

REMEDIAL INVESTIGATION

WORK ASSIGNMENT C007540-4

**FORMER KLINK COSMO CLEANERS SITE
GREENPOINT/EAST WILLIAMSBURG INDUSTRIAL AREA**

**SITE NO. 224130
KINGS (C), NY**

Prepared for:
**NEW YORK STATE
DEPARTMENT OF ENVIRONMENTAL CONSERVATION
625 Broadway, Albany, New York**

Joseph Martens, Commissioner

**DIVISION OF ENVIRONMENTAL REMEDIATION
REMEDIAL BUREAU B**

**URS Corporation
77 Goodell Street
Buffalo, New York 14203**

PHASE II REMEDIAL INVESTIGATION
FOR THE
FORMER KLINK COSMO CLEANERS SITE
SITE ID NO. 224130
BROOKLYN, KINGS COUNTY, NEW YORK

PREPARED FOR:

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
DIVISION OF ENVIRONMENTAL REMEDIATION
REMEDIAL BUREAU B
WORK ASSIGNMENT NUMBER C007540-4

PREPARED BY:

URS CORPORATION
77 GOODELL STREET
BUFFALO, NEW YORK 14203

TABLE OF CONTENTS

	<u>Page No.</u>
1.0 INTRODUCTION	1-1
1.1 Site Background.....	1-1
1.1.1 Site Location and Description.....	1-1
1.1.2 Summary of Records Search.....	1-3
1.2 Findings of Previous Investigations and Phases of Site Investigation Fieldwork.....	1-3
1.2.1 Previous Investigations	1-3
1.2.2 Previous Investigations by URS.....	1-6
1.2.2.1 Summary of SC Phase I Findings.....	1-6
1.2.2.2 Summary of SC Phase II Findings	1-7
1.2.2.3 Summary of SC Phase III Findings	1-7
1.2.2.3.1 SC Phase III Source Characterization	1-8
1.2.2.4 Summary of SC Phase IV Investigation Findings	1-10
1.2.2.4.1 SC Phase IV Source Characterization.....	1-10
1.2.2.5 Summary of SC Phase V Investigation Findings.....	1-11
1.2.2.6 Groundwater Split Sampling and Compound-Specific Stable Isotope Analysis.....	1-11
1.2.2.6.1 Groundwater Split Sampling Source Characterization Sources	1-12
1.2.2.7 2009 Groundwater Sampling Event	1-12
1.2.2.8 Summary of SC Phase VI Investigation Findings	1-12
1.2.2.8.1 Geology.....	1-13
1.2.2.8.2 Soil.....	1-13
1.2.2.8.3 Groundwater	1-14
1.2.2.8.4 Soil Vapor.....	1-14
1.2.2.8.5 SC Phase VI Source Characterization.....	1-15
1.3 Objectives of the RI	1-17
1.4 Report Organization.....	1-17
2.0 REMEDIAL INVESTIGATION FIELD ACTIVITIES	2-1
2.1 Utility Clearance	2-1
2.2 Geophysical Survey for Utility Markouts.....	2-1
2.3 Soil Vapor Implant Installation	2-2
2.4 Soil Vapor Sampling.....	2-3

1.0 INTRODUCTION

This Remedial Investigation (RI) Report has been prepared to summarize the field activities and analytical results from the RI Phases I and II field investigation at the Former Klink Cosmo Cleaners (Klink Cosmo) Site (New York State Department of Environmental Conservation [NYSDEC] Site Number 224130) in the Greenpoint/East Williamsburg Industrial Area section of Brooklyn, New York. The work for this site was issued to URS Corporation – New York (URS) as Work Assignment No. C007540-4. This report presents data and information gathered prior to and during the RI Phase I field investigation, which was conducted from May 2 through July 15, 2011; data collected during the Meeker Avenue Plume Trackdown Site Characterization (SC) Phase VI field investigation; and data from the RI Phase II field investigation, which was conducted from February 27, 2012 through April 20, 2012.

1.1 Site Background

The Klink Cosmo Site is located in the Greenpoint/East Williamsburg Industrial Area section of the Borough of Brooklyn, New York (Figure 1-1). The Klink Cosmo Site is located within the Meeker Avenue Plume Trackdown Site (NYSDEC Site Number 224121) investigation area. Based on data gathered during investigations at the Meeker Avenue Plume Trackdown Site conducted between May 2007 and July 2009, and a groundwater sampling event in November 2009, a source of groundwater contamination was identified originating from near the buildings housing the Former Klink Cosmo Cleaners, which was located at 368 Richardson Street (Tax District of Brooklyn, Block 02860, Lot 0001). In January 2009, the above mentioned source of groundwater contamination was listed as a NYSDEC Class 2 Inactive Hazardous Waste Disposal Site (Site Number 224130). Geographical site and background information is provided in the following sections.

1.1.1 Site Location and Description

The area is a mixture of residential and manufacturing, including both commercial and industrial facilities. The Klink Cosmo property is currently being used for sheet metal fabrication. The entire site property and the majority of the project area are covered by one-story buildings and/or pavement/concrete. The area associated with the Klink Cosmo Site consists of the area bound by Lombardy Street to the north, Porter Avenue to the east, Withers Street to the south and Morgan Avenue to the west. Residential areas are found along Beadel Street between Morgan Avenue and Porter Avenue; interspersed along Morgan Avenue between Lombardy Street and Beadel Street; and

along Vandervoort Avenue between Lombardy Street and Division Place. A public recreational area (baseball diamonds) is located across Vandervoort Avenue from the Site.

The area east of the Site across from Vandervoort Avenue includes the previous location of the two manufactured gas plant (MGP) gas holders which were part of a Brooklyn Union Gas Company former MGP site. The 400-foot tall gas holders were constructed in 1927 and 1948, and used until the 1990s by the Brooklyn Union Gas Company, a predecessor to KeySpan, currently National Grid. The gas holders, used to help maintain consistent gas pressure to customers, were removed via a controlled implosion in July 2001.

The Klink Cosmo Site is located south of a region of historic petroleum refining and storage operations that occupied a significant portion of the Greenpoint area. By 1870 over 50 refineries were located along the banks of Newtown Creek located northeast of the Site. Currently, bulk oil storage terminals exist north of the Site, including the British Petroleum (BP) Terminal and the ExxonMobil Brooklyn Terminal (ExxonMobil). The former Paragon Oil facility was located along Newtown Creek, north of Bridgewater Street, between Meeker Avenue and Apollo Street.

In September 1978, the United States Coast Guard (USCG) noted the signs of an oil spill entering Newtown Creek from the northeastern end of Meeker Avenue. A subsequent investigation concluded that the area of the spill under the Greenpoint/East Williamsburg Industrial Area was in excess of 52 acres and the total spill volume, as estimated in 1979, was approximately 17 million gallons of petroleum products as documented by Roux Associates, Inc. (Roux) (Roux, October 14, 2005). The current BP property was determined to be the source of a petroleum free-product plume located generally north of the Brooklyn-Queens Expressway (BQE). Investigation and remediation activities were conducted by Roux on behalf of ExxonMobil from 1990 to the present further defining the extent of the Off-Site plume. The Off-Site Plume area consists of the area underlain by the petroleum-free product plume that is not on the BP Terminal or the Peerless, Inc. properties. Currently, the extent of the Off-Site Plume area is less than what it was in 1990 due to the operation of the Off-Site Free-Product Recovery System (Off-Site System). The Off-Site System has recovered over 6,000,000 gallons of free-product since it became operational in 1995 (Roux, August 12, 2011). Based upon water level information, some hydraulic influence associated with the operation of the product recovery system has been noted in the Klink Cosmo Site area.

1.1.2 Summary of Records Search

Based on the results of several investigations conducted in the area (see Section 1.1.3 for more details), chlorinated solvents such as tetrachloroethene (PCE) and trichloroethene (TCE) were found in soil vapor, soil, and groundwater in areas outside the historic petroleum spill. As these chemicals are not related to petroleum, the NYSDEC initiated the Meeker Avenue Plume Trackdown Site investigation in order to determine the source(s) of this contamination. Information was gathered relevant to the Klink Cosmo Site and other nearby potential contamination sources as part of these previous investigations. These potential source areas are shown on Figure 1-2.

1.2 Findings of Previous Investigations and Phases of Site Investigation Fieldwork

1.2.1 Previous Investigations

Impact Environmental Consulting, Inc. - March 1998

In March 1998, Impact Environmental Consulting, Inc. (Impact Environmental) conducted a Phase I Environmental Site Assessment (ESA) at 46-60 Anthony Street/ 95 Lombardy Street for ACME Architectural Products Inc., of Brooklyn, New York (ACME) (Impact Environmental, March 30, 1998a). A copy of the Phase I ESA may be found in PDF format on a compact disc which is included in Appendix A of the Phase IV Data Summary Report (URS, May 2009). The property historically had been utilized for iron working, metal shearing and finishing operations. At the time of the ESA, operations at the property included office space and operational space. The operational space was utilized for the machining, finishing, and storage of materials and products used in the manufacture of doors and knock down frames. The ESA identified a number of potential contamination sources that existed on the property due to current and/or past site activities. Numerous floor drains were identified throughout the building and their outfall locations were unknown. It was suspected that some drains may have discharged directly to on-site soils. Several underground storage tanks (USTs) and above ground storage tanks (ASTs) were identified and had been used for fuel oil storage and storage of degreasing products, respectively. It was noted that at the time of the ESA the facility was using a phosphate wash and rinse as a degreaser. During a personal interview, it was revealed that any regulated waste (i.e., waste paint, waste oil, waste degreaser and waste water precipitate) generated at the property was stored in the yard at 72 Anthony Street prior to disposal.

Impact Environmental Consulting, Inc. - March 1998

In March 1998, Impact Environmental conducted a Phase I ESA at 72 Anthony Street for ACME (Impact Environmental, March 30, 1998b). A copy of the Phase I ESA may be found in PDF format on a compact disc which is included in Appendix A of the Phase IV Data Summary Report (URS, May 2009). The property historically had been utilized as a brass foundry and civilian observation patrol. Operations on the property at the time of the ESA included office space and operational space. The operational space was utilized for the grinding, sanding and finishing of steel doors. The investigation identified a number of potential contamination sources that existed on the property due to current and/or past site activities. Numerous floor drains were identified throughout the building and their outfall locations were unknown. It is suspected that some drains may have discharged directly to on-site soils. One UST and one AST dip tank existed and were used for fuel oil storage and storage of degreasing products, respectively. It was noted that at the time of the ESA, the facility was using a phosphate wash and rinse as a degreaser. It was also noted that the floor of the room containing the AST dip tank was impacted by the release of degreasers from the dip tank. In addition, significant storage of portable chemical containers was observed in the building. A paint room was identified in the center of the building, as was an associated paint storage room. The floor of the paint room was significantly stained by painting operations. Floor drains were observed in the paint storage room. A chemical storage area existed outside and to the east of the building and a bermed, concrete storage pad was also observed. Numerous chemical containers were noted outside the building and consisted of 55-gallon drums and smaller containers of primers, cutting oils, hydraulic oils, waste water, xylene, waste paints, adhesives, waste degreasers, steam cleaners and waste oil contaminated absorbents. However, most of the drums were located outside the bermed, concrete storage pad and were uncovered or missing screw caps. Two dry wells were identified along the south side of the building. In addition, during a personal interview it was revealed that the property previously maintained two dip tanks for degreasing. It was noted that a Phase I ESA was previously performed on the property in June 1995 by Conestoga-Rovers & Associates (CRA). The CRA Phase I revealed that 1,1,1-trichloroethane (1,1,1-TCA) was formerly utilized in the dip tanks and that a floor drain was observed under one of the dip tanks.

Impact Environmental Consulting, Inc. - June 1998

In June 1998, Impact Environmental conducted a Phase II ESA at 46-60 Anthony Street/ 95 Lombardy Street for ACME (Impact Environmental, June 1998). A copy of the Phase II ESA may be found in PDF format on a compact disc which is included in Appendix A of the Phase IV Data Summary Report (URS, May 2009). The scope of the Phase II ESA was based on the recommendations of the Phase I ESA and included a remote survey [i.e., ground penetrating radar (GPR)] of a floor drain located in the northeast portion of the building and the collection of a sample from 0-2 feet below ground surface (bgs) below the floor drain. The remote survey conducted confirmed that the floor drain directly discharged to the subsurface soils. A soil sample collected from the 0-2 foot interval below the floor drain contained the volatile organic compounds (VOCs) PCE and TCE, at 1,190 and 99.2 micrograms per kilogram ($\mu\text{g/kg}$), respectively. In addition, the semi-volatile organic compounds (SVOCs) di-n-butylphthalate, pyrene and bis (2-ethylhexyl) phthalate were detected at 4,460, 539 and 1,690 $\mu\text{g/kg}$, respectively. Metals which included arsenic (4.93 milligrams per kilogram [mg/kg]), barium (114 mg/kg), cadmium (6.53 mg/kg), chromium (123 mg/kg), lead (906 mg/kg) and mercury (0.045 mg/kg) were also detected. Cadmium, chromium and lead exceeded their respective criteria found in the Technical and Administrative Guidance Memorandum (TAGM) #4046, *Determination of Soil Cleanup Objectives and Cleanup Levels* (NYSDEC, January 24, 1994). The Phase II ESA concluded that on-site operations had impacted the environmental quality beneath the property and recommended that corrective actions were required to mitigate the contaminated soil associated with the floor drain.

Environmental Planning and Management, Inc. – September 2005

In September 2005, Environmental Planning and Management, Inc. (EPM) completed an investigation for the New York State Department of Transportation (NYSDOT) in connection with the Kosciuszko Bridge Project (EPM, January 2006). The investigation included the collection and analysis of soil and groundwater samples. PCE was also detected at a concentration of 89.9 micrograms per liter ($\mu\text{g/L}$) in ExxonMobil monitoring well MW-018 (east side of Vandervoort Avenue between Anthony and Cherry Streets).

Roux Associates – September 2005

In September 2005, Roux Associates on behalf of ExxonMobil sampled soil vapor at 23 temporary locations in and around the perimeter of the Off-Site Plume area (Roux, October 14, 2005). The soil vapor samples collected in September 2005 indicated the presence of PCE at a concentration of 10,200 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) at a monitoring point located on the southwest corner of the Vandervoort Avenue and Anthony Street intersection. It was determined that the chlorinated solvents detected (i.e., PCE and TCE) were from a different source than the petroleum free product plume.

1.2.2 Previous Investigations by URS

To date, URS has conducted six phases of site investigation fieldwork at the Meeker Avenue Plume Trackdown Site. Data gathered during the Phase I, II, III, and VI field activities and the September 2009 Groundwater Split Sampling event and the November 2009 Groundwater Sampling Event field activities are relevant to the Klink Cosmo site. The Phase IV activities were focused in an area to the northeast of the Klink Como Site. The Phase V activities were focused in an area to the northwest of Klink Cosmo. Sample locations and PCE/TCE results from these investigations relevant to the Klink Cosmo Site Investigation Area, the extent of which is shown on Figure 1-2, are shown on Figure 1-3 for soil vapor, Figure 1-4 for groundwater, and Figure 1-5 for soil.

1.2.2.1 Summary of SC Phase I Findings

The Phase I field investigation was conducted from May 7 through July 10, 2007. The field activities of Phase I were primarily focused on locations that were identified as potential historic users of PCE and/or TCE during the historical information review. A complete description of the field investigation and results may be found in the Phase I Data Summary Report (URS, October 2007).

Based upon the results of the Phase I field investigation, the following conclusions were made about the vicinity of the Klink Cosmo Site:

- Soil vapor samples indicated that PCE and TCE have impacted soil vapor quality. Elevated soil vapor concentrations appear to be identified near locations that potentially have used PCE and TCE.

- Groundwater samples indicated that groundwater has been impacted above NYSDEC TOGS 1.1.1 Class GA groundwater standards for both PCE and TCE. Elevated groundwater concentrations appear to be identified near locations that potentially have used PCE and TCE.

1.2.2.2 Summary of SC Phase II Findings

The Phase II field investigation was conducted from November 5 through December 27, 2007. The field activities of Phase II were primarily focused on investigating and delineating the extent of impacted soil vapor, soil and/or groundwater at locations where elevated concentrations of PCE and/or TCE were encountered during the Phase I field investigation. A complete description of the field investigation and results may be found in the Phase II Data Summary Report (URS, April 2008).

Based upon the results of the Phase II field investigation, the following conclusions were made about the vicinity of the Klink Cosmo Site:

- There appear to be areas of elevated soil vapor concentrations in the area next to the former Klink Cosmo Cleaners building.
- There appear to be potential source areas where dissolved phase chlorinated solvents have adversely impacted shallow groundwater in the Klink Cosmo Site Area.

1.2.2.3 Summary of SC Phase III Findings

The Phase III field investigation was conducted from May 5 through July 24, 2008. The purpose of the Phase III fieldwork was to fill any data gaps identified during Phase II concerning the horizontal extent of impacted soil vapor at areas identified; determine if impacted soils existed at one potential source area; determine the horizontal extent of impacted shallow groundwater at the potential sources; and to assess the vertical extent of impacted groundwater at each of the potential sources. Activities included submitting Freedom of Information Law (FOIL) requests to the New York City (NYC) Fire Department (FDNY), NYC Department of Buildings (NYCDOB), and the NYC Department of Environmental Protection (NYCDEP) for records on potential sources. A complete description of the field investigation and results may be found in the Phase III Data Summary Report (URS, October 2008).

Based upon the results of the three phases of the field investigation, the following conclusions were made about the vicinity of the Klink Cosmo Site:

- The former and current metal works (ACME Steel Metals Works) located at 95 Lombardy was identified as a source of groundwater contamination. Groundwater samples from monitoring wells indicate significant TCE contamination and the potential presence of dense non-aqueous phase liquids (DNAPL) given the increasing TCE concentrations with depth.
- A former brass foundry located at 72 Anthony has been identified as source of soil and groundwater contamination. Soil samples from DEC-016 and SB-08, located at the northeast corner of the facility along Anthony Street, indicate PCE contamination adjacent to this facility. Monitoring wells DEC-016 and DEC-016D are located on the Anthony Street (north) side of the facility. Groundwater samples from these wells indicate significant PCE and TCE contamination. The PCE contamination is in the shallow groundwater zone, indicating the contamination is near its source. Although PCE, TCE and their associated degradation products have been found in groundwater samples from surrounding upgradient, downgradient and side gradient wells, the concentrations are one to two orders of magnitude lower than in DEC-016/016D.
- The former Klink Cosmo Cleaners, located at 364 Richardson Street was identified as a source of groundwater contamination. Monitoring wells DEC-031 and DEC-031D are located on the southwestern corner of Vandervoort Avenue and Richardson Street (northeast building corner). Soil vapor and groundwater samples indicate significant PCE and TCE contamination at the northeastern corner of the building.

1.2.2.3.1 SC Phase III Source Characterization

Using data obtained during the three Phases of the investigation [i.e., historical information (e.g., Sanborn maps, EDR reports, and business directories) soil vapor data, soil data, and groundwater data], four sources and two potential sources of PCE and/or TCE contamination were identified within the study area. The description and location of the three sources identified within and around the Klink Cosmo area is described below.

Sources

- The former and current metal works located at 95 Lombardy (Brooklyn Tax District, Block 02819, Lot 0008) was identified as a source of groundwater contamination. Based on Sanborn map data, the facility has been utilized from the 1930s to approximately 2009 as a metal fabricator and painting facility. ACME is listed in an Environmental Data Resources, Inc. (EDR) report as a generator of F001 waste (spent halogenated solvents used in degreasing) for this facility. Monitoring wells DEC-005 and DEC-005D are located on the western side of the building on Vandervoort Avenue. Groundwater samples from these wells indicate significant TCE contamination and the potential presence of DNAPL given the increasing TCE concentrations with depth.
- A former brass foundry located at 72 Anthony Street (Brooklyn Tax District, Block 02820, Lot 0005) was identified as a source of soil and groundwater contamination. Based on Sanborn map data, the facility was utilized as a brass foundry from the mid-1960s to approximately 1993. ACME is listed in the EDR report as a generator of F001 waste (spent halogenated solvents used in degreasing) for this facility. Soil samples from DEC-016 and SB-08, located at the northeastern corner of the facility along Anthony Street, indicate shallow PCE contaminated soils are located adjacent to this facility. Monitoring wells DEC-016 and DEC-016D are located on the Anthony Street (north) side of the facility. Groundwater samples from these wells indicate significant PCE and TCE contamination.
- The former Klink Cosmo Cleaners, located at 364 Richardson Street (Tax District of Brooklyn, Block 02860, Lot 0001) was identified as a source of groundwater contamination. The facility is shown on Sanborn Maps to be a clothing warehouse from the mid-1950s until sometime after 1995. Klink Cosmo Cleaners is listed in the EDR report as a generator of F002 waste (spent halogenated solvents) for this facility. Monitoring wells DEC-031 and DEC-031D are located on the southwestern corner of Vandervoort Avenue and Richardson Street (northeast building corner). Soil vapor and groundwater samples indicate significant PCE and TCE contamination at the northeastern corner of the building.

Potential Sources

One potential source was identified to the northeast of the Klink Cosmo area.

- The facility that contained a former soap manufacturer and lacquer storage, located at 171 Lombardy Street (Brooklyn Tax District, Block 02821, Lot 0001), is a potential source of groundwater contamination. Based on Sanborn map data, the facility was utilized during the 1930s for lacquer storage and as a manufacturer of powdered soap from the early 1950s to 1989. Monitoring wells DEC-018 and DEC-018D are located on the Varick Avenue or western side of the building, near Lombardy Street. Groundwater samples from these wells indicate significant PCE and TCE contamination. The PCE and TCE contamination in the shallow groundwater zone is centered on DEC-018, suggesting the contamination is near its source.

1.2.2.4 Summary of SC Phase IV Investigation Findings

The Phase IV field investigation was conducted from November 3 through December 8, 2008. The investigation area for Phase IV was limited to the area south of Meeker Avenue, in the area located east of, but not including DEC-016/016D and DEC-040 (i.e., between Porter and Varick Avenues) to the eastern boundary of the site investigation area (i.e., Newtown Creek). In addition, the NYSDEC directed URS to obtain and review additional Sanborn maps for the area bound by Meserole Avenue to the north, Sutton Avenue to the east, Nassau Avenue to the south and Humboldt Street to the west. The purpose of the review of the additional Sanborn maps was to confirm the report of a dry cleaner north of Norman Avenue and west of Kingsland Avenue. The extent of the Phase IV fieldwork was concentrated to the northeast of the Klink Cosmo site and is not relevant to this investigation. A complete description of the field investigation and results may be found in the Phase IV Data Summary Report (URS, May 2009).

1.2.2.4.1 SC Phase IV Source Characterization

Sources

No additional sources were identified within the Klink Cosmo area.

Potential Sources

No additional potential sources were identified within the Klink Cosmo area.

1.2.2.5 Summary of SC Phase V Investigation Findings

The Phase V field investigations were conducted from June 15 through July 13, 2009. The extent of the Phase V fieldwork was concentrated to the northwest of the Klink Cosmo Site and is not relevant to this investigation. A complete description of the field investigation and results may be found in the Phase V Data Summary Report (URS, October 2009).

1.2.2.6 Groundwater Split Sampling and Compound-Specific Stable Isotope Analysis

In September, 2009, URS obtained split samples from eight groundwater monitoring wells (DEC-004, DEC-005, DEC-008, DEC-016, DEC-017, DEC-018, DEC-022, MW-18) being sampled by J.C. Broderick & Associates, Inc. (JCB) personnel on behalf of ACME. These monitoring wells were from the vicinity of the identified ACME Steel source areas. Groundwater samples were analyzed for compound-specific isotope analysis (CSIA) of cis-1,2-dichloroethene (cis-1,2-DCE), PCE and TCE. A complete description of the field investigation and results may be found in the Groundwater Split Sampling Letter Report (URS, February 2010).

Based upon the results obtained during the groundwater split sampling event, the following conclusions and recommendations were provided in the Groundwater Split Sampling Letter Report.

- DEC-016 and DEC-017 seem to be affected by the same source.
- While DEC-018 is strongly affected by the same source that impacts DEC-016 and DEC-017, it is likely that it is also affected by a second source of a particularly light TCE.
- DEC-004 and DEC-005 are affected by separate sources.
- DEC-022 seems to be affected by the same source which has impacted DEC-016 and DEC-017.
- DEC-008 appears to be affected by a separate source (i.e., Klink Cosmo site) and not that affected by the sources impacting any other wells.
- Shallow monitoring wells were recommended to be installed southwest of DEC-004 to determine if there is an upgradient source of the TCE that has been detected in DEC-004.

1.2.2.6.1 Groundwater Split Sampling Source Characterization Sources

No additional sources were identified within the Klink Cosmo area.

Potential Sources

One potential source of TCE was identified to the west of the Klink Cosmo Site. CSIA sampling results have indicated the presence of a potential unidentified source of TCE located to the southwest of DEC-004 based on the presence of a heavier carbon isotope found in the TCE in DEC-004 compared to that in DEC-005. The shallow groundwater flow has been shown to be to the east from DEC-004 towards DEC-005. Any source identified upgradient of DEC-004 would be considered sidegradient to upgradient of the Klink Cosmo Site.

1.2.2.7 2009 Groundwater Sampling Event

From November 3 through November 9, 2009, URS personnel collected groundwater samples from 20 monitoring wells in the vicinity of the Klink Cosmo Site. PCE was detected in 19 of the 20 groundwater samples, with 17 locations at concentrations exceeding groundwater criteria. TCE was detected in 16 of the 20 groundwater samples collected, with 10 locations exceeding groundwater criteria. PCE and TCE degradation products were detected at concentrations exceeding groundwater criteria, and similar to concentrations found during Phase III groundwater sampling. A complete description of the field investigation and results may be found in the November 2009 Groundwater Sampling Event Letter Report (URS, January 2010).

1.2.2.8 Summary of SC Phase VI Investigation Findings

The Phase VI field investigation was conducted from August 2, 2011 through October 28, 2011 and November 15, 2011 through January 13, 2012 as part of the overall SC at the Meeker Avenue Plume Trackdown Site. The purpose of the Phase VI fieldwork was to assist in determining: if there are additional potential sources of PCE and TCE impacting groundwater at the site; the horizontal and vertical extent of PCE and TCE impacted groundwater across the site; the depth and areal extent of any DNAPL found at the top of the clayey silt unit; and, to establish a baseline for groundwater sample results which will be used to assess the potential for natural attenuation in groundwater. Using data obtained during Phases I, II, III, V, and VI, the following conclusions were provided in the Phase VI Report for the Klink Cosmo area. A complete description of the field investigation and results may be found in the Phase VI Data Summary Report (URS, April 2012).

1.2.2.8.1 Geology

- The potentiometric surface may be found between approximately 11 and 55 feet bgs across the Meeker Avenue Plume Trackdown Site.
- A perched shallow groundwater zone was identified in the area West of Morgan Avenue. Groundwater flow in this area is towards the east.
- The flow of the shallow overburden groundwater in the Klink Cosmo area was to the north/northeast. The flow of the deep overburden groundwater in the Klink Cosmo Area was to the northeast. The flow of the top of clay overburden groundwater in the Klink Cosmo area was to the northeast/northwest.
- The entire thickness of the upper glacial aquifer has been penetrated throughout most of the Meeker Avenue Plume Trackdown Site and in the Klink Cosmo area it varies from approximately 108.5 to 113 feet thick.
- The top of the Raritan Formation (i.e., a regional aquiclude) was encountered across the Meeker Avenue Plume Trackdown Site. The elevation of the top of the Raritan Formation in Klink Cosmo area varied between -73.31 to -74.05 feet above mean sea level (amsl) and has been described as gray with white banding, brown, brownish gray, greenish gray, dark gray to greenish brown, fine sand and silt, clays mixed with carbonized plant fragments and clays with varying amounts of sand, to silts with varying amounts of sand and clay. The top of the Raritan Formation slopes towards the northwest. The Raritan Formation is a well-defined aquiclude regionally and has significant lateral extent. Permeabilities within the unit are less than 10^{-6} centimeters per second (cm/sec).

1.2.2.8.2 Soil

There were no exceedances of unrestricted use or protection of groundwater criteria in soil samples from either the Klink Cosmo Area or West of Morgan Avenue. This is consistent with information from previous phases of the SC.

1.2.2.8.3 Groundwater

PCE and its degradation products were detected in numerous groundwater monitoring wells in both the shallow and deep overburden groundwater as well as in downgradient top of clay monitoring wells. High concentrations of PCE were detected at the site (DEC-031) in the shallow overburden groundwater at a concentration of 5,800 µg/L; and downgradient of the site to the northeast (DEC-014R) at a concentration of 46,000 µg/L; (DEC-029/029D/029TC) at concentrations of 4,400, 27 and 4,400 µg/L, respectively; (DEC-007/007D) at concentrations of 1,400 and 400 µg/L, respectively, and (DEC-006D/006DD) at concentrations of 8,000 and 440 µg/L, respectively; and to the north (DEC-008) at a concentration of 3,000 µg/L, and DEC-028 at a concentration of 3,100 µg/L. TCE and cis-1,2-DCE were generally detected above criteria where PCE was detected. Vinyl chloride (VC) was detected above criteria only in DEC-009 (36 µg/L). BTEX and/or fuel-related compounds were generally not detected within the Klink Cosmo area.

Based upon the observed concentrations of VOCs from the latest groundwater sampling event, a dissolved chlorinated solvent plume appears to originate at the Klink Cosmo Site. The horizontal extent of the chlorinated solvents has been mostly delineated. It appears that the chlorinated solvent plumes in the shallow and deep overburden have higher concentrations of PCE immediately north and east of the Klink Cosmo site. The extent of PCE has a larger footprint in the shallow groundwater compared to the deep groundwater and appears to be moving to the northeast and comingles with the dissolved chlorinated solvent plume originating within the ACME Steel Areas. The vertical extent of PCE and TCE impacted groundwater was determined to extend down to the top of the Raritan Formation. The horizontal extent of PCE impacted groundwater in the deep overburden near the top of the Raritan Formation has not fully been delineated. The impacted groundwater appears to be migrating to the northeast and extends into the ACME Steel Areas in the vicinity the intersection of Porter Avenue and Lombardy Street. The vertical extent of PCE and TCE impacted groundwater is not expected to migrate below the top of the Raritan Formation due to its vast areal extent and low permeability.

1.2.2.8.4 Soil Vapor

Soil vapor samples were collected to the north and northeast of the Klink Cosmo area during the SC Phase VI field investigation. In general, the concentrations found within the Klink Cosmo Area showed no discernible trend as compared to previously sampled locations. Concentrations at

some locations were different from the last sampling events by up to three orders of magnitude. This may be attributed to a significant amount of precipitation that had occurred prior to the soil vapor sampling event on August 17 and 18, 2011. For example, SG-042 was sampled in June 2011 and a PCE concentration of 803,000 $\mu\text{g}/\text{m}^3$ was detected. When an attempt was made to sample SG-042 on August 17, 2011, it was found to contain water. This location was re-sampled on September 29, 2011 and a concentration of 540 $\mu\text{g}/\text{m}^3$ was detected.

1.2.2.8.5 SC Phase VI Source Characterization

Sources

No additional sources were identified within the Klink Cosmo area.

Potential Sources

A total of eleven additional potential source areas have been identified west of the Klink Cosmo Site. The eleven potential source areas have been identified as areas where additional information needs to be gathered to determine if any of these areas are responsible for, or are contributing to, the presence of PCE and/or TCE in the environment. In addition to dry cleaners, numerous other facilities that may have used PCE and/or TCE as degreasers or processed drums containing degreasers (e.g., metal plating operations, metal working facilities, and drum recycling/storage facilities) have been identified. No data was gathered during Phase VI that would definitively exonerate any of the potential sources. The potential sources are listed below.

- The facility that contained the former Belmet Products was located at 485 Morgan Avenue (Brooklyn Tax District, Block 02841, Lot 0020) and 43 Beadel Street (Brooklyn Tax District, Block 02834, Lot 0034). Belmet Products occupied these properties from at least 1951 to 1995 and worked with metal products. EDR listed the former Belmet Products as a F001 waste generator and also a Resource Conservation and Recovery Act (RCRA) small quantity generator (SQG). The Sanborn maps also indicate that the property at Block 02841, Lot 0020 was a carpet cleaner in 1933 and a garage in 1951. The Sanborn maps also indicate that the property at Block 02834, Lot 0034 was occupied by a gas station in 1933 and 1951.
- The property at 34 Beadel Street/ 45 Division Place (Brooklyn Tax District, Block 02841, Lot 0010) and 48 Beadel Street (Brooklyn Tax District, Block 02841, Lot 0018) historically contained a warehouse and plating facility from at least 1951 to 1995.

- The property at 35 Division Place (Brooklyn Tax District, Block 02841, Lot 0035) is currently, and historically has been, occupied by dry cleaning facilities (Aphrodite Cleaners, French Valet Cleaner and Naxos Cleaners). EDR listed the former French Valet Cleaners as a RCRA SQG. The Sanborn maps also indicate that the property at Block 02841, Lot 0035 was also part of the metal works found at 45 Division Place (Brooklyn Tax District, Block 02841, Lot 0010) in 1951.
- The property at 25 Division Place (Brooklyn Tax District, Block 02841, Lot 0001) currently houses EPNER Technology Inc. (EPNER), which is a metal plating business. EDR listed EPNER as a F001 waste generator and also a RCRA large quantity generator (LQG). The Sanborn maps also indicate that the property at Block 02841, Lot 0001 had been used as a wholesale paint and hardware store in 1951 and for manufacturing (not specified) from 1965 to present.
- The property at 18 Division Place (Brooklyn Tax District, Block 02849, Lot 0010) is currently occupied by Goodman Bros. Steel Drum Co. Inc. Sanborn maps indicate that the property historically has been a cooperage since 1933. EDR listed the cooperage as a F001 waste generator and also a RCRA LQG.
- The property at 297 Richardson Street (Brooklyn Tax District, Block 02850, Lot 0001) currently houses Adar Medical Uniforms. Sanborn maps indicate that the property historically contained manufacturing and steel working.
- The properties at 38 Division Place (Brooklyn Tax District, Block 02850, Lot 0010) and 42-50 Division Place (Brooklyn Tax District, Block 02850, Lot 0014), were formerly associated with Albert Plating Works Inc. (Albert). The property at Block 02850, Lot 0014 performed rayon dying in 1933. Albert occupied both properties from at least 1951 through 1995.
- The property at 87 Debevoise Avenue (Brooklyn Tax District, Block 02858, Lot 0021) performed shellac manufacturing from at least 1933 to 1995 according to Sanborn maps.
- The property at 84 Debevoise Avenue (Brooklyn Tax District, Block 02859, Lot 0001) which currently houses ELIOU and Scopelitis Steel has records at the NYSDEC as being a RCRA waste generator. The property has been occupied since at least 1965.
- The property at 310 Richardson Street (Brooklyn Tax District, Block 02859, Lot 0011) is identified on Sanborn maps as a sign manufacturer from at least 1951 to 1995.

- The property at 329 Frost Street (Brooklyn Tax District, Block 02859, Lot 0011) previously housed a drum cleaning and painting facility. Sanborn maps indicate that the property housed steel drum reconditioning and painting in 1951 and a drum cleaning and storage operations from 1965 to 1981.

1.3 Objectives of the RI

The objective of the RI is to define the horizontal and vertical extent of contamination related to the Klink Cosmo Site in soil, overburden groundwater, and soil vapor. The results of this investigation, together with data from previous investigations and additional investigations to be conducted as part of the area-wide site characterization, will be used to develop remedial action objectives and support the selection of an appropriate remedial action to address contamination related to the site.

1.4 Report Organization

This report has eight sections. Section 1 includes background information and a synopsis of URS' previous activities at this site. Section 2 includes a description of field activities that occurred during the RI fieldwork. Section 3 includes a description of the local and regional geology and hydrogeology. Section 4 discusses the nature and extent of the contamination. Section 5 presents a conceptual model and discusses contaminant fate and transport. The Qualitative Human Health Exposure Assessment (HHEA) and the Fish and Wildlife Resources Impact Analysis (FWRIA) are included in Section 6.0. Summary and Recommendations are provided as Section 7.0 in this submittal. Section 8 contains a list of references cited. Tables, Figures, and Appendices immediately follow the text.

2.0 REMEDIAL INVESTIGATION FIELD ACTIVITIES

Field activities were performed during the RI Phase I between May 2 through July 15, 2011 and during the RI Phase II between February 27, 2012 and April 20, 2012. These are discussed below. Monitoring well and soil boring locations are shown on Plate 1; soil vapor points are shown on Plate 2.

2.1 Utility Clearance

Prior to site work, each subcontractor arranged for all appropriate utility clearance mark-outs. This included (but was not limited to) contacting the NYCDEP and NYCDOT, the Transit Authority, Consolidated Edison Company of New York, Inc. (Con Edison), Keyspan, and Verizon, in addition to using the Dig-Safely number for New York City – 811 or (800) 272-4480. In addition, URS coordinated with Con Edison for the installation of protective jackets on overhead wires near several proposed boring locations. The jackets for RI Phase I field activities were installed by Con Edison on May 19, 2011. The jackets for RI Phase II were installed by Con Edison prior to the start of field activities (February 27, 2012). Photographs of jacketed overhead wires are included in Appendix A.

2.2 Geophysical Survey for Utility Markouts

On May 2 and 3, 2011 for RI Phase I and again on February 27, 2012 for Phase II, Radar Solutions International (RSI) mobilized a one person crew with GPR and electromagnetic (EM) induction equipment to the site. The purpose of the geophysical survey was to screen for and identify the presence/location of underground utilities in areas where monitoring well installations were proposed.

A 10-foot square reference grid was established around each monitoring well location prior to collecting the geophysical data. A GSSI SIR-2000 digital radar system was used to perform the GPR survey. GPR data were acquired along lines spaced 1.0 to 2.5 feet apart. The EM induction equipment used to determine the location of buried utilities was a Ditch Witch 950 RT locating system and a McLaughlin's Verifier G2 digital locator.

RSI marked utilities and anomalies by spray-painting the outline on the pavement as soon as they were located. A photograph of a completed RSI utility mark out can be found in Appendix A. A

URS geologist supervised and assisted RSI. Copies of the daily field notes are provided in Appendix B. RSI's reports are provided in Appendix C.

2.3 Soil Vapor Implant Installation

Prior to any intrusive activities, the subcontractor obtained all necessary permits (i.e., NYCDOT sidewalk permits) for conducting intrusive activities. During RI Phase I field activities, 10 permanent soil vapor implants (SG-078 through SG-087) were installed on May 6, 2011 by Zebra Environmental Corporation of Lynbrook, NY (Zebra), under the direction of a URS geologist. During RI Phase II field activities, 12 permanent soil vapor implants [11 new (SG-112 through SG-122) and 1 replacement (SG-061R)] were installed on March 1 and 2, 2012 by Zebra under the direction of a URS geologist. It should be noted that soil vapor implant SG-061 had been destroyed in the time between RI Phase I and Phase II sampling events. Locations of existing and newly installed soil vapor implants are shown on Plate 2. All locations were installed through sidewalks. Rotary concrete drill bits were used to drill through the concrete sidewalk. A track-mounted Geoprobe® 6620 DT hydraulic direct-push unit was utilized to advance a 2-inch outside diameter (OD) by 5-foot long acetate-lined Macrocore sampler to a maximum depth of 8 feet bgs.

Each sample core was screened with a photoionization detector (PID). Up to one soil sample was collected from each boring from the interval exhibiting odors, staining, or the highest PID reading. If no odors, staining, or elevated PID readings were encountered, then a sample from the bottom of the boring was collected.

A 6-inch long double-woven stainless steel Geoprobe® vapor sampling implant was connected to an anchor and positioned above the silty clay layer (if present) or at the bottom of the probe hole. Polyethylene tubing ($\frac{3}{8}$ -inch OD) was connected to the implant and was cut above the ground surface. The annular space around the implant (screen) was backfilled with #1 silica sand to 6 inches above the implant. A bentonite slurry was placed immediately above the sand for the seal, and extended to the ground surface. During the RI Phase I field activities, the implants were completed with 3-inch diameter aluminum flush-mount protective casings, secured with approximately 1 foot of concrete. Each flush mount casing cover was secured with a $\frac{9}{16}$ -inch bolt. During the RI Phase II field activities, implants were completed with 5-inch diameter aluminum flush-mount protective casings, secured with approximately 1 foot of concrete. Each flush mount casing cover was secured with $\frac{9}{16}$ -inch bolts.

All downhole equipment was decontaminated with a non-phosphate detergent and potable water between each soil vapor implant location. A photograph of a sampling implant and a completed soil vapor implant location can be found in Appendix A. Copies of the daily field notes are provided in Appendix B. Soil boring logs are provided in Appendix D and soil vapor implant construction logs are provided in Appendix E.

For the soil samples collected during installation of the soil vapor implants, a chain-of-custody (COC) form was maintained and accompanied the soil sample containers to Spectrum Analytical, Inc. of Rhode Island (Spectrum), a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP) accredited laboratory. The soil samples were analyzed for target compound list (TCL) VOCs listed in Table 2-1, plus tentatively identified compounds (TICs), following United States Environmental Protection Agency (USEPA) SW846 Method 8260B.

All investigation derived wastes (IDW) generated from the soil vapor implant installation was containerized in DOT approved 55-gallon drums and picked up by AARCO Environmental Services Corporation (AARCO) on a daily basis for off-site disposal at a permitted facility.

2.4 Soil Vapor Sampling

During the RI Phase I field activities, between June 13 and 15, 2011, soil vapor samples were collected from 30 existing and newly installed soil vapor implants plus quality assurance/quality control (QA/QC) samples. Sampling locations are shown on Plate 2. An adequate soil vapor sample could not be obtained from location SG-083. It should be noted that there was no loss in the Summa® canister vacuum pressure in the attempt to collect a sample at location SG-083. It is unknown if the inability to grab a sample from the SG-083 location was due to a problem with the equipment (i.e., regulator) or the presence of water in the soil vapor implant.

During the RI Phase II field activities, between March 5 and 7, 2012, soil vapor samples were collected from 38 existing and newly installed soil vapor implants plus QA/QC samples. Soil vapor samples were unable to be collected from 4 soil vapor implants (SG-043, SG-045, SG-057, and SG-078) due to the presence of tight cohesive soils and/or water within the implant. Sampling locations are shown on Plate 2.

The soil vapor samples were collected in accordance with the procedures outlined in the Field Activities Plan (FAP) (URS, April 2010) using laboratory evacuated 6-liter Summa® canisters with 1

hour flow regulators provided by Pace Analytical Services, Inc. of Minneapolis, MN (Pace). Per NYSDOH's *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* (NYSDOH, October 2006), a helium tracer gas was utilized during the sampling of each soil vapor implant. The tracer gas was used to verify that the infiltration of outdoor (ambient) air was not occurring during sample collection. A one-quart enclosure was placed over the well head. The well tubing was run through an outlet and plumber's putty was used to seal the interface between the tubing and the enclosure. The enclosure was then sealed at the ground surface with a polyurethane foam gasket. A tank containing ultra-high purity helium (99.999%) was connected to the side port of the enclosure and enough helium was released to displace any ambient air and to maintain a positive pressure within the enclosure. Following the application of the tracer gas, one to three volumes were purged from the soil vapor implant using a Gilian GilAir-3 air sample pump.

A Dielectric MGD-2002 helium detector was used to check for the presence of the tracer gas in the purged soil vapor; if less than 10% of the tracer gas was detected, a sample was collected. Following the collection of the soil vapor sample, the helium detector was re-connected to the tubing to check for the presence of the tracer gas in the soil vapor; if less than 10% of the tracer gas was detected, the sample was acceptable for analyses. No elevated concentrations of helium were detected prior to or following the sample collection from any of the soil vapor implants.

One outdoor (ambient) air sample was collected each day from a location upwind of the sample locations. The outdoor ambient air sample was collected by opening a summa canister fitted with a one-hour flow controller and drawing in the ambient air. Field duplicate samples were collected using stainless steel 'T' fittings. Copies of the completed Summa Canister Sampling Field Data Sheets from the sampling event are provided in Appendix F.

A COC form was maintained and accompanied the air and soil vapor samples, which were shipped, via Federal Express, to Pace, a NYSDOH ELAP accredited laboratory. The soil vapor and outdoor air samples were analyzed for the TCL VOCs listed in Table 2-1, following USEPA Method TO-15.

2.5 Groundwater Monitoring Well Installation

The following sections describe the monitoring well installation program for the RI fieldwork.

2.5.1 Pre-Boring Clearing

Prior to any intrusive activities, the subcontractor obtained all necessary permits (i.e., NYC DOT street opening permits) for conducting intrusive activities. During RI Phase I field activities, on May 9, 2011, Aquifer Drilling & Testing, Inc. (ADT) mobilized two Vac-Tron® units to perform location specific utility clearance at each of the proposed monitoring well locations. A total of 17 monitoring well locations were cleared between May 9 and 11, 2011. During RI Phase II field activities, on February 27, 2012, ADT mobilized two Vac-Tron® unit to perform location specific utility clearance at each of the proposed monitoring well locations. Between February 27 and 28, 2012, 12 monitoring wells locations were cleared for utilities. At each location, a two-foot by two-foot square area of the sidewalk was cut. An approximately one-foot diameter by five-foot deep hole was excavated using post-hole diggers, pry bars, and an air knife along with the Vac-Tron® unit. After the location was cleared for drilling, the hole was backfilled flush with the sidewalk using the excavated spoils (rocks and debris removed) and temporarily patched with blacktop patch or concrete.

During pre-boring clearing activities, if odors, staining, or elevated PID readings were encountered, then a soil sample was collected. Copies of the daily field notes are provided in Appendix B; and soil boring logs are provided in Appendix D.

A COC form was maintained and accompanied the soil sample containers to Spectrum. During The RI Phase I field activities, the soil samples were analyzed for TCL VOCs plus as listed in Table 2-1, plus TICs. In addition, select samples were also analyzed for TCL semi-volatile organic compounds (SVOCs) plus TICs, TCL pesticides/polychlorinated biphenyls (PEST/PCBs), target analyte list (TAL) metals, hexavalent chromium (Cr+6), cyanide (CN) [i.e., Part 375 parameters] as listed in Table 2-1. During The RI Phase II field activities, the soil samples were analyzed for TCL VOCs plus as listed in Table 2-1, plus TICs.

All IDW generated from the pre-boring clearing was containerized in DOT approved 55-gallon drums and picked up by AARCO on a daily basis for off-site disposal at a permitted facility.

2.5.2 Soil Borings

During RI Phase I field activities between May 10 and June 6, 2011, ADT utilized track-mounted AMS Compact Roto Sonic 17-C drill rigs for the installation of 17 monitoring wells at the locations shown on Plate 1. Of the 17 monitoring wells installed, 4 were water table (shallow wells)

and the remaining 13 were deep overburden wells. During RI Phase II field activities between February 28 and March 16, 2012, ADT utilized track-mounted AMS Compact Roto Sonic 17-C drill rigs for the installation of 12 monitoring wells at the locations shown on Plate 1. Of the 12 monitoring wells installed, 5 were water table (shallow wells) and the remaining 7 were deep overburden wells.

The soil borings associated with monitoring wells were advanced using a combination of a 3-inch diameter inner sampler (5 feet in length) and a 5-inch diameter outer casing. The procedure for the advancement of the borehole was to advance the inner sampler the appropriate interval (5 feet) and then advance the outer casing over the inner sampler to the desired depth. After the outer casing was advanced, the inner sampler was retrieved and the collected sample core was placed in a polyethylene sample tube. The process was repeated until the desired depth was reached.

Each sample core was screened with a PID. Up to two soil samples were collected from each boring; one soil sample was collected from the interval just above water table; the second sample was collected from the interval exhibiting odors, staining, or the highest PID reading. If no odors, staining, or elevated PID readings were encountered, then only one sample from the interval just above the water table was collected. Copies of the daily field notes are provided in Appendix B; and soil boring logs are provided in Appendix D.

A COC form was maintained and accompanied the soil sample containers to Spectrum. During The RI Phase I field activities, the soil samples were analyzed for TCL VOCs plus as listed in Table 2-1, plus TICs. In addition, select samples were also analyzed for TCL semi-volatile organic compounds (SVOCs) plus TICs, TCL pesticides/polychlorinated biphenyls (PEST/PCBs), target analyte list (TAL) metals, hexavalent chromium (Cr+6), cyanide (CN) [i.e., Part 375 parameters] as listed in Table 2-1. During The RI Phase II field activities, the soil samples were analyzed for TCL VOCs plus as listed in Table 2-1, plus TICs. Shelby tube and grab samples were submitted to 3rd Rock, LLC of East Aurora, NY (3rd Rock) for geotechnical analysis.

All IDW generated from the monitoring well installation was containerized in DOT approved 55-gallon drums and picked up by AARCO on a daily basis for off-site disposal at a permitted facility.

2.5.3 Monitoring Well Construction

All shallow and deep monitoring wells installed during the RI field activities were constructed using the following methodologies.

The 9 shallow monitoring wells were constructed with 15 feet of 2-inch inside diameter (ID), Schedule 40 polyvinyl chloride (PVC) 0.010-inch slot screen and 2-inch ID, Schedule 40 PVC riser. The screen was nominally set between 5 feet above and 10 feet below the water table at most locations (approximate depth between 30 to 50 feet bgs). A 00 size sand pack was installed from the bottom of the well up to 2 feet above the top of the well screen. A bentonite seal was then installed around the riser to an elevation of 2-foot below grade using a bentonite slurry installed via tremie pipe or $\frac{3}{8}$ -inch bentonite chips.

The 20 deep monitoring wells were constructed with 10 feet of 2-inch ID, Schedule 40 PVC 0.010-inch slot screen and 2-inch ID, Schedule 40 PVC riser (approximate depth between 70 to 90 feet bgs). A 00 size sand pack was installed from the bottom of the well up to 2 feet above the top of the well screen. A bentonite slurry was then installed around the riser to an elevation of 2-foot below grade via tremie pipe.

Each monitoring well was finished with a locking well cap, a 2-foot square concrete apron, and a flush-mounted curb box. Security bolts were installed in the well covers to minimize the potential for unauthorized well access. The concrete apron for each well pad was approximately 6 inches thick. Monitoring well construction logs are provided in Appendix G.

2.6 Monitoring Well Development

All monitoring wells installed during the RI field activities were developed using the following methodologies.

At least 24 hours after the monitoring wells were installed, the wells were developed by URS personnel with the pump and surge development method using a Waterra Inertial Hydrolift pump with dedicated/disposable high density polyethylene (HDPE) tubing and dedicated/disposable HDPE check valves. Prior to well development, a 100-foot long Solinst oil/water interface probe was used to check for the presence/thickness of any free product. During well development, water quality parameters (pH, specific conductivity, temperature, turbidity) were measured using a Hanna 991301 Multiparameter Meter and a Lamotte 2020 turbidimeter and recorded. A monitoring well was considered developed when a minimum of 100 gallons was removed, and water quality parameters had stabilized. Well development logs may be found in Appendix H. Well development water was collected in DOT approved 55-gallon drums and picked up daily by AARCO for off-site disposal at a permitted facility.

2.7 Groundwater Level Measurements

Several rounds of groundwater levels were collected and used to develop groundwater contour elevation maps during the investigation so that groundwater flow directions could be determined. Monitoring wells within the area were checked for depth to groundwater and thickness of accumulated NAPL, if any. Water levels were determined using a 100-foot long Solinst oil/water interface probe. Table 2-2 presents groundwater level measurements and the presence/absence of non-aqueous phase liquid (NAPL) in monitoring wells. Groundwater elevations were adjusted if light non-aqueous phase liquid (LNAPL) was present, based upon the (laboratory) measured specific gravity of the product present in monitoring well(s) at the site.

2.8 Aquifer Testing

Following well development, slug testing was conducted on select monitoring wells to estimate the horizontal hydraulic conductivity within the overburden. Falling head tests were performed by recording the initial water level in the well, lowering a pressure transducer/datalogger (In-situ MiniTroll) into the well, inserting a decontaminated slug to raise the water level in the well, and recording the water level over time until it returned to the original static level. Rising-head tests were performed immediately following completion of the falling head test. With the slug already in the water column, the static water level was recorded, the slug was then removed, and water level readings were taken as the water level gradually returned to static condition. Aquifer testing data and results are provided in Appendix I.

2.9 Non-Aqueous Phase Liquid Gauging

During Site Characterization Phases I through VI and both Phase I and II of the RI, monitoring wells were checked for the presence of NAPL. LNAPL was observed at the site only during RI Phase I field activities, as discussed below and presented on Table 2-1. No dense non-aqueous phase liquid (DNAPL) was observed during any SC or RI field activities.

2.9.1 Dense Non-Aqueous Phase Liquid Gauging

No DNAPL was observed during any SC or RI field activities.

2.9.2 Light Non-Aqueous Phase Liquid Gauging

During the RI Phase I field activities, from June 20 to 22, 2011, LNAPL was observed with thicknesses ranging between 0.0 feet and 0.12 feet in DEC-048. LNAPL had not been previously observed in this monitoring well which was installed in June 2008. During the SC Phase VI and RI Phase II field activities, LNAPL was not observed at this location.

2.10 Non-Aqueous Phase Liquid Sampling

During the RI Phase I fieldwork, one NAPL sample was collected from DEC-048 on June 24, 2011.

2.10.1 Dense Non-Aqueous Phase Liquid Sampling

No DNAPL samples were collected during any SC or RI field activities.

2.10.2 Light Non-Aqueous Phase Liquid Sampling

During the RI Phase I field activities, on June 24, 2011, URS personnel collected an LNAPL sample from DEC-048 using a dedicated/disposable HDPE bailer. The LNAPL sample was transported under COC via laboratory courier to Spectrum. The sample was analyzed by Spectrum for TCL VOCs plus TICs, TCL SVOCs plus TICs, and Petroleum Hydrocarbons by Method 8100 (modified), as listed in Table 2-1. Specific gravity was analyzed by American Society for Testing and Materials (ASTM) method D4052 by Mt. Tom Generating Co. LLC Analytical Laboratory (Mt. Tom) of West Springfield, MA as a subcontractor to Spectrum.

2.11 Groundwater Sampling

During the RI Phase I field activities, between June 20 through June 24, 2011, URS measured depth to groundwater and collected groundwater samples from 45 monitoring wells plus QA/QC samples using low-flow sampling procedures. Due to the presence of LNAPL, the groundwater sample from monitoring well DEC-048 was collected using 1-inch PVC with a tethered cap inserted into the well to bypass the LNAPL. The sample tubing was then inserted through the PVC pushing out the cap at a depth below the LNAPL in order to sample the well at the midpoint of the screen.

During the RI Phase II field activities, between January 23 and January 31, 2012, URS collected groundwater samples from 58 monitoring wells (12 newly installed and 46 existing NYSDEC wells) plus QA/QC samples using low-flow sampling procedures.

Prior to sample collection, standing water was purged from each well with a QED SamplePro Micropurge bladder pump or a Grundfos Redi-Flo2 submersible pump using dedicated/disposable bladders and HDPE tubing. Wells were purged at a rate of 1-liter per minute or less and the purge rate was adjusted to minimize draw down. During the purging of the well, water quality parameters (pH, specific conductivity, temperature, dissolved oxygen, turbidity) were measured using a Horiba U-22 Multi-parameter Instrument with a flow-through cell and documented on a purge log. Samples were collected after the water quality parameters stabilized. Purge logs are provided in Appendix J. Purge water was collected in DOT approved 55-gallon drums, and was picked up daily by AARCO for proper disposal.

All samples were transported under COC via laboratory courier to H2M. During RI Phase I field activities, the groundwater samples were analyzed for TCL VOCs plus TICs. In addition, 4 groundwater samples were collected and analyzed for TCL SVOCs, TCL pesticides, TCL PCBs, TAL metals, and cyanide. During RI Phase II field activities, the groundwater samples were analyzed for TCL VOCs plus TICs and natural attenuation parameters [i.e., alkalinity, chloride, nitrate-nitrite, total phosphorous, sulfate, and sulfide] as listed in Table 2-1.

2.12 Investigation Derived Waste Disposal

AARCO was contracted for the daily pick-up and disposal of all drummed IDW at a permitted disposal facility. Copies of the non-hazardous bills of lading and hazardous waste manifests are provided in Appendix K. Analytical results from waste profile samples may be found in Table 3 of the Data Usability Summary Reports (DUSRs) in Appendix Q, on a compact disc (CD).

2.13 Monitoring Well Maintenance

During RI fieldwork, well maintenance was performed on all DEC wells where groundwater samples were collected. Every well cover was removed and all the bolt holes were tapped out and lubricated with an anti-seize paste. All flush-mount protective casings on DEC wells were equipped with new Penta Head tamper proof bolts.

2.14 Monitoring Well Decommissioning

During the RI Phase II fieldwork, three monitoring wells (DEC-006, DEC-014, and DEC-022) were decommissioned in accordance with NYSDEC protocol *CP-43: Groundwater Monitoring Well Decommissioning Policy*. At DEC-014, the well string was removed and a bentonite slurry was installed via tremie pipe. At DEC-006 and DEC-022, the well riser broke while attempting to pull the well string; the remainder of the well string was left in place and a bentonite slurry was installed via tremie pipe. Copies of the daily field notes are provided in Appendix B and well decommissioning records may be found in Appendix L.

2.15 Concrete Sidewalk Flag Replacement

During RI Phase I field activities, AARCO was contracted for the replacement of sidewalk flags that had been drilled through during previous and current site activities. AARCO replaced a total of 25 sidewalk flags between July 11 and 15, 2011. The sidewalk flags ranged in size from 5-foot by 5-foot to 10-foot by 10-foot square. Prior to removal of the damaged flags, AARCO cut the perimeter of each flag to be replaced using a water-cooled pavement saw. The flags were demolished, removed and disposed of by AARCO. New flags were replaced in kind to the surrounding flags.

During RI Phase II field activities, AARCO was contracted for the replacement of sidewalk flags that had been drilled through during previous and current site activities. AARCO replaced a total of 23 sidewalk flags between April 16 and 20, 2012. The sidewalk flags ranged in size from 3-foot by 5-foot to 5-foot by 6-foot. At 5 locations (DEC-031, DEC-031D, DEC-031TC, DEC-044, and DEC-044D), the flags and existing flush-mount protective casings were replaced with flush-mount well covers made of cast aluminum due to the high traffic of forklifts using the sidewalk at these locations. Prior to removal of the damaged flags, AARCO cut the perimeter of each flag to be replaced using a water-cooled pavement saw to reduce fugitive dust. The flags were demolished, removed and disposed of by AARCO. New flags were replaced in kind to the surrounding flags. Copies of the daily field notes are provided in Appendix B.

2.16 Site Survey

URS surveyed the area, including all new soil borings, monitoring wells, and soil vapor points installed for location and elevation. The survey provides 100-scale mapping and does not include elevated roadways and expressways (i.e., BQE). All surveying was performed under the supervision

of a New York State licensed land surveyor. All vertical control points were referenced to the North American Vertical Datum 1988 (NAVD 1988). Horizontal datum was referenced to the North American Datum of 1983 (NAD83), New York State Plane Coordinate System, Long Island Zone. Copies of survey field notes and site sketches are provided in Appendix M. A site survey drawing is provided in Appendix N.

3.0 PHYSICAL CHARACTERISTICS OF THE STUDY AREA AND GEOLOGY

This section discusses the physical characteristics of the study area including surface features, groundwater use, demography and land use, soil, surface water hydrology, geology and hydrogeology.

3.1 Surface Features

The topography of the site investigation area slopes gently downward to the south. The elevation near the Klink Cosmo area ranges from approximately at 39 feet amsl near the corner of Morgan Avenue and Richardson Street to 35 feet amsl near the corner of Vandervoort Avenue and Richardson Street to 28 feet amsl farther south at the corner of Frost Street and Vandervoort Avenue. The entire site property and the majority of the project area are covered by buildings and/or pavement/concrete.

Limited green space is present in the area and is generally situated in the vicinity of residential properties. Surface soil is present in landscape boxes adjacent to area sidewalks; however, given the nature of the urban environment the soil should not be construed as representative of clean surface soil. Recreation areas in the vicinity are baseball fields directly east of the Site, across Vandervoort Avenue, and Monsignor McGolrick Park which is a 9.13 acre park 2,000 feet northwest of the Site bounded by Monitor and Russell Streets and Nassau and Driggs Avenues.

3.2 Demography and Land Use

The site is located in the Greenpoint/East Williamsburg Industrial Area section of the Borough of Brooklyn, Kings County, New York. Petroleum refining and storage operations occupy a significant portion of the Greenpoint area, especially to the north and east. The population of Brooklyn (Kings County) is 2,504,700 according to the 2010 Census. The Klink Cosmo property is currently being used for sheet metal fabrication. The area is a mixture of residences and manufacturing facilities, including both commercial and industrial facilities. A recreational area is situated directly east of the Site across Vandervoort Avenue.

Land use in New York City is regulated by the City's Zoning Resolution, which has two parts: zoning text and zoning maps. The text establishes zoning districts and sets forth regulations governing their land use and development. The maps show the locations and boundaries of the zoning districts. The City is divided into three basic zoning districts: residential (R), commercial (C), and

manufacturing (M). The three basic districts are further divided into a range of lower-, medium-, and higher-density residential, commercial, and manufacturing districts.

The project area falls within three zoning districts identified by the New York City Department of City Planning (http://www.nyc.gov/html/dcp/html/zone/zh_zmactable.shtml). These zoning districts are: R6B, M1-1, and M3-1. The current (2011) zoning and land use of individual properties was determined through the NYCityMap (<http://gis.nyc.gov/doitt/nycitymap>).

R6 and R6B Residential Districts (medium density). Primary permitted uses in the R6 district include medium density residential. A mixture of building types are allowed and range from small apartment buildings set back on small lots to row houses to large-scale apartment towers. The “B” suffix indicates a contextual district, where supplemental regulations require a new development to maintain the scale and form of the existing neighborhood context. Residential buildings are zoned as R6B north of Division Place and south of Lombardy Street between Morgan and Porter Avenues.

M1-1 Manufacturing District (light industrial). Permitted uses in the M1 districts include typical light industrial, office and retail uses. M1 districts are often a buffer between M2 or M3 manufacturing districts and adjacent residential or commercial districts. Residences are generally not included within M1 districts unless as part of a Special Mixed Use District. The majority of properties south of Meeker Avenue east of Morgan Avenue and west of Porter Avenue are located in the M1-1 district.

M3-1 Manufacturing District (heavy industrial). Permitted uses in the M-3 industrial district include heavy industry that generate potential nuisance effects such as noise, traffic or pollutants and include power plants and fuel supply depots. The “1” suffix refers to supplemental parking requirements. Properties south of Meeker and east of Porter Avenue are zoned M3-1.

3.3 Regional Geology

The Klink Cosmo Site is located within the Atlantic Coastal Plain physiographic province of New York State (Broughton, et al. 1966). The Atlantic Coastal Plain is characterized by low relief with elevations ranging from sea level to almost 400 feet amsl. The lithology of Brooklyn and Queens consists of Cretaceous and Pleistocene age unconsolidated deposits underlain by Precambrian

crystalline bedrock. The unconsolidated deposits pinch out in northwestern Queens where bedrock outcrops, but reach a thickness of more than 1,000 feet in southeastern Queens. The unconsolidated deposits form six distinct hydrogeologic units consisting of four aquifers and two confining layers that generally dip to the south-southeast (Figure 3-1). The units in ascending order are the Lloyd aquifer (0-300 feet thick), the Raritan confining unit (0-200 feet thick), the Magothy aquifer (0-500 feet thick), the Jameco aquifer (0-200 feet thick), the Gardiners clay (0-150 feet thick), and the upper glacial aquifer (0-300 feet thick) (USGS, 1999a and b). The units pinch out to the north-northeast and may not all be found at any one location.

Based on borings performed near the site for unrelated work, the site is underlain from the surface down by upper glacial aquifer, the Raritan Formation, and crystalline bedrock. The upper glacial aquifer is of Wisconsin age and consists of a terminal moraine, a ground moraine, and glacial outwash deposits whose area is characterized as an unsorted and unstratified mixture of clay, sand, gravel and boulders. The Raritan Formation is recognized as a confining unit which has been described as light to dark gray, brown-red, pink, red and gray-white clay, silty clay and clayey to silty fine sand. Disseminated lignite and pyrite are common and calcareous concretions may be found. Prior to the SC Phase VI fieldwork, the Raritan Formation had previously been encountered in three borings performed near the site by the USGS: one boring near Morgan Avenue and Meeker Avenue (-47 feet amsl); one boring under the BQE near the west bank of Newtown Creek (-48 feet amsl); and one boring near Meeker Avenue between Stewart Avenue and Gardner Avenue (-71 feet amsl). The boring near Morgan Avenue and Meeker Avenue penetrated the Raritan Formation into the underlying crystalline bedrock at an elevation of -163 feet amsl.

During the SC Phase VI fieldwork, the Raritan Formation was positively encountered in eight top of clay well locations at depths between 108.5 and 138.0 feet bgs (elevations of -56.95 to -121.19 feet amsl) and was described as gray with white banding, brown, brownish gray, greenish gray, dark gray to greenish brown, fine sand and silt, clays with carbonized plant fragments, clays with varying amounts of sand to silts with varying amounts of sand and clay.

3.4 Site Geology

Figure 3-2 presents the locations of the monitoring wells and cross sections developed during the RI. Cross sections A-A', B-B' and C-C' are shown on Figures 3-3, 3-4, and 3-5, respectively. Based upon subsurface data obtained during this and previous investigations, the upper glacial aquifer

has been penetrated and the top of the Raritan Formation has been encountered at the top of clay locations. The following textural units have been found in the upper glacial aquifer in most borings, from the surface downward: a fill unit; a sand unit or a discontinuous glacial till unit; a sand unit if the discontinuous glacial till unit was encountered at the surface; a discontinuous clayey silt unit within the sand unit; sand and gravel unit; and the Raritan Formation. Due to the heterogeneous nature of the geology, some but not all of the units may or may not be present at each boring. The thickness of the upper glacial aquifer in the Klink Cosmo area is approximately 108.5 to more than 113.0 feet thick. The Raritan Formation was encountered between -73.31 and -74.05 feet amsl. An isopleth of the top of Raritan Formation is shown on Figure 3-6.

A fill unit is present, varying in thickness from approximately 0 to 11 feet, and consists of a heterogeneous mixture of sand, silt, clay and varying amounts of construction and demolition debris (i.e., bricks, concrete, coal, slag, etc.). Potentially former MGP related fill material (i.e., cinder and/or trace slag) was found to be present across Vandervoort Avenue in the vicinity of a former MGP facility in DEC-014D (5-7 feet bgs), DEC-043 (1-11 feet bgs), SG-079 (1-2 feet bgs), and SG-086 (at 1 foot bgs).

A glacial till unit was noted at the surface in some borings and consists of a heterogeneous mixture of sand, silt, and clay and varying amounts of gravel, cobbles and boulders.

A sand unit is present at all the boring locations and is represented by stratified sands of varying textures containing some to no fines.

A lacustrine clayey silt/silt unit has been observed as an inclusive unit within the sand unit. The thickness of the clayey silt/silt unit, where present, varies from 0.5 to over 10 feet thick.

A sand and gravel unit has been found to overlie the Raritan Formation at DEC-029TC and DEC-031TC. The Raritan Formation consisted of gray or dark gray, silt with some clay and fine sand stringers; clay with some sand; clay and silt; or fine sand and silt.

3.5 Geotechnical Test Results

Geotechnical samples were collected from the Klink Cosmo area during both phases of the RI field activities and from the SC Phase VI field activities. Soil samples from grab samples and Shelby tubes were analyzed by 3rd Rock for grain size distribution (ASTM D422), Atterberg Limits (ASTM

D4318), and falling head permeability (ASTM D5084). Results are presented in Appendix O, summarized on Table 3-1 and discussed below.

3.5.1 Geotechnical Samples from Upper Glacial Aquifer

Upper glacial aquifer samples from DEC-065D and DEC-066D with depths between 9 and 25 feet bgs were generally poorly graded sand with silt, silty sand, and clayey sand with an Unified Soil Classification System (USCS) classifications of SM, SC, and SP-SM. Soils were identified as either non-plastic or of low plasticity. Two samples were analyzed by ASTM D5084 Method C for permeability. Results ranged from 1.1×10^{-7} to 4.9×10^{-8} cm/sec.

Deeper upper glacial aquifer samples were collected from DEC-011D, DEC-028D, DEC-029D, and DEC-044D with depths between 50 and 84.5 feet bgs. The soils were identified as poorly graded sand, well graded sand with silt and gravel, silt, clay, and clay with sand with USCS classifications of SP, SW-SM, ML, CL and CH. Soils were identified as either non-plastic or of low plasticity. Three samples were analyzed by ASTM D5084 Method C for permeability. Results ranged from 2.0×10^{-8} to 5.1×10^{-8} cm/sec.

3.5.2 Geotechnical Samples from Top of Raritan Formation

Samples were collected from the top of the Raritan Formation, and included samples from the silty sand material from above the clay, DEC-029TC (108-113 feet bgs) and DEC-031TC (105-106 feet bgs), and from the clay DEC-029TC (115-117 feet bgs) and DEC-031TC (115-116.5 feet bgs). USCS classifications in the Raritan Formation ranged from SM, ML, and CL. Soils were identified as either non-plastic or of low plasticity. The measured permeability values were 2.0×10^{-3} cm/sec for the silty sand above the clay, and varied between 1.7×10^{-6} to 9.9×10^{-6} cm/sec for the clay.

3.6 Groundwater Levels and Hydrogeology

The primary hydrogeologic unit identified within the investigation area is the upper glacial aquifer. Groundwater in the area is generally present in unconfined conditions; however, localized semi-confined or confined conditions are possible due to the presence of interbeds of sand, clay, and silt. The water table surface may be found between approximately 25 and 50 feet bgs depending on the well location.

During the RI Phase I field activities, a round of synoptic groundwater levels was obtained on June 20, 2011 from monitoring wells in the Klink Cosmo area. These were used to develop groundwater contour elevation maps during the RI so that groundwater flow directions could be determined. Potentiometric surface maps based on the water level measurements from the shallow wells (screened generally at 30 to 50 feet bgs), using a 0.2-foot contour interval, are provided in Figure 3-7, and in Figure 3-8 for deep wells (screened generally at 70 to 90 feet bgs). A thin layer of LNAPL was detected in DEC-048. The water level in this monitoring well was adjusted based on specific gravity measurements. An LNAPL sample from DEC-048 was collected and sent to Mt. Tom Generating Company for determination of specific gravity. Analytical results are provided in Appendix P. Water level measurements are included in Table 2-2. Vertical hydraulic gradient calculations are provided on Table 3-2.

During RI Phase II field activities, an additional synoptic round of groundwater levels were obtained on March 28 and 29, 2012 from monitoring wells in the Klink Cosmo area. Potentiometric surface maps based on the water level measurements using a 0.2-foot contour interval are provided in Figure 3-9 for the shallow overburden wells and in Figure 3-10 for the deep overburden wells. Water levels were obtained from only two top of clay wells (DEC-029TC and DEC-031TC) during the RI Phase II, therefore groundwater flow direction could not be determined. However, during the SC Phase VI field activities the flow direction of groundwater above the top of clay was determined to be to the northeast/northwest. Water level measurements are included in Table 2-2. Vertical hydraulic gradient calculations are provided on Table 3-2.

In the immediate vicinity of the Klink Cosmo area, the shallow and deep groundwater flow is east/northeast. The horizontal hydraulic gradient of the shallow groundwater flow during the RI Phase I and RI Phase II field activities was less than approximately 0.001 to 0.004 foot per foot (ft/ft). In the immediate vicinity of the Klink Cosmo area, groundwater measurements in the top of Raritan Formation monitoring wells were similar (2 feet amsl in DEC-031TC and 2.18 feet amsl in DEC-029TC).

The vertical hydraulic gradients in shallow and deep well pairs varied in direction across the investigation area during RI Phase II field activities. Vertical hydraulic gradients in well pairs DEC-043/043D, DEC-064/064D, DEC-065/065D, and DEC-066/066D are positive or downwards (0.004, 0.002, 0.012, 0.006 ft/ft, respectively). Vertical hydraulic gradients in the majority of well pairs downgradient of the site, DEC-014R/014D, DEC-015/015D, DEC-029/029D, DEC-031/031D, and

DEC-045/045D, were slightly negative, or upwards (-0.002 to -0.007 ft/ft) based upon the water level information. Vertical hydraulic gradients in well pairs DEC-006D/006DD, DEC-007/007D, DEC-013/013D, DEC-030/030D, and DEC-044/044D were also upwards but were greater in magnitude (-0.012 to -0.017 ft/ft).

The vertical hydraulic gradients in top of Raritan Formation well triplets were similar in direction and magnitude during RI Phase II field activities. Vertical hydraulic gradients between the shallow and top of Raritan Formation wells at DEC-029/029TC and DEC-031/031TC were slightly negative or upwards (-0.002 to -0.006 ft/ft, respectively). Vertical hydraulic gradients between the deep and top of Raritan Formation wells at DEC-029D/029TC and DEC-031D/031TC were slightly positive or downwards (0.004 to 0.003 ft/ft, respectively).

3.6.1 Slug Test Results

Representative slug test results are presented on Table 3-3. Horizontal hydraulic conductivity values for the shallow overburden range from 2.69×10^{-5} cm/sec to 4.77×10^{-3} cm/sec. Horizontal hydraulic conductivity values for the deep overburden range from 9.74×10^{-3} cm/sec to 2.48×10^{-2} cm/sec.

3.7 Surface Water and Hydrology

The site slopes slightly to the east and south and is bounded by streets on the north, west and east. The surface of the site is entirely covered by buildings and/or pavement/sidewalks. There is a storm water drop inlet (DI) along Richardson Street near Vandervoort Avenue.

The nearest surface water body is Newtown Creek located approximately 2,500 feet northeast of the site. Newtown Creek is classified as a Class SD (marine waters) surface water body by the NYSDEC. The best usage of Class SD waters is fishing. These waters shall be suitable for fish, shellfish, and wildlife survival. The classification may be given to those waters that, because of natural or man-made conditions, cannot meet the requirements of primary and secondary contact recreation and fish propagation. While Newtown Creek may not be suitable for swimming and other recreational activities that involve human contact with surface water, individuals use Newtown Creek for fishing and boating. Water is not withdrawn from Newtown Creek for potable use. Numerous storm water drains from surrounding roadways and permitted Spill Discharge Elimination System (SPDES) outfalls discharge into Newtown Creek, including those discharging groundwater collected and treated on the nearby ExxonMobil remediation site.

Surface water levels within Newtown Creek vary depending on the tide. High tide in Newtown Creek is generally at an elevation of 4 to 5 feet amsl; low tide is generally at an elevation of 0 to -1 feet amsl (www.saltwatertides.com).

3.8 Utilities

Utilities on and near the site include underground water, electric, natural gas, sanitary and storm sewer. Overhead electric and communication lines run north-south adjacent to the site within the eastern sidewalk along Morgan Avenue, north-south within the western sidewalk along Vandervoort Avenue, and east-west within the north sidewalk along Withers Street. Fire hydrants are located on Richardson Street, Morgan Avenue, Withers Street, and Vandervoort Avenue. Approximate utility information is provided on the site survey which may be found in Appendix N.

3.9 Standards, Criteria and Guidance Values

For each medium, detected concentrations of individual contaminants were compared to applicable standards, criteria and guidance values (SCGs). The site-specific SCGs were determined for the individual media as follows:

3.9.1 Soil

Three sources of soil SCGs are considered appropriate for this site: site-specific background soil samples, NYSDEC Part 375, and NYSDEC CP-51.

On August 3, 2011, eight soil samples were obtained from the 0 to 2-foot depth interval from eight locations in Monsignor McGolrick Park as part of the SC Phase VI field activities. These samples were analyzed for target compound list/target analyte list (TCL/TAL) contaminants. Detected concentrations will be considered to be representative of site-specific background for the Klink Cosmo site. These soil background concentrations will be included as soil SCGs on the soil analytical tables presented in Section 4.

A summary of the detected analytical results in the background soil samples compared to unrestricted and protection of groundwater SCGs is presented in Table 3-4. Table 3-4 lists the detected analytical results for background soil samples within/near residences compared to residential SCGs for RI soil samples. Results exceeding criteria are indicated with circles and/or squares on the table. Table 3-5 provides a statistical summary of the detected TCL parameters for background soil

samples as follows: the number of detections; the minimum, maximum and average values; the location and depth of the maximum value, and the number of exceedances of unrestricted use criteria. One VOC, toluene, was detected below unrestricted use criteria at six of the eight sampling locations. As indicated on Table 3-5, SVOCs, including polycyclic aromatic hydrocarbons (PAHs), were detected in the majority of samples. One SVOC, di-n-butylphthalate, exceeded unrestricted use criteria at one location (SS-02). The pesticides dichlorodiphenyldichloroethane (4,4'-DDD), dichlorodiphenyldichloroethylene (4,4'-DDE), and dichlorodiphenyltrichloroethane (4,4'-DDT) were detected in all samples and exceeded unrestricted use criteria at all locations. Additionally, dieldrin exceeded unrestricted use criteria at two locations; gamma-chlordane was detected at three locations below unrestricted use criteria.

Metals which exceeded unrestricted use criteria in all samples include: copper, iron, lead, and mercury. Additionally, arsenic exceeded unrestricted use criteria at five locations, and zinc exceeded unrestricted use criteria at one location.

Since the detected concentrations of di-n-butylphthalate, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, dieldrin, arsenic, copper, iron, lead, mercury, and zinc exceeded unrestricted use criteria in the background soil samples, these contaminants are considered to be present as background conditions for the site. The maximum concentration of each contaminant detected at concentrations exceeding unrestricted use criteria is included as the soil background concentration and presented on the soil analytical results tables in Section 4.

Part 375 criteria are considered as SCGs for soil samples in conjunction with CP-51 criteria. CP-51 supplements Part 375 by providing criteria for contaminants previously included under TAGM 4046 where values were not included in Part 375. Hereafter, mention of Part 375 includes incorporation of CP-51 criteria values. Part 375 unrestricted use criteria are considered to assist in the development of a remedial alternative capable of achieving unrestricted future use, as required by DER-10 Section 4.4 (b) 3 ii. In addition, criteria for the Protection of Groundwater are considered as SCGs for contaminants which exceed groundwater SCGs. These are identified in Section 4.

Soil samples were obtained from soil borings on properties zoned residential and/or manufacturing by the NYC Department of City Planning. The zoning classification for the property of location of the soil boring is a consideration in the determination of the appropriate soil SCGs. The majority of properties within the investigation area are zoned manufacturing.

As discussed in Section 3.2, properties located in the manufacturing districts in NYC may be either industrial or commercial use. However, land uses allowed within manufacturing districts include residential use either within special mixed use districts or by special permit. Therefore, residences may be present on properties throughout the entire investigation area. Therefore, the soil SCGs considered appropriate for the site are residential criteria (as opposed to commercial or industrial criteria). Part 375 restricted residential and residential land use soil cleanup criteria for the soil samples are used on the soil analytical data tables in Section 4.

3.9.2 Groundwater

The SCGs for groundwater are the Class GA standards and guidance values presented in NYSDEC Technical and Operational Guidance Series (TOGS) 1.1.1 Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations, June 1998 (including subsequent revisions). These groundwater SCGs are included on the groundwater analytical tables presented in Section 4.

3.9.3 Surface Water/ Sediments

No surface water or sediment samples were collected therefore no SCGs were determined.

3.9.4 Soil Vapor

There are no criteria for soil vapor analytical data.

4.0 NATURE AND EXTENT OF CONTAMINATION

The following sections discuss the results of the soil, NAPL, groundwater and soil vapor/air sample analyses for the RI fieldwork at the Klink Cosmo Site.

4.1 Soil Analytical Results

4.1.1 RI Phase I and SC Phases I through III Soil Analytical Results

The soil sample results were compared to appropriate Part 375 criteria identified for the soil samples discussed in Section 3.9. Twenty samples were collected during RI Phase 1 from 10 soil vapor and 17 monitoring well locations during the period between May 6 through June 6, 2011. (At some locations, more than one sample was collected from multiple depths.) Including the RI Phase 1 and Phases I through III of the SC, 57 soil samples have been obtained from 47 monitoring well borings, 12 soil borings and 31 soil vapor locations in the Klink Cosmo area. A summary of the detected VOC analytical results in all soil samples as compared to soil background concentrations, unrestricted use, and protection of groundwater SCGs is presented in Table 4-1 and in Table 4-2 for SVOCs, pesticides/PCBs, herbicides, metals and cyanide. A summary of the detected VOC analytical results in all soil samples compared to residential and restricted residential SCGs are presented in Table 4-3 and in Table 4-4 for SVOCs, pesticides/PCBs, herbicides, metals and cyanide. Table 4-5 provides a statistical summary of the detected TCL parameters for all soil samples collected from RI Phase I and the SC Phases I through III in the Klink Cosmo area as follows: the number of samples, the number of detections; the minimum, maximum and average values; and the location and depth of the maximum value. The complete validated analytical results from the RI soil samples are presented in the DUSR in Appendix Q, on a CD. Data summary tables, Form I and Form Ie (TICs) are provided in the DUSR and include the reporting limit for each non-detected compound. RI Phase I and Phases I through III of the SC soil data exceeding criteria is presented on Figure 4-1A for Unrestricted Use and Protection of Groundwater and Figure 4-1B for Residential Use and Restricted Residential Use.

Background, Unrestricted Use, and Protection of Groundwater Soil Criteria

Soil sample results from the RI Phase 1 and Phases I through III of the SC were compared to soil background concentrations, unrestricted use, and protection of groundwater criteria as shown on Figure 4-1A. Locations which exceeded criteria for unrestricted use generally exceed protection of groundwater criteria. Acetone slightly exceeded unrestricted use, and protection of groundwater

criteria at DEC-004 (0.12 mg/kg 35-36 feet bgs) and SB-11 (0.056 mg/kg 25-26 feet bgs). Methylene chloride slightly exceeded unrestricted use, and protection of groundwater criteria at SB-11 (0.072 mg/kg 25-26 feet bgs) and xylene slightly exceeded unrestricted use criteria at DEC-048 (0.89 mg/kg 24.5-25.5 feet bgs). Di-n-butylphthalate exceeded soil background concentrations, unrestricted use, and protection of groundwater criteria at DEC-030D (0.13 mg/kg 3.5-4.5 feet bgs) and the pesticide Dieldrin exceeded unrestricted use criteria at DEC-030D (0.0052 mg/kg 3.5-4.5 feet bgs). 2-methylnaphthalene exceeded unrestricted use criteria at DEC-048 (16 mg/kg 24.5-25.5 feet bgs).

Iron exceeded soil background concentrations and unrestricted use criteria in DEC-030D (23,100 mg/kg 3.5-4.5 feet bgs), DEC-065D (27,700 mg/kg 9-10 feet bgs), and DEC-065D (54,900 mg/kg 14-15 feet bgs). Iron exceeded soil unrestricted use criteria in DEC-029D (4,730 mg/kg 75-76 feet bgs) and DEC-066D (10,100 mg/kg 24-25 feet bgs). Lead and mercury exceeded unrestricted use criteria in DEC-030D (74.2 mg/kg and 0.32 mg/kg, respectively 3.5-4.5 feet bgs), and aluminum, chromium, and vanadium exceeded unrestricted use criteria in DEC-065D (10,100 mg/kg, 32.7 mg/kg, and 54.2 mg/kg, respectively 14-15 feet bgs).

Residential and Restricted Residential Soil Criteria

Soil sample results from the RI Phase 1 and Phases I through III of the SC were compared to residential use and restricted residential use criteria as shown on Figure 4-1B. 2-methylnaphthalene exceeded residential use criteria at DEC-048 (24.5-25.5 feet bgs).

Iron exceeded residential and restricted residential use criteria was iron in DEC-029D (4,730 mg/kg 75-76 feet bgs), DEC-030D (23,100 mg/kg 3.5-4.5 feet bgs), DEC-065D (27,700 mg/kg 9-10 and 54,900 mg/kg 14-15 feet bgs), and DEC-066D (10,100 mg/kg 24-25 feet bgs).

4.1.2 RI Phase II and SC Phases VI Soil Analytical Results

Soil samples collected during the SC Phase VI and RI Phase II were compared to appropriate Part 375 criteria identified for the soil samples discussed in Section 3.9.

A summary of the detected VOC analytical results in soil samples were compared to soil background concentrations, unrestricted use, and protection of groundwater SCGs is presented in Table 4-6. Table 4-7 lists the detected analytical results for soil samples as compared to residential and restricted residential SCGs for VOCs. The complete validated analytical results from the RI Phase II and SC Phase VI soil samples are presented in the DUSR in Appendix Q, on a CD. Data summary

tables, Form I and Form Ie (TICs), are provided in the DUSR and include the reporting limit for each non-detected compound. RI Phase II and the SC Phase VI soil data exceeding criteria is presented on Figure 4-2A for Unrestricted Use and Protection of Groundwater and Figure 4-2B for Restricted Residential and Residential Use. A summary of these detected analytical results in all soil samples collected to date within the Klink Cosmo area compared to soil background concentrations, unrestricted use and protection of groundwater SCGs is presented in Table 4-8 for VOCs. The summary for all for SVOCs, pesticides/PCBs, herbicides, metals, and cyanide can be found in Table 4-2 since these parameters had only been analyzed for in the RI Phase I and SC Phases I-III soil samples. Table 4-9 lists the detected analytical results for soil samples as compared to residential and restricted residential SCGs for VOCs. The summary for all for SVOCs, pesticides/PCBs, and metals can be found in Table 4-4 since these parameters had only been analyzed for in the RI Phase I and SC Phases I-III soil samples. Table 4-10 provides a statistical summary of the detected TCL parameters for all soil samples collected to date within the Klink Cosmo area.

Background, Unrestricted Use, and Protection of Groundwater Soil Criteria

Soil sample results from the SC Phase VI and RI Phase II were compared to soil background concentrations, unrestricted use, and protection of groundwater criteria as shown on Figure 4-2A. There were no exceedences of soil background concentrations, unrestricted use, and protection of groundwater criteria in any soil sample results from the SC Phase VI and RI Phase II.

Residential and Restricted Residential Soil Criteria

Soil sample results from the SC Phase VI and RI Phase II were compared to residential and restricted residential use criteria as shown on Figure 4-2B. There were no exceedences of soil background concentrations, unrestricted use, and protection of groundwater criteria in any soil sample results from the SC Phase VI and RI Phase II.

4.2 Non-Aqueous Phase Liquid Analytical Results

During the RI Phase I field activities, LNAPL was observed during the collection of the synoptic round of groundwater levels in DEC-048 on June 21, 2011. LNAPL was not previously observed in this monitoring well, which was installed in June of 2008. URS called the NYSDEC Spill Hotline and NYSDEC Spill No. 1103190 was assigned on June 21, 2011 to the LNAPL found in this

area. It was noted that a fuel truck had been parked at this location and there was staining on the sidewalk around the well and on the wall of the adjacent building.

An LNAPL sample was collected from DEC-048 on June 21, 2011 and analyzed for VOCs, SVOCs, fuel oils, and specific gravity. A summary of the detected TCL VOCs and SVOCs in the NAPL sample is presented in Table 4-11. The complete validated analytical results from the RI NAPL samples are presented in the DUSR in Appendix Q. Data summary tables, Form I and Form Ie (TICs) are provided in the DUSR and include the reporting limit for each non-detected compound. The laboratory result for LNAPL specific gravity is provided in Appendix P.

4.2.1 Dense Non-Aqueous Phase Liquid Analytical Results

No DNAPL samples were collected during any SC or RI field activities.

4.2.2 Light Non-Aqueous Phase Liquid Analytical Results

A LNAPL sample was collected by URS personnel during the RI Phase I fieldwork on June 21, 2011. The results are presented on Table 4-11 and summarized below. Fuel oil was found at a concentration of 950,000 mg/kg (95%). Organics detected, at concentrations ranging from 130 ppm to 3,500 ppm, include: 1,2,4-trimethylbenzene, 2-methylnaphthalene, acenaphthene, fluorene, naphthalene, phenanthrene, and pyrene. These detected compounds are consistent with fuel oil(s). Two additional compounds, 1,1-biphenyl and bis (2-ethylhexyl) phthalate were also detected within the same range of concentrations. The specific gravity of the sample at 60 degrees F was determined to be 0.8608, which is consistent with a No. 2 fuel. The laboratory report for specific gravity is presented in Appendix P. A comparison of the DEC-048 sample chromatogram to a general diesel/Fuel Oil No. 2 chromatogram indicates a similarity, although degradation of the product found in DEC-048 is evident.

4.3 Groundwater Analytical Results

RI Phase I

A summary of the detected TCL VOCs, SVOCs, pesticides, PCBs, TAL metals, and cyanide in the RI Phase I groundwater samples collected from monitoring wells is presented in Table 4-12. Results exceeding TOGS No. 1.1.1 Class GA groundwater criteria are indicated with a circle. The locations of detected VOCs that have exceeded their respective criteria are shown on Figure 4-3.

Isoconcentration contours of PCE in the RI Phase I groundwater samples are shown on Figures 4-4 and 4-5 for the shallow and deep upper glacial aquifer, respectively. Table 4-13 provides a statistical summary of the detected parameters for the RI Phase I groundwater samples as follows: the number of detections; the minimum, maximum and average values; and the location of the maximum value. The complete validated analytical results from the RI Phase I groundwater samples are presented in the DUSR in Appendix Q. Data summary tables, Form I and Form Ie (TICs) are provided in the DUSR and include the reporting limit for each non-detected compound.

RI Phase II

A summary of the detected TCL VOCs and natural attenuation parameters [i.e., alkalinity, chloride, nitrate-nitrite, total phosphorous, sulfate, and sulfide] in the RI Phase II groundwater samples collected in March 2012 from monitoring wells is presented in Table 4-14. Results exceeding TOGS No. 1.1.1 Class GA groundwater criteria are indicated with a circle. The locations of detected VOCs that have exceeded their respective criteria are shown on Figure 4-6. Isoconcentration contours of PCE in the RI Phase II groundwater samples are shown on Figures 4-7, 4-8, and 4-9 for the shallow, deep, and top of Raritan Formation monitoring wells, respectively. Table 4-15 provides a statistical summary of the detected parameters for the RI Phase II groundwater samples as follows: the number of samples, the number of detections; the minimum, maximum and average values; and the location of the maximum value. Table 4-16 provides a historical summary of the detected parameters for all groundwater samples collected to date in the Klink Cosmo area. Table 4-17 provides a statistical summary of the detected parameters for all groundwater samples collected to date in the Klink Cosmo area as follows: the number of detections; the minimum, maximum and average values; and the location of the maximum value. The complete validated analytical results from the RI Phase II groundwater samples are presented in the DUSR in Appendix Q on a CD. Data summary tables, Form I and Form Ie (TICs) are provided in the DUSR and include the reporting limit for each non-detected compound.

4.3.1 Groundwater PCE Detections

RI Phase I

PCE was detected above SCGs in the majority of groundwater samples collected during the RI Phase I from the shallow and deep overburden. It was either not detected or detected below SCGs in several monitoring wells upgradient of the site (2.9 µg/L in DEC-047, 3.6 µg/L in DEC-048, 3 µg/L in

DEC-032, ND in DEC-033), and in DEC-004 (1.5 µg/L) downgradient of the site. In the deep overburden PCE was either not detected or detected below SCGs in DEC-066D (1.7 µg/L), DEC-44D (1.5 µg/L), and DEC-045D (ND) north and east of the Klink Cosmo property, respectively. The highest concentration of PCE in the shallow overburden was detected at DEC-14R (44,000 µg/L) located downgradient of the site, followed by DEC-006D (6,600 µg/L) located downgradient of DEC-14R, DEC-031 (6,100 µg/L) located on the northeast corner of the Klink Cosmo property, and DEC-029 (5,700 µg/L) located downgradient of DEC-14R. The highest concentration of PCE in the deep overburden was detected at DEC-015D (640 µg/L), followed by DEC-006DD (420 µg/L), and DEC-007D (340 µg/L), located downgradient of the site. It should be noted that the screened intervals of DEC-006D and DEC-022D are screened in the shallow overburden; DEC-006DD is screened in the deep overburden.

Figure 4-4 depicts isoconcentration contours for PCE in the shallow groundwater from analytical data collected during the RI Phase I groundwater sampling. The concentrations of PCE in shallow wells are the highest at the downgradient edge and downgradient of the Klink Cosmo property. The shallow dissolved phase plume appears to be migrating downgradient of the Klink Cosmo property, in the direction of groundwater flow, towards the north, northeast and east as shown in the contours identified in Figure 4-4.

Figure 4-5 depicts isoconcentration contours for PCE in the deep groundwater from analytical data collected during the RI Phase I groundwater sampling. The plume appears to have migrated downgradient of the Klink Cosmo property, to a lesser extent than in the shallow overburden, moving with regional deep groundwater flow towards the northeast. The concentrations of PCE have been found to be 1 to 3 orders of magnitude lower in the deep groundwater than in the shallow groundwater.

RI Phase II

Similar to RI Phase I, PCE was detected above SCGs in the majority of groundwater samples collected during the RI Phase II from the shallow and deep overburden. It was either not detected or detected below SCGs in several monitoring wells upgradient of the site (ND in DEC-032, 2.1 µg/L in DEC-033, 2.5 µg/L in DEC-047, 4.4 D µg/L in DEC-048, ND in DEC-091), and in DEC-004 (1.2 µg/L) downgradient of the site. The highest concentration of PCE in the shallow overburden was detected at DEC-14R (15,000 µg/L) located downgradient of the site, followed by DEC-029 (12,000

µg/L) located downgradient of DEC-14R, DEC-031 (9,200 µg/L) located on the northeast corner of the Klink Cosmo property, and DEC-006D (3,300 µg/L) located downgradient of the site. In the deep overburden PCE was either not detected or detected below SCGs upgradient of the site (3.5 µg/L in DEC-046D), and in DEC-031D (3.6 µg/L) and DEC-044D ND) north of the property, in DEC-011D (1.9 µg/L) west of the property, and in DEC-045D (ND), DEC-066D (ND), and DEC-091D (3.3 µg/L) east of the property. The highest concentration of PCE in the deep overburden was detected at DEC-089D (1,200 µg/L), followed by DEC-006DD (320 µg/L), and DEC-015D (310 µg/L), located downgradient of the site. It should be noted that the screened intervals of DEC-006D and DEC-022D are screened in the shallow overburden; DEC-006DD is screened in the deep overburden.

Figure 4-7 depicts isoconcentration contours for PCE in the shallow groundwater from analytical data collected during the RI Phase II groundwater sampling. The concentrations of PCE in shallow wells are the highest at the downgradient edge and downgradient of the Klink Cosmo property. The shallow dissolved phase plume appears to be migrating downgradient of the Klink Cosmo property, in the direction of groundwater flow, towards the north, northeast and east as shown in the contours identified in Figure 4-7. RI Phase II PCE concentrations were generally the same upgradient and near the downgradient edge of the plume, and marginally lower within the plume itself as compared to RI Phase I PCE concentrations. As seen in the RI Phase I groundwater results and with the exception of PCE in DEC-029TC, the concentrations of PCE have been found to be 1 to 3 orders of magnitude lower in the deep groundwater than in the shallow groundwater.

Figure 4-8 depicts isoconcentration contours for PCE in the deep groundwater from analytical data collected during the RI Phase II groundwater sampling. The plume appears to have migrated downgradient of the Klink Cosmo property, to a lesser extent than in the shallow overburden, moving with regional deep groundwater flow towards the northeast. RI Phase II PCE concentrations were marginally lower as compared to RI Phase I concentrations except in the area of DEC-015D, DEC-007D, and DEC-006DD, which were higher.

Figure 4-9 depicts isoconcentration contours for PCE at the top of the Raritan Formation from analytical data collected during the RI Phase II groundwater sampling. Elevated concentrations of PCE are found at DEC-029TC (4,500 µg/L) which, is located downgradient of the Klink Cosmo property. The concentration of PCE at DEC-031TC (1.9 µg/L) which, is located at the northeast corner of the former Klink Cosmo building, is three orders of magnitude lower.

4.3.2 Groundwater TCE Detections

RI Phase I

TCE was detected in the majority of groundwater samples collected during the RI Phase I when PCE was detected, at concentrations exceeding groundwater criteria ranging from 6.8 µg/L to 750 µg/L. The highest concentration of TCE in the shallow overburden was detected at DEC-027 (750 µg/L), followed by DEC-014R (300 µg/L) and DEC-039 (240 µg/L). The highest concentration of TCE in the deep overburden was detected at DEC-065D (670 µg/L), followed by DEC-006DD (210 µg/L), and DEC-030D (170 µg/L).

RI Phase II

TCE was detected in the majority of groundwater samples collected during the RI Phase II when PCE was detected, at concentrations exceeding groundwater criteria ranging from 5.5 µg/L to 470 µg/L. The highest concentration of TCE in the shallow overburden was detected in DEC-027 and DEC-028 (190 µg/L), followed by DEC-039 (150 µg/L) and DEC-008 (83 µg/L). The highest concentration of TCE in the deep overburden was detected in DEC-065D (470 µg/L), followed by DEC-006DD (220 µg/L), and DEC-028D (99 µg/L). The highest concentration of TCE in groundwater above the top of Raritan Formation was detected in DEC-029TC (300 µg/L).

4.3.3 PCE and TCE Degradation Products and Other Detections

RI Phase I

The presence of PCE and TCE degradation products have also been detected in the RI Phase I groundwater samples at concentrations exceeding groundwater criteria (Figure 4-3). Cis-1,2-DCE was detected above groundwater criteria in 21 of the 49 RI groundwater samples. The range of cis-1,2-DCE varied from 1.6 µg/L to 52 µg/L, with the highest concentration detected at DEC-028. Vinyl chloride exceeded criteria in 2 of the RI Phase I groundwater samples with the highest concentration detected at DEC-009 (54 µg/L) followed by DEC-008 (19 µg/L).

RI Phase II

The presence of PCE and TCE degradation products have also been detected in the RI Phase II groundwater samples at concentrations exceeding groundwater criteria (Figure 4-6). Cis-1,2-DCE

was detected above groundwater criteria in 25 of the 64 RI groundwater samples. The range of cis-1,2-DCE varied from 0.6 µg/L to 38 µg/L, with the highest concentration detected at DEC-022D. Vinyl chloride exceeded criteria in 1 of the RI Phase II groundwater samples at DEC-009 (37 µg/L) which, is located to the north of the former Klink Cosmo Cleaners building.

4.3.4 Summary of Groundwater Analytical Results – RI Phase II

PCE and some degradation products were detected in numerous groundwater monitoring wells in both the shallow and deep overburden groundwater. High concentrations of PCE were detected in the shallow overburden downgradient of the site to the north in DEC-013 and DEC-030 at concentrations of 2,500 and 1,900 µg/L, respectively; and to the northeast in DEC-014R and DEC-029 at concentrations of 15,000 and 12,000 µg/L, respectively. High concentrations of PCE were detected in the deep overburden downgradient of the site to the northeast in DEC-089D at 1,200 µg/L. PCE was detected in deep groundwater above the top of Raritan to the northeast of the site in DEC-029TC at 4,500 µg/L.

TCE and cis-1,2-DCE were generally detected at much lower concentrations than where PCE was detected to the north and northeast of the site. Vinyl chloride was only sporadically detected and exceeded criteria in DEC-009 (north of the site) at 37 µg/L. Similar to wells with PCE and TCE, during Phase I and II, some degradation products including cis-1,2-DCE have typically been found in monitoring wells to the northeast and east indicating some degradation of the plume via reductive dechlorination. The absence of significant daughter breakdown products indicates that substantial chlorinated hydrocarbon reduction is not occurring at a large scale.

As indicated on Table 4-15, few additional compounds were detected during RI Phase II (i.e., ethanes, propane isomers and benzene isomers). Generally, these additional compounds were detected below criteria. Including duplicates samples, chloride exceeded criteria in 19 of the 64 RI Phase II groundwater samples (maximum concentration of 2,500 µg/L in DEC-029TC) including upgradient sample DEC-047 (410 µg/L); nitrate in 3 of the RI Phase II samples (maximum concentration of 19.2 µg/L in DEC-039); sulfate in 7 of the RI Phase II samples (maximum concentration of 720 µg/L in DEC-029TC); and sulfide in 2 of the 64 RI Phase II groundwater samples (maximum of 0.1 µg/L in DEC-011D).

Compounds related to petroleum products (i.e., 1,2,4-trichlorobenzene, 1,4-dichlorobenzene, benzene, isopropylbenzene and/or MTBE) in general, have not been detected above criteria in

monitoring wells in the Klink Cosmo area during either RI Phase I or II. The one detection of MTBE above groundwater criteria in each of RI Phase I and II was in upgradient monitoring well DEC-047, and this appears to be attributed to an upgradient unknown fuel spill.

Based upon the RI Phase II sampling event, a dissolved chlorinated solvent plume originates at the Klink Cosmo Site. The horizontal extent of the chlorinated solvents has been mostly delineated. RI Phase II PCE concentrations were marginally lower as compared to RI Phase I concentrations except in the area of DEC-015D, DEC-007D, and DEC-006DD, which were higher. It appears that the chlorinated solvent plume in the shallow and deep overburden is more concentrated with PCE immediately north and east of the Klink Cosmo site. The extent of PCE has a larger footprint in the shallow groundwater compared to the deep groundwater and appears to be moving with regional deep groundwater flow towards the northeast and comingles with the dissolved chlorinated solvent plume originating within the ACME Steel Areas. The vertical extent of PCE and TCE impacted groundwater was determined to extend down to the top of the Raritan Formation. The horizontal extent of PCE impacted groundwater in the deep overburden near the top of the Raritan Formation has not fully been delineated. The impacted groundwater appears to be migrating to the northeast and extends into the ACME Steel Areas in the vicinity the intersection of Porter Avenue and Lombardy Street. The vertical extent of PCE and TCE impacted groundwater is not expected to migrate below the top of the Raritan Formation due to its vast areal extent and low permeability.

4.4 Soil Vapor Analytical Results

4.4.1 RI Phase I Soil Vapor Results

The locations of the VOCs detected in soil vapor during the RI Phase I, including PCE and its breakdown products, are shown on Figure 4-10. A summary of detected VOCs in the soil vapor and ambient air samples collected during the RI Phase I is presented in Table 4-18. Table 4-19 provides a statistical summary of the detected parameters for the RI Phase I air and soil vapor samples as follows: the number of detections; the minimum, maximum and average values; and the location of the maximum value. The complete validated analytical results from the RI air and soil vapor samples are presented in the DUSR in Appendix Q. Data summary tables and Form I's are provided in the DUSR and include the reporting limit for each non-detected compound.

Three ambient air samples were collected during the RI Phase I to represent background air conditions. VOCs detected in all three ambient air samples include ethanol, hexane, methyl ethyl

ketone, methylene chloride, toluene, and xylene. Concentrations of VOCs ambient air samples ranged from 0.092 to 93.1 $\mu\text{g}/\text{m}^3$.

PCE was detected in all 30 soil vapor sampling locations, at concentrations ranging from 35 $\mu\text{g}/\text{m}^3$ to a maximum of 48,200,000 $\mu\text{g}/\text{m}^3$ at location SG-060. PCE concentrations of 13,100,000; 282,000; and 176,000 $\mu\text{g}/\text{m}^3$ were detected at locations SG-049, SG-084, and SG-058 respectively. All of these sampling locations are located along the north and east perimeters of the former Klink Cosmo Cleaners building. Figure 4-11 depicts isoconcentration contours for PCE in soil vapor from analytical data collected during the RI Phase I. Additional high levels of PCE detected away from the Klink Cosmo site include:

- SG-042 at 803,000 $\mu\text{g}/\text{m}^3$ on the northeast corner of Vandervoort Avenue and Beadel Street;
- SG-043 at 48,500 $\mu\text{g}/\text{m}^3$ on the southwest corner of Vandervoort Avenue and Beadel Street;
- SG-056 at 88,900 $\mu\text{g}/\text{m}^3$ on Division Place;
- SG-061 at 79,800 $\mu\text{g}/\text{m}^3$ on Morgan Avenue; and
- SG-086 at 69,500 $\mu\text{g}/\text{m}^3$ on the southeast corner of Morgan Avenue and Richardson Street.

Concentrations of TCE were generally detected at locations where PCE was detected, at lower concentrations. The two locations with the highest PCE concentrations also have the highest TCE concentrations. Location SG-060 had TCE a concentration of 220,000 $\mu\text{g}/\text{m}^3$ and location SG-049 had a TCE concentration of 230,000 $\mu\text{g}/\text{m}^3$. Location SG-084, also located adjacent to the former Klink Cosmo Cleaners building, had a high PCE concentration (282,000 $\mu\text{g}/\text{m}^3$) requiring the laboratory to perform a dilution prior to sample analysis. Consequently, detection limits of some VOCs, including TCE (dilution detection limit of 1,030 $\mu\text{g}/\text{m}^3$), were higher than for remaining samples. Therefore, while TCE is reported as not detected in SG-084, it was not detected above 1,030 $\mu\text{g}/\text{m}^3$. Figure 4-12 depicts isoconcentration contours for TCE in soil vapor from analytical data collected during the RI Phase I. High levels of TCE detected away from the Klink Cosmo site, which were generally at locations of high PCE concentrations include:

- SG-056 at 3,090 $\mu\text{g}/\text{m}^3$ on Division Place;
- SG-042 at 2,850 $\mu\text{g}/\text{m}^3$ on Beadel Street; and
- SG-043 at 1,170 $\mu\text{g}/\text{m}^3$ on Beadel Street.

VOCs (in addition to PCE and TCE) detected in approximately half (or more) of the sampled locations include: 1,1,1-trichloroethane, 1,2,4-trimethylbenzene, benzene, cyclohexane, ethanol, hexane, toluene, and xylene. These contaminants suggest a possible petroleum or fuel source. Locations SG-019, SG-020, and SG-021 on Beadel Street east of Vandervoort Avenue; SG-047, SG-055, and SG-079 on Division Place east of Vandervoort Avenue; and SG-078 between these two cross streets east of Vandervoort Avenue all had significant concentrations of petroleum related compounds. SG-079 had the highest total VOCs concentration compared to the other locations in the area.

4.4.2 RI Phase II Soil Vapor Results

The locations of the VOCs detected in soil vapor during the RI Phase II including PCE and its breakdown products are shown on Figure 4-13. A summary of detected VOCs in the soil vapor and ambient air samples collected during the RI Phase II is presented in Table 4-20. Table 4-21 provides a statistical summary of the detected parameters for the RI Phase II air and soil vapor samples as follows: the number of detections; the minimum, maximum and average values; and the location of the maximum value. Table 4-22 provides a historical summary of the detected parameters for all air and soil vapor samples collected by URS in the Klink Cosmo site area since SC Phase I. Table 4-23 provides a statistical summary of the detected parameters for all samples collected by URS since SC Phase I in the Klink Cosmo area as follows: the number of samples, the number of detections; the minimum, maximum and average values; and the location of the maximum value. The complete validated analytical results from the RI air and soil vapor samples are presented in the DUSR in Appendix Q. Data summary tables and Form I's are provided in the DUSR and include the reporting limit for each non-detected compound.

Three ambient air samples were collected during the RI Phase II to represent background air conditions. VOCs detected in all three ambient air samples include benzene, ethanol, methyl ethyl ketone (MEK), methylene chloride, toluene, and xylene. Concentrations of VOCs in ambient air samples ranged from 1.0 to 21.9 ug/m³.

PCE was detected in all 38 sampling locations, at concentrations ranging from 21.9 µg/m³ to a maximum of 23,600,000 µg/m³ at location SG-116. PCE concentrations of 5,140,000; 1,740,000; 320,000; and 287,000 µg/m³ were detected at locations SG-049, SG-119, SG-118, and SG-117 respectively. All of these sampling locations are located to the north and along the east perimeter of the former Klink Cosmo Cleaners building. A PCE concentration of 227,000 µg/m³ was also detected

at location SG-087 west of the site along Morgan Avenue. Figure 4-14 depicts isoconcentration contours for PCE in soil vapor from analytical data collected during the RI Phase II. Additional high levels of PCE detected away from the Klink Cosmo site include:

- SG-086 at 22,200 $\mu\text{g}/\text{m}^3$; SG-058 at 8,800 $\mu\text{g}/\text{m}^3$; and SG-084 at 66,200 $\mu\text{g}/\text{m}^3$ on Richardson Street;
- SG-082 at 75,300 $\mu\text{g}/\text{m}^3$ and SG-083 at 280,000 $\mu\text{g}/\text{m}^3$ along Vandervoort Avenue east of the intersection with Richardson Street; and
- SG-056 at 19,000 $\mu\text{g}/\text{m}^3$ and SG-048 at 17,600 $\mu\text{g}/\text{m}^3$ on Division Place.

Concentrations of TCE were generally detected at locations where PCE was detected, at lower concentrations. The two locations with the highest PCE concentrations also have the highest TCE concentrations. Location SG-116 had TCE a concentration of 67,600 $\mu\text{g}/\text{m}^3$ and location SG-049 had a TCE concentration of 70,700 $\mu\text{g}/\text{m}^3$. Location SG-117, also located adjacent to the former Klink Cosmo site, had a high TCE concentration (4,800 $\mu\text{g}/\text{m}^3$). Figure 4-15 depicts isoconcentration contours for TCE in soil vapor from analytical data collected during the RI Phase II. High levels of TCE were also detected away from the Klink Cosmo site, which were generally found at locations also having high PCE concentrations include:

- SG-114 at 2,460 $\mu\text{g}/\text{m}^3$ along Vandervoort Avenue;
- SG-119 at 1,620 $\mu\text{g}/\text{m}^3$ at the northwest corner of Vandervoort Avenue and Frost Street; and
- SG-056 at 1,230 $\mu\text{g}/\text{m}^3$ on Division Place.

VOCs (in addition to PCE and TCE) detected in approximately half (or more) of the sampled locations include: 1,1,1-trichloroethane, 1,2,4-trimethylbenzene, cis-1,2-dichloroethene, benzene, chloroform, ethanol, MEK, methylene chloride, hexane, toluene, and xylene. These contaminants suggest a possible petroleum or fuel source. The majority of soil vapor samples along Vandervoort Avenue and Division Place all had significant concentrations of petroleum related compounds. SG-113 (along Vandervoort Avenue) and SG-114 (along Division Place) had the highest total VOCs concentrations compared to other locations in the area. Fewer contaminants were present along Morgan Avenue and Richardson Street.

4.4.3 Summary of Soil Vapor Results

Soil vapor in the Klink Cosmo area has been adversely impacted by the presence of PCE, TCE and their daughter products. The elevated soil vapor concentrations were generally present to the west, north and the eastern perimeter of the former Klink Cosmo Cleaners building and immediately down gradient (SG-048, SG-060, SG-082, SG-083, SG-084, SG-086, SG-087, SG-116, SG-117, SG-118, and SG-119). A second area of elevated soil vapor concentration was found north/ northwest of the site (i.e., SG-048 and SG-056).

The approximate size of the PCE and TCE plumes from RI Phase I and II are similar in size and appear to also mimic the extent of the dissolved phase shallow groundwater plume. The exception to this is the concentrations that exist along the west side of the former Klink Cosmo Cleaners building (i.e., SG-086 and SG-087) and north/ northwest of the site (i.e., SG-048 and SG-056).

5.0 CONTAMINANT FATE AND TRANSPORT

This section describes fate and transport processes that may influence the behavior of the contaminants detected at the site. The discussion emphasizes the processes that are essential in evaluating potential exposure of human and environmental receptors to the site contaminants detected at concentrations above the SCGs. The following items are presented in this section:

- General description of fate and transport processes occurring in soil, groundwater and soil vapor/air systems.
- Identification and description of properties of contaminants detected above the SCGs in the various media at the site.
- Media-specific and contaminant-specific evaluation of potential fate and transport mechanisms occurring at the site.

5.1 General Description of Fate and Transport Mechanisms

This section provides general descriptions of the fate and transport processes that can occur in the environment in which samples were collected as part of the site investigations. In addition, the site characteristics that can affect these processes are discussed.

5.1.1 Contaminants of Concern

Contaminants of concern which would be identified as from a former dry cleaners site include PCE and its degradation products, which as indicated on Figure 5-1, under anaerobic conditions are TCE, 1,2-dichloroethene, and vinyl chloride. These VOCs are predominantly chlorinated hydrocarbons. Other VOCs, SVOCs, and metals detected in soil, groundwater, and soil vapor samples within the Klink Cosmo project area are not necessarily the result of the former dry cleaners present on the Klink Cosmo property, and therefore, are not considered contaminants of concern.

5.1.2 Transport Processes

Contaminant transport in the subsurface can occur as movement of dissolved contaminants in groundwater; and/or as migration of volatilized contaminants in soil vapor. The primary transport mechanisms are advection, dispersion, and partitioning of mass.

Mass partitioning is a process in which contaminants move between different environmental media in response to concentration gradients. For example, contaminants dissolved in groundwater may sorb (i.e., attach) onto soil particles or volatilize into the soil vapor. The process may involve mass transfer in any direction between any of the environmental media. The net result of mass partitioning is the distribution of the contaminant between all phases that remain in physical contact with each other. Typically, mass partitioning acts to inhibit the migration of contaminants in groundwater or soil vapor by immobilizing a part of the mass in the soil matrix (retardation). However, the process may be reversed, resulting in the slow release of the sorbed contamination into the groundwater or soil vapor.

In the unsaturated zone (i.e., between ground surface and the water table), the total mass of a contaminant is partitioned between the dissolved phase (soil moisture), the gas phase (soil vapor), and the solid phase (soil matrix). In the saturated zone, the soil vapor phase is absent and the partitioning occurs only between the soil matrix and groundwater. Under equilibrium conditions, each phase contains a fraction of the total contaminant mass present in the system (i.e., total of all phase's equals 100 percent of the contaminant mass present). The relative mass fractions are determined by the properties of each contaminant and by the nature of the soil matrix. Equilibrium conditions may be disturbed by phenomena such as migration of contaminated groundwater or soil vapor into an area, or removal of contaminant mass from one of the media through degradation processes or gravity flow. Under these circumstances, concentration gradients are created resulting in the occurrence of mass transfer between the media.

The contaminant mass sorbed onto the soil matrix is essentially immobile. The exception is the mass in the topmost soil layer, which can be transported by processes capable of moving soil particles (wind, surface water runoff). However, since soil within most of the site area is not exposed due to covers such as pavement, sidewalks and buildings, this is not a significant transport pathway. Sorbed contaminants generally act as a source for the dissolved and gas phases.

Transport of contaminants dissolved in the soil moisture in the unsaturated zone is generally limited as a result of very low flow rates in the absence of full saturation. The only significant mechanisms may be driven by water level fluctuations (such as tidal influences and groundwater levels impacted by extraction wells on nearby properties) and gravity-driven downward flow during wet-weather periods, or possibly sewer lines which may be leaking and/or act as preferential pathways. Such vertical transport of contaminants acts as a source for the saturated zone below.

The contaminant mass contained within the soil vapor and within groundwater in the saturated zone is more mobile. Soil vapor can migrate in both vertical and horizontal directions in response to pressure gradients. The migration can create a discharge of contaminants into the atmosphere or building basements, or act as a source of contamination for groundwater in the saturated zone. Migrating soil vapor may transfer mass into the soil matrix and soil moisture in previously uncontaminated areas, thus increasing the areal extent of soil contamination in the unsaturated zone.

The primary transport mechanisms for contaminants dissolved in groundwater are advection and dispersion. Advection is the movement of the dissolved contaminants carried by the flow of groundwater. Dispersion refers to dissolved contaminants spreading due to the presence of non-uniformities of the groundwater flow field. Dispersion results in a general widening of a plume, as well in smearing of the plume boundaries. The magnitude of dispersion is site specific and is generally difficult to measure. Processes similar to those that occur for soil vapor can enable dissolved contaminants to reach a previously uncontaminated area and enter other environmental media.

Contamination migrating with soil vapor or groundwater constantly interacts with the soil matrix. The driving forces behind this process are created by concentration gradients between different phases and the properties of the contamination and the soil matrix. Contaminant mass may either sorb from the mobile soil vapor or groundwater onto the soil particles or it may undergo a reverse process of desorption.

In the case of sorption, contaminant mass is transferred from the mobile medium into the immobile soil medium. This phenomenon tends to decrease the velocity of contaminant migration, and is consequently referred to as retardation. The magnitude of the retardation depends on the properties of each contaminant and the soil matrix. The key indicator parameter for the retardation properties of the soil is the organic carbon content. Soils with high organic carbon content sorb dissolved contaminants more readily and create a more significant retardation effect than soil with limited, or no organic carbon content. Desorption is the reverse process. Contamination is transferred from the soil matrix into the groundwater or soil vapor. As a result, soil containing contaminant mass may act as a source if exposed to the less-contaminated soil vapor or groundwater. Desorption from soil into the soil vapor or groundwater is increasingly inhibited by increasing content of organic carbon in the soil.

5.1.3 Mass Destruction Processes

In the urban environment of the Klink Cosmo site, contaminant mass in the soil is not exposed at the ground surface. Contaminant mass contained within the saturated zone is not exposed to sunlight or the atmosphere. Therefore, abiotic mass destruction processes that rely on the presence of air or exposure to sunlight (such as hydrolysis and photolysis) have little impact within the subsurface and will not be discussed further.

The most significant mass destruction process that takes place in subsurface environment is microbial degradation. The most significant microbial degradation processes for organic contaminants that operate in groundwater systems are: biological oxidation (aerobic and anaerobic); reductive dechlorination; and cometabolic degradation. During degradation, organic compounds are transformed into daughter forms, which may be recalcitrant or further degradable. Daughter compounds can be either more or less toxic than the parent compounds. If a contaminant degrades into a sequence of degradable daughter compounds, it is ultimately fully metabolized into such compounds as carbon dioxide, methane, water, and chloride. Contaminants at the Klink Cosmo site, PCE and TCE, degrade to dichloroethene (1,2-DCE) and vinyl chloride (VC), as shown on Figure 5-1. Ultimately, PCE and TCE metabolize into carbon dioxide, and ethene.

5.1.4 Properties

VOCs, including PCE, TCE, and 1,2-DCE, are generally moderately to highly soluble in water. They readily volatilize into the atmosphere or soil vapor. At the surface, VOCs generally decay under the action of sunlight and upon the exposure to the atmosphere. Dissolved VOCs are transported by advection and dispersion in groundwater. The same processes of advection and dispersion are responsible for the migration of VOCs in the atmosphere or the soil vapor. These compounds have low to moderate organic carbon-to-water partitioning coefficients and do not readily partition into the soil, making them relatively mobile in the environment.

In the subsurface environment, chlorinated VOCs, including PCE, TCE and 1,2-DCE, undergo reductive dechlorination under anaerobic conditions but are typically recalcitrant under aerobic conditions. Benzene, toluene, ethylbenzene and xylenes (BTEX) compounds are relatively degradable under aerobic conditions and also degrade under anaerobic conditions, albeit at slower rates.

5.1.5 Source(s) of Contamination

In the past, the Klink Cosmo site was utilized as a dry cleaner facility. PCE is the main solvent used in dry cleaning. The original source of the PCE contamination is likely to be leakage from any storage tanks, drains which may have been used for disposal, and/or spills occurring during handling. However, the mechanism by which the source(s) act on the environment can be described based on the known factors, such as the nature of the chlorinated solvents and the observed distribution and level of the soil and ground water contamination.

Following the release of PCE, it migrates downward under the influence of gravity as a separate-phase liquid proceeding through the unsaturated zone. However, PCE is heavier than water and the downward migration continues after the spill reaches the saturated zone. During the migration, the total mass of PCE present in a flowable form is continuously depleted by the process of absorption within the soil. The migrating front leaves behind a zone where soil contains PCE in the form of separate-phase ganglia, immobilized between the soil particles and held in place by surface forces. If the PCE liquid encounters an impermeable barrier, such as a clayey silt or clay layer, it comes to rest on the surface of the barrier in the form of pools. However, if no such barrier is present and the aquifer is thick, all of the PCE mass is eventually absorbed and immobilized within the soil.

The zone of PCE ganglia and the liquid pools (if present) form the source of contamination within the aquifer. PCE constantly dissolves in ground water (saturated zone) and soil vapor (unsaturated zone), initiating mass transfer and destruction processes described in Section 5.1.2.

5.1.6 Fate and Transport in the Unsaturated Zone

5.1.6.1 Migration

The propagation of contaminants in the unsaturated zone is dominated by two processes: migration of the dissolved phase into infiltrating precipitation and migration of the volatilized contaminants in the soil vapor. Migration of the contamination adsorbed into soil with the fugitive dust emissions or surface runoff will generally not be an issue at this Site.

Most of the soil at the site is located under a relatively impervious cover (either pavement or buildings). DIs which lead to the storm sewers are present along the roadways. Infiltration from precipitation across the site area is limited to the cracks and joints of the pavement and concrete

surfaces. Therefore, the extent of the infiltration-induced migration is likely to be limited. The process is of little significance in the overall balance of mass transfer occurring at the site.

Contaminants of concern enter the soil vapor through the process of volatilization. The site and vicinity is almost entirely paved, and the thickness of the unsaturated zone is high. Therefore, the sources of contamination are not in close contact with the atmosphere. As a result, the lateral migration of the gas phase of the contamination is likely to be significant. Separated from direct contact with the atmosphere, the soil vapor will tend to migrate laterally, possibly at great distances, and seek discharge points at discrete locations, such as basements or underground sewer pipes.

The area contains little unvegetated and unpaved areas with the exception of the recreational areas across Vandervoort Avenue. Soil at the site does not generate fugitive dust emissions. Likewise, the erosion and transport of surface soils by runoff is not present onsite. Contamination adsorbed into soils is unlikely to migrate via the pathways of dust emissions or runoff transport.

5.1.6.2 Degradation

Generally, the occurrence and rates of unsaturated zone degradation have to be determined by means of field studies, such as, for example, respiration tests. However, this is only appropriate for contaminants that can be aerobically degraded. PCE is not readily aerobically degradable. Rates of biological degradation depend largely on the presence of water. In the unsaturated zone, sufficient water may not be present continuously, thus limiting the potential for the growth of microorganisms.

The Site area is mostly paved or covered by buildings. The unsaturated zone is not exposed to the action of sunlight and high temperature in the summer. Therefore, rates of abiotic degradation are likely to be very low, even in the top-most layers. In general, rates of contaminant degradation in the unsaturated zone are expected to be relatively low.

5.1.7 Fate and Transport in the Saturated Zone

5.1.7.1 Migration

Migration in the saturated zone takes place predominantly by means of the transport of the dissolved-phase contamination in groundwater. The dominant factors are the direction of the flow within the aquifer, the hydraulic gradient, the hydraulic conductivity of the aquifer material (both the average value and spatial distribution) and the chemical composition of the soil matrix.

The site is located within the Upper Glacial Aquifer. The aquifer is characterized by high hydraulic conductivity and low gradients but vary locally. In the immediate vicinity of the Klink Cosmo property, groundwater flow is east/northeast. The horizontal hydraulic gradient is between approximately 0.001 to 0.004 ft/ft. Vertical gradients are both downward in the vicinity of the site, and upward downgradient. Horizontal hydraulic conductivity values for the shallow overburden range from 2.69×10^{-5} cm/sec to 4.77×10^{-3} cm/sec. Horizontal hydraulic conductivity values for the deep overburden range from 9.74×10^{-3} cm/sec to 2.48×10^{-2} cm/sec.

The extent of the plume in the shallow and deep overburden has been mostly delineated; a PCE plume appears to originate from the Klink Cosmo site.

5.1.7.2 Degradation

Compounds detected at the site are potentially degradable in groundwater. The bulk of the contamination is present as chlorinated hydrocarbons, especially PCE. The predominant mechanism for the degradation of these compounds is reductive dechlorination. The likelihood of the occurrence of this pathway can be assessed using the following indicators (after the *Technical Protocol for Evaluating Natural Attenuation of Chlorinated Solvents in Ground Water*, USEPA 1998). Table 5-1 summarizes groundwater analytical data that was collected in the vicinity of the Klink Cosmo area during previous phases of site characterization as well as both phases of the RI. This data includes both laboratory analytical results and field measured results. The March 2012 sampling results were used to establish the baseline data for future comparison of groundwater sampling data, which will be used to evaluate the potential for natural attenuation. The parameters listed below were considered in assessing the groundwater data.

Dissolved Oxygen

Dissolved oxygen (DO) is the most favored electron acceptor in biodegradation of hydrocarbons. Levels of less than 1 mg/L indicate that aerobic degradation has occurred, oxygen has been largely utilized, and a shift to anaerobic processes is taking place. Reductive dechlorination takes place under anaerobic conditions, generally when the DO levels are less than 0.5 mg/L. Typically, the anaerobic environment is created by the degradation of non-chlorinated compounds, such as BTEX. Following that, the likelihood of degradation of chlorinated hydrocarbons becomes high. Table 5-1 and Figures 5-2 and 5-3 present the dissolved oxygen levels at the site in the shallow and deep overburden, respectively. The data collected shows seven wells having DO values below the 0.5 mg/L

threshold, including DEC-007D, DEC-029TC, DEC-030D, DEC-031D, DEC-031TC, DEC-044D, and DEC-065D. This suggests that a significant portion of the site may be largely aerobic and that DO conditions to promote reductive dechlorination are generally not ubiquitous.

pH

The pH of groundwater has an effect on the presence and activity of microbial populations. Generally, microorganisms that are most efficient biodegraders prefer neutral pH values (6 to 8). Table 5-1 presents the pH levels at the site in the shallow and deep overburden. The range of values allowing the reductive dechlorination to occur is between 5 and 9. Values of pH are within the neutral range and within the range in which the biodegradation of chlorinated solvents can take place with a singular exception that during SC Phase VI, west of Morgan Avenue, a pH value of 4.82 in was recorded in DEC-078 in October 2011.

Oxidation/Reduction Potential

Oxidation/reduction potential (ORP) is measured as Eh. Reductive dechlorination becomes possible at Eh levels of less than approximately 50 millivolts (mV). The likelihood of its occurrence is significant for the ORP values less than -100 mV. Table 5-1 and Figures 5-4 and 5-5 present the measured ORP levels in the onsite shallow and deep overburden groundwater, respectively. For the March 2012 sampling round, the ORP values are between -100 and 242 mV. The majority of the recorded ORP values lie above the 0 mV indicating that the ORP conditions at the site are generally not suitable for reductive dechlorination. Negative ORP values occurred in DEC-011D, DEC-028D, DEC-029TC, DEC-031TC, DEC-043D, DEC-088D, DEC-090D, DEC-091, and DEC-091D. Based upon these results, the deeper overburden is more anaerobic than the shallow overburden.

Ferrous Iron

Iron-reducing conditions are favorable to the process of reductive dechlorination. Concentrations of ferrous iron higher than 1 mg/L suggest iron reduction is occurring, and thus oxidation/reduction (redox) conditions are suitable for reductive dechlorination. Table 5-1 presents the ferrous iron levels at the site in the shallow and deep overburden. For the October 2011 sampling round, concentrations of ferrous iron above 1 mg/L were reported at DEC-004, DEC-009, DEC-029TC, DEC-031TC, and DEC-071.

Sulfate

Sulfate may be used as an electron acceptor after dissolved oxygen has been depleted during anaerobic degradation. Reductive dechlorination can occur under favorable anaerobic conditions with sulfate concentrations below 20 mg/L; however, reductive dechlorination can still occur in groundwater plumes with high levels of sulfate. Table 5-1 presents the sulfate levels at the site in the shallow and deep overburden. Detected concentrations of sulfate from the March 2012 sampling round ranged from non-detect in DEC-071 to 380 mg/L in DEC-010. In samples from DEC-031TC, DEC-032, and DEC-091, sulfate concentrations were below 20 mg/L.

Organic Carbon

Organic carbon, either naturally occurring or anthropogenic, typically serves as the electron donor required to drive the dechlorination process. Levels above 20 mg/L are favorable. Table 5-1 summarizes the total organic carbon in groundwater during the October 2011 groundwater sampling round. None of the reported concentrations are above 20 mg/L. However, the ExxonMobil Off-Site Plume area (Roux, August 12, 2011) exists immediately north and east of the site area, and the LNAPL as a source of carbon can promote reductive dechlorination.

Chloride

Chloride levels two times higher than background may indicate that the compound has been produced as a byproduct of dechlorination. Typically, any high chloride levels occur within the downgradient portion of the plume undergoing dechlorination. Table 5-1 presents the chloride levels at the site in the shallow and deep overburden. Detected chloride concentrations from the March 2012 groundwater sampling round ranged from 40 mg/L in DEC-044 to 2,500 mg/L in DEC-029TC. Reported concentrations in the upgradient wells DEC-033, DEC-046/046D, DEC-047, and DEC-048 were 900 mg/L, 160/170 mg/L, 410 mg/L, and 140 mg/L, respectively. In the shallow and deep overburden groundwater, no trends in chloride concentrations are apparent.

Distribution of Chlorinated Species

Significant degradation of chlorinated solvents is marked by a shift in the relative concentrations of various compounds. As degradation progresses, the original compound released into the environment breaks down into the daughter product, where successively more chloride atoms are removed from the compound molecule and replaced with hydrogen. In this case, PCE would shift to TCE, then to DCE and finally to VC. Vinyl chloride is difficult to dechlorinate further (requires very

strong reducing conditions), but is readily oxidized under aerobic conditions to ethene. Under favorable anaerobic conditions, VC can be reduced to ethene as shown of Figure 5-1.

Figures 5-6 and 5-7 depict the concentrations of TCE in the shallow overburden and deep overburden, respectively, based upon groundwater data collected as part of the March 2012 sampling round. In the shallow overburden, the most concentrated portion of the TCE plume is situated along Lombardy Street and Beadel Street. In the deep overburden, the highest concentrations of TCE occurred in DEC-065D along Richardson Street and in DEC-006DD along Porter Avenue.

Figures 5-8 and 5-9 depict the concentrations of cis-1,2-DCE in the shallow overburden and deep overburden, respectively, based upon groundwater data collected as part of the March 2012 sampling round. Concentrations of cis-1,2-DCE are generally lower than the TCE concentrations. The horizontal extent of cis-1,2-DCE is diffusely scattered throughout the shallow overburden. In the deep overburden, cis-1,2-DCE is somewhat less concentrated than in the shallow overburden, but is also diffusely scattered throughout.

Figures 5-10 and 5-11 depict the concentrations of VC in the shallow overburden and deep overburden, respectively, based upon groundwater data collected as part of the March 2012 sampling round. VC was detected only scarcely in the shallow overburden, in DEC-009 at 37 ug/L. VC was not detected in the deep overburden.

Summary

Based upon the data collected to assess the potential for degradation of PCE in the groundwater system as presented above, there is evidence that some reductive dechlorination is occurring in the vicinity of the Site. Rates of degradation are very difficult to determine due to the unknown quantity of source material present beneath the Klink Cosmo Site. Based upon the geochemical conditions in the groundwater system, the aquifer is only slightly conducive for naturally occurring reductive dechlorination. It is possible that the geochemical conditions could be enhanced via in-situ bioremediation technologies to further promote higher rates of reductive dechlorination.

5.1.7.3 Overall Plume Behavior

Phase I RI

Based upon the RI Phase I sampling event, a dissolved chlorinated solvent plume appears to originate at the Klink Cosmo Site. In the shallow and deep groundwater regime, it appears that the chlorinated solvent plume has higher concentrations of PCE immediately north and east of the Klink Cosmo Site. PCE contamination appears to be spreading with groundwater movement towards the northeast and east, and also to a lesser extent, via downward migration to deeper geologic zones.

Phase II RI

Based upon the RI Phase II sampling event, the horizontal extent of the chlorinated solvents has been mostly delineated. RI Phase II PCE concentrations were marginally lower compared to RI Phase I concentrations except in the area of DEC-015D, DEC-007D, and DEC-006DD, which were higher. It appears that the chlorinated solvent plume in the shallow and deep overburden has higher concentrations of PCE immediately north and east of the Klink Cosmo site. The extent of PCE has a larger footprint in the shallow groundwater compared to the deep groundwater and appears to be moving with regional deep groundwater flow towards the northeast and comingles with the dissolved chlorinated solvent plume originating within the ACME Steel Areas. The vertical extent of PCE and TCE impacted groundwater was determined to extend down to the top of the Raritan Formation. The horizontal extent of PCE impacted groundwater in the deep overburden near the top of the Raritan Formation has not fully been delineated. The impacted groundwater appears to be migrating to the northeast and extends into the ACME Steel Areas in the vicinity the intersection of Porter Avenue and Lombardy Street. The vertical extent of PCE and TCE impacted groundwater is not expected to migrate below the top of the Raritan Formation due to its vast areal extent and low permeability.

6.0 QUALITATIVE HUMAN HEALTH EXPOSURE ASSESSMENT AND FISH AND WILDLIFE ASSESSMENT

This section presents the Qualitative Human Health Exposure Assessment (HHEA) and the Fish and Wildlife Resources Impact Analysis (FWRIA) for the site. This qualitative HHEA uses data and information collected during the SC Phase I through Phase VI and the RI Phases I and II to assess human health exposure in the immediate and surrounding areas. The qualitative HHEA provides an evaluation of potential adverse health effects under current and potential future site conditions that may result from exposure to contaminants attributable to former activities at the site.

6.1 Qualitative Human Health Exposure Assessment

This qualitative HHEA follows the general format and procedures set forth in the USEPA's Risk Assessment Guidance for Superfund. As such, it includes three of the four required components (the fourth component, Risk Characterization, is not included because this assessment is qualitative), which are presented in the following subsections. This qualitative HHEA uses data and information collected during the two phases of the RI, and appropriate information from site characterization activities to assess human health exposure in the immediate and surrounding areas. The qualitative HHEA provides an evaluation of potential adverse health effects under current and potential future site conditions that may result from exposure to contaminants attributable to former activities at the site.

6.1.1 Identification of Chemicals of Potential Concern

Based upon the analytical data obtained and presented in Section 4, the contaminants of potential concern (CPCs) were selected based on the frequency of detection, range of concentrations, and potential for migration, as well as whether the detected analytes exceeded applicable standards, criteria, or guidance values for the media. A “medium of potential concern” is identified as a physical medium (soil, groundwater, soil vapor) in which one or more contaminants were detected at concentrations exceeding their SCGs.

Of the soil samples analyzed for VOCs, SVOCs, pesticides and metals, a few were detected. Soil analytical results were compared to soil background concentrations (surface soil samples from McGolrick Park), and Part 375 unrestricted use criteria as presented on Tables presented in Section 4. The few metals which exceeded background concentrations or Part 375 unrestricted use criteria are not considered CPCs for soil.

Several VOCs were detected in groundwater. For groundwater, the SCGs are the NYSDEC Class GA (groundwater) standards and guidance values presented in TOGS 1.1.1, April 2000 (including subsequent revisions). All contaminants detected in groundwater that exceeded SCGs are considered CPCs. Table 6-1 presents a summary of CPCs for soil groundwater, and soil vapor.

Soil vapor was also sampled during the investigation and found to be contaminated with VOCs. There are no criteria for soil vapor analytical data; however, the NYSDOH Soil Vapor Guidance Decision Matrix 1 and 2 (NYSDOH, 2006 with 2008 updates) were utilized to evaluate the potential for soil vapor intrusion by reviewing sub-slab vapor concentrations for the VOCs relevant to the Decision Matrices: 250 $\mu\text{g}/\text{m}^3$ for TCE, carbon tetrachloride, and VC; and 1,000 $\mu\text{g}/\text{m}^3$ for PCE, 1,1,1-trichloroethane, 1,1-dichloroethene, and cis-1,2-dichloroethene. Detected analytical results were sufficiently high for either PCE and/or TCE at many locations to indicate the highest level of action recommended: mitigate. These compounds are therefore considered CPCs for soil vapor as indicated on Table 6-1.

6.2 Exposure Pathways

An exposure pathway is the manner by which an individual may come in contact with a contaminant. The elements of a completed exposure pathway include: the contaminated environmental media (i.e., soil, water, or soil vapor); the receptor (e.g., construction worker, onsite employee, public) exposed to the contamination; and the routes of exposure or how the contaminant enters the body (i.e., inhalation, ingestion, and/or absorption through the skin). Tables 6-2 and 6-3 present the exposure pathways assessed for the site under current and future land use scenarios, respectively. There are no exposure pathways from soil under either current or future use conditions as there are no CPCs in soil at the site. However, there are potential exposure pathways from soil vapor through the inhalation of VOCs to construction workers, onsite employees, and the public under both the current and future use scenarios. Exposure pathways are not complete for the public under current conditions for outdoor air, or for any receptors for groundwater. The following subsections discuss the rationale for identifying completed exposure pathways.

6.2.1 Soil

The Property is a commercial facility. There is no surface soil onsite since the entire surface of the Property is covered by the building, pavement and/or sidewalks. Subsurface soil is not accessible to the general public because soil on the Property is entirely covered by the building,

pavement and sidewalks. The only potential complete exposure is for construction workers who could come into contact with contaminated soil during intrusive activities; however, since there are no CPCs in soil at the site, this is not a completed exposure pathway.

6.2.2 Soil Vapor/Indoor Air

Currently, there are employees working within the onsite building. While there are no indoor air or sub-slab sample results, VOCs were detected at relatively high concentrations in soil vapor. The potential exists for these high concentrations to be present in soil vapor beneath the onsite building and nearby homes impacting indoor air quality. Therefore, there could be a completed pathway under the current and future use scenarios for onsite employees and the public. Under the current and future use scenarios, construction workers could come into contact with contaminated soil vapor. Therefore soil vapor is also considered a potentially completed exposure pathway under the current and future use scenarios for construction workers.

6.2.3 Outdoor Air

Since there are no CPCs in soil at the site, there is no potential for inhalation of VOCs from soil or fugitive dust for either the current use or future use scenarios.

6.2.4 Groundwater

Under the current use scenario, groundwater is not known to be used as a potable water supply (drinking water is supplied to local residents by the NYCDEP) or for any other known industrial purposes in the vicinity of the Property. Therefore, it is not a completed exposure pathway under the current use scenario. It is not anticipated that in the future, onsite groundwater would be used for potable purposes. Construction workers would not be exposed to groundwater contaminants during current or future intrusive activities as the depth to groundwater in the area of the site is a minimum of 24 feet bgs, and generally greater than 30 feet bgs.

6.2.5 Summary

Tables 6-2 and 6-3 present a summary of the potential routes of exposure, the potential receptors, and the potential completed pathways. There are no completed exposure pathways from soil under either current or future use conditions as there are no CPCs in soil at the site. However, there are potential exposure pathways from soil vapor through the inhalation of VOCs to construction workers,

onsite employees, and the public under both the current and future use scenarios. Exposure pathways are not complete for the public under current conditions for outdoor air, or for any receptors for groundwater.

6.3 Fish and Wildlife Resources Impact Analysis

This Fish and Wildlife Resources Impact Analysis has been prepared for the Site located in Brooklyn, Kings County, New York. The Site location is shown on Figure 1-1. An aerial view of the Site and vicinity is presented as Figure 1-2.

The FWRIA follows the guidance provided by the NYSDEC Division of Fish and Wildlife (NYSDEC 1994). The FWRIA is a stepwise process that was developed to determine the nature and extent of ecological impacts from hazardous waste sites in New York State. The objective of Step I of the FWRIA process is to identify fish and wildlife resources that exist on and/or adjacent to the Site.

6.3.1 Step I.A – Covertypes Map

An aerial photography-based cover type map of the area within a one-half mile radius of the Site (project area) is presented as Figure 6-1. The Site is zoned M1-1 for a light industrial and manufacturing district. The Site is currently the location of a commercial business. The project area is highly urbanized with commercial, industrial, residential, and road and utility development. Land use in the surrounding area is predominantly industrial and commercial. A large apartment building complex is located southwest of the Site.

Newtown Creek, designated Class SD marine water by the NYSDEC, is located approximately 2,500 feet east of the Site. The SD classification for marine waters indicates a best usage for fishing, but these waters may not support fish propagation. Newtown Creek is an estuary connected with the East River. Newtown Creek was designated as a Superfund site in 2010. The East River is located approximately 7,000 feet west of the Site. The East River is classified as a Class I saline surface water. The best usages of Class I waters are secondary contact recreation and fishing. These waters are suitable for fish, shellfish, and wildlife propagation and survival. The East River is a New York State-protected stream.

6.3.2 Step I.B – Description of Fish and Wildlife Resources

6.3.2.1 Fish and Wildlife Resources and Covertypes

There are no NYSDEC Wetlands, Critical Habitats or designated Wild, Scenic or Recreational Rivers mapped within the project area. The project area is composed of three vegetated terrestrial-cultural covertypes: mowed grass with trees (landscaped areas associated with residential, commercial and industrial facilities); mowed grass (associated with lawns and park facilities such as baseball diamonds); and urban vacant lot (associated with vegetated areas with exposed soil, rubble and debris). The remainder of the project area is included in the terrestrial-cultural urban structure exterior covertype. This covertype includes the exterior surfaces of metal, wood or concrete structures such as buildings, roads, storage areas and parking lots.

6.3.2.2 Fauna Expected within each Covertype and Aquatic Resource

The three terrestrial-cultural covertypes in the project area provide limited feeding, resting and breeding habitat for birds and small mammals. Wildlife species typically associated with these covertypes in an urbanized environment include the Norway rat, house mouse, deer mouse, gray squirrel and several common bird species including rock pigeon, house sparrow, European starling, red-tailed hawk, American kestrel, herring gull, ring-billed gull and mourning dove. Spring, winter and fall migrant bird species may pass over the project area or rest and feed in the area on a transient basis. The urban vacant lot and mowed grass covertypes may present suitable breeding habitat for killdeer.

The NYSDEC Division of Fish and Wildlife & Marine Resources New York Natural Heritage Program was contacted regarding the presence of State-listed rare, threatened and endangered species or habitats at the Site. In their response letter dated March 21, 2011 (provided in Appendix R), the NYSDEC indicated that:

“We have no records of rare or state-listed animals or plants, significant natural communities or other significant habitats, on or in the immediate vicinity of your site.”

According to the NYSDEC Environmental Resource Mapper, the Site is located within the historic range of the American burying beetle (*Nicrophorus americanus*). The Site does not provide suitable habitat for the American burying beetle. This species requires natural soil and vegetation resources for propagation. The United States Fish and Wildlife Service (USFWS) identified the

Federally Endangered shortnose sturgeon (*Acipenser brevirostrum*) as present within Kings County. The USFWS noted that this sturgeon occurs primarily in the Hudson River. The Site would have no impact on this species.

There are no United States Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) wetlands mapped in the project area.

6.3.2.3 Observations of Stress

No atypical biotic conditions such as reduced vegetative growth and density, wildlife mortality, changes in species assemblages and distribution, or the absence of expected biota have been observed at the Site.

6.3.3 Step I.C – Description of Fish and Wildlife Resource Values

Because of its location in an urbanized area and the presence of the building and sidewalks which cover the entire surface of the Site, the Site provides very limited habitat for urban-dwelling wildlife. The Site does not provide any current or potential value to humans as a nature recreation area.

6.3.4 Step I.D – Identification of Applicable Fish and Wildlife Regulatory Criteria

No USFWS NWI or State-regulated wetlands or other aquatic resources are located on or adjacent to the Site. The Site does not provide suitable habitat for wildlife other than urban dwelling species. Newtown Creek, located approximately 2,500 feet east of the Site, and the East River, located approximately 7,000 feet west of the Site, are regulated by the U.S. Army Corps of Engineers under Section 10 of the Rivers and Harbors Act and Section 404 of the Clean Water Act. They are also regulated by the NYSDEC under Section 401 of the Clean Water Act. The East River is regulated by the State under the Protection of Waters Program (Article 15 of the ECL).

6.3.5 Summary and Recommendations

The Site is located in an old, highly developed, urbanized area. Plant communities in the project area include mowed lawn and trees, mowed lawn, and vegetated areas on disturbed sites. These communities are associated with residential, commercial and industrial areas in the project area. No plant communities were identified on the Site. The results of the FWRIA Step I analysis indicate that

there is limited potential for wildlife at the Site. Because of its location in an urbanized area and the presence of the building and sidewalks which cover the entire surface of the Site, the Site provides very little if any suitable habitat for wildlife. The Site does not provide any current or potential value to humans as a nature recreation area.

7.0 SUMMARY AND RECOMMENDATIONS

7.1 Summary

Based upon the results of the previous site investigations, the following conclusions are provided. Field investigations performed in the Klink Cosmo area are the SC Phases I, II, III, and VI and the RI Phases I and II.

7.1.1 Geology

- The following textural units have been found in the upper glacial aquifer in most borings, from the surface downward: a fill unit; a sand unit or a discontinuous glacial till unit; a sand unit if the discontinuous glacial till unit was encountered at the surface; a discontinuous clayey silt unit within the sand unit; sand and gravel unit; and the Raritan Formation. Due to the heterogeneous nature of the geology, some but not all of the units may or may not be present at each boring. The thickness of the upper glacial aquifer in the Klink Cosmo area is approximately 108.5 to more than 113.0 feet thick. The Raritan Formation was encountered between -73.31 and -74.05 feet amsl.
- The top of the Raritan Formation (i.e., a regional aquiclude) was encountered across the Meeker Plume Trackdown Site area. The Raritan Formation elevation near the Klink Cosmo site varied between -73.31 to -74.05 feet above mean sea level (amsl) and has been described as gray with white banding, brown, brownish gray, greenish gray, dark gray to greenish brown, fine sand and silt, clays mixed with carbonized plant fragments and clays with varying amounts of sand, to silts with varying amounts of sand and clay. The top of the Raritan Formation slopes towards the northwest. The Raritan Formation is a well-defined aquiclude regionally and has significant lateral extent. Permeabilities within the unit are less than 10^{-6} centimeters per second (cm/sec).
- The water table surface may be found between approximately 24 and 50 feet bgs. In the immediate vicinity of the Klink Cosmo area, the shallow and deep groundwater flow is east/northeast. In the immediate vicinity of the Klink Cosmo area, groundwater measurements in the top of Raritan Formation monitoring wells were similar (2 feet amsl in DEC-031TC and 2.18 feet amsl in DEC-029TC).

- The horizontal hydraulic gradient of the shallow groundwater flow during the RI Phase I and RI Phase II field activities was approximately less than 0.001 to 0.004 foot per foot (ft/ft).
- Horizontal hydraulic conductivity values for the shallow overburden range from 2.69×10^{-5} cm/sec to 4.77×10^{-3} cm/sec. Horizontal hydraulic conductivity values for the deep overburden range from 9.74×10^{-3} cm/sec to 2.48×10^{-2} cm/sec.
- Vertical hydraulic gradients in well pairs DEC-043/043D, DEC-065/065D, and DEC-066/066D are positive or downwards (0.004, 0.014, 0.004 ft/ft, respectively). Vertical hydraulic gradients in the majority of well pairs downgradient of the site, DEC-014R/014D, DEC-015/015D, DEC-029/029D, DEC-031/031D, DEC-045/045D, and DEC-064/064D, were slightly negative, or upwards (-0.002 to -0.007 ft/ft) based upon the water level information. Vertical hydraulic gradients in well pairs DEC-006D/006DD, DEC-007/007D, DEC-013/013D, DEC-030/030D, and DEC-044/044D were also upwards but were greater in magnitude (-0.012 to -0.017 ft/ft).
- The vertical hydraulic gradients in top of Raritan Formation well triplets were similar in direction and magnitude during RI Phase II field activities. Vertical hydraulic gradients between the shallow and top of Raritan Formation wells at DEC-029/029TC and DEC-031/031TC were slightly negative or upwards (-0.002 to -0.006 ft/ft, respectively). Vertical hydraulic gradients between the deep and top of Raritan Formation wells at DEC-029D/029TC and DEC-031D/031TC were slightly positive or downwards (0.004 to 0.003 ft/ft, respectively).

7.1.2 Soil

Soil sample results were compared to background, unrestricted use, residential, restricted residential and protection of groundwater criteria. PCE and its daughter compound TCE were not found to exceed any soil criteria at any locations.

7.1.3 Groundwater

Based on the RI Phase II groundwater sampling results, PCE detected was in numerous groundwater monitoring wells in both shallow and deep overburden groundwater. It was either not detected or detected below SCGs in several monitoring wells upgradient of the site (ND in DEC-032,

2.1 µg/L in DEC-033, 2.5 µg/L in DEC-047, 4.4 D µg/L in DEC-048, ND in DEC-091), and in DEC-004 (1.2 µg/L) downgradient of the site. In the deep overburden PCE was either not detected or detected below SCGs upgradient of the site (3.5 µg/L in DEC-046D), and in DEC-031D (3.6 µg/L) and DEC-044D ND) north of the property, in DEC-011D (1.9 µg/L) west of the property, and in DEC-045D (ND), DEC-066D (ND), and DEC-091D (3.3 µg/L) east of the property. The highest concentration of PCE in the shallow overburden was detected at DEC-14R (15,000 µg/L) located downgradient of the site, followed by DEC-029 (12,000 µg/L) located downgradient of DEC-14R, DEC-031 (9,200 µg/L) located on the northeast corner of the Klink Cosmo property, and DEC-090 (2,400 µg/L) located downgradient of DEC-031. The highest concentration of PCE in the deep overburden was detected at DEC-089D (1,200 µg/L), followed by DEC-006DD (320 µg/L), and DEC-015D (310 µg/L), located downgradient of the site. Elevated concentrations of PCE were found at DEC-029TC (4,500 µg/L) which, is located downgradient of the Klink Cosmo property above the top of the Raritan Formation. The concentration of PCE at DEC-031TC (1.9 µg/L) which is located at the northeast corner of the former Klink Cosmo building, is three orders of magnitude lower.

TCE and cis-1,2-DCE were generally detected above criteria, but at lower concentrations than PCE, to the north and northeast of the Site. Vinyl chloride was only sporadically detected and exceeded criteria in DEC-009 (north of the site) at 37 µg/L. Similar to wells with PCE and TCE, during Phase I and II, some degradation products have typically been found in monitoring wells to the northeast and east indicating some degradation of the plume due to reductive dechlorination. The absence of significant daughter breakdown products indicates that substantial chlorinated hydrocarbon reduction is not occurring at a large scale.

Based upon the RI Phase II sampling event, a dissolved chlorinated solvent plume originates at the Klink Cosmo Site. The horizontal extent of the chlorinated solvents has been mostly delineated. RI Phase II PCE concentrations were marginally lower as compared to RI Phase I concentrations except in the area of DEC-015D, DEC-007D, and DEC-006DD, which were higher. It appears that the chlorinated solvent plume in the shallow and deep overburden has higher concentrations of PCE immediately north and east of the Klink Cosmo site. The extent of PCE has a larger footprint in the shallow groundwater compared to the deep groundwater and appears to be moving with regional deep groundwater flow towards the northeast and comingles with the dissolved chlorinated solvent plume originating within the ACME Steel Areas. The vertical extent of PCE and TCE impacted groundwater was determined to extend down to the top of the Raritan Formation. The horizontal extent of PCE impacted groundwater in the deep overburden near the top of the Raritan Formation has not fully been

delineated. The impacted groundwater appears to be migrating to the northeast and extends into the ACME Steel Areas in the vicinity the intersection of Porter Avenue and Lombardy Street. The vertical extent of PCE and TCE impacted groundwater is not expected to migrate below the top of the Raritan Formation due to its vast areal extent and low permeability.

Based upon the data collected to assess the potential for degradation of PCE in the groundwater system as presented above, there is evidence that some reductive dechlorination is occurring in the vicinity of the site. Rates of degradation are very difficult to determine due to the unknown quantity of source material present beneath the Klink Cosmo site. Based upon the geochemical conditions in the groundwater system, the aquifer is only slightly conducive for naturally occurring reductive dechlorination. It is possible that the geochemical conditions could be enhanced via in-situ bioremediation technologies to further promote higher rates of reductive dechlorination.

7.1.4 Non-Aqueous Phase Liquids

During the RI Phase I field activities, LNAPL found in DEC-048 was analyzed and a fuel oil was detected at a concentration of 950,000 mg/kg (95%). NYSDEC Spill No. 1103190 was assigned on June 21, 2011 to the LNAPL found in this area. The specific gravity measured (0.8608), and organic compounds detected in the sample were consistent with fuel oil(s).

7.1.5 Soil Vapor

Soil vapor in the Klink Cosmo area has been adversely impacted by the presence of PCE, TCE and their daughter products. The elevated soil vapor concentrations were generally present to the west, north and the eastern perimeter of the former Klink Cosmo Cleaners building and immediately down gradient (SG-048, SG-060, SG-082, SG-083, SG-084, SG-086, SG-087, SG-116, SG-117, SG-118, and SG-119). A second area of elevated soil vapor concentration was found north/ northwest of the site (i.e., SG-048 and SG-056).

The approximate size of the PCE and TCE plumes from RI Phase I and II are similar in size and appear to also mimic the extent of the dissolved phase shallow groundwater plume. The exception to this is the concentrations that exist along the west side of the former Klink Cosmo Cleaners building (i.e., SG-086 and SG-087) and north/ northwest of the site (i.e., SG-048 and SG-056).

7.1.6 Qualitative Human Health Exposure Assessment

There are no completed exposure pathways from soil under either current or future use conditions as there are no CPCs in soil at the site. However, there are potential exposure pathways from soil vapor through the inhalation of VOCs to construction workers, onsite employees, and the public under both the current and future use scenarios. Exposure pathways are not complete for the public under current conditions for outdoor air, or for any receptors for groundwater.

7.1.7 Fish and Wildlife Resources Impact Analysis

Results of the Fish and Wildlife Resources Impact Analysis indicate that the site is located in an old, highly developed, urbanized area. Plant communities in the project area include mowed lawn and trees, mowed lawn, and vegetated areas on disturbed sites. These communities are associated with residential, recreational, commercial and industrial areas in the project area. No plant communities were identified on the site. The results of the FWRIA Step I analysis indicate that there is limited potential for wildlife at the site. Because of its location in an urbanized area and the presence of the building and sidewalks which cover most of the surface of the site, the site provides very little if any suitable habitat for wildlife other than Norway rat, house mouse and perching birds. The site does not provide any current or potential value to humans as a nature recreation area.

7.1.8 Source Characterization

Based on the results of all soil vapor, soil and groundwater data collected to date, the former Klink Cosmo Cleaners is the origin of PCE and TCE contamination which has migrated to the east, north, and northeast of the building that formerly housed the dry cleaning operations. The exact location of the PCE source has yet to be determined and most likely lies beneath the building. Additional intrusive and non-intrusive methods of investigation inside the building that housed the former Klink Cosmo Cleaners are warranted to determine the location(s) and size(s) of the PCE source(s) material(s).

7.2 Recommendations

The following recommendations are offered for consideration by the NYSDEC. The recommendations include additional Remedial Investigation/Feasibility Study (RI/FS) activities.

- One top of clay monitoring well should be installed to an approximate depth of 125 feet at DEC-006TC. The construction specification of the top of clay well is discussed in more detail below. The rationale for the top of clay well location can be found in Table 7-1 and the proposed location is shown on Figure 7-1.
- At the top of clay well location, a hybrid well consisting of a 10-foot screen of 4-inch ID, Type 304 stainless steel 0.010-inch slot screen with a 2-foot long sump, 10 feet of 4-inch ID, Type 304 stainless steel riser above the screen and, 4-inch ID, Schedule 40 PVC the remainder of the well string, to the surface, should be set. A 00 or 00N size sand pack will be installed from the bottom of the well up to 2 feet above the top of the well screens. A cement/bentonite slurry will then be installed around the riser to an elevation of 1-foot below grade via tremie pipe. A 12-inch diameter, flush-mount protective casing will complete the well.
- Up to sixteen soil borings should be advanced within the building that housed the former Klink Cosmo dry cleaners. The borings should be installed through the building floor slab(s) to assist in determining the location and horizontal and vertical extent of source material. The borings should be advanced in a grid like pattern using a remote access drill rig(s) or direct-push unit(s). The proposed locations are shown on Figure 7-1.
- Up to five soil samples should be collected from each boring location to establish the full vertical extent of impact within each soil boring. At a minimum, one soil sample should be collected from the interval just above the water table; the second sample should be collected from the interval exhibiting odors, staining, or the highest PID reading; and additional samples should be collected below intervals of significant impact. If no odors, staining, or elevated PID reading are encountered, then only one sample from the interval just above the water table should be collected, as per the FAP (URS, April 2010). All soil samples should be analyzed for TCL VOCs plus TICs by 8260B.
- A visual inspection will be performed inside the former Klink Cosmo building to look for any apparent point sources (i.e., floor drains/grates, former tank locations, dry wells and/or former dry cleaning machinery locations). If floor drains/grates and/or dry wells are located, the floor drain cover(s)/grate(s) should be removed and up to ten sediment samples should be collected and analyzed for TCL VOCs plus TICs by 8260B. A video

inspection and Ground Penetrating Radar geophysical survey should be conducted to determine the location of the discharge piping (if any), and a dye tracer test should also be conducted using an environmentally friendly tracer dye to determine the outflow discharge points from the floor grates (if any).

- One soil vapor extraction (SVE) well should be installed to allow for a SVE pilot test to be performed in the vicinity of the northeast corner of the former Klink Cosmo building. The water table is at an approximate depth of 35 feet bgs. In order to minimize groundwater inflow and capture by the SVE extraction wells, the well screen will be approximately 3 feet above the water table. In order to avoid drawing outdoor air into the well screen (i.e., short-circuiting), the screen will be approximately 20 feet below the ground surface. The SVE well should be screened from approximately 20 to 30 feet bgs. The SVE well should be constructed with 2-inch ID PVC screen and PVC riser. A 00 or 00N size sand pack should be installed from the bottom of the well up to 2 feet above the top of the well screen. Bentonite chips should then be installed around the riser to an elevation of 1-foot below grade and hydrated. A 12-inch diameter, flush-mount protective casing should complete the well. The proposed location of the SVE well is shown on Figure 7-1.
- Three vacuum observation wells should be installed to allow for soil vapor test monitoring. The observation wells should be spaced at 5, 10, and 15 feet laterally from the SVE well and used to establish the radius of influence. Each observation well should be screened from approximately 20 to 30 feet bgs. The observation wells should be constructed with 2-inch ID PVC screen and PVC riser. A 00 or 00N size sand pack should be installed from the bottom of the well up to 2 feet above the top of the well screen. Bentonite chips should then be installed around the riser to an elevation of 1-foot below grade and hydrated. A 12-inch diameter, flush-mount protective casing should complete each well. The proposed locations of the observation wells are shown on Figure 7-1.
- Up to five air sparging wells should be installed in the vicinity of the SVE pilot test area to depths up to 60 feet bgs. The air sparging wells will be used to enhance SVE recovery rates. The air sparging wells should be constructed with 2-inch ID PVC screen in the bottom 2 feet and solid PVC riser. A 00 or 00N size sand pack should be installed from

the bottom of the well up to 2 feet above the top of the well screen. Bentonite chips should then be installed around the riser to an elevation of 1-foot below grade and hydrated. A 12-inch diameter, flush-mount protective casing should complete each well.

- An SVE/Air Sparging pilot test should be performed. A technical memorandum will be compiled detailing the SVE and air sparging test requirements following a discussion with the NYSDEC Project Manager and prior to testing.

Table 3-1
Former Klink Cosmo Cleaners Site
Geotechnical Laboratory Results

	Sample Type	Material Description	Grain Size	Atterberg Limits	USCS Classification	Average permeability (cm/sec)
Upper Glacial Aquifer - Shallow						
DEC-065D (9-10')	grab	silty sand	5.1% gravel; 56.2% sand; 27% silt; 11.6% clay	plastic	SM	1.1×10^{-7}
DEC-065D (14-15')	grab	clayey sand	11.9% gravel; 46.8% sand; 21.6% silt; 19.7% clay	plastic	SC	4.9×10^{-8}
DEC-066D (24-25')	grab	poorly graded sand with silt	88.1% sand; 11.9% fines	non-plastic	SP-SM	*
Upper Glacial Aquifer - Deep						
DEC-011D (75-77')	shelby tube	clay	0.1% gravel; 14.4% sand; 47.5% silt; 38% clay	PL:24; LL:35; PI:11	CL	5.1×10^{-8}
DEC-028D (80-82')	shelby tube	silt	0.1% gravel; 9.3% sand; 27.5% silt; 63.1% clay	PL:29; LL:47; PI:18	ML	2.0×10^{-8}
DEC-029D (84-84.5')	grab	clay with sand	4.5% gravel; 17.6% sand; 37.7% silt; 40.2% clay	plastic	CH	4.6×10^{-8}
DEC-044D (50-51')	grab	poorly graded sand	9.6% gravel; 86.7% sand; 3.7% fines	non-plastic	SP	*
DEC-044D (70-71')	grab	well-graded sand with silt and gravel	27.1% gravel; 62.6% sand; 8.2% silt; 2.1% clay	non-plastic	SW-SM	*
Sand above Top of Clay						
DEC-029TC (108-113')	grab	silty sand	0.8% gravel; 47.4% sand; 15.6% silt; 5.2% clay	non-plastic	SM	2×10^{-3}
DEC-031TC (105-106')	grab	sand with gravel	28% gravel; 53.3% sand; 13.2% silt; 5.5% clay	non-plastic	SM	**
Top of Clay						
DEC-029TC (115-117')	shelby tube	clayey silt	14.7% sand; 45.5% silt; 39.8% clay	PL:27; LL:46; PI:19	CL	1.7×10^{-6}

Table 3-1
Former Klink Cosmo Cleaners Site
Geotechnical Laboratory Results

	Sample Type	Material Description	Grain Size	Atterberg Limits	USCS Classification	Average permeability (cm/sec)
DEC-031TC (115-116.5')	shelby tube	sandy silt	41.8% sand; 39.9% silt; 18.3% clay	non-plastic	ML	9.9×10^{-6}

Notes: * Invalid result as the grab sample was re-worked.

** Invalid result for a material with SM USCS.

Notes:

ft. - feet

msl. - mean sea level

Positive is DOWNWARD, Negative is UPWARD

June 30, 2011 horizontal gradient from DEC-044 to DEC-031 is 0.001 ft/ft
 $[2.77' \text{ (DEC-044)} - 2.67' \text{ (DEC-030)}] / 90' \text{ (distance between)} = 0.001 \text{ ft/ft}$

March 29, 2012 horizontal gradient from DEC-044 to DEC-031 is 0.001 ft/ft
 $[2.13' \text{ (DEC-044)} - 2.07' \text{ (DEC-031)}] / 90' \text{ (distance between)} = 0.001 \text{ ft/ft}$

June 30, 2011 horizontal gradient from DEC-031 to DEC-030 is 0.0006 ft/ft
 $[2.67' \text{ (DEC-031)} - 2.52' \text{ (DEC-030)}] / 250' \text{ (distance between)} = 0.0006 \text{ ft/ft}$

March 29, 2012 horizontal gradient from DEC-031 to DEC-030 is 0.0005 ft/ft
 $[2.07' \text{ (DEC-031)} - 2.1.94' \text{ (DEC-030)}] / 250' \text{ (distance between)} = 0.0006 \text{ ft/ft}$

Indeno(1,2,3-cd)pyrene	MG/KG	0.5	8.2	-	
Naphthalene	MG/KG	12	12	-	

Criteria (1)- 6 NYCRR Part 375.6, Remedial Program Soil Cleanup Objectives, Effective 12/14/06. Unrestricted Use, plus CP-51 Table 1 10/21/10.

Criteria (2)- 6 NYCRR Part 375.6, Remedial Program Soil Cleanup Objectives, Effective 12/14/06. Restricted Use. Protection of Groundwater, plus CP-51 Table 1 10/21/10.

Criteria (3)- Background soil concentrations from Msgr. McGolrick Park collected August 3, 2011 exceeding 6 NYCRR Part 375.6 Unrestricted Use and CP-51 Table 1 limits.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria 1

Concentration Exceeds Criteria (2)

Concentration Exceeds Criteria (3)

- = No standard, criteria or guidance value. CP-51 - The criteria was obtained from CP-51. All other criteria are from 6NYCRR Part 375.6.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Blank cell - Not Detected. NA - Not analyzed.

Only Detected Results Reported.

Copper	MG/KG	270	270	8.3
Iron	MG/KG	2000 CP-51	-	10,100
Lead	MG/KG	400	400	3.2
Magnesium	MG/KG	-	-	1,990
Manganese	MG/KG	2000	2000	235
Mercury	MG/KG	0.81	0.81	0.0032 B
Nickel	MG/KG	140	310	8.8

Criteria (1)- 6 NYCRR Part 375.6, Remedial Program Soil Cleanup Objectives, Effective 12/14/06. Protection of Public Health, Residential, plus CP-51 Table 1 10/21/10.

Criteria (2)- 6 NYCRR Part 375.6, Remedial Program Soil Cleanup Objectives, Effective 12/14/06. Protection of Public Health, Restricted Residential, plus CP-51 Table 1 10/21/10.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria (1)

Concentration Exceeds Criteria (2)

- = No standard, criteria or guidance value. CP-51 - The criteria was obtained from CP-51. All other criteria are from 6NYCRR Part 375.6.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Blank cell - Not Detected. NA - Not analyzed.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

Chloroethane	UG/L	5					
Chloroform	UG/L	7	1.8 J	2.8 J	2.8	2.6	9.2
Chloromethane	UG/L	5					

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

Depth Interval (ft)			-	-	-	-	-
Date Sampled			11/09/09	11/09/09	06/21/11	10/20/11	03/30/12
Parameter	Units	Criteria*		Field Duplicate (1-1)			
Miscellaneous Parameters							
Sulfate (as SO ₄)	MG/L	250	NA	NA	NA	125	86
Sulfide	MG/L	0.05	NA	NA	NA	NA	
Total Organic Carbon (TOC)	MG/L	-	NA	NA	NA	2.5	NA
Dissolved Gases							
Ethane	UG/L	-	NA	NA	NA		NA
Ethene	UG/L	-	NA	NA	NA		NA
Methane	UG/L	-	NA	NA	NA	5.0	NA

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

Ethane	UG/L	-	NA	NA	NA	NA	NA
Ethene	UG/L	-	NA	NA	NA	NA	NA
Methane	UG/L	-	NA	NA	NA	NA	NA

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

*Criteria- NYSDEC TOGS (1.1.1), Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations. June 1998, including April 2000 and June 2004 Addenda, Class GA.

Flags assigned during chemistry validation are shown.

 Concentration Exceeds Criteria

- = No standard, criteria or guidance value. Blank cell or ND - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

B (metals only) - The reported concentration is above the method detection limit but below the quantitation limit.

Only Detected Results Reported.

Dichlorodifluoromethane	UG/M3	1.4 J
Ethanol	UG/M3	570 J
Ethylbenzene	UG/M3	47.1
Hexane	UG/M3	NA
Isopropylbenzene (Cumene)	UG/M3	NA
Methyl ethyl ketone (2-Butanone)	UG/M3	15.4
Methyl tert-butyl ether	UG/M3	
Methylcyclohexane	UG/M3	NA
Methylene chloride	UG/M3	224 J
n-Hexane	UG/M3	16.8
Styrene	UG/M3	1.4 J
t-Butyl alcohol	UG/M3	
Tetrachloroethene	UG/M3	66.6
Tetrahydrofuran	UG/M3	NA
Toluene	UG/M3	148
Trichloroethene	UG/M3	0.60 J
Trichlorofluoromethane	UG/M3	0.54 J
Vinyl chloride	UG/M3	
Xylene (total)	UG/M3	222

Flags assigned during chemistry validation are shown.

Blank cell - Not Detected. NA - Not analyzed.

J - The reported concentration is an estimated value. D - Result reported from a secondary dilution analysis. R - The data is rejected.

Only Detected Results Reported.

NA - Not analyzed.

-- - Not detected above the applicable standard, criteria or guidance value.

**TABLE 6-2
POTENTIAL PATHWAYS OF EXPOSURE
CURRENT USE SCENARIOS
FORMER KLINK COSMO SITE**

Potentially Contaminated Medium	Potential Routes of Exposure	Potential Receptors	Potential Pathway Complete
Surface Soil	None	None	No. There is no surface soil at the site. All soil is covered by the building, pavement or sidewalks.
Subsurface Soil	Dermal absorption, ingestion.	Construction workers	No. No CPCs in soil at this site.
Soil Vapor/Indoor Air	Inhalation of VOCs from soil vapor.	Construction workers	Yes. Disturbance of soil vapors may occur during intrusive activities.
	Inhalation of VOCs from soil vapor beneath onsite building.	Onsite employees	Yes. There is potential for VOCs to migrate from the subsurface into the building through the vapor phase.
	Inhalation of VOCs from soil vapor beneath homes.	Public	Yes. There is potential for VOCs to migrate from the subsurface into homes through the vapor phase.
Outdoor Air	Inhalation of VOCs from soil or fugitive dust.	Public	No. No CPCs in soil at this site.
Groundwater	Dermal absorption, inhalation.	Construction workers	No. Groundwater level > 11 feet bgs would not impact disturbance of subsurface soil during intrusive activities.
	Ingestion.	Onsite employees, public	No. No current potable water use at or near site.

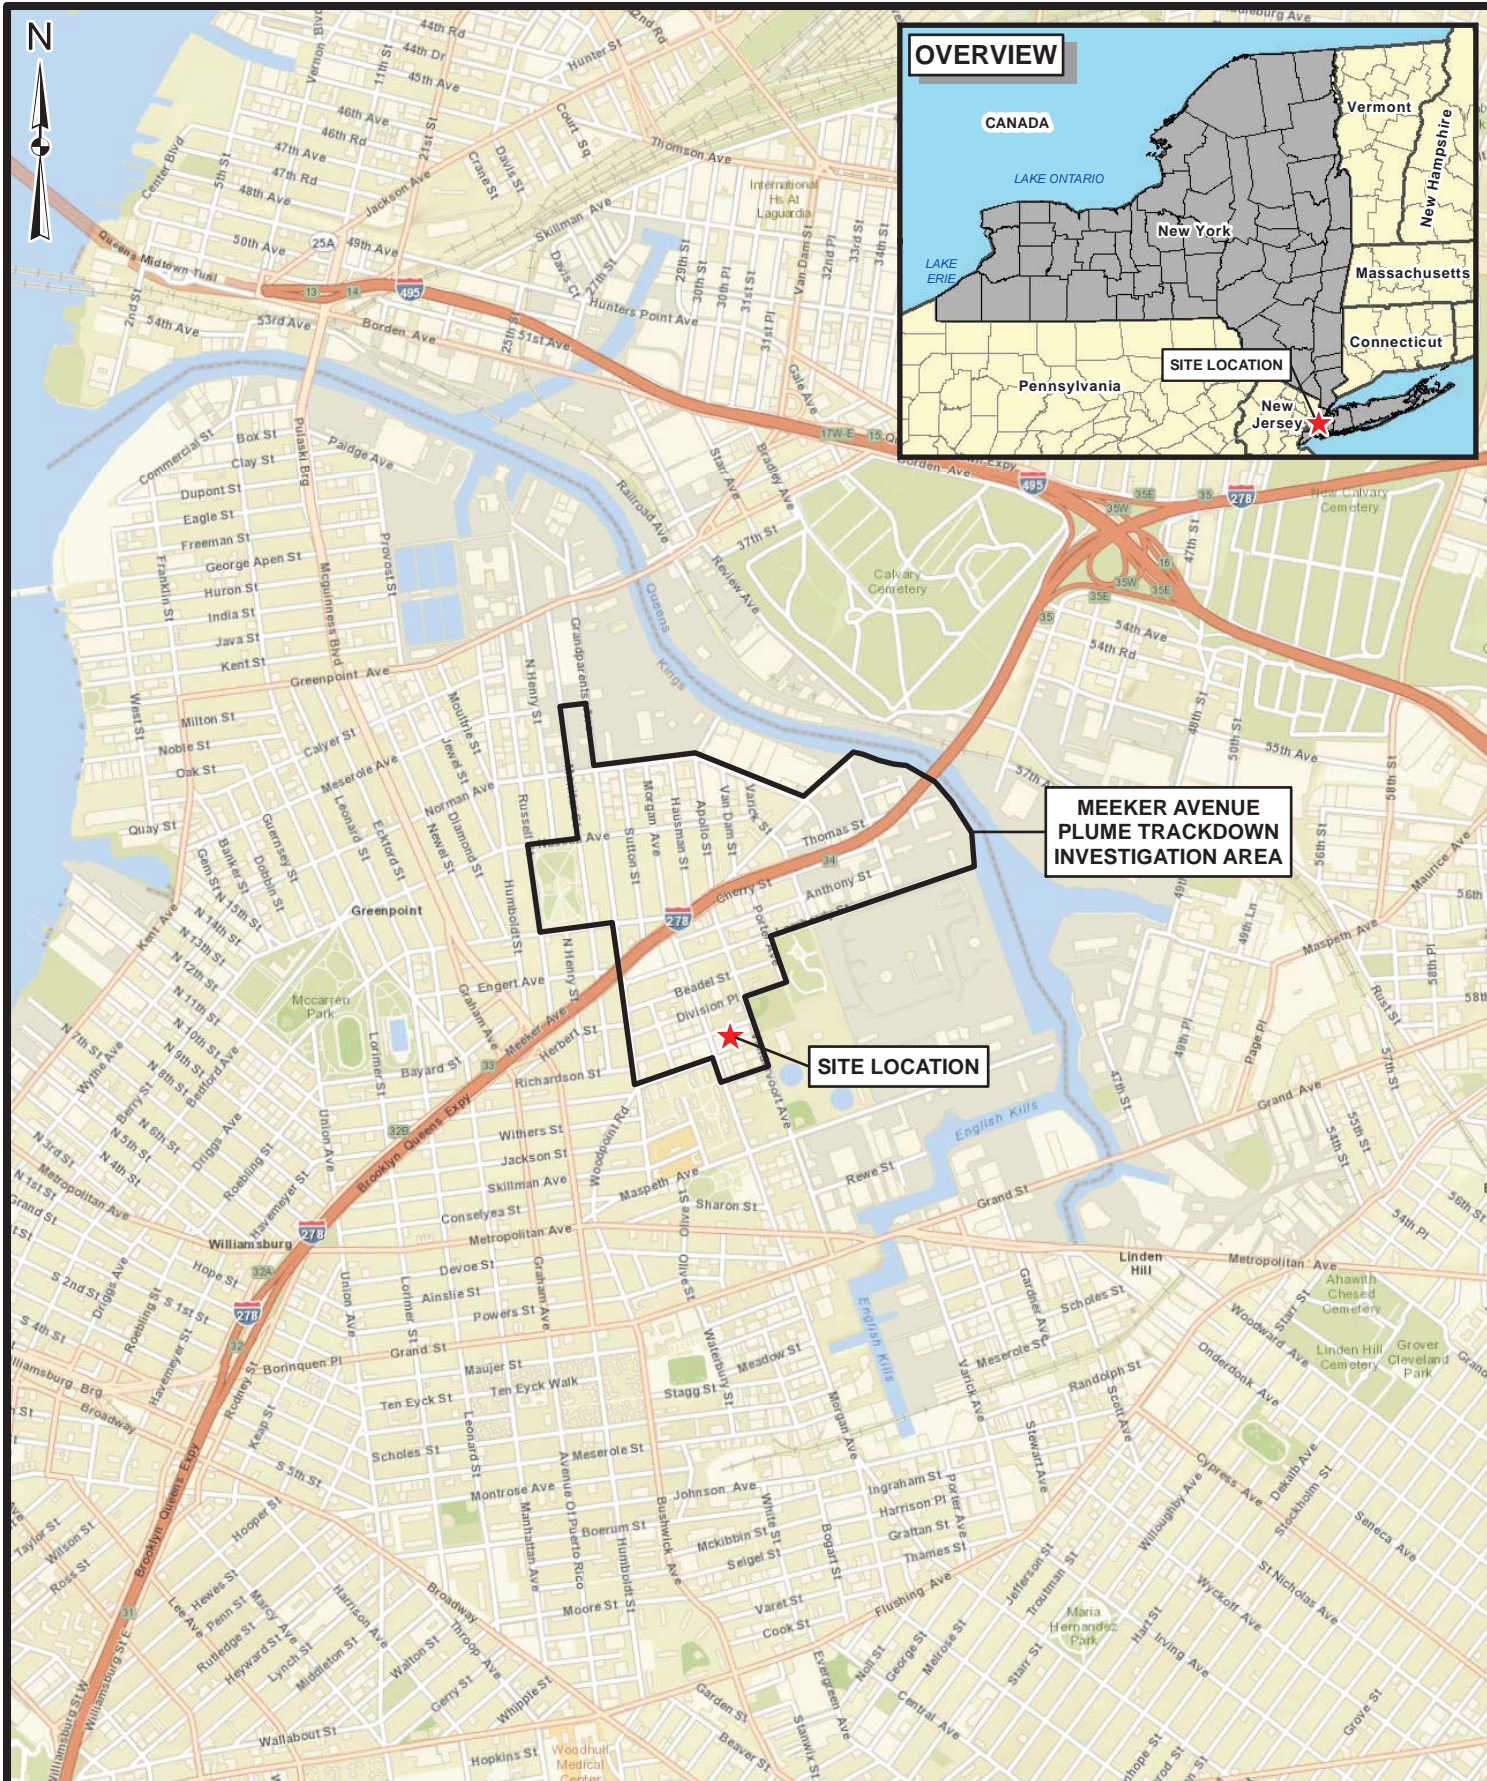

**TABLE 6-3
POTENTIAL PATHWAYS OF EXPOSURE
FUTURE USE SCENARIO
FORMER KLINK COSMO SITE**

Potentially Contaminated Medium	Potential Routes of Exposure	Potential Receptors	Potential Pathway Complete
Surface Soil	None	None	No. There is no surface soil at the site. All soil is covered by the building, pavement or sidewalks.
Subsurface Soil	Dermal absorption, ingestion.	Construction workers	No. No CPCs in soil at this site.
Soil Vapor/Indoor Air	Inhalation of VOCs from soil vapor.	Construction workers	Yes. Disturbance of soil vapors may occur during intrusive activities.
	Inhalation of VOCs from soil vapor beneath onsite building.	Onsite employees	Yes. There is potential for VOCs to migrate from the subsurface into the building through the vapor phase.
	Inhalation of VOCs from soil vapor beneath homes.	Public	Yes. There is potential for VOCs to migrate from the subsurface into homes through the vapor phase.
Outdoor Air	Inhalation of VOCs from soil or fugitive dust.	Public	No. No CPCs in soil at this site.
Groundwater	Dermal absorption, inhalation.	Construction workers	No. Groundwater level > 11 feet bgs would not impact disturbance of subsurface soil during potential future intrusive activities.
	Ingestion.	Onsite employees, Public	No. Due to existing public water supply systems in the area, no potable water use at or near the site is anticipated.

TABLE 7-1
PROPOSED MONITORING WELL LOCATION RATIONALE FOR THE
FORMER KLINK COSMO CLEANERS SITE

Location ID	Type	Rationale
DEC-006TC	Top of Clay	Assess the horizontal extent of PCE and TCE at the top of the Raritan Formation. This well will also assist in the assessment of the contributions at the top of the Raritan Formation of PCE and TCE from the Klink Cosmo Site and the ACME Sites.

 1635: CF off-site

0715: OK on site
 0850: Jeremy + Frank (ADT) pulling up. Dave H. Knisoec) also here.
 1000: resume DEC-065D from 25ft
 1230: @ 65ft, ADT lunch. Greg's rig has been down since before 1100 AM, mechanic (ADT) on way from shop.
 1345: ADT lunch over
 1600: pump broke on Jeremy's rig while mixing grout. DEC-065D installed @ 80ft, no manhole. Arco here for 5 drums total. 1 solid @ 66D and 1 solid 3 mud @ 13D.
 1630: ADT off-site
 1700: JF to develop DEC-065D at off-site

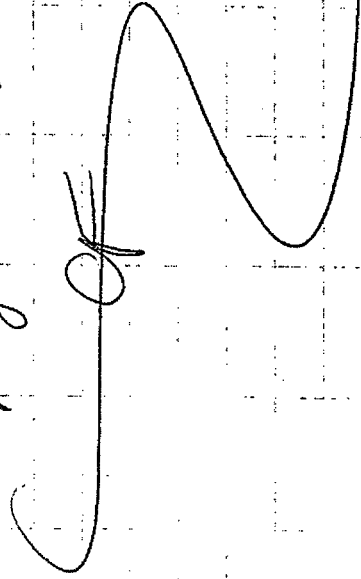

0700: OK on-site
 0845: Greg + Dave (ADT) have been here for 1/2 hr. No sign of Jeremy and Frank yet. Jeremy has to fix pump on rig before we can drill.
 0900: Jeremy and Frank on-site. Frank to set manhole @ 66D @ DEC-065D manhole set.
 Jeremy still working on pump on rig.
 1100: Jeremy still putting pump back together.
 1230: Jeremy tracking to DEC-065D
 1230: start drilling DEC-065D
 1530: DEC-065D down to 55ft 3 drums
 Total of 7 drums to go w/ Arco tonight 2 H₂O 3 mud 2 solid.
 Mitham here @ 1300 for sample pick-up.

5/24/11

1630: ADT off-site, TF (URS) calls to say that DEC-0645 is only 25ft deep and it's H₂O level is @ 25ft. Tried to force tubing past 25ft and could not, bottom felt hard, will have Greg (ADT) try to flush out well, if he can't will over-drill, pull well and then clean ~~out~~ (C) a new hole and re-drill well. Harco here for 7 drums. 2 solid, 2 H₂O, 3 mud.

1715: CF signs Harco paperwork TI developing 660, CF off-site

CF

5/25/11

0715: CF on-site on Richardson
0910: Jeremy pulling up now Greg is flushing out DEC-0645 (20ft at well sand in PVC)
1010: Jeremy starts drilling
1030: Tim calls to say DEC-0645 is down open to correct depth Greg's rig is not working properly, Jeremy going over to see what the problem is with the pump Greg will keep trying

1145: Greg comes over, says the rig and pump are not good. Rig leaking hydraulic oil from same spot as earlier in the week. Rigs down all together Greg taking rig back to the shop, casing is sticking 25ft out of ground, Jeremy will go over and finish it off leave casing in the ground but bring it flush

5/25/11

1210: ADT lunch
 1310: ADT resumes drilling DEC-065D
 1500: DEC-065D installed,
 Frank cleaning up while Jeremy
 is @ DEC-0130 making casing
 flush w/ ground.
 Harco here for drums
 Total of 5 H₂O, / mud and
 1 solid drum.
 1600: ADT off-site
 1615: CF off-site

5/26/11

0715: CF on-site
 0800: ADT on-site
 0840: flushing out DEC-045D
 1000: DEC-045D flushed out
 to 70ft, no further, well
 seems to be broken @ top
 of screen. ADT cleanup to
 move over to DEC-0130 to
 finish well
 1130: casing @ DEC-0130
 down to 65 ft, rig down
 Jeremy off to find a fuel
 filter after CF over to Auto
 Zone where they are out of
 that model filter.
 @ 1020am woman who lives
 near corner of Division and
 Vandeventer Ave in one of
 row houses comes over @
 in her vehicle w/ her husband
 honks her horn @ me and
 says "do I have to look @
 those guys throwing an orange
 out the window", I said

1600: CF/SL off-site

CF

6/24/11 55

0610: CF/SL on-site

725: DEC-004 sampled
CF/SL off to buy DEC
(1") to collect LNAPEL
and GW samples @
DEC-048

1000: five env on-site w/
pen-pump

1100: Collect 1 full 40 ml
vial and 1/2 full 40
ml vial of LNAPEL, CF
checked w/ George K (URS
chemist) he says it should
be enough volume

1200: Tim I picks up 3
open-top drums from JR
Cooperage 12 left on acct.

1300: ~~DEC-048~~ DEC-048 sampled
(DEC-0624(1)) and MS/MSD

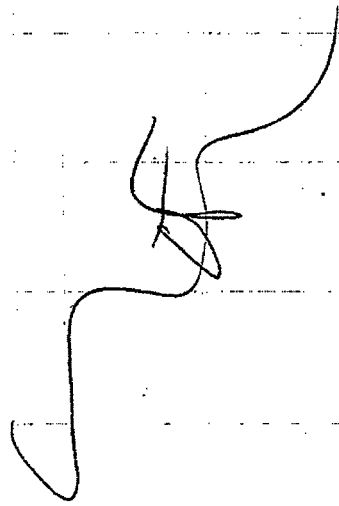

6/24/11

1300: also collected

1325: Spectrum / MTKem
dicks up 2 coolers, noted
no COC that samples were
just collected and are
not yet chilled. 15 amber
liter jars brought up temp
in both coolers.

~~1525~~ 1520: Arco here for
4 drums / H₂O, 3 PPE

1535: CF / SL off-site, TI / KM
off-site @ 1300

7/11/11

hazy, hot, humid

0700: CF on-site for, Silverwill
flag replacements 25 flags total.

0730: Arco on-site to do flags
w/ll start on Vandeventer
w/ DEC-045D, DEC-045DR,
DEC-045 (abandoned boring)
DEC-014D, and DEC-014DR

0900: Flags for DEC-045S, DEC-
045D and DEC-045 ~~DR~~ all
busted out, concrete is 5-6"
thick. Arco will then do
DEC-014D and DEC-014DR

0940: DEC-014D and DEC-014DR
are done on the same flag.

030: 5 Flags busted out, concrete
truck (Brooklyn Concrete) here.

1100: Bob Reeves (NYC Parks)
718 965 6965

1120: Spoke w/ Bob Reeves of
McCormick about sampling in
McGlowrie Pk on Monitor St.
He said he would call me
back w/ a good time

1255: 5 flags completed and
covered off w/ caution tape
Aarico off to get lunch, they
are done for the day.

1315: Off-site, have not
heard back from Bob Reeves
(Nite Parks)

CF

0700: CF on-site, Aarico also
pulling up.

Aarico will work on
~~CF~~ ~~underfoot~~ ~~underfoot~~
SB-25, SB-26, DEC-232
DEC-060; DEC-060

CF marking all remaining
flags w/

0740: AWL (Gray bldg on
Richardson) complained about
Aarico's being on sidewalk
w/ trench and about general
sidewalk condition. I said
we generally fix where we
put holes in ground. I

Saatchi we are here doing an
investigation for the stalled and
grave him Dave's ^(w/ wife) name, not
contact into the did not ask, I
left phone in the car
He was not overly angry,
and gave me his card.

5/23/14

Project / Client

Meeker - Klink Cosmo

Cloudy 60°

0730 Tiffen (URS) on site, meet up w/ C. Friedman (URS) to discuss the days work. Will setup to drill DEC-013D. Will drill straight to 45' feet & begin logging. (use DEC-013 boring log for 0-45' description)

0830- ADT on site

Gregg Rivera - Driller

Dave Moon - Helper

0900- Drillers fill up water tank @ hydrant & setup on DEC-013D. Had Tailgate safety meeting w/ drillers.

Borehole was previously cleaned to 5' bys by Vector.

NYS DEC - Dave Harrington on site

Drillers are using a Compact Foton

Sonic 17-C Drill Rig

1030- Rig sprung a leak of hydraulic fluid from a fitting above the head.

Gregg took a picture & called the shop

ADT will drive the parts out to repair.

Will perform a slug Test on DEC-012

while waiting

1215 Rerford slug Test on DEC-07D &

DEC-64D. Still waiting on parts to be delivered.

1235- The ADT mechanic arrives to fix the rig

1235- Picked up 2 drums for development later.

Driller left w/ mechanic to pick up supplies to fix rig.

1305- Driller & Mechanic return to fix rig.

1315- Rig was fixed, resume drilling

1400- Around 17 lbs, drilling through boulder. water was unable to get down through the stuffed casing. Driller's used rods to drill through the casing & try to clean out the material clogging the casing. A fitting on the water pump also seems to be leaking. Have difficulty sucking up water from the mud pan.

1435- Support Truck goes to fill up water. Aired the drillers to drain the mud pan more frequently to avoid overflow.

1515- Drillers got to 40'. 3 drums of water & 1 soil drum. Carrie also asked drillers to clean up muddy water left around the borehole & spread

1620- Drillers Filled up w/ fresh water & cleaned up the area.

Drillers off site

1650- Put up w/ C. Friedman to discuss progress. Start to develop DEC-006DD

1730- Just able to get generator started. may be oil, will pick some up after well is developed

1900- Development complete @ DEC 006DD. TI off site to Antelope for oil.

Date 5/24/14

Project: Meeker Ave - Klink Casms

Partly Cloudy, 80°

0715 - T. Iskovich (URS) on site to block off

Area around DEC-013D. Meet w/

C. Friedman (URS) to discuss the days work.

Will continue to drill DEC-013D & start
logging the Log @ 75', currently @ 40'.

0730 - TI Slug Tests well DEC-045.

0805 - Slug Test Complete. Instant Recovery

0830 - Drillers begin setting up on DEC-013D

0900 - Drillers go to fill up water tank @ hydrant

0920 - Drillers return w/ water ~~begin drilling~~0927 - Drillers go to other support truck to
grab another 7" casing, the 7" casing already
in the hole has sunk down

0935 - Drillers return, begin drilling

Driller - Greg Rivera, Helper - Dave Moon

1000 - Drilled to 55', drillers move to get water

1112 - Drillers return w/ water

1159 - Drillers on of water again. Break for lunch

1215 - Drillers continue drilling

1300 - Haven't drilled 5' since restarting & already
out of water, this is the fifth trip

1310 - Continue drilling, picked up 2 drums for development

1345 - Collected sample from 60-65' but out of water
again (4th trip), the formation seems to be

Location:

Project: Meeker Ave - Klink Casms

Partly Cloudy, 80°

taking all the water sent down the casing.

No water has come up through the casing
into the mud pan. Drillers still think

these water pump isn't working properly

Asked the drillers to clean up some of the

puddles in the road made by water coming

out of the rods during sample extraction.

1357 - Continue drilling

1414 - Drillers fill up water tank again (in)

1420 - Spoke w/ S. McCabe regarding progress
& about using so much water @ thislocation. Will continue to drill down
to 85' bgs

1430 - Return w/ water, continue drilling

1515 - Sampled 65-70' interval, at this rate

will not be able to drive another 5' section
of casing in before 1600. Driller movesto fill water tank & will move casing flush
w/ ground level

1530 - Drillers begin to clean up.

1620 - Drillers off site. Set up on DEC-064
for development. Well is supposed to

be 45' deep. But a depth to

water was found @ 2.22' & confi →

Sunny, 80°

0730 - T I French on site, spoke w/ C. Finckley about the days work. Performed slug test on DEC-066DD, however, will run the test again later. Don't think the slug was completely under water, need longer rope. Spoke w/ S. McCabe, drillers will try to flush out DEC-064.

0840 - Drillers arrive. Greg Rivera - Driller

Gave names - helper

0900 - Drillers setup on DEC-064

0945 - Drillers flushed outside well using extreme. They injected water into the well pushing out the sand that got into the well. Took a depth to bottom measurement of 44.8' bgs.

Spoke w/ S. McCabe on progress

1000 - Drillers begin drilling @ DEC-030D

Starting @ 70' bgs

1045 Still having trouble pushing the casing down.

Jeremy came over to look @ the rig.

Drillers will try to bypass the water pump to see if it helps to put water down. Believe the water pump still isn't working properly.

1115 - Drillers try again to advance casing, unable to advance casing
 1130 - Drill sig still not working properly.

decide the rig has to be taken back to the shop for maintenance. Spoke w/

C. Friedman. Drillers will leave casing, to be completed by the other drill sig. Drillers begin clean up.

1300 - Pick up 5 drums to continue development

1315 - Attempted to develop DEC-015, the

well was installed to ~80' depth to

bottom was measured 60.9'. Tried

cleaning well w/ water but tubing

kept getting clogged w/ sand. C.F. spoke

w/ McCabe, will have drillers flush it

out in the morning. Move to DEC-064

to continue development

1630 - Development complete @ 64'. AARCO

picked up 5 purge water drums + 2 soil/mud

TI off site

APPENDIX C

GEOPHYSICAL SURVEY REPORT

RI PHASE I

May 31, 2011

Mr. Chuck Dusiel
Mr. George Kisluk
Mr. Scott McCabe
URS Corporation, Inc.
77 Goodell Street
Buffalo NY 14203

Re: Finalized Report
Klink Cosmo Cleaners Borehole Clearance Survey
Site ID# 2-24-130
Work Order No. 243779 US
Brooklyn, New York
URS/NYCDDC Project
RSI Job No. 11-042

Dear Gentlemen,

Please find below our finalized GPR and EM induction (EMI) interpretations for the Klink Cosmo Cleaners borehole clearance survey in Brooklyn, New York. On May 2nd and 3rd, 2011, RSI conducted ground penetrating radar (GPR) and EMI surveys to locate potential utilities and other obstructions coincident with 17 proposed soil boring and 10 proposed monitoring well locations.

RSI used a GSSI SIR-20 radar system, with a 500 MHz antenna and utility cart with a built-in encoder in it, as well as two different EM induction tools, both of which detect 60 Hz energy and enable the receiver to trace any utility carrying an induced frequency, to clear an area approximately 10 feet by 10 feet around each proposed soil boring and monitoring well location. The table below summarizes our field interpretation.

We greatly appreciate this opportunity to work with URS Corporation, Inc. again. Please call should you have any inquiries regarding this or future assignments.

Sincerely,
RADAR SOLUTIONS INTERNATIONAL

Doria Kutrubes, M.Sc., P.G.
President and Sr. Geophysicist

TABLE 1
SUMMARY OF GPR AND EM INDUCTION RESULTS

Well/Boring ID	Proposed Location(s)	Recommended Re-Location(s)	Comments
MW-30D	5E, 5N	0N, 3.5E	Water line 5 feet from and parallels west curb of Division Street. Electrical service 5' south of building's northeast corner. Existing SG-48 at 5E, 9N. No live 60 Hz observed within 10x10 grid using EMI.
O MW-13D	5E, 5N	5E, 2N	Existing MW at 0.5N, 5.2E. Looks OK; could move to 5E, 2N. No live 60 Hz observed within 10x10 grid using EMI.
MW-64D	5E, 2.5N and 5E, 7.5N	5E, 1N 6E, 7.5N	Possible MH cover or metal plate, 7.5E from 2.7N-7.5N. No live 60 Hz observed within 10x10 grid using EMI.
SB-80	5E, 5N	n/a	Looks OK. No live 60 Hz observed within 10x10 grid using EMI.
SB-81 MW-14 MW-14D	5E, 21N 5E, 10N 5E, 5N	n/a n/a 5E, 3N alternate	Existing DEC-14 at 4.5E, 15.5N. Looks clear. No live 60 Hz observed within 10x10 grid using EMI.
SB-82	5E, 5N	3.5E, 5N	Possible point target at proposed boring location (probable cinder, metal scrap). No live 60 Hz observed within 10x10 grid using EMI.
SB-83	5E, 5N	2E, 3N	Something near 5E, 4N. No live 60 Hz observed within 10x10 grid using EMI.
MW-45D	5E, 5N	n/a	Should be OK. Nearby telephone utility to east is fiberoptic with no 60 Hz tracer wire. Unable to detect with either EMI device.
MW-66D MW-66S	5E, 2.7N 5E, 1.5N	n/a 5E, 0N	Possible point target at shallow well.
SB-84 DEC-44	10E, 5N 1E, 5N	n/a n/a	Existing well DEC-44 at 6E, 6N. Both proposed locations look OK.
MW-65S MW-65D SB-85	15E, 5N 6.5E, 5N 11E, 5N	n/a n/a n/a	Water service parallel 3W. Nearby point targets, but nothing coincident with proposed locations.
SB-86	5E, 5N	n/a	Looks OK
SB-87	5E, 5N	n/a	Looks OK. Electrical line parallel 10N (+/- 2'). Water gate at 5W, 13N.
EC-43D	5E, 5N	7E, 5N	possible cobble/metal at initial location.
SG-78	5E, 5N	5E, 7.5N	Probable cobble.
DEC-006DD	5E, 5.5N	5E, 7.5N	Electrical utility 3 feet east of curb line in street.
DEC-007D	5E, 5N	5E, 7.5W	Gas line roughly parallel 6.5E.
DEC-015D	5E, 5N	n/a	Should be OK.
SG-79	5E, 5N	hand dig	Possible buried slab, below which we do not see anything along Lines 5E and 7.5E. Hand dig this location
MW-89D	5E, 5N	n/a	Should be OK. Small point targets in fill (cinders or metal scrap).

Klink Cosmo Cleaners Borehole Clearance Survey - Phase II
Site ID# 2-24-130
Work Order No. 243779 US
Brooklyn, New York
URS/NYCDDC Project
RSI Job No. 12-009

Dear Gentlemen,

Please find below our finalized GPR and EM induction (EMI) interpretations for the Klink Cosmo Cleaners, Phase II, borehole clearance survey in Brooklyn, New York. RSI conducted ground penetrating radar (GPR) and EMI surveys on February 27, 2012 to locate potential utilities and other obstructions coincident with proposed soil boring and monitoring well locations.

RSI used a GSSI SIR-3000 radar system, with a 500 MHz antenna and utility cart with a built-in encoder in it, as well as a Subside Ditch Witch 950 T/R EM induction tool. The EMI tool was used to detect coherent 60 Hz energy and enable the receiver to trace any utility carrying an induced frequency, to clear an area approximately 10 feet by 10 feet around each proposed soil boring and monitoring well location. The table below summarizes our field interpretation.

We greatly appreciate this opportunity to work with URS Corporation, Inc. again. Please call should you have any inquiries regarding this or future assignments.

Sincerely,
RADAR SOLUTIONS INTERNATIONAL

Doria Kutrubes, M.Sc., P.G.
President and Sr. Geophysicist

TABLE 1
SUMMARY OF GPR AND EM INDUCTION RESULTS

Well/Boring ID	Proposed Location(s)	Recommended Re-Location(s)	Comments
DEC 88D and DEC 88	5E, 5N 5E, 14N	n/a 5.5E, 17N	Small, shallow targets observed; possible cobbles/tentative utilities. No live, coherent 60 Hz observed within 10x10 grid using EMI.
SG-113	5E, 5N	n/a	DEC-29 at 2.5E, 2.5N. Should be OK. No live, coherent 60 Hz detected using EMI.
DEC-15R	5.3E, 4.7N	n/a	existing DEC-15D at 5.3E, 0.5S, Water Svc. is 4' from Hydrant, parallel to 11.5N (from EMI). May be shallow pipe trending from 10E, 1.5N to 5.5E, 6N; is 1' deep.
DEC-28D	9.5E, 5N	9.5E, 6.5N	Existing DEC 28 at 3E, 6N; small point target around 9E, 5N; move proposed well to be safe. No 60Hz detected using EMI
SG-112	5E, 5N	1.5E, 6N	Deeper point targets observed along Lines 0N, 2.5N, and 5N at 5E. Live, 60 Hz signal detected: possible utility parallel 3E.
DEC 11D	5E, 5N	n/a	No EMI detected. Looks OK.
DEC-46D	5N, 11E	3N, 10.5E	Initially under car, which moved during survey. Electrical Lines detected roughly parallel 6.5N and 8N (the latter marked out by Dig-Safe). Some interference between two E lines, EMI not clear. Relocated further to south to be safe.
SG-120	5E, 5N	n/a	May be utility trending from 0E, 10N to 10E, 6.5N; No 60Hz detected at proposed boring
SG-61R	5E, 5N	n/a	Damaged existing SG-61 at 5E, 2N. No EMI detected at proposed location. Should be OK.
SG-122	5E, 5N	n/a	Existing DEC 47 at 5E, 1N. Lots of point targets around. No EMI detected. Should be OK.
DEC 90D DEC 90	5E, 5N 5E, 10N	n/a At discretion of URS	evidence of excavation just north of proposed well. Centerline of excavation trends from 2.5E, 7N to 5E, 9N to 7.5E, 11.5N. DEC 90D looks OK; DEC-90 is near CL of trench. May want to relocate DEC-90 to north in case there is a utility near the trench CL that can not be detected using GPR and EMI. Relocation at the discretion of URS - vacuum excavating.
SG-115	5E, 5N	n/a	SG-83 at 5E, 9N. Looks OK, but unable to get good EMI reading due to proximity to cell/communications tower.
SG-118	5E, 5N	n/a	Should be OK. However GPR had limited penetration. No EMI due to proximity to cell/communications tower.
DEC 91 DEC 91D	5E, 15N 5E, 6N	n/a n/a	Both look OK. No EMI detected, but still in proximity of tower
SG-121	5E, 5N	n/a	Looks OK. No EMI detected.
SG-119	5E, 5N	Drill through old SG location	Possible utility parallel 3.5N. Also, may be a second utility parallel 5N, or seam in sidewalk. URS proposes drilling new SG through original SG location; OK from a geophysical standpoint.
SG-117	5E, 5N	n/a	DEC-66 at 4.5E, 1.2S. Some point targets, but nothing consistent with a utility.
SG-116	5E, 5N	7.5E, 5N	Possible utility trending from 10E, 8.5N to 7.5E, 7N to 5E, 5N to 2.5E, 3.5N; No EMI detected within grid. Relocate to avoid possible utility.
SG-114	5E, 5N	8.5E, 5N	Moved to avoid multiple, small point targets. No EMI detected within grid.

SUMMA CANISTER SAMPLING FIELD DATA SHEETS

RI PHASE I

Summa Canister Sampling Field Data Sheet

Site: Klink/Cosmo

Samplers: C. Friedman / D. Swain

Date: 6/13/2011

Sample #	SG-55	SG-79	SG-78	AA-061311	SG-19
Location	Porter/Division	Division	Porter	Northside of Porter in front of old gas holder	In front of 137 Beadel
Summa Canister ID	843	1695	1497	1074	707
Flow Controller ID	FC246	FC0422	FC 170	FC0190	FC173
Additional Tubing Added	NO/ YES - How much 1ft	NO/ YES - How much 1ft	NO/ YES - How much 1ft	NO / YES - How much	NO/ YES - How much 1 ft
Purge Time (Start)	1012	1022	1031		1207
Purge Time (Stop)	1013	1023	1032		1208
Total Purge Time (min)	1 min	1 min	1 min		1 min
Purge Volume					
PID Test of Purge Air	1.2	1.1	0.3		0.4
Initial Tracer Gas Results	0 ppm	0 ppm	0 ppm		0 ppm
Pressure Gauge - before sampling	-25	-29	-24	-28	-30
Sample Time (Start)	1016	1024	1034	1038	1215
Sample Time (Stop)	1115	1124	1129	1138	1314
Total Sample Time (min)	59 min	60 min	55 min	60 min	59 min
Pressure Gauge - after sampling	-3	-4	-2	-4	-4
Sample Volume					
Canister Pressure Went To Ambient Pressure?	YES / NO	YES / NO	YES / NO	YES / NO	YES / NO
Final Tracer Gas Results	0 ppm	0 ppm	0 ppm		0 ppm
Associated Ambient Air Sample Number	AA-061311	AA-061311	AA-061311		AA-061311
General Comments:

DEPTH

The diagram illustrates a well construction with the following details:

- Ground Level:** Elevation 39.21
- Flush Mount Protective Casing and Lockable Cap:** Located at the top of the well.
- AUGERHOLE:** 8 inch dia., 47 feet length.
- PVC CASING:** 2 inch dia., 31 feet length.
- PVC SCREEN:** 2 inch dia., 15 feet length.
- Elevations:** 39.21, 38.80, 30', 31', 46', 47'.
- Materials:** Cement/Bentonite Grout (hatched), Bentonite Seal (solid black), Silica Sandpack (dotted).

DRILLING SUMMARY		 <p>The diagram shows a cross-section of a well. At the top is a 'Flush Mount Protective Casing and Lockable Cap'. Below it is the 'AUGERHOLE' with an 8 inch diameter and 43 feet length. This is followed by 'PVC CASING' with a 2 inch diameter and 25 feet length. Below the casing is a 'PVC SCREEN' with a 2 inch diameter and 15 feet length. The well is filled with 'Silica Sandpack' (hatched pattern). A 'Bentonite Seal' (solid black) is located between the casing and screen. 'Cement/Bentonite Grout' (hatched pattern) is at the top of the well. Elevation markers on the left indicate depths of 37.43, 37.12, 2.0, 20.5, 25.0, 40.0, and 45.0 feet. The word 'DEPTH' is written vertically next to the diagram.</p>

MONITORING WELL CONSTRUCTION DETAILS		

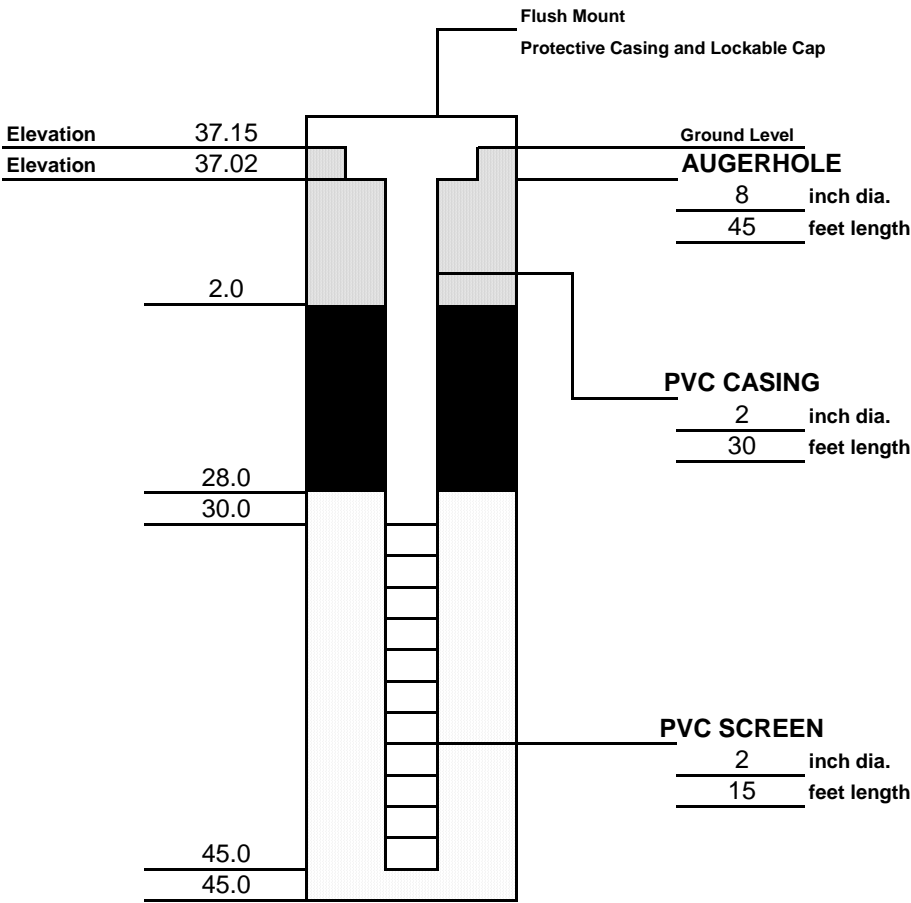

DRILLING SUMMARY		 <p>The diagram illustrates the well construction details. It shows a vertical cross-section of the well. At the top, there is a 'Flush Mount' and a 'Protective Casing and Lockable Cap'. The 'Ground Level' is indicated. The 'AUGERHOLE' is shown with an 8-inch diameter and 55 feet length. The 'PVC CASING' is 2 inches in diameter and 25 feet long. The 'PVC SCREEN' is 2 inches in diameter and 15 feet long. The well is filled with 'Silica Sandpack' and has a 'Bentonite Seal' at the bottom. The 'Casing Material' is 'Steel grade box' and the 'Screen Material' is '2" PVC'. The 'Filter Material' is '#2 Sand' and the 'Seal Material' is 'Bentonite'. The 'Comments' section is empty. The 'Legend' identifies the materials: 'Cement/Bentonite Grout' (hatched), 'Bentonite Seal' (solid black), and 'Silica Sandpack' (dotted).</p>

WELL DESIGN		
<p>The diagram illustrates the well construction details. It shows a central well shaft with various materials indicated by patterns: hatched for Cement/Bentonite Grout, solid black for Bentonite Seal, and stippled for Silica Sandpack. Key components include a Flush Mount Protective Casing and Lockable Cap at the top, an AUGERHOLE (8 inch dia., 54 feet length), PVC CASING (2 inch dia., 38 feet length), and a PVC SCREEN (2 inch dia., 15 feet length). Elevation markers on the left indicate depths from 45.02 to 54.0 feet. A depth scale on the right ranges from 0 to 60 feet.</p>

COMMENTS:

Well developed with Wattera Hyrolift pump using dedicated/disposable HDPE foot valve and tubing.

All development water containerized in 55-gallon drum for off-site disposal.

Pump stopped around 45 gallons, had to restart.

COMMENTS:

Well developed with Wattera Hyrolift pump using dedicated/disposable HDPE foot valve and tubing.

All development water containerized in 55-gallon drum for off-site disposal.

Initial 10 gallons removed without taking water quality readings due to high amounts of sand in development water.

AQUIFER TESTING DATA AND RESULTS

DEC-031RH

Data Set: I:\...\DEC-031.aqt

Date: 09/08/11

Time: 12:38:09

PROJECT INFORMATION

Company: URS Corporation

Client: NYSDEC

Location: Klink Cosmo

Test Well: DEC-031

AQUIFER DATA

Saturated Thickness: 13.15 ft

Anisotropy Ratio (K_z/K_r): 0.1

WELL DATA (DEC-031)

Initial Displacement: 1. ft

Static Water Column Height: 113.2 ft

Total Well Penetration Depth: 13.15 ft

Screen Length: 15. ft

Casing Radius: 0.0833 ft

Wellbore Radius: 0.1533 ft

Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined

Solution Method: Bouwer-Rice

$K = 0.001852$ cm/sec

$y_0 = 0.03455$ ft

APPENDIX J

MONITORING WELL PURGE LOGS

RI PHASE I

LOW FLOW GROUNDWATER PURGING/SAMPLING LOG

Project: NYSDEC - Meeker Ave Site: Klink/Cosmo Well I.D.: DEC-004

Date: 6/24/2011 Sampling Personnel: CF/SL Company: URS Corporation

Purging/ Sampling Device:	Bladder Pump	Tubing Type:	Poly	Pump/Tubing Inlet Location:	Screen midpoint
---------------------------------	--------------	--------------	------	-----------------------------------	-----------------

Measuring Point:	Below Top of Riser	Initial Depth to Water:	36.45	Depth to Well Bottom:	49.97	Well Diameter:	2"	Screen Length:	15'
------------------	--------------------	-------------------------	-------	-----------------------	-------	----------------	----	----------------	-----

Casing Type:	PVC	Volume in 1 Well Casing (liters):	8.3	Estimated Purge Volume (liters):	15
--------------	-----	-----------------------------------	-----	----------------------------------	----

Sample ID: DEC-004 Sample Time: 0725 QA/QC:

Sample Parameters: TCL VOCs + Tics

PURGE PARAMETERS

TIME	pH	TEMP (°C)	COND. (mS/cm)	DISS. O₂ (mg/l)	TURB. (NTU)	Eh (mV)	FLOW RATE (ml/min.)	DEPTH TO WATER (btor)
0650	7.55	18.92	2.020	16.09	>800	-24	500	36.45
0655	7.51	17.70	2.020	15.20	366.0	-26	500	36.45
0700	7.48	17.55	2.020	15.37	200.0	-26	500	36.45
0705	7.47	17.51	2.020	14.57	113.0	-33	500	36.45
0710	7.45	17.44	2.010	14.61	66.3	-34	500	36.45
0715	7.44	17.42	2.010	14.31	59.7	-42	500	36.45
0720	7.41	17.40	2.010	14.25	60.1	-46	500	36.45
Tolerance:	0.1	---	3%	10%	10%	+ or - 10	---	

Information: WATER VOLUMES--0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft; 4 inch diameter well = 2470 ml/ft ($vol_{cyl} = \pi r^2 h$)

Remarks: Water color very rusty at initial purging.

Device: Bladder Pump Tubing Type: Poly Pump/Tubing
Inlet
Location: Screen midpoint

Measuring Point:	Below Top of Riser	Initial Depth to Water:	36.45	Depth to Well Bottom:	80.30	Well Diameter:	2"	Screen Length:	10'
------------------	--------------------	-------------------------	-------	-----------------------	-------	----------------	----	----------------	-----

Casing Type:	PVC	Volume in 1 Well Casing (liters):	27.1	Estimated Purge Volume (liters):	30
--------------	-----	-----------------------------------	------	----------------------------------	----

Sample ID: DEC-065D Sample Time: 0745 QA/QC: _____

Sample Parameters: _____ TCL VOCs + Tics

PURGE PARAMETERS

[illegible]

Information: WATER VOLUMES--0.75 inch diameter well = 87 ml/ft; 1 inch diameter well = 154 ml/ft; 2 inch diameter well = 617 ml/ft;
4 inch diameter well = 2470 ml/ft ($\text{vol}_{\text{cyl}} = \pi r^2 h$)

Remarks: NR - Not Recorded

1.0 INTRODUCTION

This Data Usability Summary Report (DUSR) has been prepared following the guidelines provided in New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation *DER-10 Technical Guidance for Site Investigation and Remediation, Appendix 2B-Guidance for Data Deliverables and the Development of Data Usability and Summary Reports, May 2010*. Analytical data for 25 soil samples, 45 groundwater samples, 1 product sample, 31 soil gas samples, 4 groundwater field duplicates, 4 soil gas field duplicates, 2 groundwater matrix spikes/matrix spike duplicates (MS/MSD) pairs, 3 ambient air samples, and 2 trip blanks collected by URS personnel on May 5, 2011-June 24, 2011 from the Former Klink Cosmos site are discussed in this DUSR.

2.0 ANALYTICAL METHODOLOGIES

All soil and groundwater samples were sent to Miktem Laboratories, Inc. (Warwick, RI) for analysis. The soil samples were analyzed for: volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method SW8260B; semivolatile organic compounds (SVOCs) by USEPA Method SW8270C; pesticides/PCBs by USEPA Methods 8081B/8082A; herbicides by USEPA Method 8151; metals/cyanide by USEPA Methods 6010C/7471B/9012B; and hexavalent chromium by USEPA Method 7196A. Not all samples were analyzed for all parameters.

Two soil samples underwent a Toxicity Characteristic Leaching Procedure (TCLP) extraction in accordance with USEPA Method 1311. The extracts were then analyzed for TCLP VOCs by USEPA Method 8260C; TCLP SVOCs by USEPA Method 8270D; TCLP Pesticides by USEPA Method 8081B; TCLP Herbicides by USEPA Method 8151A; TCLP metals by USEPA Method 6010C/7470A; flashpoint by USEPA Method 1010; pH by USEPA Method 9045C; and reactive cyanide/sulfide by section 7.3.4.2.

One product sample was analyzed for VOCs by USEPA Method SW8260B; SVOCs by USEPA Method SW8270C; total petroleum hydrocarbons by USEPA Method 8015D; and specific gravity by American Society for Testing and Materials (ASTM) Method 2170F. The specific gravity analysis was subcontracted to Mt. Tom Generating Co. LLC Analytical Laboratory located in West Springfield, MA.

The air samples were analyzed for VOCs by USEPA Compendium of Methods for the Determination of Toxic Compounds in Ambient Air Method TO-15.

A limited data validation was performed following the guidelines in the following USEPA Region II documents:

- *Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8260B, SOP HW-24, Rev. 2, August 2008;*
- *Validating Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW-846 Method 8270D, SOP HW-22, Rev. 4, August 2008;*
- *Validating Pesticide Compounds by Gas Chromatography SW-846 Method 8081B, SOP HW-44, Rev.1, August 2006;*
- *Validating PCB Compounds by Gas Chromatography SW-846 Method 8082A, SOP HW-45, Rev.1, August 2006;*
- *Validation of Metals for the Contract Laboratory Program (CLP) Based on SOW ILM05.3, SOP HW-2, Rev. 13, September 2006; and*
- *Validating Chlorinated Herbicides by GC, SW-846, Method 8151A, SOP HW-17, Rev. 2, September 2006.*

The limited validation included: a review of holding times and completeness of all required deliverables; a review of quality control (QC) results (blanks, instrument tunings, calibration standards, duplicate analyses, and laboratory control sample (LCS) recoveries to determine if the data are within the protocol-required limits and specifications; a determination that all samples were analyzed using established and agreed upon analytical protocols; an evaluation of the raw data to confirm the results provided in the data summary sheets; and a review of laboratory data qualifiers.

Qualifications applied to the data include 'J' (estimated concentration), 'UJ' (estimated quantitation limit), and 'R' (rejected/data unusable). Definitions of USEPA Region II data qualifiers are presented at the end of this text. A summary of data qualifications is provided on Table 1. The validated analytical results are presented on Tables 2 – 7. Copies of the validated laboratory results (i.e., Form 1's) are presented in Attachment A. Documentation supporting the qualification of data is presented in Attachment B. Only analytical deviations affecting data usability are discussed in this report.

3.0 DATA DELIVERABLE COMPLETENESS

Full deliverable data packages were provided by the laboratory, which included all reporting forms and raw data necessary to fully evaluate and verify the reported analytical results.

4.0 PRESERVATION/HOLDING TIMES/SAMPLE RECEIPT

All samples were received by the laboratory intact, properly preserved, and under proper chain-of-custody (COC). All samples were analyzed within the required holding times.

5.0 NON-CONFORMANCES

Instrument Calibration

The relative response factors (RRF) for VOCs acetone, 2-butanone, and 1,4-dioxane in the initial calibration (ICAL) and/or the continuing calibration (CCAL) standards associated with the soil samples were below the lower QC limit (0.05). The non-detected results for these compounds in the associated soil samples listed on Table 1 have been qualified 'R' and the detected compounds qualified 'J'.

The RRF for VOCs 1,4-dioxane in the ICAL and/or the CCAL standards associated with the groundwater samples were below the lower QC limit (0.05). The non-detected results for these compounds in the associated groundwater samples listed on Table 1 have been qualified 'R' and the detected compounds qualified 'J'.

The RRF for VOCs acetone, 2-butanone, and 1,4-dioxane in the ICAL and/or the CCAL standards associated with the product sample were below the lower QC limit (0.05). The non-detected results for these compounds in the associated product sample listed on Table 1 have been qualified 'R'.

The percent relative standard deviation (%RSD) of VOCs 1,1-dichloroethene, naphthalene, and/or cis-1,2-dichloroethene in the ICAL exceeded the QC limit of 15%. The detected results for these compounds in the associated groundwater samples listed on Table 1 have been qualified 'J'.

The percent difference (%D) between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the soil samples exceeded the QC limit of 20% for VOCs 2-hexanone, 1,2-dibromo-3-chloropropane, naphthalene, and/or n-butylbenzene. The non-detect results for these compounds in the associated soil samples listed on Table 1 were qualified 'UJ'.

The %D between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the groundwater samples exceeded the QC limit of 20% for VOCs cis-1,2-

dichloroethene, 1,2-dichloropropane, 2-chlorotoluene, 2-hexanone, 4-methyl-2-pentanone, 1,2-dibromo-3-chloropropane, 1,2,3-trichlorobenzene, 1,2,4-trichlorobenzene, benzene, carbon tetrachloride, chloromethane, cyclohexane, dichlorodifluoromethane, hexachlorobutadiene, idomethane, sec-butylbenzene, methylcyclohexane, naphthalene, trichlorofluoromethane, vinyl acetate, and/or vinyl chloride. The non-detect results for these compounds in the associated groundwater samples listed on Table 1 were qualified 'UJ'.

The %D between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the air samples exceeded the QC limit of 20% for VOCs 1,2,4-trichlorobenzene and/or hexachloro-1,3-butadiene. The non-detect results for these compounds in the associated air samples listed on Table 1 were qualified 'UJ'.

The %D between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the soil samples exceeded the QC limit of 20% for SVOCs 2-methylnaphthalene, 2,4-dinitrophenol, 4-chloroaniline, 4-nitrophenol, atrazine, hexachlorobutadiene, nitrobenzene, and/or pyridine. The detected results for these compounds in the associated soil samples listed on Table 1 were qualified 'J', and the non-detected results 'UJ'.

The %RSD of SVOCs benzo(k)fluoranthene and/or pyridine in the ICAL exceeded the QC limit of 15%. The detected results for these compounds in the associated soil samples listed on Table 1 have been qualified 'J'.

The %D between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the groundwater samples exceeded the QC limit of 20% for SVOC 2,4-dinitrophenol. The non-detect results for this compound in the associated groundwater samples listed on Table 1 were qualified 'UJ'.

The %D between the ICAL average RRF and the RRF in one or more of the CCAL standards associated with the product sample exceeded the QC limit of 20% for SVOCs 2,2'-oxybis(1-chloropropane), n-nitroso-di-n-propylamine, butylbenzyl phthalate, bis(2-ethylhexyl)phthalate, di-n-octylphthalate, and/or atrazine. The non-detect results for these compounds in the associated product sample listed on Table 1 were qualified 'UJ', and the detected results qualified 'J'.

The %D in the herbicide CICAL standard associated with the soil samples listed on Table 1 exceeded the QC limit of 25% for MCPA and MCPB. The non-detect results for these compounds in the associated samples listed on Table 1 were qualified 'UJ'.

Documentation supporting the qualification of data (i.e., VOC/SVOC/Herbicides Forms 6 and 7) is presented in Attachment B.

Laboratory Control Samples (LCS)

The percent recovery (%R) of VOC naphthalene was above the upper QC limit in the LCS. The detected result for naphthalene in soil sample DEC-065D (34-35) was qualified 'J'.

The %R of VOC cyclohexane was below the lower QC limit in the LCS. The non-detected results for cyclohexane in the associated groundwater samples listed on Table 1 were qualified 'UJ'.

The %Rs of SVOC 2-methylphenol and caprolactam were below the lower QC limit in the LCS. The non-detected results for these compounds in the associated groundwater samples listed on Table 1 were qualified 'UJ'.
