Borough of Brooklyn, to accompany application dated December 23, 1931 of the Standard Oil Co. of New York, Inc. to the Board of Estimate and Apportionment, City of New York"

a copy of which is attached hereto and made a part hereof upon the following terms and conditions:

1. This consent shall continue only during the pleasure of the Board of Estimate and Apportionment and shall be revocable upon sixty (60) days' notice in writing to the grantee, but in no case shall it extend beyond a term of ten (10) years from the date of its approval by the Mayor and thereupon all rights of the grantee in said street, by virtue of this consent, shall cease and determine.

2. The grantee shall pay into the treasury of The City of New York, as compensation for the privilege hereby granted, and for expenses in connection with the examination and granting of the petition and in connection with the regulation, supervision and inspection necessary because of the structure the sum of five hundred dollars ($500) per annum. Such payments shall be made in advance on November 1 of each year, provided, however, that the first payment shall be made within thirty (30) days after the date of approval by the Corporation Counsel of the agreement accepting this consent, hereinafter provided for, and shall be only such proportion of the annual charge as the time between the approval of this consent by the Mayor and November 1 following bears to a whole year.

Such rate of compensation shall continue up to the date of the restoration of the street pavement after the removal of the structure from the street.

Such payments shall not be considered in any manner in the nature of a tax, but shall be in addition to any and all taxes of whatsoever kind or description now or hereafter required to be paid under any ordinance of The City of New York, or by any law of the State of New York.

3. Upon the removal of the grantee from either of the premises to be connected by the structure, or upon the revocation or termination by limitation of this consent, the grantee shall cause the structure hereby authorized to be removed and all of said street affected by this permission to be restored to its proper and original condition, if required so to do by The City of New York or its duly authorized representatives, and the entire cost of such work shall be borne by the said grantee. If this consent

be not renewed or if the structure hereby authorized shall not be required to be removed, it is agreed that it shall become the property of The City of New York.

4. This consent is for the exclusive use of the grantee and shall not be assigned either in whole or in part, or leased or sublet in any manner, nor shall title thereto, or right, interest or property therein pass to or vest in any other person, firm or corporation whatsoever, either by the acts of the grantee or by operation of law, without the consent in writing of The City of New York, acting by the Board of Estimate and Apportionment.

5. The grantee shall pay the entire cost of all work, labor and material in connection with the structure hereby authorized, and particularly—

(*a*) Its construction, maintenance and removal.

(*b*) The protection of all structures which shall in any way be disturbed by its construction or removal.

(*c*) All changes in sewers or other subsurface structures necessitated by its construction or removal, including the laying or relaying of pipes, conduits, sewers or other structures.

(*d*) The replacing or restoring of the pavement in said street which may be disturbed during its construction or removal.

(*e*) Each and every item of the increased cost of the installation of any future structures or repairs or alterations to any existing or future structures caused by its presence in the street.

(*f*) The inspection of all work during its construction or removal as herein provided, which may be required by the President of the Borough and the Commissioner of Water Supply, Gas and Electricity.

6. Before the construction or removal shall be begun, the grantee shall obtain permits to do the work from the President of the Borough and from the Commissioner of Water Supply, Gas and Electricity. The grantee shall perform all the duties which may be imposed by those officials as conditions of such permits, provided such conditions are not inconsistent with the provisions of this consent. The grantee shall submit to those officials working plans which shall include and show in detail the method of construction of the structure hereby authorized and the mode of protection or changes in all structures required by the construction or removal of the same.

Upon the completion of the work, the grantee shall furnish to the President of the Borough a plan of such character as he may direct, showing accurately and distinctly the location, size and type of construction, and complete dimensions of the structure erected or installed under this consent; also the location and dimensions of all substructures encountered during the progress of the work. The depth below the street surface of the new structure and of the substructures encountered must be shown; also their location with reference to the nearest curb-line and the nearest curb-line intersection.

If so ordered by the Borough President, all work in connection with the installation, repair or removal of the structure hereby authorized shall be carried on only at night or continuously for twenty-four (24) hours each day.

It is made a particular condition of this consent that the grantee shall obtain the approval of the Bureau of Buildings to the plans of the pipe and supports. It is also made a particular condition of this consent that the grantee shall file with the Board of Estimate and Apportionment the consent of the Brooklyn Union Gas Company to the installation and maintenance of the said pipe across the said streets.

7. The grantee shall allow to The City of New York a right of way through, under or above any part of the structure hereby authorized for any and all structures which are now or may be hereafter placed in said street by The City of New York.

If at any time it shall become necessary to replace or alter any structure in said street, the City shall have the right to break through or remove all or any portion of the structure hereby authorized and the grantee shall pay to the City the expense incurred by such removal.

8. The structure hereby authorized and any fixtures laid therein shall be constructed, maintained and operated subject to the supervision and control of the proper authorities of The City of New York. It shall be open at all times to the inspection of all the authorities who have jurisdiction in such matters under the Charter of The City of New York.

9. This consent is subject to whatever right, title or interest the owners of abutting property or others may have in and to said street.

10. Said grantee shall be liable for all damages to persons or property, including the street and structures therein and thereunder, by reason of the construction and operation or maintenance of the structure hereby authorized, and it is a condition of this consent that The City of New York assumes no liability to either person or property on account of this consent.

11. This consent is granted on the further and express condition that all laws or ordinances now in force, or which may hereafter be adopted, shall be strictly complied with.

12. This consent is upon the express condition that within thirty (30) days after the date of approval by the Corporation Counsel of the agreement accepting this consent, hereinafter provided for, and before anything is done in exercise of the rights conferred hereby, the grantee shall deposit with the Comptroller of The City of New York the sum of two thousand dollars ($2,000.), either in money or in securities to be approved by him, which fund shall be security for the performance of the terms and conditions of this consent. In case of default in the performance by said grantee of any of such terms and conditions the City of New York shall have the right to cause the work to be done and the materials to be furnished for making the necessary changes or repairs, after ten (10) days' notice, and shall collect the reasonable cost thereof from the said fund without legal proceedings, or in case of default in the payment of the annual charge, shall collect the same, with interest, from such fund after ten (10) days' notice in writing to the said grantee.

In case of any drafts so made, upon the security fund the said grantee shall, upon thirty (30) days' notice in writing, pay to the Comptroller of The City of New York a sum of money sufficient to restore the said fund to the original amount of two

thousand dollars ($2,000.), and in default of the payment thereof, the consent hereby given may be cancelled and annulled, at the option of the Board of Estimate and Apportionment of The City of New York, acting on behalf of said City. No action or proceeding or rights under the provisions of this section shall affect any other legal rights, remedies or causes of action belonging to The City of New York.

13. Said grantee shall give notice, in writing, to the President of the Borough and to the Commissioner of Water Supply, Gas and Electricity of its intention to begin the work hereby authorized at least forty-eight hours before such work commences. The grantee shall also give to the Board of Estimate and Apportionment notice in writing, of the date on which the work is commenced and also the date on which the same is completed, not later than ten (10) days after such dates.

14. Said grantee shall commence the construction of the structures hereby authorized and complete the same on or before July 1,, 1933, otherwise this consent shall be forfeited forthwith and without any proceedings, either at law or otherwise, for that purpose; provided, however, that such time may be extended by the Board of Estimate and Apportionment.

15. This consent shall be null and void unless said grantee shall duly execute an instrument in writing, wherein said grantee shall accept this consent and shall promise, covenant and agree to conform to, abide by and perform all the terms, conditions and requirements in this consent fixed and contained and file said instrument with the Board of Estimate and Apportionment of The City of New York within sixty (60) days after the approval of this consent by the Mayor; provided, however, that such time may be extended by the Board of Estimate and Apportionment.

And said grantee shall promise, covenant and agree in said instrument to hold The City of New York harmless from all damages to persons or property which may result from the construction, use, maintenance or operation of the structure hereby authorized.

A true copy of resolution adopted by the Board of Estimate and Apportionment May 6, 1932.

PETER J. McGOWAN,
Secretary.

The foregoing resolution is hereby approved.

JAMES J. WALKER,
Mayor.

Dated, New York, May 20, 1932.

WHEREAS,

The President of the Borough of Brooklyn and the Department of Water Supply, Gas and Electricity advised that the said conduit had been removed on July 22, 1937, now, therefore, be it

RESOLVED,

That the aforesaid consent be and the same is hereby rescinded, and be it further

RESOLVED,

That the Comptroller or the Department of Finance as the case may be is hereby authorized and directed to return to the owner thereof the security now held on deposit under the terms and conditions of the said consent upon the payment of compensation at the rate of two hundred and fifty dollars ($250) per annum for the period from November 1, 1936 to July 22, 1937, and be it further

RESOLVED,

That this resolution shall not become effective unless and until the said Brooklyn Fire Brick Works shall execute an instrument in writing releasing the City of New York from any and all claims of any kind, character or description whatsoever held or claimed to be held under the terms and conditions of the aforesaid consent and agreeing to quitclaim, waive and surrender to the City of New York any and all rights and privileges in or under said street held or claimed to be held under or by virtue of the said consent and file said instrument with the Board of Estimate of the City of New York.

A true copy of resolution adopted by the Board of Estimate January 20, 1938.

PEARL BERNSTEIN,
Secretary.

The foregoing resolution is hereby approved.

F. LAGUARDIA,
Mayor.

Dated, New York, February 3, 1938.

BOARD OF ESTIMATE
CITY OF NEW YORK

Rescinding consent granted

STANDARD OIL COMPANY OF NEW YORK
and
SOCONY-VACUUM CORPORATION

to maintain a 6 inch pipe over and across North 11th and North 12th Streets, Borough of Brooklyn, and authorizing the return of security deposited under said consent and the proportionate part of the annual charge paid in advance for the period from June 15th, 1937 to November 1, 1937.

See Minutes, May 28, 1937; January 20, 1938.

WHEREAS,

By resolution adopted by the Board of Estimate and Apportionment on May 6, 1932 and approved by the Mayor on May 20, 1932, consent was jointly granted to the Standard Oil Company of New York, Inc. and Socony-Vacuum Corporation to install, maintain and use a 6 inch pipe over and across North 11th and North 12th Streets, in the Borough of Brooklyn, at points respectively 669 feet 9½ inches and 697 feet west of the westerly line of Kent Avenue and 19 feet 3 inches above the street surface of North 11th Street and 16 feet 1½ inches above the street surface of North 12th Street, the said pipe to be used to convey steam between plants of the petitioners situated on the south side of North 11th Street and the northerly side of North 12th Street, the pipe to pass overhead across the property of the Brooklyn Union Gas Company situated on the block between North 11th and North 12th Streets, Kent Avenue and the East River, and the grantee duly accepted the consent and complied with the terms and conditions thereof including the maintenance of security in the sum of two thousand dollars ($2,000) on deposit with the Comptroller for the faithful performance of its terms and conditions and the payment of compensation in the sum of five hundred dollars ($500) per annum up to November 1, 1937, and

WHEREAS,

The Socony-Vacuum Oil Company, Incorporated, presented a petition dated May 15, 1937 to the Board of Estimate and Apportionment reciting therein that Socony-Vacuum Corporation changed its name to Socony-Vacuum Oil Company, Incorporated and the Standard Oil Company of New York, Inc., was duly merged on June 30, 1934 with the Socony-Vacuum Oil Company, Incorporated, and requesting the recission of the above mentioned consent and the return of security maintained on deposit with the Comptroller for the faithful performance of the terms and conditions of the consent, and

WHEREAS,

The President of the Borough of Brooklyn, in a communication dated July 9, 1937, advised that the work in connection with the removal of the said pipes was completed on June 15, 1937; and

WHEREAS,

Section 2 of the consent provides in part that the rate of compensation shall continue up to the date of the restoration of the street pavement after the removal of the structure from the street; now, therefore, be it

RESOLVED,

That the resolution adopted May 6, 1932, approved by the Mayor May 20, 1932, be and it is hereby rescinded; and be it further

RESOLVED,

That the Comptroller, or the Department of Finance as the case may be, of the City of New York be and it, or he, hereby is authorized and directed to return to the owner thereof the security now held on deposit under the terms and conditions of the said consent and refund that part of the annual compensation paid in advance to November 1, 1937, for the period from June 15, 1937, to November 1, 1937; and be it further

RESOLVED,

That this resolution shall not become effective unless and until the said Socony-Vacuum Oil Company, Incorporated, shall execute an instrument in writing releasing The City of New York from any and all claims of any kind, character or description whatsoever, held or claimed to be held under the terms and conditions of the aforesaid consent and agreeing to quitclaim, waive and surrender to the City of New York any and all rights and privileges in or over said street held or claimed to be held under or by virtue of the said consent and file the said instrument with the Board of Estimate of the City of New York.

A true copy of resolution adopted by the Board of Estimate January 20, 1938.

PEARL BERNSTEIN,
Secretary.

The foregoing resolution is hereby approved.

F. LaGUARDIA,
Mayor.

Dated, New York, February 3, 1938.

BOARD OF ESTIMATE
CITY OF NEW YORK

Application of

BROOKLYN TRUST COMPANY, TRUSTEE,

to continue to maintain and use a 6-inch pipe under and across the public boardwalk and beach at Brighton Beach, at a point about 130 feet west of Parkway Court, Borough of Brooklyn.

See Minutes, April 30, 1937; January 20, 1938.

WHEREAS,

By resolution adopted by the Board of Estimate and Apportionment on January 20, 1927 and approved by the Acting Mayor on February 1, 1927, consent was granted to Realty Associates to install, maintain and use a six inch pipe under and across the public boardwalk and beach at Brighton Beach, Borough of Brooklyn, at a point about 130 feet west of the westerly line of Parkway Court, connecting the bathing establishment of the grantee with the Ocean, in order to obtain salt water for use in the bathing establishment and the grantee accepted the consent and complied with the terms and conditions thereof including the maintenance of security in the sum of $750 on deposit with the Comptroller and the payment of compensation in the sum of $450 per annum up to the date of expiration of the consent on February 1, 1937; and

WHEREAS,

The Brooklyn Trust Company, as trustee of all the property constituting the trust estate in a certain proceeding entitled "In the Matter of a Readjustment, etc., of the rights of the holders of investments in a certain mortgage covering premises located on the Boardwalk between the Railroad Right of Way and Parkway Court, Borough of Brooklyn, County of Kings, City and State of New York, guaranteed by Bond and Mortgage Guaranteed Company, and designated as Guarantee No. 186077", requested the renewal of the consent for a period of three years; now, therefore, be it

Re: Site No. 224055 Williamsburg Works Former MGP
Remedial Investigation Work Plan Addendum - Parcels 3 and 4
Portion of Williamsburg Works Site

Dear Mr. Campbell:

The New York State Department of Environmental Conservation (the Department) and Department of Health (DOH) have reviewed the Remedial Investigation Work Plan Addendum, dated July 2021, for the Williamsburg Former Manufactured Gas Plant Site. The Agencies hereby approve the workplan.

If you have any questions, please contact me at the above phone number or gerald.pratt@dec.ny.gov.

Sincerely,

Gerald Pratt PG

Dear Mr. Pratt:

Re: Addendum to Remedial Investigation Work Plan Addendum – Parcels 3 and 4
Portion of K – Williamsburg Works Site
Brooklyn, New York
Site No. 224055
Index No. CO 2-20200901-300

The *Remedial Investigation Work Plan Addendum – Parcels 3 and 4, July 2021* (Work Plan) for a portion of the K – Williamsburg Works Site was approved by NYSDEC in a letter dated August 25, 2021. This Work Plan includes installing and sampling six shallow monitoring wells (WW-MW-200 through WW-MW-205). Pursuant to your email to Donald Campbell at National Grid on February 11, 2022, groundwater from three of these newly installed monitoring wells will be sampled and analyzed for Per- and Polyfluoroalkyl Substances (PFAS) by EPA Method 537.1 to characterize the upgradient onsite and downgradient conditions of the Investigation Area:

- WW-MW-204, the monitoring well on the upgradient side of the Investigation Area.
- WW-MW-200, a monitoring well located onsite in the center of the Investigation Area.
- WW-MW-201, a downgradient monitoring well in the Investigation Area.

The sample locations are shown in Plate 1 of the Work Plan. The sample rationale table (Table 1) has been updated with the additional analyses.

If you have any questions, please feel free to contact Donald Campbell at 347-452-5973.

Sincerely,

GEI CONSULTANTS, INC.

WW-SV-205	Lot 30	Evaluate the subsurface soil vapor concentrations	0	0	1	5 feet, or 1 foot above the water table if the water table is shallower than 6 feet		X													

Notes:
Chemical analysis test methods specified are from U.S. EPA SW-846 test methods
EPA - Environmental Protection Agency
EPH - extractable petroleum hydrocarbon
PAH - polycyclic aromatic hydrocarbon
PCBs - polychlorinated biphenyls
PFAS - per- and polyfluoroalkyl substances
SVOC - semivolatile organic compounds
TAL - target analyte list
TPH - total petroleum hydrocarbons
VOC - volatile organic compounds
1 - Four soil samples will be collected from 11 borings where the fill wedge is present
2 - Soils will be analyzed by Free Cyanide, water will be analyzed by Total Cyanide
3 - One soil sample of the fill in each boring will be sampled for PCBs, pesticides, herbicides, and PFAS
4 - TPH will only be collected from the fill wedge
5 - Only soils will be analyzed for Alkylated PAHs, N-alkanes and Isoprenoids, EPH, and PFAS. If four samples are collected from a boring due to the fill wedge being sampled, only the shallowest soil sample will be analyzed for PFAS and the fill wedge will not be analyzed for forensic analyses.
6 - Only groundwater will be analyzed for PFAS.

Albany, NY 12233-7014

Dear Mr. Pratt:

Re: Addendum to Remedial Investigation Work Plan Addendum – Parcels 3 and 4
Portion of K – Williamsburg Works Site
Brooklyn, New York
Site No. 224055
Index No. CO 2-20200901-300

The *Remedial Investigation Work Plan Addendum – Parcels 3 and 4, July 2021* (Work Plan) for a portion of the K – Williamsburg Works Site was approved by NYSDEC in a letter dated August 25, 2021. Eight shallow monitoring wells (WW-MW-200 through WW-MW-207) were installed on Parcels 3 and 4 in accordance with the approved-work plan. Pursuant to your email to Donald Campbell and Jessica Phillips at National Grid on September 14, 2022, non-aqueous phase liquid (NAPL) has been observed at multiple wells on Parcels 3 and 4 of the Site. DNAPL was observed at three locations (WW-MW-200, 201, and 202) and LNAPL was observed at WW-MW-205 (Table 1).

The eight newly installed monitoring wells will be gauged for the presence and thickness of DNAPL and LNAPL monthly for 6-months starting in October 2022. NAPL gauging will be performed using a weighted tape. The thickness of LNAPL will be measured with a bailer. The depth to the bottom of the well and the thickness of NAPL will be measured to the nearest 0.1 foot at each recovery well during each gauging event. If no measurable NAPL is identified in a recovery well during the monthly gauging events throughout a 6-month time frame, then a recommendation will be made to stop monthly gauging. If the DNAPL accumulates to greater than 1-ft in thickness within the well sump, the DNAPL will be removed from the well. If the DNAPL accumulates to greater than 2 ft in thickness within the well sump, then the DNAPL gauging, and recovery frequency will be increased. An oil-absorbent monitoring well skimming sock will be installed in WW-MW-205 for passive LNAPL recovery. The sock will be replaced as needed.

Drums generated during NAPL gauging and recovery will be picked up the same day they are generated.

The monitoring well locations are shown in Fig. 1.

EXTERNAL EMAIL

Hi Melissa,

Please see below email from DEC. The NAPL recovery plan has been accepted. Please put together a CN for the NAPL recovery work and start planning the first event.

Jessica

Hi Gerry and Richard,

Please see attached revised NAPL recovery plan. We have included a table showing the gauging results from September through Nov, as you will see the results show monthly monitoring is an appropriate gauging/recovery frequency and states the frequency will be increased in the DNAPL accumulates to greater than 2 ft within the sump.

After approval of this plan, we are prepared to start NAPL recovery the first week of January 2023.

Hi Jessica,
DEC offers the following comment.

The recharge rate for WW-MW-202 should be determined first prior to determining an appropriate recovery frequency for all wells. This is based on the observed thickness on 9/13/22 of 0.7ft and 9/16/22 of 1.25 ft which seems to be the well with the most accumulation and already exceeding the sump depth.

Thanks,
Gerry

Executive Summary

By way of an Order on Consent (Order), The Brooklyn Union Gas Company d/b/a National Grid NY (National Grid), while preserving its rights to seek reimbursement from any responsible parties, has agreed to complete delineation of the nature and extent of contamination at, and emanating from the K - Williamsburg Works site, site #224055 in Brooklyn, Kings County, New York (the Site, Figure 1). Pursuant to that Order, National Grid has further agreed to implement this Supplemental Remedial Investigation (SRI) Work Plan (SRIWP)

Remedial investigation (RI) activities were previously performed in accordance with an Order on Consent (AOC) and Administrative Settlement Index No. A2-0552-0606 between New York State Department of Environmental Conservation (NYSDEC) and The Brooklyn Union Gas Company (BUG) d/b/a KeySpan Corporation and AOC Index No. CO 2-20200910-300 between New York State Department of Environmental Conservation (NYSDEC) and BUG d/b/a National Grid NY, and it was conducted in accordance with the NYSDEC-approved Remedial Investigation Work Plans (RIWPs). A draft RI Report was submitted to the NYSDEC October 2023 (draft RI Report). For ease of discussion in the draft RI Report, the RI study area has been divided into six parcels identified as Parcels 1 through 6 as shown in the table below and in Figure 2.

Parcel ID	Address	Current Owner	Block	Lot
Within Former Williamsburg Works MGP Footprint (*i.e.*, Within the Site)				
Parcel 1	35 Kent Avenue Brooklyn, NY	North 12th Associates, LLC	2288	1
Parcel 2	50 Kent Avenue (aka 41 North 11th Street), Brooklyn, NY	NYC Department of Parks and Recreation (NYCDPR)	2287	1
Parcel 3	20 North 12th Street Brooklyn, NY	NYCDPR	2287	16
Parcel 4	2 North 12th Street Brooklyn, NY	NYCDPR	2287	30
Outside Former Williamsburg Works MGP Footprint (*i.e.*, Outside the Site)				
Parcel 5	16 North 11th Street Brooklyn, NY	NYCDPR	2294	1
	33 North 10th Street Brooklyn, NY	NYCDPR	2294	5
Parcel 6	26 North 12th Street Brooklyn, NY	NYCDPR	2277	1
Source: NYCity Map https://experience.arcgis.com/experience/d826b115c87841d491c2b41fcb175305 accessed 4/16/2024				

On March 4 and 15, 2024, NYSDEC provided two letters commenting on the draft RI Report. The comments were discussed with NYSDEC and it was determined that National Grid would address NYSDEC's comment on delineating groundwater by installing additional wells at Parcels 3 and 4 (the Investigation Area). This SRIWP has been prepared by GEI Consultants, Inc. (GEI), on behalf of National Grid, and in general accordance with the New York State Department of Environmental Conservation (NYSDEC) *DER-10 Technical Guidance for Site Characterization and Remedial Investigation,* dated May 2010.

The Site is adjacent to properties located at Parcels 5 and 6 and 25 Kent Avenue, where a large-scale oil refining and storage facility (Pratt Works) was operated by Standard Oil and its predecessors (now collectively ExxonMobil) from the 1860s until 1949, generally contemporaneous with the operation of the Williamsburg Works. Both the Williamsburg Works and ExxonMobil operations, as well as onsite and adjacent operations by Bayside Fuel Oil Depot Co, Motiva Enterprises LLC., Buckeye Partners, L.P., Sunoco, Inc., and Chevron U.S.A. Inc. (ChevTex), included the storage and use of petroleum and petroleum products. Parcels 3 and 4 are currently vacant and comprise a portion of one of five blocks that have been or will be redeveloped by the New York City Department of Parks and Recreation (NYCDPR) as part of Bushwick Inlet Park (Friends of Bushwick Inlet Park, 2024).

At the NYCDEC's request and in address of draft RI Report comments, this SRIWP includes tables and figures comparing soil analytical data to Protection of Groundwater (POG) Soil Cleanup Objectives (SCOs) (Tables 1 through 3 and Figures 3 through 6).

In this SRIWP, the installation of soil borings and monitoring wells to further evaluate the extent of impacts in subsurface soil and groundwater at the Investigation Area, is described. The conceptual site model (CSM) will be updated and incorporated into the draft RI Report, including tables and figures.

1. Introduction

By way of an Order on Consent (Order), The Brooklyn Union Gas Company d/b/a National Grid NY (National Grid), while preserving its rights to seek reimbursement from any responsible parties, has agreed to complete delineation of the nature and extent of the contamination at, and emanating from the K - Williamsburg Works site, site #224055 which is approximately 5.5 acres in area and consists of the following properties located in Brooklyn, Kings County, New York (the Site).

Tax Map/Lot No.	Address
Block 2287 Lot 1	50 Kent Avenue (aka 41 North 11th Street), Brooklyn, NY
Block 2287, Lot 16	20 North 12th Street, Brooklyn, NY
Block 2287, Lot 30	2 North 12th Street, Brooklyn, NY
Block 2288, Lot 1	35 Kent Avenue, Brooklyn, NY

The Site location is shown in Figure 1. Pursuant to the Order, National Grid has further agreed to implement this Supplemental Remedial Investigation Work Plan (SRIWP).

A remedial investigation (RI) was performed, and a draft RI Report was submitted to NYSDEC in October 2023 (RI Report). The RI was conducted in accordance with an Order on Consent (AOC) and Administrative Settlement Index No. A2-0552-0606 between New York State Department of Environmental Conservation (NYSDEC) and The Brooklyn Union Gas Company (BUG) d/b/a KeySpan Corporation and AOC Index No. CO 2-20200910-300 between New York State Department of Environmental Conservation (NYSDEC) and BUG d/b/a National Grid NY, and it was conducted in accordance with the NYSDEC-approved Remedial Investigation Work Plans (RIWPs). For ease of discussion, in the draft RI Report, the RI study area has been divided into six parcels, identified as Parcels 1 through 6, as shown in the table below and in Figure 2.

Parcel ID	Address	Current Owner	Block	Lot
Within Former Williamsburg Works MGP Footprint (*i.e.*, Within the Site)				
Parcel 1	35 Kent Avenue Brooklyn, NY	North 12th Associates	2288	1
Parcel 2	50 Kent Avenue (aka 41 North 11th Street), Brooklyn, NY	NYC Department of Parks and Recreation (NYCDPR)	2287	1

Parcel 3	20 North 12th Street Brooklyn, NY	NYCDPR	2287	16
Parcel 4	2 North 12th Street Brooklyn, NY	NYCDPR	2287	30
Outside Former Williamsburg Works MGP Footprint (*i.e.*, Outside the Site)				
Parcel 5	16 North 11th Street Brooklyn, NY	NYCDPR	2294	1
	33 North 10th Street Brooklyn, NY	NYCDPR	2294	5
Parcel 6	26 North 12th Street Brooklyn, NY	NYCDPR	2277	1
Source: New York City Oasis Map http://www.oasisnyc.net/map.aspx accessed 10/25/2023				

The Site is adjacent to properties located at Parcels 5 and 6, and 25 Kent Avenue, where a large-scale oil refining and storage facility (Pratt Works) was operated by Standard Oil and its predecessors (now collectively ExxonMobil) from the 1860s until 1949, generally contemporaneous with the operation of the Williamsburg Works. Both the Williamsburg Works and ExxonMobil operations as well as on-site and adjacent operations by Bayside Fuel Oil Depot Co; Motiva Enterprises LLC.; Buckeye Partners, L.P.; Sunoco, Inc.; and Paragon Oil, Inc. and Texaco Inc., and Chevron U.S.A. Inc. (collectively ChevTex) included the storage and use of petroleum and petroleum products.

On March 4 and 21, 2024, NYSDEC provided two letters commenting on the draft RI Report. The comments were discussed with NYSDEC, and it was determined that National Grid would address NYSDEC's comment on delineating groundwater by installing additional wells at Parcels 3 and 4 (the Investigation Area). In this SRIWP, the installation of soil borings and monitoring wells is proposed to further evaluate the extent of impacts in subsurface soil and intermediate and deep groundwater at the Investigation Area. Plate 1 shows the Investigation Area, proposed investigations, and sample locations from prior investigations. Data generated during the implementation of this SRIWP investigation will be used to evaluate the extent of impacts and to update the Draft RI Report, including the conceptual site model, with respect to the Investigation Area.

Parcels 3 and 4, currently vacant, were most recently used for document storage and, in addition to gas manufacture, were previously used for a railroad terminal (Brooklyn Eastern Terminal District), for lumber storage (Bridge Lumber Co.), and by various oil companies. They comprise a portion of one of five blocks that have been or will be redeveloped by the NYCDPR as part of Bushwick Inlet Park (Friends of Bushwick Inlet Park, 2024). Located on Lots 16 and 30 of Block 2287, Parcels 3 and 4 occupy 2.75 acres of park land.

This SRIWP has been prepared by GEI Consultants, Inc. (GEI), on behalf of National Grid, and in general accordance with the NYSDEC *DER-10 Technical Guidance for Site Characterization and Remedial Investigation,* dated May 2010. The Investigation Area

history and Site geology and hydrogeology is described in the 2023 Draft RI Report. The scope of work is described in Section 2. The Health and Safety Plan (HASP), Community Air-Monitoring Plan (CAMP), Field Sampling Plan (FSP), and Quality Assurance Project Plan (QAPP) have been updated to incorporate new information and changes to policy and industry practice since 2008 (*e.g.*, 2010 version of DER-10) and are provided as Appendices A through D, respectively. If data for Parcel 6 is available prior to completion of the implementation of this SRIWP, National Grid reserves the right to amend/add to this SRIWP to incorporate and or consider recent sampling data from Block 2277.

2. Scope of Work

The proposed activities will be conducted in accordance with the HASP (Appendix A), CAMP (Appendix B), QAPP (Appendix C), and FSP (Appendix D). The remainder of this SRIWP describes the proposed soil borings and monitoring wells as well as analytical samples. At the NYCDEC's request, this SRIWP includes tables and figures comparing soil analytical data to Protection of Groundwater (POG) Soil Cleanup Objectives (SCOs) (Tables 1 through 3 and Figures 3 through 6).

2.1 Soil Borings

Eight soil borings (WW-MW-200D through WW-MW-207D) are proposed for installation in the Investigation Area to facilitate installing eight monitoring well pairs collocated with the existing shallow monitoring wells. The proposed soil boring locations are shown in Plate 1. Table 4 contains sample descriptions, rationale, and analysis. Actual drilling locations will be determined based upon the subsurface utility clearance activities, permanent above-ground structures, and property owner requirements. The borings will be installed with a sonic drill rig in accordance with drilling methods and procedures in the FSP and SRIWP. The concrete foundation will be removed, and each boring location will be hand-cleared for utilities to 5 feet bgs. Soil samples will be collected and logged continuously from each boring. It is anticipated that drilling will proceed to the clay layer present at approximately 60 feet bgs. After completing each borehole, the casing will be removed, and a monitoring well will be installed.

Up to three soil samples per boring will be selected for chemical analysis, as follow.

- One sample will be collected from the screen interval of the intermediate monitoring well.
- One sample will be collected from the screen interval of the deep monitoring well.
- The final sample will be collected beneath impacts within the screened interval of the deep monitoring well, if any. Impacts include visual and olfactory impacts, as well as elevated PID readings within the screened interval compared to soil at the completion depth of the boring.

Each sample will be analyzed, at a minimum, for volatile organic compounds (VOCs) by the United States Environmental Protection Agency (EPA) Method 8260C, semi-volatile organic compounds (SVOCs) by EPA Method 8270D, target analyte list (TAL) metals plus tin by EPA Method 6000/7000 series, free cyanide by EPA Method 9014.

Drilling and sampling equipment will be decontaminated between each sample location as described in the FSP. Soil cuttings and decontamination fluids will be contained within properly labeled United States Department of Transportation (USDOT) 55-gallon drums or a lined roll-off and disposed of at a National Grid-approved disposal facility.

2.2 Monitoring Wells

The proposed soil borings (WW-MW-200D through WW-MW-207D) will be completed as permanent monitoring wells collocated with existing shallow monitoring wells on Parcels 3 and 4. Two monitoring wells, deep and intermediate, will be installed at each location. The proposed well locations are shown in Plate 1. Table 4 provides sample description, rationale, and analysis. The wells will be installed using rotosonic methods in accordance with drilling methods and procedures in the FSP.

Each proposed deep monitoring well will be screened above the clay layer, which is expected to be encountered at 60 feet bgs. Each proposed intermediate monitoring well will be screened at the midpoint between the bottom of the existing shallow and deep wells. The proposed deep and intermediate wells will be spaced approximately 5-feet apart and 5-feet from the existing shallow well. Each monitoring well will be constructed with an approximate 10-foot length of 2-inch inner diameter (ID), 0.010-inch-slotted, monitoring well screen and finished with 2-inch ID poly vinyl chloride (PVC) riser pipe to the surface and a 2-foot sump. The annular space between the well screen and borehole wall will be backfilled with chemically inert sand to promote sufficient groundwater flow to the well and to minimize the passage of any fine-grained formational material into the well. A bentonite clay seal will be placed above the sand pack. The remaining annular space will be filled to grade with cement/bentonite grout. Each monitoring well will be fitted with a lockable cap and finished with a flush-mounted curb box secured with cement.

Each newly installed monitoring well will be developed by alternatively surging and pumping until the turbidity is less than 50 nephelometric turbidity units (NTUs) or until a maximum of 10 well volumes of water has been removed. A field turbidity meter will be used to monitor the NTU levels. Well development will be completed in general accordance with the FSP.

Each of the newly installed monitoring wells will be sampled after a minimum of two weeks following completion of well development. Prior to sampling, two synoptic rounds of groundwater level measurements will be recorded for the existing and newly installed monitoring wells and the established surface water measuring point in the East River; the groundwater will be gauged at both the low and high tidal levels.

Each newly installed monitoring well will be purged and sampled using low flow groundwater sampling procedures and in accordance with the FSP unless NAPL is observed

in the monitoring well. Each groundwater sample will be analyzed for VOCs by EPA Method 8260C, SVOCs by EPA Method 8270D, TAL metals and tin by EPA Method 6000/7000 series, and total cyanide by EPA Method 9014. The QAPP details the QA/QC samples that will be collected.

Purge water generated during the installation and sampling of monitoring wells will be collected in 55-gallon USDOT drums or a fractionation tank and will be disposed at a National Grid-approved disposal facility.

2.3 Survey

Monitoring wells will be surveyed by a New York State Licensed Land Surveyor to A-2 standards of accuracy with an approximate horizontal precision of ±0.02 feet. The elevation of each sample location will be determined to ±0.01 foot and will be tied into the Site benchmark. All locations and elevations will be referenced to the New York State Plane Eastern Zone North American Datum 1983 and North American Vertical Datum 1988.

2.4 Data Validation and Management

Soil and groundwater samples will be analyzed by a NYSDOH environmental laboratory approval program accredited laboratory. Analytical results will be provided in a New York State Category B data deliverable format. The data will be validated in accordance with New York State Analytical Service Protocols, and a data usability summary report will be prepared documenting the adequacy of the analytical data obtained from the laboratory and discussing any quality control non-compliance issues or limitations on the use of the data.

3. RI and AA Report Preparation

3.1 Remedial Investigation Report

The information collected as part of this SRIWP will be used to update the conceptual site model (CSM) and will be incorporated into the 2023 Draft RI Report, including tables and figures, to create a RI report that is comprehensive for at least Parcels 1 through 4. The CSM and RI report developed using data collected as part of this SRIWP will build upon data already collected at the Site including the 2023 RI Report, 50 Kent Avenue PDI, and other data collected previously on the Site.

3.2 Alternatives Analysis Report

An Alternatives Analysis (AA) Report that develops, evaluates, and recommends a remedy to address MGP wastes will be prepared in accordance with section 4.4 of DER-10. This will include the following:

- A discussion of the remedy already implemented on Parcel 2.
- Screening of technologies that can be implemented as part of remedial alternatives for Parcels 1, 3, and 4.
- Development and evaluation of remedial alternatives which can be implemented on Parcels 3 and 4, given the known future use and redevelopment plan.
- Recommendations for a remedial alternative for Parcels 3 and 4 and technologies which can be suitable for implementation of a remedial alternative for Parcel 1 when the property becomes available for remediation.

4. Schedule

Field activities can commence two to four weeks following NYSDEC and NYSDOH approval of this SRIWP and access to private properties, pending contractor availability. The field work is projected to last approximately 6 weeks (approximately 3 weeks for drilling activities and groundwater sampling at least two weeks following development). The draft RI report will be submitted to NYSDEC for review within 20 weeks following the completion of field activities.

A draft AA will be submitted to NYSDEC within 60 days of approval of the Final RI Report for Parcels 1 through 4.

Table 1. Detected Surface Soil Analytical Results - Adjacent to Parcels 3 and 4
Supplemental Remedial Investigation Work Plan - Parcels 3 and 4
Portion of K - Williasmburg Works Site
Brooklyn, NY

Notes:

mg/kg = milligrams/kilogram or parts per million (ppm)

BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
PAH = Polycyclic Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
SVOC = Semi-Volatile Organic Compound
VOC = Volatile Organic Compound

Total BTEX, Total VOCs, Total PAHs, Total SVOCs, and Total PCBs are calculated using detects only.
Total PAHs are calculated using the list of analytes: Acenaphthene, Acenaphthylene, Anthracene, Benz[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Benzo[g,h,i]perylene, Benzo[k]fluoranthene, Chrysene, Dibenz[a,h]anthracene, Fluoranthene, Fluorene, Indeno[1,2,3-cd]pyrene, Naphthalene, 2-Methylnaphthalene, Phenanthrene, and Pyrene

6 NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York
Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater

ND = Not Detected
NE = Not Established

Bolding indicates a detected result concentration
Shading and bolding indicates that the detected concentration is above the SCO it was compared to

Validation Qualifiers:

J = The result is an estimated value.
JN = The analyte is presumptively present at an approximated quantity.
R = The result is rejected.
U = The result was not detected above the reporting limit.
UJ = The results was not detected at or above the reporting limit shown and the reporting limit is estimated.

Table 2. Detected Subsurface Soil Analytical Results - Within and Adjacent to Parcel 1

Table 2. Detected Subsurface Soil Analytical Results - Within and Adjacent to Parcel 1
Supplemental Remedial Investigation Work Plan - Parcels 3 and 4
Portion of K - Williasmburg Works Site
Brooklyn, NY

Notes:
mg/kg = milligrams/kilogram or parts per million (ppm)

BTEX = Benzene, Toluene, Ethylbenzene, and Xylenes
PAH = Polycyclic Aromatic Hydrocarbon
PCB = Polychlorinated Biphenyl
SVOC = Semi-Volatile Organic Compound
VOC = Volatile Organic Compound

Total BTEX, Total VOCs, Total PAHs, Total SVOCs, and Total PCBs are calculated using detects only.
Total PAHs are calculated using the list of analytes: Acenaphthene, Acenaphthylene, Anthracene, Benz[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Benzo[g,h,i]perylene, Benzo[k]fluoranthene, Chrysene, Dibenz[a,h]anthracene, Fluoranthene, Fluorene, Indeno[1,2,3-cd]pyrene, Naphthalene, 2-Methylnaphthalene, Phenanthrene, and Pyrene

6 NYCRR = New York State Register and Official Compilation of Codes, Rules and Regulations of the State of New York

Comparison of detected results are performed against one or more of the following NYCRR, Chapter IV, Part 375-6 Soil Cleanup Objectives (SCO)s: Unrestricted Use, Residential, Restricted-Residential, Commercial, Industrial, Protection of Ecological Resources, or Protection of Groundwater

NA = Not Analyzed
ND = Not Detected
NE = Not Established

Bolding indicates a detected result concentration
Shading and bolding indicates that the detected concentration is above the SCO it was compared to

Validation Qualifiers:
J = The result is an estimated value.
JN = The analyte is presumptively present at an approximated quantity.
R = The result is rejected.
U = The result was not detected above the reporting limit.
UJ = The results was not detected at or above the reporting limit shown and the reporting limit is estimated.

Table 3. Detected Subsurface Soil Analytical Results - Within and Adjacent to Parcels 2-6
