1.0 INTRODUCTION

This report presents the results of the Site Characterization (SC) completed by HRP Associates, Inc. (HRP) between November 2021 and March 2024 at the Elton Street Groundwater Site (Site #224250) and Linwood Street Groundwater Site (Site #224250), located at the intersections of Elton Street and Linwood Street with Wortman Avenue in the East New York neighborhood of Brooklyn, New York (referred to hereinafter as the Sites). Since the Sites are not tied to specific property boundaries, the geographic area of SC investigations is referred to hereinafter as the "study area." The study area location is depicted on **Figure 1**. A geographic description of the study area is included in **Section 1.3**. The investigation was conducted to identify the sources of chlorinated volatile organic compound (CVOC) contamination identified in groundwater beneath the study area. The SC was completed for the New York State Department of Environmental Conservation (NYSDEC).

Interpretations presented within this report are based primarily on the investigations described herein. Site history and background information were compiled by HRP based on review of previous environmental reports and other records obtained from the NYSDEC, New York State Department of Health (NYSDOH), and other agencies. Applicable data from available documents and environmental investigations have been included in sections of this report.

This report has been redacted to remove addresses and other information that could identify private properties associated with the SC investigation activities which are not in NYSDEC remediation programs.

DRAFT

1.1 Report Organization

The text of this report is divided into seven sections. Immediately following the text are the tables, figures, and appendices. A summary of each report section is provided below:

Section 1.0 **Introduction:** Includes the purpose and objectives of the SC, a description of the study area, a record review (historical map review, regulatory database records and information obtained from New York City, and a summary of previous environmental investigations and records), and description of areas of concern (AOCs).

Section 2.0 **Physical Characteristics of the Study Area:** Includes results of field activities to describe physical characteristics, including topography, geology, and hydrogeology.

Section 3.0 **Study Area Investigations:** Summarizes field activities associated with the SC, including the community air monitoring plan (CAMP), underground utility clearance, subsurface soil investigations, groundwater investigations, soil vapor investigations, deviations from the work plan, and a description of the interim remedial measure (IRM).

Section 4.0 **Observations, Findings, and Laboratory Analytical Results:** Presents field observations and analytical results of soil, groundwater, and soil vapor sampling completed for the SC in relation to relevant standards, criteria and guidance values (SCGs). Data validation and usability is also discussed.

Section 5.0 Nature and Extent of Contamination: Presents a conceptual site model (CSM), including an assessment of the contaminant fate and transport for soil, groundwater, and soil vapor to describe the nature and extent of contamination in relation to the physical features and processes of the study area and potential migration pathways.

Section 6.0 Conclusions: Presents conclusions of the SC investigation and a discussion of data gaps.

Section 7.0 References: Provides a list of references used throughout this report.

1.2 Purpose and Objectives

The purpose of the SC is to determine whether Site conditions pose a risk to public health and the environment. In accordance with DER-10 *Technical Guidance for Site Investigation and Remediation (May 2010),* the primary objectives of the SC are to:

- Investigate the identified AOCs associated with the Sites and evaluate the extent of contamination related to the AOCs. Specifically, the SC was intended to identify the sources and extent of contamination of two CVOC groundwater contamination plumes in the study area (see Section 1.5).
- Obtain geologic and hydrogeologic data from the Sites. The specific information that should be collected and/or verified includes: soil types (or fill), depth to groundwater, groundwater flow direction, subsurface geology, bedrock characteristics, etc. Determine if applicable SCGs contained in NYSDEC DER-10 and set forth for the Sites are contravened.
- Preliminarily delineate the vertical and horizontal extent of contaminated groundwater, if any.
- Determine if the site represents a threat to public health or the environment.

1.3 Study Area Description

The approximate center of the study area is located at the intersections of Elton Street and Linwood Street with Wortman Avenue, in the East New York neighborhood of Brooklyn, New York (**Figure 1**). The SC investigation activities took place over an area which extends east to west from Shepard Avenue to Ashford Street and north to south from Linden Boulevard to Cozine Avenue (**Figure 2**). The Former Watermark Design Facility (FWDF), a NYSDEC Brownfield Cleanup Program (BCP) site located at 491 Wortman Avenue, is situated within the study area and is depicted on **Figure 2**. Based on the results of this SC investigation, 869 Stanely Avenue, a former manufacturing property and machine shop located within the study area, was entered into the NYSDEC Registry of Inactive Hazardous Waste Disposal Sites as a Class 2 site (#224394). 869 Stanley Avenue is depicted on **Figure 2**. This site is discussed further in **Sections 4**, **5**, and **6**.

According to the New York City Zoning and Land Use Map (NYC ZoLa), current zoning within the study area includes the following designations:

- M1 – light industrial (generally east of Elton Street).

DRAFT

- R5 – residential, including low-rise attached houses, small multifamily apartment houses, and detached and semi-detached one- and two-family residences (generally west of Elton Street). Residentially zoned properties include two properties occupied by New York State Office for People with Developmental Disabilities (NYOPWDD) located at 1038 Cleaveland Street and 434 Wortman Avenue (respectively designated properties 56 and 57 on **Figure 2**).
- C8-1 – commercial (Livonia Yard, a New York City Transit [NYCT] train yard located between Elton Street and Linwood Street, north of Stanley Avenue).
- C1 – commercial overlay, within an area zoned residential (a small area at the intersection of Ashford Street and Stanley Avenue).

Present-day property use as identified by the New York City Department of City Planning (NYC DCP) is depicted on **Figure 3**.

1.4 Records Review

Historical information concerning the history of the Sites and study area was reviewed as part of this SC. This included a review of the following sources of information:

- Regulatory database records and historical records available through Environmental Database Resources Inc. (EDR), a commercial database provider.
- Municipal files and historical records available through the New York City Department of Environmental Protection (NYCDEP).
- Environmental investigations and related reports completed by others and provided to HRP by the NYSDEC.

1.4.1 Historic Map and Regulatory Record Review

Available Sanborn Fire Insurance Company maps, aerial photographs, historical topographic maps, city directories and regulatory database records were obtained from EDR. Maps and records were reviewed to identify "properties of interest" (POIs) which represent potential sources of CVOC contamination based on their commercial, industrial, and regulatory history. Historic uses and relevant regulatory findings from the properties of interest are described on **Table 1**. The addresses and locations of the POIs have been redacted from the table. The EDR Report is included in **Appendix A.**

Based on review of available records provided by EDR, Inc., the study area has consisted of light industrial/manufacturing, commercial, and residential uses since the early 1900's. Properties within the study area have been used and, in some cases, continue to be used as machine shops, auto body and automotive repair shops, and various types of manufacturing.

Multiple metal manufacturers and warehouses are located throughout the study area, specifically along Linwood Street and Essex Street. Processes involved with metal manufacturers include cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products.

DRAFT

Chlorinated solvents, including trichloroethene (TCE) and tetrachloroethene (PCE) have been known to be used as degreasers in the manufacturing process to clean various metal products.

1.4.2 State and Local Agency File Review

In addition to the record searches performed through EDR a Request for Records Form was submitted on January 19th, 2022, to the NYCDEP. The purpose of the request was to obtain information related to sewer infrastructure within the study area, to determine if infrastructure may have an impact on groundwater flow. In response to the request, NYCDEP provided a map depicting sewer line locations, depths, age, dimensions, and construction. The NYCDEP sewer maps are included in **Appendix B**.

1.4.3 Environmental Investigations by Others

Site environmental investigation reports and related reports provided to HRP by NYSDEC are summarized below. A bibliography of reports reviewed by HRP can be found in **Section 7.0**.

FWDF BCP Site, Various Reports, prepared by P.W. Grosser Consulting (PW Groser), and Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C. (Langan), 2008-2020

The FWDF is a former metal manufacturer and current warehouse located at 491 Wortman Avenue, managed under the BCP as Site #C224139. The property was historically operated as a manufacturer and distributor of decorative metal fixtures and hardware for bathrooms and kitchens and used PCE and TCE in site operations.

Numerous phases of site assessment and remedial investigations completed at the FWDF site identified CVOCs at concentrations exceeding NYSDEC SCGs in soil, groundwater, and soil vapor on the western side of the property. A source area of PCE and TCE contamination was identified in a truck scale pit located in the northwest corner of the FWDF building.

An air sparge system and soil vapor extraction system (AS/SVE) was installed on the site in 2015 to remediate CVOC impacts. In February 2020, based on reductions in CVOC groundwater impacts, the NYSDEC approved the permanent shutdown of the AS/SVE system and implementation of a sub-slab depressurization system (SSDS) for long-term mitigation of vapor intrusion at the site.

Investigations performed by the BCP volunteer concluded that some off-site groundwater contamination was attributable to the FWDF site, at the intersection of Linwood Street and Wortman Avenue, downgradient and crossgradient from the site, encompassing the shallow off-site monitoring wells MW-6, -7, -8, -10, -11, and ML-002S. CVOC impacts to groundwater at greater depths in the Upper Glacial Aquifer (investigated to a depth of 60 feet below grade [ft bg]) were more widespread but attributed to other off-site sources in addition to the FWDF site. The monitoring wells are depicted on **Figure 2**.

During FWDF site investigations, two off-site plumes were identified which were attributed to unknown off-site sources by the BCP volunteer. The off-site plume identified herein as the "Elton

DRAFT

Street Plume" was first identified at MW-13 (crossgradient, southwest of the FWDF site) and was differentiated from the FWDF plume based on lower CVOC concentrations in shallow groundwater in wells between the site and MW-13 (including MW-7, MW-8, MW-10, MW-11, ML-002S) and based on its chemical composition which was dominated by TCE and included the CVOCs 1,1,1-trichloroethane (1,1,1-TCA), and 1,1-dichloroethane (1,1-DCA), in contrast to the FWDF plume which generally consisted of near 1:1 concentrations of PCE and TCE and did not include 1,1,1-TCA and 1,1-DCA. The off-site plume identified herein as the "Linwood Street Plume" was first identified at MW-19 (upgradient, north of the FWDF site), and was differentiated from the FWDF plume based on the presence of CVOCs at higher concentrations than were detected in on-site wells. Sources of the plumes (as defined by 6 NYCRR Part 375-1.2 (au) as discrete areas of soil, sediment, surface water, or groundwater, containing contaminants at sufficient concentrations to migrate in that medium or to release significant levels to another medium, which could result in a threat to public health and the environment and typically including concentrated solid or semi-solid hazardous substances, non-aqueous phase liquids [NAPL], or grossly contaminated media), were not identified during off-site investigations associated with the FWDF site. Monitoring well locations are depicted on **Figure 2**.

Plume Track-Down Summary Report, Elton Street GW, **prepared by Environmental Assessment & Remediations (EAR) and dated June 2017**

In 2017 EAR conducted a plume track-down investigation of the Elton Street Plume. Three sets of nested monitoring wells were installed upgradient and downgradient of MW-13 at depths up to 60 ft bg (designated herein as EAR-MW-17, -18, and -19 to be differentiated from wells with similar IDs installed by the FWDF BCP volunteer). The investigation identified CVOC impacts at EAR-MW-17, similar in composition (TCE-dominated) but in greater concentrations than detected in MW-13, suggesting the source of the impacts was located upgradient (north) of MW-13; however, the source of the Elton Street Plume (as defined by 6 NYCRR Part 375-1.2 (au)), was not identified. Monitoring well locations are depicted on **Figure 2**.

Site Characterization Report**, Elton Street Groundwater Site prepared by Preferred Environmental Services (PES) and dated January 2020**

In 2019, PES performed a Site Characterization investigation at properties located within the study area on behalf of the owner of the properties under a NYSDEC order on consent. The investigation was performed to determine if a source area of the Elton Street Plume existed within these commercial/industrial properties. The properties investigated were identified as a potential source of contamination based on the presence of a machine shop on Sanborn Fire Insurance Maps from 1965-2007 (**Table 1**). The address and location of the properties have been redacted from this report.

TCE was detected at concentrations exceeding Class GA criteria in each of three monitoring well couplets installed within buildings on the properties (screened at the groundwater interface and 30-40-ft bg intervals). 1,1,1-TCA and 1,1-DCA, which were identified as constituents of the Elton Street Plume, were not detected at concentrations exceeding Class GA criteria. The source of the Elton Street Plume (as defined by 6 NYCRR Part 375-1.2 (au)), was not identified during the investigation.

DRAFT

Soil Vapor Intrusion Investigation, **prepared by PES and dated May 2023**

In 2023, PES performed soil vapor intrusion (SVI) structure sampling at five commercial/industrial properties within the study area on behalf of the owner of the properties in response to solicitations made by NYSDEC for SVI structure sampling. Each structure sampling included the installation of one temporary sub-slab soil vapor point and collection of one sub-slab soil vapor sample and one indoor air sample from each property as well as the collection of three outdoor air samples. All samples were collected using 4-hour regulators and analyzed for VOCs via EPA Method TO-15. Comparison of the structure sampling results to the May 2017 NYSDOH Soil Vapor/Indoor Air Decision Matrices A, B, and C categorized each property as "No Further Action."

It should be noted that the SVI structure sampling completed by PES was not performed in accordance with a NYSDEC approved work plan, and soil vapor and indoor air samples were collected over 4-hr periods, instead of the NYSDOH-recommended 8-hr sampling periods for the commercial and industrial properties sampled by PES.

1.5 Areas of Concern (AOCs)

Previous investigations conducted within the study area identified two groundwater contamination plumes attributed to unknown sources outside of the FWDF site. The two plumes represent the AOCs for this SC. As stated in **Section 1.2**, an objective of the SC was to identify sources and the extent of contamination of the two plumes.

The Elton Street Plume was identified at MW-13 and EAR-MW-17 (**Figure 2**). Previous investigation data indicated the plume was TCE-dominated with lesser concentrations of PCE, cis-1,2-DCE, 1,1-DCA, and 1,1,1-TCA, and vinyl chloride. Lower CVOC concentrations in shallow wells between the FWDF and MW-13 and EAR-MW-17, and the differences in chemical composition of contamination from the FWDF site plume led previous investigations to attribute the plume to an unidentified off-site source. The source of the Elton Street Plume and the vertical and lateral extent of the plume were not defined by previous investigations.

The Linwood Street Plume was identified at MW-19. Previous investigation data indicated contaminants were detected at higher concentrations at MW-19 than at on-site FWDF wells. Additionally, MW-19 is located hydraulically upgradient of the FWDF site, leading previous investigations to attribute contamination at the well to an unidentified off-site source. The source of the Linwood Street Plume and the vertical and lateral extent of the plume were not defined by previous investigations.

Previous investigations identified impacts to soil vapor associated with both plumes within the study area; however, SVI structure sampling was only completed at a limited number of properties at the intersection of Linwood Street and Wortman Avenue.

DRAFT

2.0 PHYSICAL CHARACTERISTICS OF THE STUDY AREA

2.1 Topography

Topography ranges from 10-15 ft above mean sea level (amsl) and gently slopes northwest to southeast from Linden Boulevard to Wortman Avenue and southeast to northwest from Cozine Street to Wortman Avenue. Regional topography slopes gently southeast, towards Jamaica Bay (approximately 1.5 miles south of the study area). The nearest surface waterbodies are Hendrix Creek (approximately 0.33 miles southwest of the study area) and Betts Creek (approximately 0.5 miles southeast of the study area).

2.2 Geology

Based on SC soil logging, soils generally consist of fill materials overlying sand and gravel. Fill material containing brick, asphalt, glass, ash, porcelain, wood, concrete, coal, and cinders is found at depths between 0.5 ft bg (below pavement) and 5 ft bg. The fill material is underlain by fine to medium sand with some silt (1–10 ft bg), fine to coarse sand (3-15 ft bg), medium to coarse sand with some fine to medium gravel (15-25 ft bg), and interbedded layers of medium to coarse sand (25-60 ft bg). Soil logging during this SC was limited to a depth of 60 ft bg. Soil boring logs are included in **Appendix C**. A cross section transect map that displays the aerial extent of north-south and east-west cross sections, is depicted on **Figure 4**. The north-south cross section is depicted on **Figure 5** and the east-west cross section is depicted on **Figure 6**.

Bedrock consists of schist and gneiss (Isachsen et. al., 2000) and is as deep as 500-600 ft bg in the study area (DeMott et. al., 2023). Bedrock was not encountered during drilling activities related to this SC. No previous investigations which took place within the study area and were reviewed by HRP encountered bedrock during subsurface exploration.

2.3 Hydrogeology

The Long Island aquifer system is composed of several unconsolidated sediment deposits overlying bedrock, forming a southward dipping wedge. All previous study area investigations reviewed by HRP and investigations for this SC took place in the upper glacial aquifer, which consists of saturated sand and gravel beds deposited as outwash south of Long Island's terminal moraine and is approximately 100-150 ft thick beneath the study area (Buxton and Shernoff, 1999).

The SC investigated groundwater in three intervals. Shallow monitoring wells were screened across the groundwater interface with screen settings ranging in depth from 7-17 ft bg to 12-22 ft bg. Intermediate and deep interval depths were set based on investigations at the FWDF site, at 30-40 ft bg and 50-60 ft bg, respectively. No fine grained soil units, which would be indicative of aquitards or confining units, were encountered during SC investigations; therefore, it is assumed that all three groundwater monitoring intervals are located within the same unconsolidated aquifer.

Depth to groundwater ranged from approximately 9 to 12 ft bg across the study area (groundwater elevations of approximately 2 to 3.5 ft amsl). SC groundwater gauging events indicate groundwater flow is to the southeast in the shallow, intermediate, and deep intervals, following the slope of

DRAFT

regional topography and geology towards Jamaica Bay. The groundwater levels recorded during the SC are summarized on **Table 2.** A groundwater contour map depicting flow direction at the water table, at 30 to 40 ft bg, and at 50 to 60 ft bg are included as **Figures 7A**, **7B**, and **7C**, respectively.

Underground utilities and associated gravel packs which intersect the groundwater table may act as preferential pathways, impacting groundwater flow. Combined stormwater/sewer lines intersect the groundwater table throughout the study area. At Wortman Avenue, the groundwater table is intersected by a 158-inch (13-ft) tall, 98-inch (8-ft) wide brick sewer line, pitched to flow west along Wortman Avenue. The porous brick sewer line and gravel pack which may surround it may intercept groundwater flow from the north and redirect it west, the direction it is pitched. Sewer lines, construction, dimensions, and flow direction are depicted on groundwater flow maps, **Figures 7A**, **7B**, and **7C**, and on cross-sections, **Figures 5** and **6**. Sewer maps provided by NYCDEP are included in **Appendix B**. Potential impacts of the sewer lines on contaminant fate and transport is discussed in **Section 5.3**.

No federally registered Public Water Supply (PWS) wells were identified in the database search performed by EDR. A review of NYSDEC Info Locator records identified a supply well in the southwest portion of the study area at 1025 Elton Street, between Wortman Avenue and Cozine Avenue and is registered to Superior Laundry (well #K003611). The well is screened from 43-53 ft bg. The use of well water is listed as "washing." Potable water is provided to the study area by the City of New York (water is sourced from the Catskill and Delaware Water Supply System).

DRAFT

3.0 STUDY AREA INVESTIGATIONS

Investigations were completed at the study area in accordance with the NYSDEC and NYSDOH-approved SC Work Plan dated October 28, 2021 (Work Plan), the Preliminary SC Summary dated January 27, 2022 (Preliminary SC Summary), and the Sub-Slab Soil Vapor Intrusion Investigation Scope of Work, dated February 9, 2023 (SVI SOW). A description of the study area investigations conducted during the SC is presented in this Section.

Deviations based on field conditions are noted in **Section 3.9**. The investigation tasks described in the Work Plan adhered to the NYSDEC's *DER-10, Technical Guidance for Site Investigation and Remediation*, dated May 2010 (DER-10). HRP followed the procedures outlined in the previously approved generic Field Activity Plan (FAP), Quality Assurance Project Plan (QAPP), and Health and Safety Plan (HASP).

Field work for this SC was conducted in several mobilizations and included the following tasks:

- Completion of subsurface utility clearance at soil boring locations (November 11, 2021).
- Installation of 12 soil borings (SB-1 through SB-12; November 15 through November 19, 2021).
- Collection of 12 grab groundwater samples (GW-1 through GW-12) from boring locations SB-1 through SB-12 (November 15 through November 19, 2021).
- Collection of depth to water measurements from study area monitoring wells (November 15, 2021, July 27, 2022, and September 15, 2022).
- Collection of 27 groundwater samples from pre-existing shallow, intermediate, and deep monitoring wells installed in the study area (November 15 through November 19, 2021).
- Completion of subsurface utility clearance at soil boring locations (May 11, 2022).
- Installation of 11 soil borings (SB-13 through SB-23) (May 11 through May 17, 2022).
- Collection of 11 grab groundwater samples (GW-13 through GW-23) from boring locations SB-13 through SB-23 (May 12 through May 17, 2022).
- Collection of three soil samples from soil boring SB-20 (May 16, 2022).
- Completion of subsurface utility clearance at soil boring locations (July 25, 2022).
- Installation of 11 exterior soil vapor points (SVI-1 through SVI-11) (May 17 through May 19, 2022 and July 25, 2022).
- Collection of 11 soil vapor samples from SVI-1 through SVI-11 (May 20, 2022 and July 27, 2022).
- Installation of 10 monitoring wells including three sets of nested shallow, intermediate, and deep monitoring wells and one shallow monitoring well (May 24 through May 25, 2022 and July 26 through July 28, 2022).
- Installation of two soil borings (GW-20 and GW-24) (July 25 through July 26, 2022).
- Collection of two soil samples from soil boring GW-20 (July 26, 2022).

DRAFT

- Development of 10 newly installed monitoring wells (May 25 through May 26, 2022 and July 28, 2022).
- Collection of 10 groundwater samples from newly installed monitoring wells (August 9, 2022).
- Completion of a top of casing elevation and location survey of soil borings, monitoring wells, and soil vapor points (September 16, 2022).
- Completion of SVI structure sampling at 13 locations during the following dates:
    - March 13-14, 2023
    - March 23-24, 2023
    - March 29-30, 2023
    - April 5, 2023
    - March 18-19, 2024

3.1 Community Air Monitoring Plan (CAMP)

A CAMP was included in the scope of work as presented and approved in the SC Work Plan. Real-time monitoring was conducted for VOCs and dust particulates at the upwind and downwind perimeters of each designated work area when ground intrusive activities were being conducted (soil boring, monitoring well and exterior soil vapor point installation).

VOC monitoring was performed using Mini RAE 3000 photoionization detectors (PIDs) equipped with 10.6 eV bulbs. The PID was routinely calibrated and placed in a weather-proof box that sat on a tripod approximately 4 feet off the ground. The downwind PID readings did not exceed 5 ppm during the field investigations.

The particulate monitoring was performed using a TSI Dust Trak II, a real-time monitor capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action level. The Dust Trak was routinely zero-checked and was placed in a weatherproof box that sat on a tripod approximately 4 feet off the ground.

In some instances, while setting up or moving the Dust Trak, apparent spikes in particulate readings were triggered by handling of the equipment (i.e. blocking air flow to the inlet). This occurred on November 15, 16, and 17, 2021 and July 28, 2022, causing particulate readings to exceed 100 $\mu g/m^3$. As is demonstrated by the data, the spikes in particulate readings were isolated occurrences and were not triggered by dusty conditions in the work area. Particulate readings did not exceed 100 $\mu g/m^3$ during field investigations activities, with the exception of the instances described above. Visible dust was not observed on-site during SC field work. VOC and particulate concentration readings are included in **Appendix D**.

DRAFT

3.2 Underground Utility Clearance

Prior to conducting intrusive activities, underground utility clearance was conducted by American Geophysics. Ground penetrating radar (GPR) and other techniques were used to clear soil boring, monitoring well and exterior soil vapor point locations on November 11, 2021, May 11, 2022, and July 25, 2022.

GPR surveying is a nonintrusive, subsurface geophysical investigation technique that detects subsurface structures by transmitting electromagnetic waves from an antenna into the ground. The antenna then monitors the strength and time delay of the return signal. The return signal is then evaluated for any anomalies, which by their size, shape and orientation can be interpreted as voids, underground storage tanks, utility pipelines, soil-bedrock interface or areas of different sediment compaction. A radio frequency (RF) line locator was also used to identify subsurface utility lines based on the presence of 120 hertz signal (electric) and transmitted signals from the RF transmitter.

3.3 Subsurface Soil Investigation

3.3.1 Soil Boring Installation

To characterize subsurface soils, HRP and Island Pump and Tank (IP&T) of East Northport, NY installed a total of 38 soil borings during three separate mobilizations to the study area on November 15-18, 2021, May 12-23, 2022, and July 25, 2022. All soil borings installed in the right of way (sidewalks) and were co-located with grab groundwater sample locations, monitoring wells, or soil vapor points shown on **Figure 2.** The three types of investigation locations co-located with soil borings are described below:

- Grab groundwater sample locations – 23 soil borings advanced to a depth of 20 ft bg, designated SB-1 through SB-23, co-located with grab groundwater samples GW-1 through GW-23 depicted on **Figure 2**.
- Monitoring wells – 4 soil borings advanced to depths ranging from 30-55 ft bg, designated GW-20 (co-located with HRP-MW-22 and SB-20), SB-24 (co-located with HRP-MW-20, GW-4, and SB-4), SB-25 (co-located with HRP-MW-21 and GW-5), and SB-26 (co-located with HRP-MW-23S). Monitoring well locations are depicted on **Figure 2**.
- Exterior soil vapor points – 11 soil borings advanced to a depth of 10 ft bg, designated SVI-1 through SVI-11 and co-located with exterior soil vapor points of the same IDs, depicted on **Figure 2**.

None of the boring locations were limited by refusal. Justifications for the co-located groundwater and soil vapor sample points are included in the sub-sections below.

For all soil boring installations, IP&T used a Geoprobe 7822DT track-mounted drill rig equipped with a hollow stem auger and a 2.25-inch macro-core sampler which was advanced using a direct-push method. Soil samples were collected continuously by the macro-core sampler in 5-foot intervals.

During soil boring installation, soil samples were logged and screened in 5-foot increments by an HRP geologist. Soil samples were logged by grain size, color, moisture, presence of fill material, and

DRAFT

obvious physical evidence of contamination (i.e. odor, staining). A small portion (1-2 oz.) of each sample was placed in a polyethylene zip top bag and allowed to attain ambient temperature before PID headspace analysis. PID headspace analysis measurements and soil descriptions are presented on soil boring logs included in **Appendix C**.

All non-disposable soil sampling equipment was decontaminated between samples using an Alconox wash followed by a clean water rinse. Boreholes not converted into monitoring wells or soil vapor points were backfilled using drill cuttings and bentonite chips. Once the boreholes were backfilled, the sidewalk was patched with cement to match the grade of the sidewalk and then smoothed to avoid pedestrian injury.

3.3.2 Subsurface Soil Sampling

The collection of soil samples for laboratory analysis was not initially included in the scope of work for this SC; however, with approval of NYSDEC, a total of five soil samples were collected from the co-located soil borings SB-20 and GW-20 due to evidence of contamination (including strong odor, sheen, and a maximum PID reading of 14,488 parts per million [ppm]). SB-20 was installed to a completion depth of 20 ft bg for the purpose of collecting grab groundwater sample GW-20. Soil boring GW-20 was installed to a completion depth of 55 ft bg for the purpose of installing monitoring well HRP-MW-22 and to vertically delineate impacts observed at SB-20.

Each soil sample was submitted under chain of custody to Pace Analytical Services Inc. (Pace), a NYSDOH Environmental Laboratory Approval Program (ELAP) certified laboratory to be analyzed for TCL VOCs by EPA Method 8260.

Soil samples collected for the SC are summarized below.

Boring ID	Sample Depth (ft bg)	Sample Location	Justification
SB-20	5-10	SB-20/GW-20/HRP-MW-22 location; Northeast corner of Stanley Avenue and Linwood Street	Elevated PID reading of 59.5
SB-20	10-15		Elevated PID reading of 844
SB-20	15-20		Elevated PID reading of 14,488
GW-20	20- 25		Elevated PID reading of 162.7
GW-20	25-30		Sample collected below high PID hits to vertically delineate soil contamination

3.4 Groundwater Investigations

3.4.1 Grab Groundwater from Soil Borings

A total of 23 grab groundwater samples (GW-1 through GW-23) were collected from the shallow groundwater table to evaluate the extent of CVOC impacts to groundwater at the study area. All grab groundwater samples were collected from soil borings installed in the right of way (sidewalks).

DRAFT

Grab groundwater samples were collected in two mobilizations. GW-1 through GW-12 were installed in November 2021 to delineate CVOC impacts to shallow groundwater and identify sources of the Elton Street Plume and Linwood Street Plume. GW-13 through GW-23 were installed in May 2023 to further delineate and track down sources of the two plumes based on data from the first round of sampling.

Grab groundwater samples were collected using 3-foot, retractable steel screens advanced into shallow groundwater (within 10 ft below the groundwater interface), polyethylene tubing, and a peristaltic pump or check valve. Each groundwater sample was submitted under chain of custody to Pace to be analyzed for TCL VOCs by EPA Method 8260.

3.4.2 Monitoring Well Installation

A total of three sets of multi-level nested monitoring wells (HRP-MW-20, HRP-MW-21, and HRP-MW-22) and one shallow monitoring well (HRP-MW-23S) were installed in the study area in two mobilizations in May 2022 and July 2022. Monitoring wells were generally installed in grab groundwater locations from previous mobilizations to delineate the extent of the Linwood Street Plume, confirm shallow grab groundwater results, vertically delineate CVOC impacts to groundwater, and allow for repeatable samples. One monitoring well, HRP-MW-23S was installed in a location not previously investigated by grab groundwater samples to delineate the lateral extent of the Linwood Street Plume. HRP-MW-23S was intended to be installed as a multi-level nested well; however, the location was not safely accessible to the truck-mounted drill rig required to install the nested well. Therefore, a shallow monitoring well was installed using a track-mounted drill rig. Shallow monitoring wells were installed with 10 ft of screen set to intersect the groundwater interface. Intermediate and deep monitoring wells were installed with 10 ft of screen set to 30-40 ft bg and 50-60 ft bg to match screen settings of previous investigations. The monitoring well locations are depicted on **Figure 2**. Justifications for the monitoring well locations are summarized in the table below.

DRAFT

Area of Concern (AOC)	Monitoring Well ID	Screen Interval (ft bg)	Location	Justification
Linwood Street Plume	HRP-MW-20 (S/I/D)	8-18 30-40 50-60	Linwood Street, south of Stanley Avenue	Confirm and vertically delineate CVOC impacts at GW-4 grab groundwater location – centerline of Linwood Street Plume.
Linwood Street Plume	HRP-MW-21 (S/I/D)	8-18 30-40 50-60	Elton Street, south of Stanley Avenue	Confirm and vertically delineate CVOC impacts at GW-5 grab groundwater location – crossgradient extent of Linwood Street Plume.
Linwood Street Plume	HRP-MW-22 (S/I/D)	8-18 30-40 50-60	Linwood Street, north of Stanley Avenue	Confirm and vertically delineate CVOC impacts at GW-20

Area of Concern (AOC)	Monitoring Well ID	Screen Interval (ft bg)	Location	Justification
				grab groundwater location – upgradient extent of Linwood Street Plume.
Linwood Street Plume	HRP-MW-23S	8-18	Southwest corner of the Elton Street and Stanley Avenue intersection	Laterally delineate crossgradient extent of Linwood Street Plume.

Monitoring well construction logs are included in **Appendix E**. The monitoring wells were installed using the procedures described below:

- Nested monitoring wells HRP-MW-20, HRP-MW-21, and HRP-MW-22 were advanced to terminal depths using a CME-55 truck mounted drill rig with a 6.25-inch hollow stem auger.
- HRP-MW-23S was advanced to the desired depth using a Geoprobe 7822DT drill rig and a 4.25-inch hollow stem auger.
- The nested monitoring wells were installed with three lengths of 2-inch diameter Schedule 40 PVC well screen (0.010-inch slot) and riser pipe placed within the borehole at terminal depths of 60 ft bg, 40 ft bg, and 18 ft bg.
- All monitoring wells were installed with 10-ft screens. Shallow monitoring well screens were positioned to intercept the shallow groundwater interface.
- Number 1 or 2 filter sand was poured into the annular space between the well material and the borehole sidewall. The sand pack continued to 2-feet above the top of the screen section.
- Above the sand pack, a seal of bentonite pellets was formed in the borehole. The bentonite seal extended at least 1-foot above the top of the sand pack.
- Clean water was periodically added to the borehole to hydrate the bentonite pellets during installation.
- The well risers for wells were cut to approximately 2 inches bg and a J plug was inserted onto the top of each well casing. Flush mount road boxes were then installed within the sidewalks and over each well riser for protection.

All investigation derived waste (IDW) generated during the monitoring well installation activities was containerized in 55-gallon steel drums and transported off-site for disposal on the same day as generation. IDW disposal manifests are included in **Appendix F**.

3.4.3 Monitoring Well Development

HRP mobilized to the study area on May 5, 2022 and July 28, 2022 to develop the 10 newly installed monitoring wells. HRP developed the wells using a submersible whale pump to surge the water

DRAFT

column and evacuate the well. Pumping and surging was continued at each well until turbidity of the purge water was below 50 nephelometric turbidity units (NTUs). Non-disposable equipment was decontaminated prior to and between us in each well. Care was taken not to introduce contaminants to the equipment during well development. All development waters were emptied into a clean 5-gallon pail for approximate volume measurement and were then transferred to a 55-gallon steel drum for same-day off-site disposal. IDW disposal manifests are included in **Appendix F**. Monitoring well development data was recorded in monitoring well development data sheets and are included in **Appendix G**.

3.4.4 Monitoring Well Sampling

Depth to water measurements were recorded to the nearest 0.01-ft using an electronic water level tape prior to sampling events on November 15, 2021, July 27, 2022, and during monitoring well top of casing survey activities on September 15, 2022. Groundwater monitoring wells were sampled in general accordance with EPA low-flow techniques as described in the Work Plan and generic FAP. Low-flow stabilization parameters were recorded in field logs included in **Appendix H.**

A total of 37 groundwater samples were collected from monitoring wells during two mobilizations. Groundwater samples were collected from 27 pre-existing monitoring wells on November 15-19, 2022 and from 10 newly installed monitoring wells on August 9, 2022. Each groundwater sample was submitted under chain of custody to Pace to be analyzed for TCL VOCs by EPA Method 8260.

Monitoring well sample locations were selected to laterally and vertically delineate the two CVOC groundwater plumes. Monitoring well locations are depicted on **Figure 2**. Justifications for sample locations are summarized in the table below.

Areas of Concern (AOCs)	Monitoring Well ID	Screen Interval (ft bg)	Sample Location	Area Investigated Relative to Known Extent of Plume
Elton Street Plume	MW-12S	7 – 17	Elton Street, north of Wortman Avenue	Potential Sources/Upgradient
	MW-12I	30 – 40		
	MW-12D	50 – 60		
Elton Street Plume	MW-13S	7 – 17	Located at intersection of Elton Street and Wortman Avenue, southeast corner	Downgradient
	MW-13I	30 – 40		
	MW-13D	50 – 60		
Elton Street Plume	MW-14S	8 – 18	Elton Street, south of Wortman Avenue	Downgradient
	MW-14I	30 – 40		
	MW-14D	50 – 60		
Elton Street Plume	MW-15S	7 – 17	Linwood Street south, of Wortman Avenue	Downgradient
	MW-15I	30 – 40		

DRAFT

Areas of Concern (AOCs)	Monitoring Well ID	Screen Interval (ft bg)	Sample Location	Area Investigated Relative to Known Extent of Plume

Areas of Concern (AOCs)	Monitoring Well ID	Screen Interval (ft bg)	Sample Location	Area Investigated Relative to Known Extent of Plume
Linwood Street Plume	HRP-MW-23S	8 – 18	Southwest corner of the Elton Street and Stanley Avenue intersection	Crossgradient

3.4.5 Groundwater Quality Assurance/Quality Control (QA/QC) Sampling

In accordance with the Work Plan, 19 QA/QC groundwater samples were collected in addition to the 60 standard groundwater samples collected from the study area. All QA/QC samples were analyzed for VOCs by EPA Method 8260. QA/QC samples included the following:

- DUP-1, a duplicate of MW-18S
- DUP-2, a duplicate of GW-11
- DUP-3, a duplicate of MW-13I
- DUP-1_5.16.22, a duplicate of GW-20_5.16.22
- DUP-1_8.9.22, a duplicate of HRP-MW-22S
- Five sets of matrix spike/matrix spike duplicate (MS/MSD) samples, prepared from groundwater collected from MW-14I, EAR-MW-17S and GW-12, GW-20, and HRP-MW-22S
- Four field blanks, prepared from VOC-free water
- Four trip blanks, prepared from VOC-free water

3.5 Soil Vapor Investigations

3.5.1 Soil Vapor Point Sampling

On May 17, 18, and 20, 2022 and July 25 and 27, 2022, HRP and IP&T mobilized to the study area to install and sample a total of 11 soil vapor points in accordance the scope of work outlined in the Preliminary SC Summary. The purpose of the sampling was to screen for CVOC impacts to soil vapor outside of residential properties in the study area in the vicinity of the CVOC groundwater plumes. The soil vapor point locations are depicted on **Figure 2**. Property use as designated by the New York City Department of Planning is depicted on **Figure 3**.

The soil vapor points were installed in the right of way (sidewalks) by IP&T using a Geoprobe 7822DT track-mounted drill rig equipped with a 2.25-inch macro-core sampler which was advanced using a direct-push method. Each soil vapor point consisted of a 6-inch steel screen and Teflon tubing advanced to 10 ft bg (the approximate depth of basement slabs beneath adjacent residential structures) or 1 ft above the groundwater interface, if present. The annular space around each point was backfilled with filter sand and sealed with bentonite. Each soil vapor point was installed with a permanent flush-mount road box. Outdoor air samples were collected concurrently with all soil vapor sampling events. All soil vapor point and outdoor air samples were collected with 6-liter summa

DRAFT

canisters fitted with 2-hour regulators not exceeding flow rates of 0.2 L/min. Each sample was submitted under chain of custody to Pace to be analyzed for VOCs by EPA Method TO-15. Soil vapor point sampling forms, including helium tracer gas test results, sample start and stop times, and canister pressures are presented in **Appendix I**. Soil vapor point construction logs are included in **Appendix J**.

3.5.2 Soil Vapor Intrusion (SVI) Solicitations

HRP and NYSDEC solicited 58 properties in the study area for SVI structure sampling. Properties were selected based on SC groundwater and soil vapor point sampling results and consultation with NYSDOH. Solicitations were performed for the 2022-2023 and 2023-2024 heating season. The 2022-2023 heating season solicitations focused on residential properties, primarily on Elton Street, Wortman Avenue, and Cleveland Street. The 2023-2024 heating season solicitations focused on industrial and commercial properties, primarily on Linwood Street, Stanley Avenue, and Essex Street.

Letters requesting access for SVI structure sampling were sent to properties by NYSDEC via certified mail on January 5, 2023 and November 27, 2023. HRP personnel conducted door-to-door solicitations at properties which had not yet responded to solicitations on February 28, 2023 and February 7, 2024. At properties where no response was received, an access letter was left at the door. In addition, HRP solicited property owners via telephone and email using available contact information obtained through online directories.

3.5.3 Soil Vapor Intrusion (SVI) Structure Sampling

SVI structure sampling was performed at 13 study area properties selected in consultation with the NYSDEC and NYSDOH based on properties that provided access. HRP conducted SVI structure sampling during the 2022-2023 and 2023-2024 heating seasons. At each location, SVI structure sampling was conducted in general accordance with the NYSDOH *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* dated October 2006 and all updates, the SC Work Plan, and the SVI SOW.

DRAFT

Sub-slab soil vapor points were installed using a handheld hammer drill and a half-inch drill bit. Prior to sub-slab soil vapor sampling, a leak test was performed on each vapor point using a helium tracer gas and a minimum of three tubing volumes of air were purged from each vapor point. All sub-slab soil vapor and air samples were collected using 6-liter summa canisters outfitted with 24-hour or 8-hour regulators. Duplicate soil vapor samples were collected at a rate of 1 per 20 regular samples. Each sample was submitted under chain of custody to Pace to be analyzed for VOCs by EPA Method TO-15. SVI structure sampling forms, including helium tracer gas test results, sample start and stop times, and canister pressures were completed. In addition to sampling forms, the NYSDOH Indoor Air Quality Questionnaire and Building Inventory forms were completed for each property. These forms have been omitted so as not to identify private properties. The SVI structure sampling locations are summarized in the table below.

Property ID	Location Description	Sub-Slab Soil Vapor/Air Samples	Justification
6	3-story slab-on-grade residential building with two units. Lowest level consists of an entry area to the apartment units, a living space, and a storage room.	• One sub-slab soil vapor sample • Two ground floor indoor air samples • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.
12	2-story multi-family residential building with two units. Lowest level consists of a finished basement used for storage and as a living space.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.

DRAFT

Property ID	Location Description	Sub-Slab Soil Vapor/Air Samples	Justification
13	2-story multi-family residential building with two units. Lowest level consists of an unfinished basement used primarily for laundry and storage.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.
18	2.5-story residential building with 2 units. Lowest level consists of a finished basement used for storage, laundry, and a living space.	Two sample events, each including: • One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample (2023 sample event only) • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume. Resampled in 2023 to confirm carbon tetrachloride detection in indoor air was not related to SVI.
19	2.5-story residential building with 2 units. Lowest level consists of a finished basement with a living space.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.

DRAFT

Property ID	Location Description	Sub-Slab Soil Vapor/Air Samples	Justification
20	2-story residential building with 2 units. Lowest level consists of an unfinished basement used for utility housing.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.
23	3-story residential building with 2 units. Lowest level consists of a semi-finished basement primarily used for laundry and storage.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.
34	2-story residential building with 3 units. Lowest level consists of a finished basement used as a living area.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Linwood Street and Elton Street plumes.

DRAFT

Property ID	Location Description	Sub-Slab Soil Vapor/Air Samples	Justification
37	2-story residential building with 2 units. Lowest level consists of a finished basement used as a living space.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Linwood Street and Elton Street plumes.
42	1-story slab-on-grade commercial warehouse building used as a packing and shipping facility. Lowest level consists of a warehouse with an attached office.	• Three sub-slab slab soil vapor samples • Three ground floor indoor air samples • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Linwood Street Plume.
51	3-story residential building with multiple units. The lowest level consists of a finished basement used as a living space.	• One sub-slab soil vapor sample • One basement indoor air sample • One first floor indoor air sample • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.

DRAFT

Property ID	Location Description	Sub-Slab Soil Vapor/Air Samples	Justification
56	Two buildings. Building 1 consists of a one-story group home. The lowest level consists of an unfinished basement used for storage. Building 2 consists of a one-story slab-on-grade group home. The lowest level consists of offices.	• Two sub-slab soil vapor samples (one per building) • One basement indoor air sample • Two first floor indoor air samples • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.
57	Both buildings on the lot consist of 1-story slab-on-grade group home. The lowest level for both buildings consist of housing and offices.	• Two sub-slab soil vapor samples • Two first floor indoor air samples • One outdoor air sample	Investigate impacts to soil vapor and indoor air at a residential property in proximity to the Elton Street Plume.

3.5.4 Soil Vapor Quality Assurance/Quality Control (QA/QC) Sampling

In accordance with the SVI SOW, three duplicate soil vapor samples were collected for QA/QC purposes, in addition to the 75 standard soil vapor/air samples collected from the study area. All QA/QC samples were analyzed for VOCs by EPA Method TO-15. QA/QC samples included the following:

- DUP-1, a duplicate of SVI-7.
- A duplicate sub-slab soil vapor sample collected from Property 56.
- A duplicate sub-slab soil vapor sample collected from Property 42.

3.6 Investigation Location Survey

HRP retained the services of Rogers Surveying PLLC (Rogers) to complete a survey of SC investigation locations. Rogers completed survey field work on September 16, 2022. The survey plan is included as **Appendix K**.

All soil borings, new and existing monitoring wells, and soil vapor points were included in the survey. SVI structure sampling locations were not surveyed. Horizontal coordinate values were based on the North American Datum (NAD) of 1983. Vertical coordinate (elevation) values were based on the

DRAFT

North American Vertical Datum (NAVD) of 1988. The elevations of all monitoring well casings were established to within an accuracy of plus or minus 0.01 feet based on NAVD 1988.

3.7 Deviations from Work Plan

The following deviations were made from the Work Plan, the scope of work recommended in the Preliminary SC Summary, and the SVI SOW:

- The collection of soil samples for laboratory analysis was not included in the SC Work Plan; however, in agreement with NYSDEC, a total of five soil samples were collected from soil borings SB-20 and GW-20 for VOC analysis by EPA Method 8260. The samples were collected based on observations of sheen, odors, and elevated PID readings at the location.
- The Work Plan called for the installation of three nested monitoring wells, screened at groundwater interface, and the 30-40 ft bg and 50-60 ft bg intervals. In agreement with NYSDEC, one additional shallow monitoring well HRP-MW-23S was installed to further delineate groundwater impacts.
- Recommendations in the Preliminary SC Summary indicated eight soil vapor points would be installed in the right of way in the study area. In agreement with NYSDEC, three additional soil vapor points were installed on Stanley Avenue, and on Elton Street south of Stanley Avenue based on results from the initial soil vapor point sampling.
- The SVI SOW proposed solicitation of 57 properties for SVI structure sampling. In agreement with NYSDEC and NYSDOH, two properties (which comprise the FWDF site) were removed from the solicitation schedule as it was determined that SVI was already being mitigated at the properties. Three properties were added to the solicitation schedule based on their proximity to the Linwood Street Plume.
- The SVI SOW indicated indoor air samples would be analyzed for the contaminants of concern via EPA Method TO-15 Selective Ion Monitoring (SIM) to ensure reporting limits were below the lowest values in the NYSDOH Decision Matrices. Following discussions with Pace, it was determined that laboratory reporting limits achieved for the contaminants using standard TO-15 analysis were below the lowest applicable guidance values in the NYSDOH Decision Matrices and SIM analysis was not necessary.

3.8 Interim Remedial Measure (IRM)

Based on SVI structure sampling results, the NYSDEC is designing and installing a sub-slab depressurization system (SSDS) at Property 42 as an Interim Remedial Measure (IRM). The IRM completion will be documented under a Construction Completion Report (CCR) to be submitted under separate cover.

DRAFT

4.0 OBSERVATIONS, FINDINGS, AND LABORATORY ANALYTICAL RESULTS

The following sections present the findings from the SC related to contamination of subsurface soil, groundwater, and soil vapor beneath the study area. Some laboratory analytical reports have been omitted, so as not to identify private properties. The remainder of the laboratory analytical data is provided in **Appendix L**

4.1 Standards, Criteria, and Guidance

Compounds detected in the soil samples collected during this SC were compared to NYSDEC Regulation, 6 NYCRR Subpart 375-6, "Remedial Program Soil Cleanup Objectives." Specifically, soil analytical results were compared to Protection of Groundwater (PGW), Commercial Use (CU), and Industrial Use (IU) Soil Cleanup Objectives (SCOs).

Compounds detected in the groundwater samples collected during this SC were compared to NYSDEC Division of Water Technical and Operational Guidance Series (TOGS 1.1.1); Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations dated October 1993; Revised June 1998; ERRATA Sheet dated January 1999; Addendum dated April 2000; and Addendum dated June 2023. Specifically, groundwater sample results were compared to Class GA standards and guidance values, applicable to groundwater and referred to herein as Class GA criteria.

Compounds detected in the sub-slab soil vapor and air samples during this SC were compared to the following SCGs:

- Sub-slab soil vapor and indoor air analytical results were compared to the May 2017 NYSDOH Soil Vapor/Indoor Air Decision Matrices A, B, and C and the February 2024 NYSDOH Soil Vapor/Indoor Air Decision Matrices D, E, and F (Decision Matrices). The Decision Matrices provide recommended actions based on the concentration of 21 VOCs in sub-slab soil vapor and indoor air samples. The 21 VOCs included in the Decision Matrices are PCE, TCE, cis-1,2-DCE, 1,1,1-TCA, 1,1-dichloroethene (1,1-DCE), carbon tetrachloride, methylene chloride, vinyl chloride, benzene, ethylbenzene, naphthalene, cyclohexane, 2,2,4-trimethylpentane, 1,2,4-trimethylbenzene (1,2,4-TMB), 1,3,5-trimethylbenzene (1,3,5-TMB), o-xylene, m-xylene, p-xylene, heptane, hexane, and toluene. Recommended actions include "No Further Action," "Identify Source(s) and/or Resample or Mitigate," "Monitor," and "Mitigate."
- Indoor air sampling results were compared to Air Guidance Values (AGVs) and Immediate Action Levels identified in NYSDOH's *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*, *October 2006,* and subsequent updates. NYSDOH provides AGVs for the CVOCs PCE, TCE, and methylene chloride, and Immediate Action Levels for PCE and TCE.
- New York State does not provide SCGs for soil vapor samples collected from exterior (non-sub-slab) soil vapor points. Soil vapor analytical results from exterior soil vapor points were compared to "Mitigate Values" from the NYSDOH Decision Matrices, which represent the lowest concentration at which SVI mitigation would be recommended if the soil vapor sample was collected as a sub-slab sample during an SVI structure sampling event. Exterior soil vapor point results were compared to the Mitigate Values to delineate the

DRAFT

extent of potential SVI impacts on nearby structures and to identify properties to solicit for SVI structure sampling.

4.2 Subsurface Soil

4.2.1 Observations

Fill materials including brick, asphalt, glass, plastic, ash, porcelain, wood, concrete, coal, and cinders were observed in 30 of 38 soil borings. Obvious indications of contamination (staining, odors, and elevated PID readings) were not observed in subsurface soil samples with the exception of saturated soils in co-located soil borings SB-20/GW-20 and soil boring SB-24. Observations indicative of contamination in borings SB-20 and SB-24 are provided in the table below. The soil boring locations are depicted on **Figure 2**. Soil boring logs are included in **Appendix C**.

Boring ID	Depth (ft bg)	Observation Description	PID (ppm)
SB-20 / GW-20	0.5 – 5.0	No staining, faint odor	40.2
	5 – 10	No staining, faint odor	59.5
	10 – 15	Saturated with metallic/rainbow sheen, strong odor	844
	15 – 20	Saturated with metallic/rainbow sheen, strong odor	14,488
	20 – 25	Saturated with metallic/rainbow sheen, strong odor	162.7
SB-24	10 – 15	No staining, faint odor	31.4
	15 – 20	No staining, faint odor	120.2
	20 – 25	No staining, faint odor	90.2
	25 – 30	No staining, faint odor	66.2

4.2.2 Analytical Results

The collection of soil samples for laboratory analysis was not initially part of the scope of work for the SC. However, based on observations of contamination in soils from the co-located borings SB-20 and GW-20, a total of five soil samples were collected for VOC analysis. TCE was detected at a concentration exceeding the IU, CU, and PGW SCOs in one of the five soil samples (15-20 ft bg). No other VOCs were detected above IU and CU SCOs in any of the soil samples. VOCs, including PCE, cis-1,2-DCE, ethylbenzene, m-, o-, and p-xylene, toluene, and acetone were detected at concentrations exceeding PGW SCOs in soil samples collected from 10-15, 15-20, and 20-25 ft bg. Each of the soil samples containing VOCs at concentrations exceeding SCOs was collected from below the groundwater interface, as a saturated soil sample. VOC analytical results for soil samples are presented on **Table 3**. The SB-20/GW-20 soil boring location is depicted on **Figure 2**.

4.2.3 Findings for Soil Investigation

Based on field screening of 38 soil borings, obvious indications of VOC contamination were limited to saturated soils in two locations in the study area, SB-20/GW-20 (HRP-MW-22) and SB-24 (HRP-MW-20). Laboratory analytical results from five soil samples collected from SB-20/GW-20 indicate saturated soils in this location are impacted by TCE and other VOCs. Observations of strong odors, sheen, and elevated PID readings (14,488 ppm) from the 10-15 ft bg soil sample, and the TCE concentration of 420 µg/kg, indicate saturated soils are grossly contaminated, which is defined in 6 NYCRR Part 375-1.2 (u) as soil or other media which "contains sources or substantial quantities of

DRAFT

mobile contamination in the form of NAPL, as defined in subdivision 375-1.2 (ac), that is identifiable visually, through strong odor, by elevated contaminant vapor levels, or is otherwise readily identifiable without laboratory analysis."

The SB-20/GW-20 soil boring was located adjacent to 869 Stanley Avenue, a property identified as the "Special Corp." in Sanborn Fire Insurance Maps from 1965-2007. The Special Corp. also contained a machine shop on 1965 and 1968 Sanborn maps. The specific operations of the Special Corp. are unknown; however, machine shops are known to have historically used TCE as a degreasing solvent. Based on the results of this SC, 869 Stanley Avenue was added to the Registry of Inactive Hazardous Waste Disposal Sites (#224394), and is identified on **Figure 2**.

4.3 Groundwater

4.3.1 Observations

No obvious visual or olfactory evidence of contamination (sheen, odors) were observed during SC groundwater sampling, with the exception of sheens observed on groundwater samples collected from monitoring wells MW-16S and HRP-MW-22S. Groundwater monitoring logs are presented in **Appendix H**.

4.3.2 Shallow Groundwater Analytical Results

A total of 38 groundwater samples were collected from the shallow depth interval (7-22 ft bg). This included 23 grab groundwater samples and 15 shallow monitoring well samples. VOCs were detected at concentrations exceeding Class GA criteria in 17 of 38 groundwater samples. TCE, cis-1,2-DCE, and PCE were detected with the highest frequency and at the highest concentrations of any VOCs.

All VOCs detected at concentrations exceeding Class GA criteria in shallow groundwater samples are listed below.

SHALLOW GROUNDWATER SAMPLES EXCEEDING CLASS GA CRITERIA			
VOC	**Class GA Criteria (µg/L)**	**Locations Exceeding Class GA Criteria**	**Concentration Range (µg/L)**
PCE	5	GW-2, GW-4, GW-13, GW-20, GW-21, GW-22, MW-13S, MW-17, EAR-MW-17S, MW-18S, EAR-MW-18S, MW-19, HRP-MW-20S, HRP-MW-22S	9.0 – 3,400
TCE	5	GW-4, GW-13, GW-20, GW-21, GW-22, MW-12S, MW-13S, MW-17, EAR-MW-17S, MW-18S, EAR-MW-18S, MW-19, HRP-MW-20S, HRP-MW-22S	22.3 – 140,000
1,1,1-TCA	5	GW-20, EAR-MW-17S	32 – 200
1,1-DCA	5	GW-4, EAR-MW-17S	28 – 86.8

DRAFT

SHALLOW GROUNDWATER SAMPLES EXCEEDING CLASS GA CRITERIA			
VOC	**Class GA Criteria (µg/L)**	**Locations Exceeding Class GA Criteria**	**Concentration Range (µg/L)**
1,1-DCE	5	GW-4, HRP-MW-22S, EAR-MW-17S	49 – 190
Cis-1,2-DCE	5	GW-4, GW-13, MW-13S, EAR-MW-17S, EAR-MW-18S, MW-19, HRP-MW-20S, HRP-MW-22S	7.4 – 51,000
Vinyl Chloride	2	GW-4, MW-13S, EAR-MW-17S	2.1 – 18.3
2-Butanone (MEK)	50	MW-13S, EAR-MW-17S, HRP-MW-22S	51 – 190
Benzene	1	GW-4, HRP-MW-22S	8.5 – 100
Chloroform	7	GW-4, HRP-MW-20	29 – 39.5
Toluene	5	GW-1, GW-20	8.9 – 700
Trichlorofluoromethane	5	GW-4, HRP-MW-22S	73.1 – 120
Naphthalene	10	GW-23	88

VOC analytical results for grab groundwater samples are presented on **Table 4**. VOC analytical results for groundwater samples collected from shallow monitoring wells are presented on **Table 5A** and a comparison to results from environmental investigations completed by others is presented on **Table 5B**. The estimated extent of CVOC impacts to shallow groundwater are depicted on **Figure 8**. Total CVOC concentrations in shallow groundwater samples are depicted on **Figure 9A**.

4.3.3 Intermediate Groundwater Analytical Results

A total of 12 groundwater samples were collected from monitoring wells screened in the intermediate interval (30-40 ft bg). VOCs were detected at concentrations exceeding Class GA criteria in all 12 groundwater samples.

All VOCs detected at concentrations exceeding Class GA criteria in intermediate depth groundwater samples are listed below.

INTERMEDIATE GROUNDWATER SAMPLES EXCEEDING CLASS GA CRITERIA			
VOC	**Class GA Criteria (µg/L)**	**Locations Exceeding Class GA Criteria**	**Concentration Range (µg/L)**
PCE	5	MW-12I, MW-13I, MW-14I, MW-15I, MW-16I, EAR-MW-17I, MW-18I, EAR-MW-18I, EAR-MW-19I, HRP-MW-20I, HRP-MW-21I, HRP-MW-22I	6.8 – 98
TCE	5	MW-12I, MW-13I, MW-14I, MW-15I, EAR-MW-17I, MW-18I, EAR-MW-18I, EAR-MW-19I, HRP-MW-22I	7.2 – 1,600

DRAFT

INTERMEDIATE GROUNDWATER SAMPLES EXCEEDING CLASS GA CRITERIA			
VOC	**Class GA Criteria (µg/L)**	**Locations Exceeding Class GA Criteria**	**Concentration Range (µg/L)**
1,1,1-TCA	5	MW-12I, EAR-MW-17I	7.9 – 42
1,1-DCA	5	MW-12I, EAR-MW-17I	6.1 – 15
1,1-DCE	5	EAR-MW-17I	28
Cis-1,2-DCE	5	MW-12I, EAR-MW-17I, EAR-MW-19I	11.1 – 410
Trichlorofluoromethane	5	EAR-MW-17I	6.8

VOC analytical results for intermediate depth monitoring wells are presented on **Table 6A**, and a comparison to results from environmental investigations completed by others is presented on **Table 6B**. Total CVOC concentrations in intermediate depth groundwater samples are depicted on **Figure 9B**.

4.3.4 Deep Groundwater Analytical Results

A total of 10 samples were collected from monitoring wells screened in the deep interval (50-60 ft bg). VOCs were detected at concentrations exceeding Class GA criteria in each of the 10 deep groundwater samples.

All VOCs detected at concentrations exceeding Class GA criteria in intermediate depth groundwater samples are listed below.

DEEP GROUNDWATER SAMPLES EXCEEDING CLASS GA CRITERIA			
VOC	**Class GA Criteria (µg/L)**	**Locations Exceeding Class GA Criteria**	**Concentration Range (µg/L)**
PCE	5	MW-12D, MW-13D, MW-14D, MW-16D, EAR-MW-18D, EAR-MW-19D, HRP-MW-20D, HRP-MW-21D, HRP-MW-22D	13 – 82
TCE	5	MW-12D, EAR-MW-19D, HRP-MW-22D	18 – 180
Cis-1,2-DCE	5	EAR-MW-19D	8.1
Chloroform	7	MW-15D	21.5

VOC analytical results for deep monitoring wells are presented on **Table 7A**, and a comparison to results from environmental investigations completed by others is presented on **Table 7B**. Total CVOC concentrations in deep groundwater samples are depicted on **Figure 9C**.

4.3.5 Findings for Groundwater Investigation

Two plumes of CVOC contamination (referred to herein as the Linwood Street Plume and Elton Street plumes) are present in shallow groundwater beneath the study area. The extent of the shallow

DRAFT

groundwater plumes are depicted on **Figure 8** and total CVOC concentrations in shallow groundwater are depicted on **Figure 9A**. The extent of intermediate and deep CVOC impacts to groundwater are depicted on **Figure 9B** and **Figure 9C**.

Linwood Street Plume Groundwater Findings

The Linwood Street Plume extends south-southeast along Linwood Street, following groundwater flow from the intersection with Stanley Avenue to the intersection with Wortman Avenue. The greatest impacts related to the Linwood Street Plume are found in shallow groundwater (**Figures 8** and **9A**). Total CVOCs concentrations in the intermediate and deep wells within the shallow Linwood Street Plume footprint were below 100 µg/L (**Figures 9B** and **9C**), 2-3 orders of magnitude below concentrations detected in the shallow interval wells (**Figure 9A**). The vertical extent of the plume is depicted in cross-section A-A' (**Figure 5**). The cross-section transect is depicted on **Figure 4**.

The Linwood Street Plume is TCE-dominated, with lesser concentrations of cis-1,2-DCE, and PCE. The VOCs 1,1,1-TCA, 1,1-DCA, 1,1,-DCE, vinyl chloride, trichlorofluoromethane, toluene, chloroform, benzene, and 2-butananone (MEK) were also detected within the plume at lesser concentrations and with less frequency. The source of the plume, is located in the area of HRP-MW-22S/GW-20, northeast of the intersection of Linwood Street and Stanley Avenue, where TCE was detected in groundwater at a concentration of 140,000 µg/L. The groundwater sample locations are co-located with the grossly contaminated subsurface soil sample in which TCE was detected at a concentration of 420 mg/kg. A discrete source area, as defined by 6 NYCRR Part 375-1.2 (au), was not identified but is suspected to exist beneath the property located east of HRP-MW-22S/GW-20 at 869 Stanley Avenue, identified on historic Sanborn Fire Insurance Maps as the Special Corp. from 1965-2007 and as containing a machine shop from 1965-1968 (identified on **Figure 2**).

Elton Street Plume Groundwater Findings

The Elton Street Plume extends from southwest across and along Wortman Avenue from the northeast intersection with Elton Street to south of the intersection with Cleveland Street. The greatest impacts related to the Elton Street Plume are found in shallow groundwater (**Figures 8** and **9A**). Impacts from the Elton Street Plume extend to the intermediate and deep groundwater intervals at lower concentrations relative to those detected at the source area, EAR-MW-17S. The greatest concentration of TCE detected in the intermediate interval was found at EAR-MW-17I (1,600 µg/L), providing further evidence that the source of TCE impacts is in the vicinity of EAR-MW-17S/I. Total CVOC concentrations were greater in MW-14I and EAR-MW-19I than in their corresponding shallow intervals (**Figure 9B**). At EAR-MW-19D, the furthest downgradient monitoring well in the study area, TCE and total CVOCs were detected at greater concentrations than in the shallow or intermediate intervals (**Figure 9C**). This may be attributed to sinking contamination from the two upgradient plumes and other shallow upgradient sources of CVOC groundwater contamination.

The Elton Street Plume is TCE-dominated, with lesser concentrations of cis-1,2-DCE, and PCE. The VOCs 2-butananone (MEK), 1,1-DCE, 1,1,1-TCA, 1,1-DCA, trichlorofluoromethane, and vinyl chloride were also detected within the plume at lesser concentrations and with less frequency. The source of the plume is located in the area of EAR-MW-17S, at the northeastern corner of the intersection of Elton Street and Wortman Avenue, where TCE was detected in groundwater at a concentration of

DRAFT

2,600 µg/L. A discrete source area, as defined by 6 NYCRR Part 375-1.2 (au), was not identified but is suspected to exist beneath a property located northeast of EAR-MW-17S, which has been identified on historic Sanborn Fire Insurance Maps from 1977-2007 as a manufacturing facility.

4.4 Soil Vapor

4.4.1 Exterior Soil Vapor Point Sampling

A total of 11 soil vapor samples were collected from 11 exterior soil vapor points located on sidewalks along Stanley Avenue, Elton Street, Wortman Avenue, and Cleveland Street. VOCs were detected at concentrations exceeding Mitigate Values in 9 of the 11 samples, indicating the concentration may trigger a recommendation of "mitigate" if it were detected in sub-slab soil vapor (see **Section 4.1** for discussion of applicability of Mitigate Values).

All VOCs detected at concentrations exceeding Mitigate Values are listed below.

EXTERIOR SOIL VAPOR SAMPLES EXCEEDING MITIGATE VALUES			
VOC	**Mitigate Value (µg/m³)**	**Locations Exceeding Mitigate Values**	**Concentration Range (µg/L)**
PCE	100	SVI-2, SVI-3, SVI-10	150 – 700
TCE	6	SVI-1, SVI-2, SVI-3, SVI-4, SV-5, SVI-6, SVI-8	8.7 – 46
Cyclohexane	60	SVI-9	430
Hexane	200	SVI-9	480
Heptane	200	SVI-9	840

Soil vapor analytical results collected from the exterior soil vapor points are presented on **Table 8** and are depicted on **Figure 10**.

4.4.2 Soil Vapor Intrusion Structure Sampling

SVI structure sampling was conducted at 13 properties as a part of this investigation. VOCs were detected in soil vapor and indoor air at concentrations at which Decision Matrices recommend "mitigate" in 1 of the 13 properties sampled. VOCs were detected at concentrations at which Decision Matrices recommend "identify sources and/or resample or mitigate" in 2 of 13 properties. Sampling at all other properties resulted in a Decision Matrix recommendation of "no further action." VOCs were not detected at concentrations exceeding AGVs or Immediate Action Levels in any of the indoor air samples collected.

Decision Matrices recommendations for properties sampled by HRP are summarized in the table below.

DRAFT

Property ID	NYSDOH Decision Matrix Recommendation	Indoor Air CVOC Concentrations Exceed Air Guidance Values?	Indoor Air CVOC Concentrations Exceed Immediate Action Levels?
6	Identify Source(s) or Resample or Mitigate	No	No
12	No Further Action	No	No
13	No Further Action	No	No
18 (2022-2023)	Identify Source(s) and Resample or Mitigate	No	No
18 (2023-2024)	No Further Action	No	No
19	No Further Action	No	No
20	No Further Action	No	No
23	No Further Action	No	No
34	No Further Action	No	No
37	No Further Action	No	No
42	Mitigate	No	No
51	No Further Action	No	No
56 (Building 1)	No Further Action	No	No
56 (Building 2)	No Further Action	No	No
57 (Building 1)	No Further Action	No	No
57 (Building 2)	No Further Action	No	No

DRAFT

SVI structure sampling analytical results compared to the AGVs, Immediate Action Levels, and the Decision Matrices for each property sampled by HRP is presented on **Table 9A**. SVI structure sampling completed at five properties by PES (as described in **Section 1.4.3**) is summarized in **Table 9B**. The SVI structure sampling completed by PES was not performed in accordance with a NYSDEC approved work plan, and soil vapor and indoor air samples were collected over 4-hr periods, instead of the NYSDOH-recommended 8-hr sampling periods for the commercial and industrial properties sampled by PES.

Structure sampling at properties which did not result in a Decision Matrices recommendation of "no further action" is discussed in detail below.

Property 6

Observations

A 3-story slab-on-grade multi-family residential building is located at Property 6. The lowest level consists of an entry area to the apartment units, a kitchen and living space, a storage room, and a boiler room. The concrete slab was observed to be in good condition where visible.

No products were identified in the chemical product inventory.

Analytical Results

Naphthalene was detected in an indoor air sample at a concentration of 10 µg/m³. The indoor air sample was collected in the boiler room of the ground floor, paired with the sub-slab soil vapor sample. Naphthalene was detected at concentrations of 0.50 µg/m³ in the paired sub-slab soil vapor sample and 2.2 µg/m³ in a second indoor air sample collected in the main living area of the ground floor. The Decision Matrices recommended "identify source(s) or resample or mitigate" based on the detections. Based on the low concentration of naphthalene detected in the sub-slab soil vapor point relative to the paired boiler room indoor air sample, the naphthalene is not a result of SVI. Additionally, the lower concentration of naphthalene detected in the living area indoor air sample suggests that the source of naphthalene is located within the boiler room. Potential sources of naphthalene at the property include combustion of natural gas associated with the boiler, cigarette smoke, and building materials.

Additional VOCs were detected in the sub-slab soil vapor, indoor air, and outdoor air samples collected at this property, but at concentrations at which the Decision Matrices recommend "no further action." VOCs were not detected at concentrations exceeding AGVs or Immediate Action Levels in any of the indoor air samples collected at the property. SVI structure sampling analytical results are presented on **Table 9A**.

Property 18

Observations

A 2½-story multi-family residential building is located at Property 18. The lowest level of the building consists of a finished basement primarily used as a living space and constructed with poured concrete walls and a concrete slab in good condition.

The chemical inventory of the building found laundry detergents, spot remover, and miscellaneous household cleaners stored in cabinets and on the floor of the basement area. The chemicals were in various conditions, including opened and unopened containers.

Analytical Results

Two rounds of SVI structure sampling were performed at Property 18 in March 2023 and March 2024. During the March 2023 sampling event, carbon tetrachloride was detected in the first-floor indoor air sample at a concentration of 1.6 µg/m³. Carbon tetrachloride was not detected in the sub-

DRAFT

slab soil vapor sample and was detected at a concentration of 0.96 µg/m^3 in the basement indoor air sample. The Decision Matrices recommended "identify source(s) and resample or mitigate" based on the detections. During the follow up sample event conducted in March 2024, carbon tetrachloride was not detected in the sub-slab soil vapor sample and was detected at a concentration of 0.55 µg/m^3 in basement indoor air, resulting in a Decision Matrices recommendation of "no further action." A first floor indoor air sample was not collected during the March 2024 sampling; however, the sub-slab soil vapor and basement indoor air samples from both events indicate that the carbon tetrachloride detected in the March 2023 first floor indoor air sample was not related to SVI. Although a source of carbon tetrachloride was not identified through the chemical product inventory, indoor air sampling results suggest an unidentified source of carbon tetrachloride is present within the building in stored household chemical products, building materials, or furnishings.

Additional VOCs were detected in the sub-slab soil vapor, indoor air, and outdoor air samples collected at this property, but at concentrations at which the Decision Matrices recommend "no further action." VOCs were not detected at concentrations exceeding AGVs or Immediate Action Levels in any of the indoor air samples collected at the property. SVI structure sampling analytical results are presented on **Table 9A**.

Property 42

Observations

A 2-unit, 1-story slab-on-grade commercial building is located at Property 42. The lowest level of the building is primarily used as a warehouse and is constructed of brick walls and a concrete slab floor in average condition (some cracks present).

The chemical inventory of the building found various household cleaners, air fresheners, and motor oil/lubricants. The chemicals were in various conditions, including opened and unopened containers.

Analytical Results

PCE, TCE, and Cis-1,2-DCE were detected at maximum concentrations of 19,000 µg/m³, 23,000 µg/m³, and 400 µg/m³ respectively in sub-slab soil vapor samples collected at the property. PCE and TCE were detected at maximum concentrations of 5.9 µg/m³ and 1.9 µg/m³ respectively in indoor air samples. The Decision Matrices recommended "mitigate" based on the detections.

Additional VOCs were detected in the sub-slab soil vapor, indoor air, and outdoor air samples collected at this property, but at concentrations at which the Decision Matrices recommend "no further action." VOCs were not detected at concentrations exceeding AGVs or Immediate Action Levels in any of the indoor air samples collected at the property. SVI structure sampling analytical results are presented on **Table 9A**.

Based on the detections of PCE and TCE in sub-slab soil vapor and indoor air, SVI was occurring within the building during the sampling event. Based on groundwater sampling results from the SC, the building is located over the Linwood Street Plume, the source of PCE and TCE volatilizing into soil vapor beneath the building which enters the building through cracks and penetrations in the

DRAFT

concrete slab. An IRM to mitigate SVI at this property is currently underway as described in **Section 3.8**.

4.4.3 Soil Vapor Findings

Linwood Street Plume Soil Vapor Findings

The highest concentrations of CVOCs in soil vapor were detected in sub-slab samples collected from Property 42, located within the Linwood Street plume and immediately downgradient of the source of the plume in the area of HRP-MW-22S/GW-20. Based on sub-slab soil vapor results from Property 42 and groundwater analytical results, PCE and TCE may be present at concentrations exceeding Mitigate Values in sub-slab soil vapor from other properties Linwood Street plume which denied access for SVI structure sampling.

Results from SVI structure sampling performed by PES at commercial/industrial properties located at the downgradient extent of the Linwood Street Plume, near the Linwood Street-Wortman Avenue intersection indicate the Decision Matrices recommend "no further action" at each property. The lower concentrations of VOCs in sub-slab soil vapor results in these properties is consistent with the lower concentrations of VOCs in groundwater on Linwood Street, near its intersection with Wortman Avenue (**Figures 8**, **9A**).

Sampling performed by HRP downgradient/crossgradient of the Linwood Street Plume at residential properties on Elton Street show that the Decision Matrices recommend "no further action" or "identify sources or resample or mitigate" (Property 6 only; triggered by a detection of naphthalene in indoor air, which is not a contaminant of concern). The sub-slab soil vapor results are generally consistent with the lower concentrations of VOCs detected in groundwater on Elton Street.

In exterior soil vapor points installed in the sidewalks of Elton Street (SVI-1 and SVI-2), located downgradient/crossgradient of the Linwood Street Plume, PCE and/or TCE were detected at concentrations exceeding Mitigate Values. However, SVI structure sampling at adjacent properties show that the Decision Matrices recommend "no further action." VOC concentrations were generally detected at higher concentrations in the sidewalk soil vapor point samples compared to sub-slab soil vapor samples in this area. This may be attributed to the proximity of sidewalk soil vapor points to groundwater (the source of soil vapor contamination) as compared to sub-slab soil vapor points. Generally, sidewalk soil vapor points were installed at 10 ft bg or approximately 1 ft above the groundwater interface, whereas the proximity of sub-slab soil vapor points to the groundwater table varied based on slab elevation.

In exterior soil vapor point SVI-10, located crossgradient of the Linwood Street Plume, PCE was detected at concentrations exceeding Mitigate Values; however, access was not granted for SVI structure sampling at adjacent properties. Results from shallow groundwater monitoring wells HRP-MW-21S and HRP-MW-23S indicate VOCs were not detected at concentrations exceeding Class GA criteria in shallow groundwater around SVI-10, and therefore it is not within either groundwater contamination plume.

DRAFT

The petroleum related VOCs cyclohexane, hexane, and heptane were detected in exterior soil vapor point SVI-9 at concentrations exceeding Mitigate Values. These VOCs were not detected at concentrations exceeding Mitigate Values in any other soil vapor points or sub-slab soil vapor samples and were not detected in any study area groundwater samples at concentrations exceeding Class GA criteria. Based on these results, the petroleum related VOCs detected in soil vapor are likely related to an isolated spill near SVI-9 and are not associated with either groundwater contamination plume.

Elton Street Plume Soil Vapor Findings

SVI structure sampling performed at residential properties and two public health facility properties around the Elton Street Plume on Elton Street, Wortman Avenue, and Cleveland Street resulted in Decision Matrices recommendations of "no further action" at each property. SVI structure sampling results from the commercial/industrial properties sampled by PES within the Elton Street Plume also resulted in Decision Matrices recommendations of "no further action."

In exterior soil vapor points installed downgradient and crossgradient of the Elton Street Plume on Wortman Avenue (SVI-3 and SVI-5), and Cleveland Street (SVI-4, SVI-6, and SVI-8), PCE and/or TCE were detected at concentrations exceeding Decision Matrices mitigate values. However, SVI structure sampling at adjacent properties show that the Decision Matrices recommend "no further action."

4.5 Data Validation and Usability

Analytical data obtained during the SC were validated to evaluate the usability of the data. Data Usability Summary Reports (DUSRs) are provided in **Appendix M**. The DUSRs indicate which data are subject to limitations and identify certain data that are flagged as rejected and should not be used.

All data was qualified as usable except for 1,4-dioxane results analyzed using EPA Method 8260D in some soil and groundwater samples. The 1,4-dioxane results were qualified as unusable (R) due to low relative response factors. 1,4-dioxane results were rejected in the following laboratory data packages:

- 70195061 and 21K1545 – groundwater samples GW-1 – GW-12.
- 22E1254 – soil samples collected from SB-20.
- 70195060 and 21K1547 – groundwater samples collected from the following monitoring wells:
    - MW-12S, I, D
    - MW-13S, I
    - MW-15 I, D
    - MW-16S, I
    - MW-17

DRAFT

- MW-18S, I
- MW-19
- EAR-MW-17S, I
- EAR-MW-18S, I, D
- EAR-MW-19S, I

All data that are not qualified rejected are considered usable, with estimated (J, J-, or UJ) data associated with a higher level of quantitative uncertainty. Detailed information on data quality is included in the DUSRs included as **Appendix M**.

DRAFT

5.0 NATURE AND EXTENT OF CONTAMINATION

5.1 Conceptual Site Model

Based on data collected to date, historic releases to subsurface soils occurred in industrial properties in the area of HRP-MW-22/GW-20 and EAR-MW17S. The subsurface soil impacts from these releases were of sufficient concentration to percolate downward until they reached the groundwater interface. The movement of contaminants from the suspected release areas are the sources of the two dissolved-phase groundwater plumes within the study area, identified herein as the Linwood Street and Elton Street plumes. Fate and transport in each environmental media including soil, groundwater, and soil vapor are discussed below.

5.2 Subsurface Soil Fate and Transport

Subsurface CVOC contamination results from the release of chlorinated solvents in the form of dense NAPL (DNAPL) to the surface or subsurface. DNAPL moves through the subsurface under the force of gravity and is influenced by the orientation of geologic structures such as bedding planes and fractures, as well preferential flow pathways such as pipes, conduits, and building foundations. As DNAPL moves through the subsurface, it will become sorbed to the surrounding media. The rate of sorption within a given media is controlled by the physical and chemical characteristics of that media and the DNAPL. When DNAPL reaches the groundwater interface it begins to attenuate into dissolved phase contamination through dispersion, dilution, and chemical/biological breakdown. A concentration of any CVOC in soil, at or near 10,000 mg/kg or 1% of the total sample mass, is a strong indicator of the presence of DNAPL.

5.2.1 Linwood Street Plume

Grossly contaminated soil (characterized by the presence of TCE at a concentration exceeding the IU SCO, a PID reading of 14,488 ppm, and a strong odor), was encountered at soil boring location SB-20/GW-20 at a depth of 15-20 ft bg. Although the concentration TCE detected (420 mg/kg) was below 1% of the sample weight, the gross contamination is indicative of a nearby release. The property adjacent to SB-20/GW-20 located at 869 Stanley Avenue was historically used a machine shop identified as the Special Corp. Although specific historical operations at the property are unknown, machine shops are known to have historically used TCE as a parts degreaser. A historic surface or subsurface release of a TCE DNAPL at the 869 Stanley Avenue property may have entered the subsurface and the groundwater table beneath the building through preferential pathways. Transport of DNAPL and dissolved-phase contamination through groundwater flow and diffusion from the release area(s) resulted in the soil contamination observed at SB-20/GW-20 and the TCE groundwater contamination plume observed at the co-located monitoring well HRP-MW-22 and downgradient locations. Field observations indicate no grossly contaminated soil was encountered in any other SC soil borings. Based on the results of this SC investigation, 869 Stanely Avenue was entered into the Registry of Inactive Hazardous Waste Disposal Sites as a Class 2 site (#224394).

The location of HRP-MW-22 (co-located with SB-20/GW-20), the Linwood Street Plume, and 869 Stanley Avenue are depicted on **Figure 8**. Soil laboratory analytical data is presented on **Table 3**.

DRAFT

5.2.2 Elton Street Plume

No subsurface soil samples were collected in the vicinity of the Elton Street Plume during the SC. Field observations and laboratory analytical results from soil borings installed within and immediately upgradient of the Elton Street Plume by Langan (MW-12 and MW-13) and EAR (EAR-MW-17 and EAR-MW-18), indicate source area material was not encountered in soil in any of these locations (see investigation summaries in **Section 1.4.3**).

Although a soil source area has not been identified, groundwater laboratory analytical results indicate the source of the Elton Street Plume is located in the area of EAR-MW-17S, as evidenced by lower concentrations of CVOCs detected in upgradient monitoring wells MW-12S and MW-18S. The property adjacent to EAR-MW-17S to the northeast has been identified as a manufacturing facility on Sanborn Fire Insurance Maps. A historic surface or subsurface release of TCE DNAPL at the adjacent property may have entered the subsurface and the groundwater table beneath the building through preferential pathways. Transport of dissolved-phase contamination through groundwater flow resulted in the TCE groundwater contamination plume observed at EAR-MW-17S and downgradient locations.

The location of HRP-MW-17S and the Elton Street Plume are depicted on **Figure 8**.

5.3 Groundwater Fate and Transport

If released to the subsurface DNAPL can percolate downward through soil under the force of gravity until it reaches the groundwater interface. When DNAPL reaches the groundwater interface it begins to attenuate into dissolved phase contamination. Significant dissolved-phase concentrations of CVOCs in exceedance of 1% of their total solubility can indicate DNAPL is present near a given sample location. TCE has a maximum solubility of 1,100,000 µg/L in water.

Dissolved-phase contaminants move through the subsurface via dispersion and diffusion in the direction of groundwater flow. Diffusion is a process where contaminants at a high concentration move to an area of lower concentration to achieve a stable equilibrium. Dispersion is the spreading of a contaminant due to its movement through the media of the aquifer. The movement of groundwater through a subsurface source area will cause the contamination to spread over an area much larger than the original source, but at a reduced concentration.

5.3.1 Linwood Street Plume

Groundwater flows south-southeast through a source area of TCE contamination near HRP-MW-22/ SB-20/GW-20, and results in downgradient groundwater CVOC contamination. The TCE concentration detected in grab groundwater sample GW-20 (140,000 µg/L) is greater than 1% of the solubility of TCE in water (1,100,000 µg/L) and indicates that DNAPL is likely present in the subsurface near HRP-MW-22/SB-20/GW-20. Shallow groundwater sample points upgradient and crossgradient of this location (GW-14, -15, -16, -17, 18, -19, and -23) show TCE is not present at concentrations exceeding Class GA criteria, providing further evidence that the source is located near HRP-MW-22.

DRAFT

Contamination is transported south-southeast from the source through groundwater flow along Linwood Street following a sewer line (which intersects the groundwater interface), surface topography, and regional geology, which all slope south towards Jamaica Bay. As contamination moves laterally downgradient from the source, TCE concentrations are depleted, eventually reaching concentrations below Class GA criteria at the intersection of Linwood Street and Wortman Avenue (MW-002S, MW-10). The decrease in concentrations of TCE and other CVOCs at this intersection may be influenced by the air sparge remediation system operated at the adjacent FWDF site.

The width of the plume extends along the width of Linwood Street. Detections of TCE and CVOCs in shallow grab groundwater sample point GW-21 indicates the plume extends under some properties west of Linwood Street. Lower detections of TCE on Elton Street (GW-22 and MW-12S) represent the western edge of the plume. TCE and CVOCs were not detected in shallow groundwater sample points further west on Cleveland Street (GW-7 and GW-8). Sub-slab soil vapor sampling from Property 42 suggests the plume extends under some properties to the east of Linwood Street. TCE and other CVOCs were not detected in shallow groundwater sample points further east on Essex Street (GW-1 and MW-16S).

Sample results from the intermediate (30-40 ft bg) and deep (50-60 ft bg) groundwater sample intervals within the Linwood Street Plume indicate TCE and CVOCs are present in groundwater at concentrations exceeding Class GA criteria. However, concentrations detected in the intermediate and deep intervals are generally 1-3 orders of magnitude below the shallow interval samples (17-22 ft bg). This may be a result of a strong lateral groundwater flow gradient aided by the sewer line preferential pathways, compared to a relatively weak vertical flow gradient.

Groundwater contour maps for shallow, intermediate, and deep intervals are depicted on **Figures 7A**, **7B**, and **7C**. The extent of the shallow Linwood Street Plume is depicted on **Figure 8**. Total CVOC concentrations in shallow, intermediate, and deep groundwater intervals are depicted on **Figures 9A**, **9B**, and **9C**. A cross-section of the Linwood Street Plume showing total CVOC concentrations is depicted on **Figure 5**. An aerial view of the cross-section transect is depicted on **Figure 4**. Laboratory analytical results from groundwater samples collected during the SC and sampling events conducted by others are presented on **Tables 4-7**.

5.3.2 Elton Street Plume

Groundwater flows south-southeast through the source area near EAR-MW-17S resulting in downgradient groundwater contamination. The TCE concentration detected at EAR-MW-17S (2,600 µg/L) does not exceed 1% of the solubility of TCE (1,100,000 µg/L) and therefore does not indicate a source of DNAPL is present at EAR-MW-17S. However, TCE concentrations in upgradient monitoring wells MW-12S and MW-18S are 1-2 orders of magnitude lower than TCE concentrations in EAR-MW-17S, indicating a historic release of TCE occurred in the area of EAR-MW-17S.

Contamination is transported south-southeast from the source through groundwater flow across Wortman Avenue following surface topography and regional geology which both slope south towards Jamaica Bay. As contamination moves laterally downgradient from the source, TCE concentrations are depleted, eventually reaching concentrations below Class GA criteria on Elton Street at MW-14S. A southwest component of contaminant transport, responsible for contamination at EAR-MW-18S,

DRAFT

may be attributed to the presence of the Wortman Avenue sewer line, an approximately 13 ft tall by 8 ft wide brick archway which intersects the groundwater interface and is sloped west-southwest towards Cleveland Street. The porous brick sewer line and backfill material around the sewer line may act as a preferential pathway which intercepts contaminated groundwater, redirecting it southwest towards EAR-MW-18S.

Sample results from the intermediate (30-40 ft bg) and deep (50-60 ft bg) groundwater sample intervals within the Elton Street Plume indicate TCE and CVOCs are present in groundwater at these depths at concentrations exceeding Class GA criteria. The highest concentrations of TCE and CVOCs detected in the intermediate interval within the Elton Street Plume were found beneath the source area at EAR-MW-17I. TCE and CVOC concentrations in other intermediate and deep groundwater samples in the plume area were an order of magnitude lower than those detected at EAR-MW-17I, indicating concentrations decrease as contaminants move laterally away from the source area. The TCE and CVOC concentrations detected in intermediate and deep groundwater samples were all 1-2 orders of magnitude lower than concentrations detected in the shallow source area; however, at some intermediate and deep wells (MW-14I, EAR-MW-19I, and EAR-MW-19D) TCE and CVOCs were detected at higher concentrations than in paired shallow interval wells. This may be a result of an accumulation of sinking contamination from the two shallow plumes and other regional sources of groundwater contamination.

Groundwater contour maps for shallow, intermediate, and deep intervals are depicted on **Figures 7A**, **7B**, and **7C**. The extent of the shallow Elton Street Plume is depicted on **Figure 8**. Total CVOC concentrations in shallow, intermediate, and deep groundwater intervals are depicted on **Figures 9A**, **9B**, and **9C**. A cross-section of the plume showing total CVOC concentrations is depicted on **Figure 6**. An aerial view of the cross-section transect is depicted on **Figure 4**. Laboratory analytical results from groundwater samples collected during the SC and sampling events conducted by others are presented on **Tables 4-7**.

DRAFT

5.4 Soil Vapor Fate and Transport

Contaminants can volatilize directly from soil and groundwater into the vadose zone as soil vapor. The concentration of a contaminant in soil vapor is proportional to the contaminant's concentration in groundwater or soil and its equilibrium vapor pressure. Soil vapor moves laterally and vertically along preferential pathways from the source to the surface. Soil vapor can accumulate under low permeability surfaces (such as concrete slabs). Openings through the concrete slab in the forms of cracks, utility penetrations, sumps, and drains, can act as preferential pathways through which vapor-phase contamination enters indoor air. Heating a structure can create temperature and pressure differentials between indoor air and outdoor air, resulting in a "stack effect" which encourages vapor-phase contamination to enter a structure.

5.4.1 Linwood Street Plume

SVI structure sampling was performed at nine properties within and downgradient of the Linwood Street Plume. Sampling was conducted by HRP at six properties and by PES at three properties. TCE and other CVOCs were detected at concentrations at which the Decision Matrices recommend "mitigate" at one of the nine properties, Property ID 42. Vapor intrusion mitigation is currently

underway at Property 42 as an IRM. Based on the concentrations of TCE and CVOCs detected at Property ID 42, and concentrations of the contaminants detected in groundwater samples collected along Stanley Avenue and Linwood Street, other properties within the area of the Linwood Street Plume, which declined or did not respond to solicitations for sampling access, may be impacted by vapor intrusion. On the western edge of the groundwater contamination plume on Elton Street, SVI structure sampling at residential properties has shown TCE and CVOCs are not present at concentrations at which the Decision Matrices recommend "mitigate" and vapor intrusion is not occurring. The absence of elevated CVOC concentrations in soil vapor is consistent with groundwater results which show TCE and CVOC groundwater concentrations are 1-2 orders of magnitude lower on Elton Street than on Linwood Street. SVI structure sampling results are presented on **Tables 9A** and **9B**.

5.4.2 Elton Street Plume

SVI structure sampling was performed at 9 properties within and downgradient of the Elton Street Plume. Sampling was conducted by HRP at 7 properties and by PES at 2 properties. The Decision Matrices recommend "no further action" at each of the 9 properties sampled. Based on the SVI structure sampling, which included properties nearest to the source area and the highest concentrations of TCE and CVOCs detected in groundwater, groundwater contamination from the Elton Street Plume is not resulting in vapor intrusion at properties within the plume. SVI structure sampling locations and results are presented on **Tables 9A** and **9B**.

5.4.3 Soil Vapor Exposure Pathways

Exposure to soil vapor contamination could occur through inhalation of contaminated indoor air in structures where vapor intrusion is occurring. A vapor intrusion mitigation system is being installed as an IRM at Property ID 42. Based on SVI structure sampling and shallow groundwater sampling, vapor intrusion may be occurring at other properties which declined sampling within the Linwood Street Plume. Based on the SVI structure sampling and shallow groundwater sampling, groundwater contamination from the Elton Street Plume is not resulting in vapor intrusion at properties within the plume.

DRAFT

6.0 CONCLUSIONS

The goal of the SC is to determine whether the Sites pose a significant threat to public health and the environment, and whether the threat requires further investigation, or if sufficient information exists to make a decision regarding remediation within the study area.

The information collected during this investigation leads HRP to draw the following conclusions:

- Two TCE-dominated CVOC groundwater contamination plumes are present in groundwater within the study area.
- The Linwood Street Plume extends laterally south-southeast along Linwood Street from Stanley Avenue to Wortman Avenue.
- The Elton Street Plume extends laterally southwest from the intersection of Elton Street and Wortman Avenue to south of the intersection of Wortman Avenue and Cleveland Street.
- CVOCs are present in groundwater at concentrations exceeding SCGs to a depth of at least 60 ft bg within the two plumes; however, the greatest concentrations of CVOCs are present near the groundwater interface in each plume.
- Exposure to subsurface soil contamination could occur through direct contact to groundwater and saturated through ground intrusive work conducted within the two plumes.
- The study area is supplied potable water by the City of New York (sourced from the Catskill and Delaware Water Supply System); however, one non-potable supply well was identified within the study area at 1025 Elton Street, located between Wortman Avenue and Cozine Avenue and is registered to Superior Laundry (well #K003611).
- Based on SVI structure sampling completed for the SC and by others, the NYSDOH Decision Matrices recommend "mitigate" at 1 of 18 properties sampled within the study area. Based on sub-slab soil vapor analytical results at Property 42, CVOCs are present in soil vapor beneath the Linwood Street Plume at concentrations at which the NYSDOH Decision Matrices recommend "mitigate." An IRM to mitigate vapor intrusion is currently underway at the property.

6.1 Evaluation of Data Gaps

- Two CVOC groundwater plumes have been laterally delineated in shallow groundwater. The source of the Linwood Street groundwater plume is suspected to exist beneath the 869 Stanley Avenue, a former machine shop, which has been entered into the Registry of Inactive Hazardous Waste Disposal Sites as a Class 2 Site (# 224394). The source of the Elton Street groundwater plume is suspected to exist beneath a former manufacturing facility located adjacent to EAR-MW-17S to the northeast. Based on a records review completed for the SC, no environmental investigations have been completed at 869 Stanley Avenue. Investigations completed to date at the former manufacturing property adjacent to EAR-MW-17S have not identified a CVOC source area. Therefore, the sources of the plumes remain as data gaps.

DRAFT

- SVI structure sampling completed at properties within, downgradient, and crossgradient of the Elton Street Plume resulted recommendations of "no further action" from the NYSDOH Decision Matrices. Due to a limited response to solicitations, SVI structure sampling was completed in only one property within the Linwood Street Plume, for which the NYSDOH Decision matrices recommended "mitigate." The potential presence of vapor intrusion exposure pathways to properties within the Linwood Street Plume remains as a data gap.

Legend	
<1	Parameter not detcted above the laboratory reporting limit
1	Parameter reported at a concentrations greater than NYSDOH Soil Vapor/Indoor Air Guidence "Mitigate Values"
1	Parameter reported above the laboratory reporting limit but below the appilicable regulatory standard/criterion

Notes:
Mitigate Values from the NYSDOH Soil Vapor/Indoor Air Matrices (May 2017 & February 2024)
E = Reported result is estimated; value reported over verified calibration range
J = Value is estimated
NYSDOH = New Yorkepartment of Health
NP = not promulgated/ no applicable action level
U = Reported result is non-detected at the reporting limit
ug/m3 = micrograms per cubic meter

5.0	Parameter was detected at concentrations exceeding the NYSDOH Air Guidance Values
1.0	Parameter was detected at concentrations exceeding the laboratory reporting limit
< 1.0	Parameter was not detected at concentrations exceeding the laboratory reporting limit

Notes:

All concentrations in micrograms per cubic meter (µg/m^3)
Recommendations based on May 2017 and February 2024 NYSDOH Soil Vapor/Indoor Air Matrices (Decision Matrices)
J = Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration
E = Reported result is estimated; value reported over verified calibration range
--- = Standard Not Promulgated

Isopropyl Alcohol	**6.5 J**	**13**	**36**	---	---	---	
m,p-Xylene	**3.1**	**0.82**	**1.3**	---	---	No Further Action	
o-Xylene	**1.5**	**0.36**	**0.52**	---	---	No Further Action	
Styrene	**0.61**	**0.12 J**	**0.086 J**	---	---	---	
Tetrachloroethene	**26**	**0.39**	**0.23 J**	30	300	No Further Action	
Tetrahydrofuran	< 2.9	< 1	**0.99 J**	---	---	---	
Toluene	**3.8**	**1.8**	**2.5**	---	---	No Further Action	
Trichloroethene	**0.59**	< 0.19	< 0.19	2	20	No Further Action	
Trichlorofluoromethane	**2.3**	**1.2**	**1.3**	---	---	---	
Vinyl acetate	**3.9 J**	**1.9 J**	< 2.5	---	---	---	

Legend:

50	Decision Matrices recommend a specific action based on parameter concentrations
25	Parameter was detected at concentrations exceeding the NYSDOH Immediate Action Levels
5.0	Parameter was detected at concentrations exceeding the NYSDOH Air Guidance Values
1.0	Parameter was detected at concentrations exceeding the laboratory reporting limit
< 1.0	Parameter was not detected at concentrations exceeding the laboratory reporting limit

Notes:
All concentrations in micrograms per cubic meter (µg/m^3)
Recommendations based on May 2017 and February 2024 NYSDOH Soil Vapor/Indoor Air Matrices (Decision Matrices)
J = Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration
E = Reported result is estimated; value reported over verified calibration range
--- = Standard Not Promulgated

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/27/2021 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/22/2021 has revealed that there are 4 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/22/2021 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 05/10/2021 has revealed that there are 4 NY SHWS sites within approximately 1 mile of the target property.

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 05/10/2021 has revealed that there are 29 NY Spills sites within approximately 0.125 miles of the target property.

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/22/2021 has revealed that there are 49 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

NY DRYCLEANERS: A listing of all registered drycleaning facilities.

A review of the NY DRYCLEANERS list, as provided by EDR, and dated 03/09/2021 has revealed that there is 1 NY DRYCLEANERS site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
GARYS MASTERCRAFT CL	***803 STANLEY AVE***	***W 0 - 1/8 (0.072 mi.)***	***H45***	***140***
Facility Id: 2-6105-00544				

NY HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the NY HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 NY HSWDS site within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"7/17/06 - Raphael Ketani. Spoke to Mr. Frisco (718) 257-4068. He said that Petro was coming to repair the fuel line, but he had to take everything off of the wall in the location of the leak. He said it's the line from the tank to the boiler and it is in the concrete floor. Mr. Frisco doesn't know how much leaked out. I told Mr. Frisco that a soil boring will be necessary to see how far down the oil went and how much contaminated soil needs to come out. I will send a CSL to the home address. 7/20/06 - Raphael Ketani. Mr. Frisco called up to say that Petro fixed the line and cleaned up the spill. 9/22/06- DEC Piper reecieved call from Mr. Prisco stating cleanup is complete. Piper left message w/ Petro reg. info on repairs. Spill cleaned and repairs made. Closed."
Remarks:	"LINE LEAK IN HOME AND PETRO OIL IS ON SCENE"

Updated By: HMDUDEK
Site Description: "Location: The site is located on the southeast corner of Elton Street and Wortman Avenue, Brooklyn, NY 11208. The full extent of the site is unknown. Site Features: The full extent of the site has yet to be identified. Current Zoning and Land Use: A plume track down was performed to delineate the source of a 1,1,1-TCA and 1,1-DCE plume. Groundwater and soil samples collected indicated 465-479 Wortman Avenue as the source. The building was formerly used as a machine shop. Past Use of the Site: 465-479 Wortman Avenue was formerly used as a machine shop from 1965 to 2007. Currently the site is utilized as a warehouse. Site Geology and Hydrogeology: The site is located over the Long Island aquifer system, which underlies all of Nassau, Suffolk, Kings(Brooklyn), and Queens Counties. The unconsolidated aquifer formations form a southward-dipping wedge that attains a maximum thickness in Kings County about 800 feet in the southeast area of Brooklyn. Overlying bedrock is the Lloyd, Magothy, Jameco, and Upper Glacial aquifer systems. The lithologic description of sediments from soil borings identifies the material as fill to approximately five feet below grade, underlain by layers of fine to medium silty sands and silt. Groundwater at the site is encountered at approximately 11 feet below grade. Groundwater beneath the property is class GA denoting potential use as potable water. The site lies within New York City, which utilizes reservoirs from upstate New York as sources of potable water. "
Env Problem: "Groundwater: Wells were installed in Fall of 2014 to assess the off-site plume of Brownfield Cleanup program(BCP) site C224139, Former Watermark Design Facility (FWDF). During baseline sampling in November 2014, monitoring well MW-13S returned concentrations of Chlorinated Volatile Organic Compounds (CVOCs). Among the CVOCs returned within the analysis were dissolved phase Trichloroethylene, 1,1,1-trichloroethane, and 1,1-dichloroethane. Since the aforementioned CVOCs were not characteristic of FWDF and nature of the FWDF plume is sinking prior to MW-13s, this potential site was created. MW-13S was analyzed for CVOCs in April 2016 and October 2016 as well. Each sample collected showed increasing concentrations of Trichloroethylene, 1,1,1-trichloroethane, and 1,1-dichloroethane. In the spring of 2017 additional wells MW-17S and MW-17I were installed on the north side of Wortman Avenue near the corner of Wortman and Elton Street. Two (2) additional nested wells (MW-18 and MW-19) were installed with a shallow, intermediate and deep interval along Cleveland Avenue, south of Wortman Avenue Eight (8) new monitoring

DRAFT

ELTON STREET GW (Continued) **S120706234**

wells and eighteen (18) existing monitoring wells were sampled for VOCs including 1-4 Dioxane. Twelve (12) of the twenty-six monitoring wells were sampled for PFAS. With regards to the contaminants of concern (Trichloroethylene, 1,1,1-trichloroethane, and 1,1-dichloroethane) concentrations were highest in MW-17I and MW-17S. Soil: During the installation of monitoring well clusters, MW-17 through MW-19, soil was logged and subject to head space analysis for VOCs. Samples were collected from each monitoring well cluster from the groundwater interface and the highest recorded PID reading. All soil samples returned lower than Commercial Soil Cleanup Objective levels. Vapor: Six (6) soil vapor points were collected in the vicinity of MW-13S. One (1) ambient air sample was also collected in conjunction with the soil vapor samples. Soil vapor ranged from 1,027 ug/m3 Total VOCs in VMP-2 to 86 ug/m3 Total VOCs in VMP-6. 32 ppb Total VOCs were detected in the ambient air. VMP-2 returned a concentration of 430 ug/m3 for TCE."

Health Problem: "As information for this site becomes available, it will be reviewed by the NYSDOH to determine if site contamination presents public health exposure concerns."

DEC Memo:	"Landlord Tenant problems. Sangesland spoke to Cliff Gounden (son of owner) 718-810-7840 Owner: Vera Gounden, 152 Broadway, Howard Beach, NY 11414 He said they are doing servicing work on the boiler and the tenants are complaining about the smell of the oil. Poor quality oil clogged the filter in the fuel line and now they are cleaning out the sludge from the line and the buried 550 gal tank. He will bring sludge to a service station for disposal. FD and Police were on sight and said everything looked OK. Sangesland asked Mr. Gounden to send a copy of what he sends to Fire Dept. 9/30/2008 Sangesland reviewed a copy of Fire Dept Order along with a Boiler Inspection report performed 2 days after the incident (Aug 13, 2008). Repairs and cleanup are complete. See copies of documents in eDocs."
Remarks:	"unknown fuel oil; spilled during delievery; unknown if it is contained or cleaned up; large amounts of oil spilled on ground and side of building"

Record Upd: 01/11/2013
Updated By: BXANDERS
Site Description: "Location: The site is located at 491 Wortman Ave in the Spring Creek section of Brooklyn, a mixed industrial and manufacturing area. Site Features: The site is occupied by a one story commercial building that occupies the entire lot and is comprised of three warehouse sections referred to as Building 1, Building 2 and Building 3. The building is approximately 19,000 square feet and the site is 0.44 acres in size. Current Zoning: Manufacturing and industrial buildings surround the site to the north, south, east and west. The closest residential units are 0.08 miles to the west-southwest. Historical Uses: The site was formerly utilized as a metal etching company, a steel tube manufacturing company, and a plumbing faucet/fixture company. Since approximately 1985, the site has been owned and operated by Watermark Designs Ltd. to manufacture, store, package, and ship decorative fixtures, bathroom accessories, and hardware. Manufacturing processes on the property included cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. Cleaning agents such as TCE and PCE were "routinely used" by Watermark Designs to fine clean and polish metals and metal products. The site is currently leased to a religious group that gathers at the site several times per week. Watermark Designs Ltd. relocated to a new location, 350 Dewitt Avenue, Brooklyn in or around 2007. In 2008, the site was put on the "open market" for sale. Site Geology and Hydrogeology: Subsurface geology is comprised of historic fill materials overlying native sands. Groundwater is approximately 15 ft below ground surface. The direction of groundwater flow can not be determined after one round of groundwater measurements. Other: One TCE degreasing tank was removed from the site however details including the tank size and dates of removal have not been determined. There are no PBS or CBS registrations for the site. One fuel oil AST of unknown size encased in concrete blocks is also located in the basement of the site. Also, floor drains were observed in the

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

building. The following reports have been submitted to date: Supplemental Subsurface Investigation Report dated December 2008; Limited Subsurface Investigation Report dated February 2009; a Phase II Environmental Site Assessment dated January 2009 and a Environmental Services Report Proposed Corrective Action and Remedial Investigation Work Plan dated July 2009. A final Site Characterization work plan was approved in February of 2011. Draft Site characterization reports have been reviewed. The Department and site owner executed a "P site" investigation Order on Consent and Adminstrative Settlement. For more information, see Site # C2-24-139"

Env Problem: "A site characterization (SC) was performed in 2011. Results detailed in the draft SC Report indicate soil, groundwater and soil vapor are impacted by chlorinated volatile organic compounds (CVOCs) and, to a much lesser extent, petroleum-related compounds. Concentrations of CVOCs in soil samples collected in 2011 are below commercial soil cleanup objectives (SCOs) but exceed the protection of groundwater SCOs. Concentrations of CVOCs in groundwater samples collected in 2011 significantly exceed groundwater standards with magnitudes greater than 1 ppm in half of the monitoring locations and a maximum concentration of 3.5 ppm for PCE and 2.3 ppm for TCE. Based on concentrations of CVOCs at the site boundaries, contamination likely is migrating off-site. Concentrations of CVOCs (primarily TCE) in multiple subslab soil vapor samples exceed 100,000 ug/m^3. TCE appears to be migrating into the on-site building as results from indoor air samples show detections between 140 and 250 ug/m^3. The magnitude of CVOC concentrations in the groundwater indicate the potential for DNAPL at the site. Previous phase II investigations indicated magnitudes of contamination in soil and groundwater to be an order of magnitude or two higher."

Site Description:	"Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to

491 WORTMAN AVENUE (Continued) **S109374287**

clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "

Env Problem: "For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

	vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "
Health Problem:	"Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

Site Description:	"Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "

Env Problem: "For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002,

DRAFT

Name: FORMER WATERMARK DESIGNS FACILITY
Address: 491 WORTMAN AVENUE
City,State,Zip: BROOKLYN, NY 11208
Site Code: 464693
Control Name: Soil Management Plan
HW Code: C224139
Control Code: 14
Control Type: INST
Dt record added: 04/04/2017
Dt rec updated: 03/26/2021
Updated By: MKMEDWID
Site Code: 464693
Site Description: "Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "

Env Problem: "For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

Name: FORMER WATERMARK DESIGNS FACILITY
Address: 491 WORTMAN AVENUE
City,State,Zip: BROOKLYN, NY 11208
Site Code: 464693
Control Name: Ground Water Use Restriction
HW Code: C224139
Control Code: 08
Control Type: INST
Dt record added: 04/04/2017
Dt rec updated: 03/26/2021
Updated By: MKMEDWID
Site Code: 464693
Site Description: "Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "
Env Problem: "For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs),

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

provision for implementing actions recommended to address exposures related to soil vapor intrusion. "
Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015,

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

Name: FORMER WATERMARK DESIGNS FACILITY
Address: 491 WORTMAN AVENUE
City,State,Zip: BROOKLYN, NY 11208
Site Code: 464693
Control Name: Site Management Plan
HW Code: C224139
Control Code: 32
Control Type: INST
Dt record added: 04/04/2017
Dt rec updated: 03/26/2021
Updated By: MKMEDWID
Site Code: 464693
Site Description: "Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "

Env Problem: "For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

Record Updated Date:	01/04/2021
Update By:	HMDUDEK
Site Description:	"Site Location: The Former Watermark Designs Facility (site) is located at 491 Wortman Avenue in Brooklyn, NY. It is identified as block 4384, lots 31 and 36 on the Kings County Tax Maps and is approximately 0.436 acres in size. It is bounded by a one-story building to the north, Wortman Avenue to the south, Essex Street to the east, and Linwood Street to the west. The nearest body of water is Hendrix Creek, which is about 0.5 miles southwest of the site. Site Features: The site consists of a one story brick and steel building, with a partial basement that occupies the entire area of the property. The majority of the building, except for the partial basement, rests on concrete slab. The interior of the building is divided by a wall into east and west areas. No exposed soil or vegetation is present on the subject property. Current Zoning and Land Use: The site is located in an urban setting characterized by industrial buildings to the north, east, and south and residential buildings one block to the west. Land use within a half mile of the site is primarily industrial and residential, but also includes public parks, public institutions, day care centers, and school facilities. The site is zoned for industrial/manufacturing uses. Currently, the western portion of the site building is used as a warehouse to store sound equipment, and the eastern portion is unoccupied. There is no current plan for redevelopment of the site. Past Use of the Site: US Tube and Foundry Company, Inc. operated at the site between 1945 and 1973. The National Hanger Company, Inc. operated at the site in 1976. J and H Holding Company, LLC has owned the property since 1983 and manufacturing activities continued until 2007. The site previously manufactured, stored, packaged, and shipped decorative fixtures and hardware for bathrooms and kitchens. Processes involved cleaning, painting, plating, etching, polishing, and specific machining of metals and metal products. A cleaning and degreasing area was located along the west side of the building. Chlorinated solvents, specifically trichloroethene (TCE) and tetrachloroethene (PCE) were used in the manufacturing process to clean various products. Site Geology and Hydrogeology: The soil profile at the site generally consists of 2 to 5 feet of miscellaneous fill underlain by medium to fine sand with some gravel. The estimated depth to groundwater is about 10 feet below grade surface (bgs). Based on local topography, groundwater is expected to flow to the southwest towards Hendrix Creek. "
Env Problem:	"For OU1: On-Site Areas Nature and Extent of Contamination: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), and pesticides. Based upon investigations and an interim remedial measure (IRM) conducted to date, the primary contaminants of concern include trichloroethene (TCE) and tetrachloroethene (PCE) in groundwater, sub-surface soil and soil vapor at the site and at some near-field off-site locations. An

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

off-site investigation conducted further downgradient of the site determined that VOC contamination in groundwater and soil vapor in the far-field locations is not related to the site. (A characterization of the far-field contamination is currently being conducted by the Department as part of a separate remedial program.) In 2013, based on initial investigations and data, NYSDEC and NYSDOH determined that the site presented a significant threat to public health and the environment. Soil: In 2013, site-wide soil sampling was completed. The maximum concentration of TCE was detected at 12,000 parts per million (ppm) at one location from within the truck scale pit area, at a depth of 0 to 2.5 feet. This exceeded the TCE commercial use soil cleanup objective (SCO) of 200 ppm. Arsenic, lead and mercury also exceeded the commercial use SCOs in samples collected from the pit area samples at 0 to 2 feet deep. All other contaminants were below the commercial use SCOs. No impacts to off-site soils were detected. As part of the on-site IRM, the pit area was backfilled with flowable fill, followed by pea gravel and four inches of concrete as a cover. Groundwater: In 2015, the highest concentrations of TCE (1,800 ppb) and PCE (750 ppb) were detected at two shallow wells near the truck scale pit area. At the near-field off-site wells, which are both shallow wells, the maximum concentration of TCE was 780 ppb and PCE was 710 ppb. Concentrations of PCE and TCE have decreased at all on-site and near-field monitoring wells since implementation and on-going operation of the air sparging / soil vapor extraction (AS/SVE) system. As of July 2017, the maximum PCE and TCE concentrations in groundwater were 490 ppb and 240 ppb, respectively, at a near-field off-site well. Adjustments were made, and will continue to be made, to the AS/SVE system to address the elevated concentrations of TCE and PCE at any on-site and near-field off-site locations. Soil Vapor, Sub-Slab Vapor and Indoor Air: Prior to implementation of the AS/SVE system in 2015, at on-site locations, the maximum PCE and TCE concentrations in sub-slab samples were 9,200 ug/m3 at SV-3 and 2,300,000 ug/m3 at SV-2, respectively. The maximum PCE and TCE concentrations in indoor air samples were 10.3 ug/m3 at IA-003 and 214 ug/m3 at IA-002, respectively. The indoor air result at IA-002 for TCE was above the NYSDOH Guideline Value of 2 ug/m3. In addition, at the off-site near field locations, the maximum TCE concentration in soil vapor was 72,000 ug/m3 and PCE was 32,000 ug/m3, both at location SV-8. Access was not granted to any off-site buildings for sub-slab and indoor air sampling. Post-Remediation: Remediation at the site is complete. The site cover is in-place and to date, the AS/SVE system is effectively decreasing concentrations of chlorinated VOCs in groundwater and soil vapor. After implementation of the AS/SVE system, sub-slab and soil vapor samples were collected at on-site and near-field locations. In August 2017, the maximum PCE and TCE concentrations in sub-slab samples were 442 ug/m3 and 5,080 ug/m3, respectively, both on-site locations. Indoor air samples were not collected since the building is currently used only for storage. However, the Site Management Plan (SMP) has a provision for evaluation of the potential for soil vapor intrusion for any occupied buildings on the site, including a provision for implementing actions recommended to address exposures related to soil vapor intrusion. "

Health Problem: "Remedial actions are complete and measures are in place to control the potential for coming in contact with residual contamination remaining at the site."

DEC Memo:	"08/15/09-HRAHMED- As per PropertyShark records: Street address: 491 Wortman Ave Primary address: 1009 Linwood St Zip 11208 Borough Brooklyn Block & lot 04384-0036 First 3 alt addresses 481-491 Wortman Ave, 1009-1019 Linwood St 1/26/10-Vought-File review by Vought: Supplemental Subsurface Investigation Report (PW Grosser-John Eichler-Ph;631-589-6353)-12/9/08. Sent to: Mr. Jack Abel Watermark Designs 350 Dewitt Avenue Brooklyn, NY 11207 Site has one commercial building that covers entire area of property. Site formerly used as a metal etching company, steel tube manufacturing company and a plumbing faucet/fixture company. Possible plating pit in northwest corner of building. Phase II shows elevated TCE in soil collected from northwest portion of building . Attempts made to dye flush test floor drain in bathroom but drain was blocked but drain appeared to lead to a sewer connection pit which discharges to the municipal sewer . Fuel oil AST encased in concrete block in the basement and

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

soil samples below AST shows that soils were not impacted . Plating pit later discovered to be a loading/bay truck scale. Based on conversations with the current owner of the property, the sources of TCE appears to have been a TCE degreasing tank with was formerly located directly to the south of the former loading bay/truck scale. Report recommends additional soil and groundwater investigation via soil borings. Proposal of soil boring investigation to delineate contamination via Geoprobe collection of soil and groundwater samples. Delineation will also include vertical profile of groundwater contamination to a depth of 50'bg (i.e collection of vertical groundwater samples at 10 foot intervals from 10-50'bg to study DNAPL). Cost estimate included in proposal. EnviroTrac Limited Subsurface Investigation Report (EnviroTrac-David Lorthior-631-924-3001)-2/1/09. Seven soil boring and one well were installed including collection of five groundwater samples. Borings installed via Geoprobe. Fill from 6-8'bg and sand below. Soil analyticals show: 2400ppb TCE (B2 8-10'bg), 20000ppb TCE (B3(0-5'bg), 8800ppb TCE(B4 6'bg), 140000ppb TCE(B7 2-5'bg), 5000ppb PCE(B7 2-5'bg), 4400ppb TCE(B8 3-5'bg), 3300ppb TCE(B8 7-7.5'bg). PCE not used at site and suggests that a possible source associated with the prior usage of he building could be repsonsible for the impacted soil in this area. Depth to groundwater is 12'bg. Groundwater analyticals show:54ppb TCE(B2 15'bg), 91ppb PCE(B2 15'bg), 5700ppb TCE(B5 15'bg), 510ppb PCE(B5 15'bg), 36ppb TCE(B5 25'bg), 97ppb PCE(B5 25'bg), 14ppb TCE(B5 35'bg), 26ppb PCE(B5 35'bg), 18ppb TCE(B5 45'bg), 38ppb PCE(B5 45'bg). Report recommends submission of a Remedial Investigation Work Plan. No petroleum contamination found at site. Phase II Environmental Site Assessment (PW Grosser John Eichler Ph:631-589-6353)-1/13/09. Seven soil borings were installed at site in Nov 2008 via Geoprobe. Groundwater at 10'bg and two samples collected for analysis. Groundwater flow estimated to south. Fuel and vent noted leading to AST in basement. One boring installed adjacent to UST with no petroleum staining observed. Floor drain dye test resulted in determination drain was clogged. Boring B-02 was located in the reported vicinity of a former TCE degreasing tank. Based on this, the degreasing tank appears to be the source of TCE in the soil . Soil analyticals show: 201ppb MTBE (GP2 8-10'bg), 18900ppb TCE(GP-02 0-2'bg), 63100ppb TCE(GP-02 8-10'bg). Groundwater analyticals show: 24000ppb TCE(GP1), 544ppb PCE(GP1) 7ppb DCE(GP1), 78ppb PCE(GP4), 24ppb TCE(GP4). Report recommends further investigation to delineate contaminaton and that indoor air quality be evaluated and that AST be properly closed. Environmental Services Report Proposed Corrective Action and Remedial Investigation Work Plan(Impact Environmental-Tony Kloss-Ph:908-534-8820)-7/10/09. Prepared for Watermark Designs. Onsite building has three sections and properly is currently vacant and unoccupied. Building owned by Watermark Designs for past 25 years to manufacture, store, package and ship hardware, bathroom fixtures. Onsite processes included painting, plating, etching, polishing, and machining. Cleaning agents, such as trichloroethylene(TCE) and tetrachlorethylene(PCE) were routinely used by Watermark Designs, Ltd. at the subject property to fine clean and polish metals and metal products. Watermark purchased new property at 350 Dewitt Avenue and moved and looking to sell this site. Proposal to isolate each building section and excavated contaminated soil. It is estimated that a total of approximately 400 tons of chlorinated VOC contaminated soil will be excavated from two designated work areas in Building 1... . Work

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

activities will include the evacuation of as much chlorinated VOC contaminated groundwater as is safe and practical with estimates of removal of 18,000 gallons of contaminated groundwater. Proposal to collect endpoint soil and bottom groundwater samples and submit results report. Email from Abel to DEC Ahmed-12/3/09. I'm following-up on our most recent conversation about the NYSDEC Spill Case No. 0809879 assigned to 491 Wortman Avenue, Brooklyn, NY. Were you able to identify and/or obtain a copy of the NYSDEC correspondence issued to Mr. Jack Abel from Watermark Designs Ltd. for the subject property? Watermark Designs Ltd. received some type of NYSDEC correspondence about the subject property but misplaced the letter. The NYSDEC correspondence would have been dated late October 2009 or early November 2009. Our firm advised Watermark Designs Ltd. that the subject property is the first site assigned to a new program within the NYSDEC system for hazardous TCE and DNAPL type contaminant investigation and corrective action. As a responsible party and environmental steward, Watermark Designs Ltd. is prepared to move forward with the scope of work presented in the Proposed Corrective Action and Remedial Investigation Work Plan prepared by our firm and dated 10 July 2009. Watermark Designs Ltd. would like to start the project as soon as possible. Please provide our firm and/or Mr. Jack Abel at Watermark Designs Ltd. withan update concerning the project at your earliest convenience. I included Jack Abel's contact information below. Thank you for your time and attention to the matter. Mr. Jack Abel Watermark Designs Ltd. (p) 718.257.2800, Ext. 20 (f) 718.257.2144 (e) jabel@watermark-designs.com Email from Impact (Kloss) to DEC Ahmed-1/5/10. We spoke approximately four (4) weeks ago concerning thecorrective action project for Watermark Designs Ltd. at 491 Wortman Avenue, Brooklyn, NY. Did you have an opportunity to issue an update letter or e-mail to Mr. Jack Abel from Watermark Designs Ltd concerning the project? Also, what is the status of the consent order for the project? When last we spoke in early December 2009, you indicated that the consent order would be issued to Mr. Jack Abel within three (3) to four (4) weeks. DEC possibly requires: 1)P-Site letter 2)Check PBS for AST registration 3)delineation of chlorinated solvent soil and groundwater contamination 4)possible approval of proposal to evaluate indoor air (property vacant as per 7/09 report). 1/26/10-Vought-Meeting with DEC Krimgold and Austin. Spill reassigned from Ahmed to Vought. 1/28/10-Vought-Received email from Abel that Good morning. I'm following up on our conversation yesterday morning and the internal NYSDEC meeting you had for the contaminated soil and groundeater project at 491 Wortman Avenue, Brooklyn, NY. When you have a moment today (Thursday, 28 January 2010), please provide a brief update for the proposed project at the subject property. The update can be forwarded to me and/or Mr. Jack Abel of Watermark Designs Ltd. Contact information for Mr. Jack Abel is below. 02/2/10-Vought-Received message from Kloss (908-534-8820) and returned call and left message. 02/5/10-Vought-Received message from Impact (Kloss) and returned call and left message to return call. 02/10/10-Vought-DEC O'Connnell preparing Class II package. Site code received from DEC Spath as: Site Remediation Code:224139 T&A Code:65335 2/11/10-Vought-Received message from Impact (Kloss cell:908-623-0310) and returned call and spoke to Kloss and informed him of reclassification of site as Class II site. Vought also provided him contact info for DEC Oliva for further information regarding Class II CO and possibly beginning of soil excavation. Kloss noted that he had suspected the site would be listed as Class

DRAFT

491 WORTMAN AVENUE (Continued) **S109374287**

II and has already prepared Watermark Designs for such possibilities. Vought to complete Remediation Database so that DEC O'Connell can designate new Section A project manager. Received email from Impact (Kloss) that again, thank you for the phone call concerning the latest administrative information for 491 Wortman Avenue, Brooklyn, NY. The initial information is very much appreciated and will be a great help to our client (Watermark Designs Ltd.). Our firm will be reviewing the information with the client tomorrow morning. 2/12/09-Vought-Obtained Lat and Long from Google Earth as:40deg39min40secN and 73deg52min32sec W. Note Google earth based on same datum as DEC GIS system used by DEC 0'Connell. Area of lot is .44 acres as per Report and .218 acres when using dimensions from 491 Wortman deed only. Vought to use acreage as per Report as site may encompass other addresses in addition to 491 Wortman. Vought spoke to DEC Barrie and provided acreage of .44 acres and she also will transfer E-docs into UIS database. 02/15/10-Vought-Recevied email from Kloss to DEC Oliva that Late last week I spoke with Mr. Jeffery Vought (NYSDEC Liaison at this point) concerning the NYSDEC Remediation Case Site Code 224139 assigned to the hazardous waste site project at 491 Wortman Avenue, Brooklyn, NY. Mr. Vought provided a much anticipated update and NYSDEC agency contact information. During the conversation Mr. Vought requested that the owner/operator of the subject property (Mr. Jack Abel - Watermark Designs Ltd.) contact you to discuss a Stipulation Agreement/Consent Order for the project. I was informed that Mr. Abel is out of his office this week and will return on Monday, 22 February 2010. I'm certain Mr. Abel will contact you shortly after his return to the office. 3/11/10-Vought-DEC Oliva sent draft CO to Kloss and Abel. 3/15/10-Vought-Meeting with DEC O'Connell and DEC Austin and spill manager transferred to DEC O'Connell for further action. 3/01/2019 - Site owner entered into a Brownfields Cleanup Agreement as a participant to address the chlorinated solvents in groundwater, soil and soil vapor at the site. BCP Site #C224139. Remedial Investigation completed. Air Sparge/Soil Vapor Extraction (AS/SVE) Interim Remedial Measure construction completed 8/25/2016. Remedial Action Work Plan approved and Decision Document issued on June 1, 2017. Remedy includes an ongoing operation of AS/SVE along with a site cover, SSDS when AS/SVE complete, site management plan and environmental easement. BCP Certificate of Completion issued on 10/24/2017. Site management and monitoring ongoing. "

Remarks: "CALLER STATES THAT THEY RECIEVED SOIL BORING SAMPLES BACK TODAY INDICATING CONTAMINATED SOIL AND GROUND WATER. CLEAN UP IS PENDING."

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.
HAZARDOUS WASTE BIENNIAL REPORTER
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"02/18/14-Zhune spoke to DEP- Victor. He said the spill happened two days ago. The house went on fire and part of the fuel oil from the oil tank located in the basement went to the sewer. As per Victor house is pretty burned. He will visit the site today and he will call back with the owner information. 03/3/14-Zhune called DEP-Victor Gresseau. He said he visited the site and spoke to Andrew owner of the recyucling plant. The site is a recycling plan (Metropolitan Recycling). The Hydraulic line from the tractor broke and hit a electrical wire from the tractor and started the fire. The machine was brought outside and the Fire Department put the fire out. As per

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
AIR SYNTHETIC MINOR
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

DEC Memo:	"1/5/14: Mahat DEC Mahat received a call from PR inquring about the process to close the case. Clean up has been performed and a closure report will be submitted to the Departments for a review. DEC is waiting on a closure report. 1/5/15 TJD File review. Closure report received - less than 5 gallons of mixed automotive fluids were discharged to asphalt roadway surfaces due to equipment fire. All product reported to have be recovered and cleaned with granular absorbents. A total of (5) drums of regulated waste was generated, transported and properly disposed of during the remedial process. No drains or waterbodies were reported to have been affected by the release. All closure documentation has been uploaded to DECDOCS. No further action is required. Spill closed."
Remarks:	"Combination of motor oil and hydraulic fluid spill to asphalt, less than 5 gallons."

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D002
Waste Description:	CORROSIVE WASTE
Waste Code:	D011
Waste Description:	SILVER
Waste Code:	F003
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste Code:	K086
Waste Description:	SOLVENT WASHES AND SLUDGES, CAUSTIC WASHES AND SLUDGES, OR WATER WASHES AND SLUDGES FROM CLEANING TUBS AND EQUIPMENT USED IN THE FORMULATION OF INK FROM PIGMENTS, DRIERS, SOAPS, AND STABILIZERS CONTAINING CHROMIUM AND LEAD.

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is

DRAFT

ULTRA FLEX PKG CORP-975 ESSEX ST (Continued) **1000352448**

used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RISK AND TECHNOLOGY REVIEW
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Tank Info:

Tank Number:	01
Tank Id:	229084
Material Code:	0015
Common Name of Substance:	Motor Oil

Equipment Records:

L00 - Piping Leak Detection - None
D00 - Pipe Type - No Piping
C00 - Pipe Location - No Piping
F00 - Pipe External Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating
H00 - Tank Leak Detection - None
I00 - Overfill - None
K01 - Spill Prevention - Catch Basin
E00 - Piping Secondary Containment - None
J02 - Dispenser - Suction Dispenser
G00 - Tank Secondary Containment - None
A02 - Tank Internal Protection - Rubber Liner

Tank Location:	Aboveground - contact with impervious barrier... Tank bottom rests on impervious barrier, allowing visual indication of leaks.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Closed - Removed
Pipe Model:	Not reported
Install Date:	04/19/2009
Capacity Gallons:	250

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	"Prior to Sept, 2004 data translation this spill Lead_DEC Field was VOUGHT 1/29/2003-Vought-Spoke with Alan Serpa (EEA 516-746-4400) and he is sending proposal to owner for Geoprobe delineation off-site, resurveying of wells, and take additional soil samples by tank. 4/9/2003-Vought-Received message from Ralphy Weiss (917-548-1149).

DRAFT

STEVE'S AUTO REPAIR (Continued) **S105996599**

Vought returned call and left message to call NYSDEC. 4/25/2003-Vought-Received message from Ralphy Weiss. Vought returned call and left message to call NYSDEC. Vought called Mitchell Ross 718-366-6500. Vought received message from Charlie (Aggressive Environmental 631-224-1680) that no payment was received from owner and they will not release report. 6/19/2003-Vought-Received call from Raphi Weiss inquiring as to NYSDEC approval of construction of a retail store on-Site. Vought requested site plan of store and received fax of proposed site plan from Weiss. Proposed parking lot will be located at former UST location and store building will be located to the east. Weiss proposed that Family Dollar will be willing to remediate site but will however will not be willing to remediate off site impacts. Vought consulted Rommel who stated that property owner should sign a Stipulation agreement (because he is the responsible party) to clean both on and off-site contamination. The owner then can receive assistance from Family Dollar with on-site portion of remediation. Vought requires a meeting between Family Dollar, owner, their legal representation and the NYSDEC (along with NYSDEC legal). Before the meeting will be held, NYSDEC requires subsurface investigation of building footprint (soil and gw must be analyzed for VOC's which has not been performed to date). NYSDEC also requires results of Agressive's 4/25 off site investigation. Vought called Weiss and informed him of pre-meeting investigation and report requirements. 6/19/2003-Vought-Spoke with Raphi Weiss who will send template of letter he is seeking from NYSDEC pertaining to the release of liability of Family Dollar from site remediation. Upon receiving the template Vought will contact NYSDEC legal for confirmation. Upon confirmation, Family Dollar will initiate complete Phase II of site. Upon completion of Phase II a meeting will be set to discuss on and off-site remediation and Health and safety concerns. 7/25/2003-Vought-Teleconference with NYSDEC Rubinton, Davis, Weiss and Raguso. Family Dollar will be entering VCA with NYSDEC for on-site cleanup. Off site contamination will be registered under the properties as which it is found. Davis will obtain results of EEA off-site phase II and submit remedial plan to NYSDEC. 10/2/03-Vought-File review by Vought: Letter from Arnold Azarow (lawyers) to Steven Wittriol -4/11/90-Letter including laboratory analyticals of soil that show analyticals within the parameters of acceptable laboratory reports as indicated by NYCFD. Phase II Subsurface Investigation-Sept 2002-Aggressive Environmental (Charles Schmidgall-631-224-1680) report prepared for George Marinello (potential property purchaser). Property currently being used as auto repair shop. Two hydraulic lifts and one waste oil tank are present on property. Gasoline station was in operation until 1989 upon which USTs were excavated. Twelve soil borings were drilled to a depth of 19'. Groundwater is at a depth of 12' below grade. Thirteen soil samples were sent for analysis and eleven of those samples were collected from soil just above water table. Ten monitoring wells were installed and ten water samples were sent for analysis. Soil analyticals showed concentrations of 23600ppb napthalene(W11 at depth of 7.5'bgs), 44740ppb napthalene(W11 at depth of 10.5'bgs), 19940ppb xylene(W11 at 10.5'bgs), 5990ppb ethylbenzene(W11 at 10.5'bgs). Minor PAH exceedances also found. Groundwater analyticals show 46.1ppb napthalene(W5), 27.8ppb ethylbenzene(W5), 56.7ppb 1,2,4-trimethylbenzene(W5), 721ppb napthalene(W11), 557ppb xylene(W11) and 205ppb ethylbenzene(W11). Letter from DEC (Vought) to Agressive Environmental-10/24/02. Letter sent requiring compelete

DRAFT

STEVE'S AUTO REPAIR (Continued) **S105996599**

delineation of contamination, submission of endpoint analyticals from previous tank excavations, excavation limits, surrounding property sketch, installation of wells southwest of building containing hydraulic lifts, upgradient of MW11, northeast of MW11, two wells downgradient of MW11 and one well southeast of MW11. Letter from George Marinello (potential purchaser) to DEC Vought-11/18/02. Letter including site pictures of unknown person with garden hose going down monitoring wells (MW11) which Marinello said was being used due to high readings . Vought called Wittriol and required no more garden hoses in the well with possible penalties of ECO action and state site takeover is behavior continued. Vought also explained that garden hose would move contamination further therefore increasing remedial cost. Witriol stated that he did not know of garden hose in well and that he would ensure that it would not happen in future. Groundwater Sample Results-12/12/02-EEA, Inc. (Alan Serpa-516-746-4400). Groundwater analyticals from MW11 and MW5 that show 110ppb naphalene(MW11), 330ppb 1,2,4-trimethylbenzene (MW11) and 57ppb 1,3,5-trimethylbenzene (MW11). Letter to DEC (Vought) from Mitchell Ross (attorney for Witriol-owner)-12/20/02. Letter to DEC requesting review of EEA groundwater analtyicals referred to above and advisement on steps necessary to close spill. Additional Subsurface Investigation Proposal-2/4/03-EEA. Proposal of determination of groundwater flow via the exisiting on-site wells and the installation of three temporary wells off-site and collection of groundwater samples. Letter to DEC(Vought) from MT Property Inc. (Raphi Weiss-718-375-8585) who represents potential buyer (Family Dollar Stores) requesting that DEC and he speak regarding possibility of a limited remedial agreement. Letter to DEC(Vought) from MT Property-6/18/03-Letter asking DEC stating that they are allowed to develop the property and that tenant has no liability to any party including downgradient sites. Family dollar will not excavate below 5' (building will be slab on grade with basement), contaminated area will be occupied by parking lot. Email from Vought to MT Property (Weiss)-6/19/03-Vought fowarded email with 6/18 requirements to DEC Legal (Rubinton) for review. Conference Call-7/17/03-Rubinton, Vought, Weiss-Dave sent sample Voluntary Cleanup Agreement to Weiss. Remedial Action Plan-9/23/03-FPM Group (Stephanie Davis 631-737-6200x228). RAP only addresses on-site impact. No offsite investigation or remediation will be performed by MT Properties. Groundwater flow to the southeast based on regional maps and site data. Proposal is for excavation and disposal of soil in the vicinity of MW11. Groundwater monitoring will occur after excavation on wells MW3, MW9, MW10 and MW11. Proposal also states that soil that does not appear to be visibly impacted may be stockpiled for later reuse onsite . 10/2/2003-Vought-Sent letter approving of RAP with condition that soil resuability be determined via STARS Petroleum Contaminated Soil Guidance Policy. Vought spoke with DEC Legal (Rubinton) who stated that a VCA or STIP must be signed for RAP review. Vought left message with Weiss to call Rubinton. 10/7/2003-Vought-Received message from Weiss to return call. 10/8/2003-Vought-Spoke with Rubinton prior to returning call to Weiss. Rubinton spoke with Weiss' lawyer and sent him another copy of VCA. Vought called Weiss and left message to return call to DEC. Vought spoke with Weiss who will send in the VCA and will call Rubinton for further information. 10/15/2003-Vought-Received signed copy of VCA via fax machine. 10/23/2003-Vought-Received notarized original copy of VCA agreement. Weiss requested quick turnaround due to retaining purchasers interest

DRAFT

STEVE'S AUTO REPAIR (Continued) **S105996599**

in property lease. Vought will contact DEC Legal (Rubinton) for next step. 10/28/2003-Vought-Rubinton stated that a VCA application must be filed first and sent to Albany and Long Island City. Contact phone for Albany VCA is 518-402-9711. Vought left message with Weiss on 10/27 and 10/28 stating that application must be filed first before 10/31 to qualify under old VCA agreement. 10/29/2003-Vought-Conference call with DEC Rubinton, Rommel and Vought with Weiss and Rigano. VCA not effective with respect to timeframe of construction. Weiss and Rigano will sign a Stipulation Agreement for on-site contamination. Vought sent Stipulation to Weiss for on-site contamination and Stipulation to Witriol for all contamination as per Rommel and Rubinton. NYSDEC requires the following from Witriol: 1)complete delineation of contaminaton via installation of off-site monitoring wells 2)surrounding area sketch. Vought called Witriol (718-257-9400) for fax # and to update him on spill and STIP and left message for him to return call to DEC. Vought spoke with Witriol who said to fax copy to his lawyer (Mitchell Ross). 11/3/03-Vought-Spoke with Ross who is looking onto above requirements and will respond by 12/1/03 deadline sent with Stipulation. 12/11/2003-Vought-Received email from Raphi Weiss that he was waiting for Stipulation . Vought called Weiss and left message asking for the name of the respondent for the Stipulation. 12/17/2003-Vought-Sent email to Weiss requesting name of respondent. If no response is received by 1/5/03 the site will be referred to DEC legal. 1/9/2004-Vought-Message received from David Rubinton that STIP never received. 1/12/2004-Vought-Sent out another copy of STIP with 2/12/04 due date. Vought called Weiss and left same message. 4/21/04-Vought-Spoke with David Souseh (516-322-9912) who is potential purchaser. Vought faxed copy of FOIL request and Spill Database notes. 1/3/05-Vought-Spoke with Mark Robbins (Hydrotech) who is working for owner (David Manesh) who wants to develop property with a residential unit and is looking to do soil excavation. 1/19/05-Vought-Reviewed faxed remedial action plan from Hydrotech. We will be excavating petroluem contaminated soil from the southern portion of the site, at the vicinity of monitoring well MW11 to remove the remaining source of contamination. We'll then install one onsite and three offsite wells to supplement the existing monitoring wells... After the wells are installed we will perform an ORC injection to remediate the groundwater plume . Monthly monitoring and quarterly sampling will then be performed . Site plan shows groundwater flow to the south and proposes three wells along Cleveland Street. 1/25/05-Vought-Called Mark Robbins for owners info and left message. Vought received returned ccall and owner is: Mr. David Manesh C Land LLC. 223-17 Hempstead Avenue Queens Village, NY 11429 Fax: (718) 454-0571 Phone: (718) 454-1600 Vought called Manesh to see if he currently owned property and spoke with him and he is property owner. Vought sent Stipulation Agreement due back to DEC by 3/7/05 approving of soil excavation but with requiring a revised RAP as per CAP including: 1)determination of actual flow direction 2)sampling for ORC parameters 3)submission of a groundwater monitoring plan 4)submission of vapor mitigation effots 5)sensitive receptor survey. 2/4/05-Vought-Received signed Stipulation Agreement. Signature of David Manesh of C. Land LLC. Submitted to DEC for implementation. 2/09/05-Vought-Stipulation implemented by DEC Kunkel. Copy faxed to Manesh and Robbins. 3/11/05-Vought-Reviewed revised Remedial Action Plan (Hydro Tech) dated 3/9/05 and received on 3/9/05. Groundwater flow to the south. Proposal of the installation

DRAFT

STEVE'S AUTO REPAIR (Continued) **S105996599**

of one onsite well and three offsite wells. Monthly monitoring and quarterly sampling will be performed . Site plan with ORC injection locations which will be injected into eight monitoring wells. Groundwater sampled for ORC paramaters which show TOC 208mg/L(MW11), DO 0.1mg/L(MW11), pH 6.57, Redox +250mv(MW11)and alkalinity 553 mg/l. Site plan shows three offsite wells along Cleveland Street. pH is in acceptable range (5-8) for ORC. DEC does not approve Remedial Action Plan and reqquires new RAP with: 1)immediate sampling of offsite downgradient wells to establish baseline parameters (pH,DO, BTEX and MTBE) 2)vapor mitigation effort submission 3)sensitive receptor survey 5)monthly monitoring parmeters (Fe, Mn, DO, ORP, pH) 6)exact mixing and application procedure including application depth and either increased application amounts of decreased injection spacing. Vought called Hydro Tech (Siva Gaddipati 631-462-5866) and left message to return call to DEC. Vought sent letter with above requirements on 3/15/05. 3/17/05-Vought-Received call from Mark Robbins (Hydro Tech 631-457-0030). Vought returned call and he requested sidewalk permit letter, agreed to the offsite well installation to establish baseline parameters and will begin soil removal in a couple of weeks. 9/12/05-Obligado- Spill transfered from DEC Vought to Obligado 9/12/05- Obligado -File Review: Reviewed revised RAP (Hydro Tech) dated 4/13/05 and received on 5/2/05. Revised RAP included results from geochemical sampling of off-site monitoring wells for ORC parameters. BTEX and MTBE results were below standard (Tolune 1.83 ug/L and MTBE 5.83 ug/L in MW-3) Included sensitive receptor survey, with 8 schools located downgradient within 1 mile, the closest 0.27 mi. Base building plans were submitted but no vapor mitigation effort was submitted. Reviewed RAP approval letter sent by DEC Vought, dated 5/4/05. Reviewed Remedial Action Report (Hydro Tech) dated 7/18/05 and received on 7/21/05. On 4/12/05, 63.91 tons of petroleum contaminated soil was excavated for offsite disposal in vicinity of former monitoring wells MW-10 and MW-11. Soil removed from between 6-13 ft bgs, gw encountered at 12 ft bgs. Enpoint samples below limits. ORC injection was performed on 5/16-19/05. 225 lbs of ORCs were injected into 15 injection points. Monthly monitoring and sampling plan proposed for 1 on-site and 3 off-site wells for FE+2, Mn, ORP, DO, and pH. Samples for analysis of BTEX and MTBE will be sampled quarterly. Additional building plans were submitted however no vapor barrier evident in plans. 9/13/05-Obligado- Called Mark Robbin, left message to call NYSDEC. 9/14/05-Obligado- Called Mark Robbin to inquire about vapor barrier. He said contracter is currently installing a vapor barrier as part of standard foundation construction. He said he will follow up with an email to DEC summarizing vapor barrier installation as well as photos. 9/29/05- Obligado - Send email to Mark Robbins inquiring about status of vapor barrier photos. 11/18/05 - Obligado - Called Mark Robbins inquired about the status of vapor barrier photos 12/12/05 - Obligado - Called Mark Robbins inquired about the status of vapor barrier photos. Left message. 12/15/05 - Obligado - Received vapor barrier installation photos. 8/21/06 - Obligado - Received voice mail from Rachel Ataman. Asked about closure. Review 1Q06 Monitoring report. ND for BTEX and MTBE in off-site monitoring wells MW13,MW14,MW15. The revised RAP proposed monitoring well MW12 onsite. This well was never installed due to construction. Call Rachel Ataman to discuss. Left message to call back DEC. 8/23/06 - Obligado - Meeting with Ataman. Told her that the RAP had said that one well would remain on site (MW12) and would be included in quarterly

DRAFT

STEVE'S AUTO REPAIR (Continued) **S105996599**

monitoring. She said the well was destroyed. I told her for closure I would need a geoprobe gw sample from the on-site area of concern in addition to the offsite wells. Also would need an exposure assesment/closure petition. 11/14/06 - Obligado - Called Rachel to inquire about ground water sampling. She said they took the ground water samples and they would send report and exposure assessment within a couple weeks. 1/30/06 - Obligado - Review Exposure Assessmnet Report submitted by Hydrotech. Requests closure based on removal of 63 tons of contaminated soil, clean endpoint samples, application of ORC to treat residual ground water prior to building construction, installation of vapor barrier, 4 quarters of down gradient monitoring show only very minor VOC in ground water. No sensitive receptros. No significant off-site migration of contaminants was identified. After discussion with Joe Sun agree to close spill. 2/1/07 - Obligado - Sent NFA to David Manesh, cc to Hydrotech. "

Remarks: "TANKS REMOVED. CONTAMINATED SOIL FOUND."

groundwater analyticals: ----------GW-1
Cis-1,2-Dichloroethylene----------112
PCE----------7
TCE----------160 discussed with DEC Jane regarding chlorinated solvent compounds and metal findings in groundwater. based on historical use of the property, she mentioned that further investigation is required via installation of three monitoring wells. 3:58 PM:- spoke with Jill. informed her that the department requires further investigation. asked her to provide property owner's and buyer's contact information. she will email that. 05/08/13-Hiralkumar Patel. 2:48 PM:- received email from Jill including their client and property owner's contact info. Rodolitz Industrial Properties **property owner** PO Box 241 Woodmere, NY 11598 Attn. Bruce Rodolitz Ph. (516) 238-2989 email: brucerodolitz@aol.com C & L Sales Corp. **current tenant** 893 Shepherd Ave Brooklyn, NY 11208 Attn. Joe Lati Ph. (718) 797-3917 email: clsalescorp@gmail.com 05/13/13-Hiralkumar Patel. 12:46 PM:- spoke with Mr. Lati. he is the tenant on-site using site as warehouse for paper/household product distribution. he was planning to purchase property and bank required environmental investigation. he is planning to continue using site as warehouse if deal go through. 12:59 PM:- spoke with Mr. Rodolitz, property owner. informed him about contamination found underneath the site. Mr. Rodolitz mentioned that the entire site is built on former landfill and contamination found is related to backfill material. he asked for copy of GCI's report. 4:22 PM:- sent available documents to Mr. Rodolitz using DEC's file transfer service. 4:25 PM:- sent letter to Mr. Rodolitz requiring confirmation of groundwater contamination via installation of monitoring wells. asked him to submit investigation report by the end of 07/15/13. letter emailed to Mr. Rodolitz and Mr. Lati. 06/04/13-Hiralkumar Patel. 4:14 PM:- received email from Carla Sullivan from Laurel Environmental including response to the department's letter dated 05/13/13. Ms. Sullivan mentioned that as no contamination noted in soil samples, contamination found in groundwater samples indicating an off-site source. also, based on location of the site (within industrial area) and area covered with fill material, Laurel Env. feels that installation of monitoring wells and analysis is not warranted. in the event the department disagree, she recommended groundwater samples for VOCs only via temporary wells. she mentioned that analysis of SVOCs and heavy metals is unjustified. Carla M. Sullivan Vice President Laurel Environmental Associates, Ltd. Ph. (631) 673-0612 Ext 202 (516) 971-3308 (C) Fax (631) 427-5323 email: csullivan@laurelenv.com 06/05/13-Hiralkumar Patel. 2:14 PM:- left message for Ms. Sullivan. informed her that based on historical use of the property, the department requires investigation as stated in letter dated 05/13/13. 2:25 PM:- sent email to Ms. Sullivan and informed her that additional investigation was required only after reviewing available information and there will be no change in requirements. informed her that the investigation report is due on 07/15/13. email copied to Mr. Rodolitz. 06/06/13-Hiralkumar Patel. DEC Demeo received call form Ms. Sullivan inquiring about investigation requirements. discussed with DEC Austin, DEC Demeo and DEC Vought. based on historical use of the property, all agreed requirements for groundwater sampling and analysis as listed in the department's letter dated 05/13/13. DEC Austin mentioned that the department has no objection for collecting required groundwater samples via installation of temporary wells

DRAFT

C AND L SALES CORP (Continued) **S113493171**

(instead of permanent wells), but will require installation of permanent wells after reviewing investigation report. DEC Demeo spoke with Ms. Sullivan and informed her about discussion with DEC Austin. Ms. Sullivan will submit work plan. 06/10/13-Hiralkumar Patel. 12:10 PM:- received call from Mr. Bizmar, partner at Rodolitz Industrial Properties. he inquired reason for groundwater investigation. informed him that required investigation is needed based on historical use of the property. he requested more time to perform investigation. informed him that the investigation report is due on 07/15/13 and time can be extended based on progress in the project. Michael Bizmar Partner Rodolitz Industrial Properties Ph. (718) 399-0551 email: mbizmar@gmail.com 06/24/13-Hiralkumar Patel. 12:02 PM:- spoke with Ms. Sullivan. inquired her about work plan. she mentioned that they are going to do investigation work on 06/26/13. asked her to submit work plan for review prior to field work. 12:07 PM:- spoke with Mr. Rodolitz and suggested him to submit work plan for review, prior to field work. 3:04 PM:- received email from Ms. Sullivan including work plan. she proposed to install three (3) 1.5 inch per-pack permanent wells. will collect two soil and one groundwater samples from each well for VOCs, SVOCs and metal analyses. 3:21 PM:- sent email to Ms. Sullivan and informed her that proposed work plan looks good. email copied to Mr. Rodolitz. 06/25/13-Hiralkumar Patel. 2:44 PM:- received email from Ms. Sullivan inquiring about sampling requirement if no PID reading in soil boring. 2:51 PM:- sent email to Ms. Sullivan. asked her to collect deepest dry soil sample, if no PID readings or other signs of contamination (olfactory/visual) observed in entire column of soil boring. 07/26/13-Hiralkumar Patel. 10:27 AM:- received email from Ms. Sullivan. she received sample data and preparing the report. 08/06/13-Hiralkumar Patel. 3:15 PM:- sent email to Ms. Sullivan inquiring update. 08/07/13-Hiralkumar Patel. received report from Ms. Sullivan. abstract of Phase II: - site has an elevation of approx. 13 ft above mean sea level - groundwater was encountered at a depth of 13 ft bg - installed three (3) 1.5 inch monitoring wells - continuous soil borings were advanced from zero to at least 15 bg, which were converted to wells - on-site soils appeared to be tan to dark brown in color, well graded sands with rocky sands throughout ---------- - one soil sample collected from each boring at a depth of 10-13 ft bg - wells were installed to a depth of 18 ft bg - groundwater found between 11.32 to 12.02 ft bg - on-site groundwater flow was determined to be an easterly direction - no VOCs or SVOCs are found in soil samples - only chlorinated solvent contamination noted in groundwater samples groundwater analyticals:
----------GW-1-----GW-2------GW-3
TCE----------180-------30-------260
PCE----------10----------2
cis-1,2-Dichloroethylene------25
1,1,1-Trichloroethane----------9 the report is missing scaled site maps. 08/19/13-Hiralkumar Patel. 10:27 AM:- sent email to Ms. Sullivan and asked to submit report again with following changes: - remove previous correspondences (page # 23 to 166) to reduce file size - submit scaled site maps discussed sample results with DEC Jane. based on samples results, further investigation may be needed along upgradient edge of the property. Jane will discuss with DEC Cozzy. 08/29/13-Hiralkumar Patel. 12:42 PM:- received call from Mr. Bizmar inquiring about comments on recent investigation report. informed him that the department is waiting for response from Ms.

DRAFT

C AND L SALES CORP (Continued) **S113493171**

Sullivan (scaled site map). 09/11/13-Hiralkumar Patel. 11:39 AM:- received email from Ms. Sullivan inquiring comments on submitted report. 09/12/13-Hiralkumar Patel. 9:53 AM:- sent email to Ms. Sullivan and reminded her to submit revised report with scaled site map and without any correspondences that previously submitted. 09/30/13-Hiralkumar Patel. 2:05 PM:- received email from Ms. Sullivan including revised report with scaled site map. discussed with DEC Jane. she discussed with DEC Cozzy. as upgradient wells are located in middle of the property, the department requires two more wells, along upgradient edge of the site for two reasons: to delineate contamination and to locate possible off-site source. discussed with DEC Austin about requirement of more wells. based on available information, case will be transferred to Section A if owner refuses to do further investigation or once additional sampling data received. 10/01/13-Hiralkumar Patel. 9:25 AM:- spoke with Mr. Rodolitz. he sold property and Sit Realty LLC. is the new owner. 9:33 AM:- left message for Ms. Sullivan. 10:10 AM:- received call from Ms. Sullivan. informed her that the department requires further groundwater investigation. 11:14 AM:- left message for Mr. Turkieh. Sit Realty LLC. **new property owner** 2266 East 2nd Street Brooklyn, NY 11223 Attn.: Isaac Turkieh PH. (718) 272-1170 (516) 322-7753 (C) email: aryehrealty@aol.com 11:30 AM:- received call from Mr. Turkieh. informed him that the department requires additional investigation. he will discuss with Ms. Sullivan. 10/09/13-Hiralkumar Patel. 11:58 AM:- sent letter to Mr. Turkieh requiring further delineation via installation of minimum of two wells along up-gradient edge of the property. asked him to submit investigation report by the end of 12/31/13. letter emailed to Mr. Turkieh and Ms. Sullivan. 10/10/13-Hiralkumar Patel. 3:52 PM:- received email from Ms. Sullivan including a site map with proposed location of two upgradient wells. she proposed to install wells, within property line, along the upgradient edge. she stated that wells will be installed on 10/16/13. 10/15/13-Hiralkumar Patel. 12:52 PM:- sent email to Ms. Sullivan and informed her that proposed well location plan will be reviewed by Section A. 1:41 PM:- after discussing with DEC Jane, sent email to Ms. Sullivan and informed her that the proposed well locations look fine. 12/20/13-Hiralkumar Patel. 12:52 PM:- sent email to Ms. Sullivan inquiring updates. 4:00 PM:- received report from Ms. Sullivan. abstract: - two wells (MW-4 and MW-5) were installed on 10/16/13 - wells MW-3, MW-4 and MW-5 were surveyed and the on-site groundwater flow direction was determined to be south-southeasterly direction (previously it was found to be easterly direction) ---------- - found 3.8 ppb TCE in well MW-5 ---------- 01/14/14-Hiralkumar Patel. discuss recent investigation report with DEC Jane. she noted that the department requires sampling and gauging of all five wells at the same time. as groundwater samples were analyzed for metals (filtered and unfiltered) from all wells (three at first time and two during second round), no further metal analysis needed. due to different groundwater flow direction during two investigations, she also asked to survey all five wells to confirm groundwater flow direction. 1:44 PM:- spoke with Mr. Turkieh. informed him that as mentioned in letter dated 10/09/13, the department requires sampling of all existing wells. asked him to sample all five wells. also asked him to gauge all five wells again as two different groundwater flow directions were reported. 3:13 PM:- sent letter to Mr. Turkieh and asked him to submit report with required documents as per letter dated 10/09/13. asked him to sample

DRAFT

C AND L SALES CORP (Continued) **S113493171**

all five wells for VOCs and survey those wells to confirm groundwater flow direction. asked him to submit revised report by the end of 04/30/14. letter emailed to Mr. Turkieh and Ms. Sullivan. 03/18/14-Hiralkumar Patel. 8:57 AM:- received email from Ms. Sullivan including groundwater sampling report. report on e-doc. 03/21/14-Hiralkumar Patel. after discussing with DEC Austin, case assigned to DEC O'Connell as only chlorinated solvent contamination noted at the site. **historically, the property has been used for storage of junk motors and auto parts, manufacturing of metal product, metal tubing fabrication, appliance manufacturing and plastic products manufacturing** 2/14/17: received email from Doug Sullivan at Dewberry requesting update on spill status. He is looking into installing bioswales in the vicinity of the site. (JHO) 2/17/17: Set email to Kumar Patel: I went back in my records and found the last correspondence (email) from me dated 10/15/13 and nothing after that. Notes in the spill database indicate you transferred the spill to me on 3/21/14 but I have no record of this. Please advise. Attached copy of email dated 3/21/14 which stated: locations look ok. they should sample all 5 wells using EPA low-flow procedures . (JHO) 2/24/17: Phase II report submitted by Bianca Planas, BSD Environmental Group. Results provided for groundwater sampling indicate max concentration of TCE is 200 ug/l in well MW-3 near upgradient property boundary. Previous data from 2013 found 120 ug/l at MW-1 near downgradient property boundary. Concentration in MW-1 in Feb. 2017 is 15 ug/l. (JHO) 6/27/17: email from Denies Grattan (DEC Permits). Application has been received to operate a regulated medical waste management facility. Provided comments to her on the application. (JHO) 7/18/17: Email Notice of Incomplete Application sent to applicant (Al Aladwani) and owner (Isaac Turk). Requested vapor intrusion sampling and relocation of interior wells that would be damaged by construction of the medical waste facility. (JHO) 7/24/17: Received proposed scope of work for vapor intrusion sampling and relocation of the monitoring wells from Danraj Singh, BSD Environmental. Requested the following modifications to the scope: 1.Soil vapor intrusion duration should coincide with the proposed use (commercial), which is 8 hours, in accordance with DOH guidance. 2.Groundwater monitoring well screens should be 10 feet, set to straddle the water table. 3.The newly-installed wells should be surveyed and tied into same datum as the existing wells. 4.Gauge the new wells and the existing wells (MW-1 and MW-5) to confirm gw flow direction. 5.Wells MW-1 and MW-5 should be sampled at the same time as the newly installed wells and analyzed for VOCs. (JHO) 8/23/17: Received results from vapor intrusion sampling. 111-TCA found at 7100 ug/m3 in sub-slab vapor and 8.2 ug/m3 in indoor air; 11-DCA at 2200 ug/m3 in sub-slab and 0.61 ug/m3 in indoor air; PCE at 2600 ug/m3 in sub-slab vapor and 23 ug/m3 in idoor air; TCE at 370,000 ug/m3 in sub-slab vapor and 190 ug/m3 in indoor air. Consultant recommended upgrading the HVAC system to improve indoor air quality. Told them this approach was acceptable, but would also be sending the data to NYSDOH for their input. (JHO) 9/27/17: BSD submitted a work plan for modify the HVAC system. Forwarded to Justin Deming, DOH. (JHO) 11/10/17: DOH agrees with HVAC modifications and requests follow up indoor air sampling to confirm effectiveness. This information was relayed to BSD Environmental. (JHO) 1/25/18: Indoor air sampling report received and forwarded to DOH (Justin Deming). (JHO) 2/13/18: Response from Justin Deming: It looks to me like increasing the ventilation within the building has effectively lowered the indoor

DRAFT

C AND L SALES CORP (Continued) **S113493171**

air concentrations of many of the VOCs that were previously detected. The owner should maintain the ventilation system to ensure that the levels remain low. (JHO) 9/25/18: Site case closed. Based on data, the engineering controls implemented have sufficiently reduced indoor air concentrations of contaminants, and has done so over a several month period. Engineering and institutional controls are to be continually maintained, and the spill may be reopened if deemed necessary. (C. Allan)"

Remarks: "contamination based on lab results"

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.
AIR MINOR
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

SOIL GROUND WATER (Continued) **S121118774**

Spill Record Last Update:	2017-11-01
Spiller Name:	DAVE
Spiller Company:	UNKNOWN
Spiller Address:	931 STANLEY AVE
Spiller Company:	999
Contact Name:	DAVE
DEC Memo:	"9/11/17-zhune spoke to Dave Loeffler. Dave said they were doing due diligence on behalf of the purchaser. They identified a tank abandon in place. They did borings and collected soil samples and also collected groundwater from temporary wells. The analytical results indicated some VOCs above to the standards. They will prepare the report for the DEC. 10/26/17-Vought-Received message from Loeffler and returned call and draft investigation report to be submitted to DEC shortly . Vought also answered his questions about method of report to delivery to DEC Zhune. 10/31/17- Dave Loeffler email the report. A total of 12 borings were installed. Boring B-6 through B-10 and B-12 were drilled around the abandoned tank to depth of 16 to 24 feet bgs. Boring B-1 1was drilled to a depth of 4 feet bgs adjacent to the piping run between the tank and the fill port. Borings B-1 through B-5 were installed at locations downgradient of the tank as part of due diligence investigation of floor drains. One soil sample was collected from each boring a the depth intervals with the greatest potential for contamination(highest PID reading, staining, odors etc.). The soil analytical results indicated the petroleum constituents included low-level VOCs and SVOCs detected at concntrations above the unrestricted Use Soil Cleanup Objectives but below the Restricted use industrial soil cleanup objectives. TPI installed two temporary wells (TWP-1)and (TWP-2)on July 31, 2017 and five temporary wells (TWP-3 through TWP-7) on September 20, 2017 to evaluate groundwater conditions. Groundwater was encountered in the borings at approximate depth from 11 to 16 feet below ground surface bgs. The groundwater analytical results indicated the petroleum constituents VOCs and SVOCs exceedances generally within an order of magnitude of the groundwater standards were detected in the vicinity of the tank and showed a general decrease in concentrations in the downgradient direction. The site will continue to be used for industrial purposes, The former tank area and petroleum constituents are covered with impervious concrete foundation structure, thereby preventing storm water infiltration and migration, or contact with site occupants or sensitive receptors. Lastly the petroleum exceedances are expected to naturally attenuate over time through natural biological and chemical processes, since there is no ongoing source of petroleum contamination givwen that the UST was historically abandoned in place. Based on the information in the report this spill is closed. "
Remarks:	"clean up is pending"

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
AIR SYNTHETIC MINOR
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

HW Code: V00582
Control Code: 13
Control Type: ENG
Date Record Added: 03/05/2009
Date Rec Updated: 04/30/2015
Updated By: JJTEETER
Site Description: "Location: The site is located at 1101 Linwood Street within a commercial / industrial area of Brooklyn. Less than a mile south and down gradient are the Pennsylvania Avenue and Fountain Avenue landfills and Jamaica Bay. In recent Less than a mile south and down gradient from the site are the Pennsylvania Avenue Landfill (224002) and the Fountain Avenue Landfill (224003) and then Jamaica Bay. Beginning in about 2009, a large development of single-family row houses have been built. There are residences one block upgradient. Site Features: The property consists of a one-story warehouse-like industrial facility covers most of the block except for a paved parking lot and some landscaping at the southern end. A portion of the building was converted into a two-story facility within the existing building. Current Zoning/Use: The current use of the property is a self-storage facility where people can drive vehicles into the building. Historic Uses: The site was formerly owned by Art-Lloyd Metal Products which manufactured various metal products. Part of the manufacturing process included spray-painting the metal parts. Liquid solvents were likely used in the process. In January 2001, two 550 gallon USTs were discovered under the floor buried in concrete. The tanks had leaked and released large quantities of xylene and ethylbenzene in to the soil and groundwater (spill # 01-07758). The tanks and approximately estimated 40 cubic yards (41.8 tons) of contaminated soil was removed from the site to an approved disposal facility. An interim remedial measure was conducted in May 2003 when four groundwater extraction wells were installed in the area of the contaminated groundwater. About 2,150 gallons of contaminated groundwater was collected for off site disposal. An investigation of groundwater, soil, and soil gas began in June 2003. In the winter of 2004-05, approximately 250 cubic yards of contaminated soil was excavated from two locations and disposed of in accordance with NYSDEC regulations. NYSDEC staff requested an oxygen releasing compound (ORC) be pumped in to the excavations, but this was not done. In January 2006, the consultant pumped ORC in to the area of the outside excavations using a direct-push method to bore holes to a depth below the earlier excavations. Due to elevated concentrations of xylene and ethylbenzene in soil gas and impacts to indoor air, a sub-slab depressurization system (SSDS) was installed in November 2005. The environmental remedies conducted at the site are summarized in the Interim Remedial Measures Work Plan, May 20, 2003; Remedial Action Work Plan, April 9, 2004; and the Additional Remedial Action Work Plan, November 2005 from Shapiro Engineering. Due to the remaining contamination, engineering controls (ECs) and institutional controls (ICs) have been placed on the site. The ECs consist of operation and maintenance of the SSDS, periodic groundwater monitoring, a demarcation barrier at the depth limit of the source excavation. ICs, in the form of a deed restriction, prohibit excavation of soil without DEC approval and the use of on-site groundwater for potable purposes. Upon completion of the VCA in July 2007, environmental remediation has been completed to the satisfaction of the department. The site is currently in the site

DRAFT

S & S SHEET METAL PRODUCTS CORP (Continued) **1000130817**

management phase with operation, maintenance and monitoring and site controls as described above. Site Geology and Hydrogeology: The on-site water table is about 14 feet below grade. Local groundwater flow is to the south toward Jamaica Bay. Groundwater flow has been found to be slow. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. To date, down-gradient on-site monitoring wells have little or no evidence of contaminants migrating beyond the building footprint."

Env Problem: "Nature and extent of contamination: Remediation at the site is complete. There is some ethylbenzene and xylene contamination that remains in soil and groundwater which is being managed as a part of Site Management. The soil contamination is beneath a demarcation barrier, twelve feet of clean fill, and either the sidewalk or concrete floor. The groundwater flows south beneath the building toward the Penn and Fountain landfills and then the Jamaica Bay. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. A monitoring well was constructed at the other end of the building. No site-related contaminants were found in the well in January 2006. The post-remedy annual report / OM&M report (2006) showed some xylene (246 mg/Kg), ethylbenzene (29.1 mg/Kg), and toluene (0.2 mg/Kg) remaining in soil below the bottom of the excavation. The GW concentrations remain elevated in the source area at xylene (43,400 mg/Kg), ethylbenzene (6,590 mg/Kg), and toluene (38.1 mg/Kg). However, most of the source area is under the building and the impacted groundwater is migrating under the building. Two down-gradient monitoring wells showed some impacts from xylene at 3.45 mg/Kg and 14.8 mg/Kg. The remaining soil contamination is primarily 12 feet below grade under the sidewalk and the building slab. The soil concentrations exceed TAGM 4046 RSCOs. However, the xylene concentrations are below Part 375 commercial restricted use soil cleanup objective and the ethylbenzene concentrations are below the Part 375 residential restricted use SCO. The remaining GW contamination is primarily under the building. The source area is along the east-northeast side of the building. GW flows southernly under the building. Currently, there are no GW receptors down gradient. "

Health Problem: "Exposure to contaminants in on-site soil is not expected since remaining wastes are at depth and capped. A sub-slab depressurization system is operating to eliminate or minimize the possibility of vapors entering the on-site building. Exposure to site-related contamination in drinking water is not expected since the area is served by municipal water."

Due to elevated concentrations of xylene and ethylbenzene in soil gas and impacts to indoor air, a sub-slab depressurization system (SSDS) was installed in November 2005. The environmental remedies conducted at the site are summarized in the Interim Remedial Measures Work Plan, May 20, 2003; Remedial Action Work Plan, April 9, 2004; and the Additional Remedial Action Work Plan, November 2005 from Shapiro Engineering. Due to the remaining contamination, engineering controls (ECs) and institutional controls (ICs) have been placed on the site. The ECs consist of operation and maintenance of the SSDS, periodic groundwater monitoring, a demarcation barrier at the depth limit of the source excavation. ICs, in the form of a deed restriction, prohibit excavation of soil without DEC approval and the use of on-site groundwater for potable purposes. Upon completion of the VCA in July 2007, environmental remediation has been completed to the satisfaction of the department. The site is currently in the site management phase with operation, maintenance and monitoring and site controls as described above. Site Geology and Hydrogeology: The on-site water table is about 14 feet below grade. Local groundwater flow is to the south toward Jamaica Bay. Groundwater flow has been found to be slow. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. To date, down-gradient on-site monitoring wells have little or no evidence of contaminants migrating beyond the building footprint."

Env Problem: "Nature and extent of contamination: Remediation at the site is complete. There is some ethylbenzene and xylene contamination that remains in soil and groundwater which is being managed as a part of Site Management. The soil contamination is beneath a demarcation barrier, twelve feet of clean fill, and either the sidewalk or concrete floor. The groundwater flows south beneath the building toward the Penn and Fountain landfills and then the Jamaica Bay. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. A monitoring well was constructed at the other end of the building. No site-related contaminants were found in the well in January 2006. The post-remedy

DRAFT

S & S SHEET METAL PRODUCTS CORP (Continued) **1000130817**

annual report / OM&M report (2006) showed some xylene (246 mg/Kg), ethylbenzene (29.1 mg/Kg), and toluene (0.2 mg/Kg) remaining in soil below the bottom of the excavation. The GW concentrations remain elevated in the source area at xylene (43,400 mg/Kg), ethylbenzene (6,590 mg/Kg), and toluene (38.1 mg/Kg). However, most of the source area is under the building and the impacted groundwater is migrating under the building. Two down-gradient monitoring wells showed some impacts from xylene at 3.45 mg/Kg and 14.8 mg/Kg. The remaining soil contamination is primarily 12 feet below grade under the sidewalk and the building slab. The soil concentrations exceed TAGM 4046 RSCOs. However, the xylene concentrations are below Part 375 commercial restricted use soil cleanup objective and the ethylbenzene concentrations are below the Part 375 residential restricted use SCO. The remaining GW contamination is primarily under the building. The source area is along the east-northeast side of the building. GW flows southernly under the building. Currently, there are no GW receptors down gradient. "

Health Problem: "Exposure to contaminants in on-site soil is not expected since remaining wastes are at depth and capped. A sub-slab depressurization system is operating to eliminate or minimize the possibility of vapors entering the on-site building. Exposure to site-related contamination in drinking water is not expected since the area is served by municipal water."

Site Description: "Location: The site is located at 1101 Linwood Street within a commercial / industrial area of Brooklyn. Less than a mile south and down gradient are the Pennsylvania Avenue and Fountain Avenue landfills and Jamaica Bay. In recent Less than a mile south and down gradient from the site are the Pennsylvania Avenue Landfill (224002) and the Fountain Avenue Landfill (224003) and then Jamaica Bay. Beginning in about 2009, a large development of single-family row houses have been built. There are residences one block upgradient. Site Features: The property consists of a one-story warehouse-like industrial facility covers most of the block except for a paved parking lot and some landscaping at the southern end. A portion of the building was converted into a two-story facility within the existing building. Current Zoning/Use: The current use of the property is a self-storage facility where people can drive vehicles into the building. Historic Uses: The site was formerly owned by Art-Lloyd Metal Products which manufactured various metal products. Part of the manufacturing process included spray-painting the metal parts. Liquid solvents were likely used in the process. In January 2001, two 550 gallon USTs were discovered under the floor buried in concrete. The tanks had leaked and released large quantities of xylene and ethylbenzene in to the soil and groundwater (spill # 01-07758). The tanks and approximately estimated 40 cubic yards (41.8 tons) of contaminated soil was removed from the site to an approved disposal facility. An interim remedial measure was conducted in May 2003 when four groundwater extraction wells were installed in the area of the contaminated groundwater. About 2,150 gallons of contaminated groundwater was collected for off site disposal. An investigation of groundwater, soil, and soil gas began in June 2003. In the winter of 2004-05, approximately 250 cubic yards of contaminated soil was excavated from two locations and disposed of in accordance with NYSDEC regulations. NYSDEC staff requested an oxygen releasing compound (ORC) be pumped in to the excavations, but this

DRAFT

About 2,150 gallons of contaminated groundwater was collected for off site disposal. An investigation of groundwater, soil, and soil gas began in June 2003. In the winter of 2004-05, approximately 250 cubic yards of contaminated soil was excavated from two locations and disposed of in accordance with NYSDEC regulations. NYSDEC staff requested an oxygen releasing compound (ORC) be pumped in to the excavations, but this was not done. In January 2006, the consultant pumped ORC in to the area of the outside excavations using a direct-push method to bore holes to a depth below the earlier excavations. Due to elevated

DRAFT

S & S SHEET METAL PRODUCTS CORP (Continued) **1000130817**

concentrations of xylene and ethylbenzene in soil gas and impacts to indoor air, a sub-slab depressurization system (SSDS) was installed in November 2005. The environmental remedies conducted at the site are summarized in the Interim Remedial Measures Work Plan, May 20, 2003; Remedial Action Work Plan, April 9, 2004; and the Additional Remedial Action Work Plan, November 2005 from Shapiro Engineering. Due to the remaining contamination, engineering controls (ECs) and institutional controls (ICs) have been placed on the site. The ECs consist of operation and maintenance of the SSDS, periodic groundwater monitoring, a demarcation barrier at the depth limit of the source excavation. ICs, in the form of a deed restriction, prohibit excavation of soil without DEC approval and the use of on-site groundwater for potable purposes. Upon completion of the VCA in July 2007, environmental remediation has been completed to the satisfaction of the department. The site is currently in the site management phase with operation, maintenance and monitoring and site controls as described above. Site Geology and Hydrogeology: The on-site water table is about 14 feet below grade. Local groundwater flow is to the south toward Jamaica Bay. Groundwater flow has been found to be slow. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. To date, down-gradient on-site monitoring wells have little or no evidence of contaminants migrating beyond the building footprint."

Env Problem: "Nature and extent of contamination: Remediation at the site is complete. There is some ethylbenzene and xylene contamination that remains in soil and groundwater which is being managed as a part of Site Management. The soil contamination is beneath a demarcation barrier, twelve feet of clean fill, and either the sidewalk or concrete floor. The groundwater flows south beneath the building toward the Penn and Fountain landfills and then the Jamaica Bay. RI sampling has shown that the groundwater contamination has not migrated more than 200 feet in twenty years. A monitoring well was constructed at the other end of the building. No site-related contaminants were found in the well in January 2006. The post-remedy annual report / OM&M report (2006) showed some xylene (246 mg/Kg), ethylbenzene (29.1 mg/Kg), and toluene (0.2 mg/Kg) remaining in soil below the bottom of the excavation. The GW concentrations remain elevated in the source area at xylene (43,400 mg/Kg), ethylbenzene (6,590 mg/Kg), and toluene (38.1 mg/Kg). However, most of the source area is under the building and the impacted groundwater is migrating under the building. Two down-gradient monitoring wells showed some impacts from xylene at 3.45 mg/Kg and 14.8 mg/Kg. The remaining soil contamination is primarily 12 feet below grade under the sidewalk and the building slab. The soil concentrations exceed TAGM 4046 RSCOs. However, the xylene concentrations are below Part 375 commercial restricted use soil cleanup objective and the ethylbenzene concentrations are below the Part 375 residential restricted use SCO. The remaining GW contamination is primarily under the building. The source area is along the east-northeast side of the building. GW flows southernly under the building. Currently, there are no GW receptors down gradient. "

Health Problem: "Exposure to contaminants in on-site soil is not expected since remaining wastes are at depth and capped. A sub-slab depressurization system is operating to eliminate or minimize the possibility of vapors entering the on-site building. Exposure to site-related contamination in drinking water is not expected since the area is served by municipal water."

Site Description: "Location: The site is located at 1101 Linwood Street within a commercial / industrial area of Brooklyn. Less than a mile south and down gradient are the Pennsylvania Avenue and Fountain Avenue landfills and Jamaica Bay. In recent Less than a mile south and down gradient from the site are the Pennsylvania Avenue Landfill (224002) and the Fountain Avenue Landfill (224003) and then Jamaica Bay. Beginning in about 2009, a large development of single-family row houses have been built. There are residences one block upgradient. Site Features: The property consists of a one-story warehouse-like industrial facility covers most of the block except for a paved parking lot and some landscaping at the southern end. A portion of the building was converted into a two-story facility within the existing building. Current Zoning/Use: The current use of the property is a self-storage facility where people can drive vehicles into the building. Historic Uses: The site was formerly owned by Art-Lloyd Metal Products which manufactured various metal products. Part of the manufacturing process included spray-painting the metal parts. Liquid solvents were likely used in the process. In January 2001, two 550 gallon USTs were discovered under the floor buried in concrete. The tanks had leaked and released large quantities of xylene and ethylbenzene in to the soil and groundwater (spill # 01-07758). The tanks and approximately estimated 40 cubic yards (41.8 tons) of contaminated soil was removed from the site to an approved disposal facility. An interim remedial measure was conducted in May 2003 when four groundwater extraction wells were installed in the area of the contaminated groundwater. About 2,150 gallons of contaminated groundwater was collected for off site disposal. An investigation of groundwater, soil, and soil gas began in June 2003. In the winter of 2004-05, approximately 250 cubic yards of contaminated soil was excavated from two locations and disposed of in accordance with NYSDEC regulations. Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
AIR SYNTHETIC MINOR
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with

DRAFT

S & S SHEET METAL PRODUCTS CORP (Continued) **1000130817**

a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

I05 - Overfill - Vent Whistle
G02 - Tank Secondary Containment - Vault (w/access)

Tank Location:	Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	In Service
Pipe Model:	Not reported
Install Date:	01/01/1996
Capacity Gallons:	10000
Tightness Test Method:	NN
Date Test:	Not reported
Next Test Date:	Not reported
Date Tank Closed:	Not reported
Register:	True
Modified By:	ACDANIEL
Last Modified:	06/13/2019
Material Name:	#2 fuel oil (on-site consumption)

Tank Number:	002
Tank Id:	65115
Material Code:	0001
Common Name of Substance:	#2 Fuel Oil (On-Site Consumption)

Equipment Records:

L09 - Piping Leak Detection - Exempt Suction Piping
E00 - Piping Secondary Containment - None
H00 - Tank Leak Detection - None
F00 - Pipe External Protection - None
J02 - Dispenser - Suction Dispenser
C03 - Pipe Location - Aboveground/Underground Combination
I04 - Overfill - Product Level Gauge (A/G)
K00 - Spill Prevention - None
A00 - Tank Internal Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating
D01 - Pipe Type - Steel/Carbon Steel/Iron
G02 - Tank Secondary Containment - Vault (w/access)

Environmental Interest/Information System:
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
AIR SYNTHETIC MINOR
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
AIR EMISSIONS CLASSIFICATION UNKNOWN
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
HAZARDOUS AIR POLLUTANT MAJOR
HAZARDOUS WASTE BIENNIAL REPORTER
FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.
