2. Site Background

Sunnyside Yard is located in an urban area in northwestern Queens County (Figure 1). The East River is located approximately one mile to the west while Newtown Creek, which defines the border between Queens and Kings Counties, is located less than 0.5 mile south of the western portion of the Yard. The Yard consists of a railroad maintenance and storage facility that currently encompasses approximately 133 acres. The Yard functions as a maintenance facility for electric locomotives and railroad cars for Amtrak and a train layover storage yard for New Jersey Transit Corporation (NJTC). The Yard is currently in the New York State (NYS) Inactive Hazardous Waste Disposal Site Remedial Program, Site No. 241006, which is administered by NYSDEC. The Yard was subdivided into six operable units (OUs), OU-1 through OU-6, to streamline remedial efforts. The land use surrounding the Yard is a combination of commercial, light industrial and residential areas. The Long Island Rail Road (LIRR) currently owns a portion of the original Yard along the northern boundary (including a portion of OU-3) and maintains rights of way through the Yard. This EWP pertains to OU-3 and OU-4 only of the Yard (Site).

OU-3 encompasses approximately eight acres in the north central portion of the Yard, and as mentioned above, includes property owned by the LIRR. OU-4 comprises 120 of the total 133 acres of the Site and is located to the west of OU-3. Several former structures/features were present in OU-3 and OU-4, but have since been demolished to land surface, removed, closed, or rendered inoperable, as described in subsequent sections. Since remaining contamination exists within OU-3 and OU-4, any future intrusive work that will encounter or disturb the remaining contamination will be performed in compliance with this EWP. The locations of OU-3 and OU-4, as well as the approximate footprint of the proposed Acela /Ready Tracks construction area (limits of construction) are shown in Figure 2.

2.1 Proposed Acela / Ready Tracks Construction

As part of the proposed Acela /Ready Tracks construction project, Amtrak will be upgrading/installing subsurface utilities (i.e., water line, electrical duck banks, traction power duck banks, , etc.), new rail tracks and a retaining wall within portions of OU-3 and OU-4. The proposed Acela /Ready Tracks design details are provided in Appendix B. The approximate areas of excavation are shown on Figures 1 through 8 provided in Appendix C. Excavation depths range from approximately two feet below land surface (ft bls) to approximately 18 ft bls. Cross-sections of the proposed cut/excavation areas are provided in Appendix B (see drawings C301 through C-311). According to Amtrak, this work will include the excavation of approximately 44,000 CY of soil. Amtrak anticipates on reusing approximately 10,000 CY of soil as backfill within the excavations. The remaining approximately 34,000 CY of soil will be transported off-site for disposal at a permitted facility. Prior to commencement of the Acela /Ready Tracks work, Roux will complete an *in situ* soil characterization program (soil characterization) within the anticipated areas of excavation (see Appendix C). In accordance with Section 3 of this EWP, during soil characterization activities, Roux will collect grab/composite soil samples throughout the proposed excavation areas for laboratory analyses. All soil samples will be submitted to a New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program Contract and Laboratory Protocol laboratory and analyzed for Sunnyside Yard (SSY) site-specific criteria compounds including total Semivolatile Organic Compounds (SVOCs), polychlorinated biphenyls (PCBs) and lead for reuse evaluation. Additionally, all soil samples will be collected for full toxicity characterization leaching procedure (TCLP) and other typical waste disposal required analyses (i.e., total cyanide, Resource Conservation and Recovery Act (RCRA) characteristics, etc.). If any sample exceeds SSY site-specific criteria (total SVOCs: 500 parts per million [ppm], PCBs: 25 ppm or lead: 3,900

ppm), the soil will be transported offsite for proper disposal at a permitted waste disposal facility. Impacted soil meeting SSY site-specific criteria will not be used as backfill in the top one foot (i.e., cover system).

Following completion of the work, the surface within the limits of construction will be completed with a combination of asphalt paths, new rail tracks, and ballast stone. See Grading and Drainage drawings C-151 through C-158 provided in Appendix B.

Additionally, the Acela /Ready Tracks work will include dewatering during utility excavation activities, which will be completed in accordance with a Long Island Well Permit (LIWP), if required, and New York City Department of Environmental Protection (NYCDEP) discharge requirements, as described in Section 3.8 of this EWP.

The Acela /Ready Tracks excavation work is anticipated to commence in July 2021 and is anticipated to be completed over a duration of approximately eight months. A kickoff meeting will be conducted with the NYSDEC prior to commencement of field activities. The kickoff meeting will be coordinated with the NYSDEC.

2.2 Summary of Previous Investigations and Remediation

This section provides a detailed description of the previous investigation and remediation activities conducted in OU-3 and OU-4 including the historic separate phase hydrocarbon (SPH) plume, the soil (unsaturated and saturated), PCB Remedial Zones, groundwater, and subsurface structures.

2.2.1 SPH

By the time the OU-3 Remedial Investigation (RI) was submitted to NYSDEC in May 2005, the SPH plume had been fully delineated both horizontally and vertically. At its largest extent, the historic outer boundary of the plume (historic zero-foot SPH contour), which was very conservatively defined by the absence of a visible sheen on the water table, occupied an area of approximately three acres in the central part of OU-3 (Figure 3). Physical evidence of sheen and/or petroleum odor was noted up to 10 feet below land surface (ft bls) in several borings and deeper in some borings.

Based on the collective results of previous RIs, a detailed description of the nature and extent of contamination in OU-3 was presented in the October 2007 NYSDEC approved Remedial Action Work Plan (RAWP). With respect to SPH, 65 samples of SPH were collected from OU-3 monitoring wells and analyzed for PCBs. The results of the PCB testing showed detections in 22 locations, ranging from 460 micrograms per kilogram (µg/kg) to 360,000 µg/kg. Analytical results of SPH samples collected in 1994 indicate that the SPH in the plume consists of a slightly degraded No. 2 fuel oil.

Significant SPH recovery activities have been completed both as Interim Remedial Measures (IRMs) before the October 2007 OU-3 RAWP, and as part of the final OU-3 remedy following the October 2007 OU-3 RAWP. These SPH remedial activities included SPH recovery using a dual phase vacuum extraction system (DPVE), soil/SPH excavation, surfactant enhanced SPH recovery, bioremediation, and manual SPH bailing/recovery. As a result of this work, an estimated total of 14,920 gallons of SPH has been recovered, and therefore, the extent of the SPH plume has been reduced significantly. Currently, the SPH plume consists of only one small, isolated occurrence of SPH (less than 0.1 feet thickness), as shown on Figure 4, which presents the current SPH plume configuration (as measured on December 15, 2020). To fully achieve the remedial requirements outlined in the OU-3 Record of Decision (ROD) prepared by NYSDEC dated

March 2007, Roux Environmental Engineering and Geology, D.P.C. (Roux) is actively monitoring SPH occurrences. SPH occurrences with apparent measured thickness of great than 0.1 feet will be addressed through the use of surfactant enhanced SPH recovery, as necessary.

2.2.2 Soil

The Site-specific action soil cleanup objective for the Site are lead: 3,900 ppm; PCBs: 25 ppm; and total SVOCs: 500 ppm. In 2008, a 0.2-acre area of hydrocarbon-impacted surface soil was visually delineated to the north, west and east of the former Engine House, partly within the bounds of the historic SPH plume and partly within the limits of the mobile SPH plume. Based on observations from soil borings completed during multiple investigations, the average depth of hydrocarbon impacts was one ft bls, within the unsaturated zone. Surficial hydrocarbon-impacted soil was excavated to a depth of two ft bls, transported off-site and properly disposed of as part of the approved remedy for OU-3. The excavation was then backfilled with clean fill and brought to grade. The extent of the surface soil excavation is presented on Figure 3.

In 2010, a PCB soil hot spot (measuring 24-feet long by 21.5-feet wide by approximately 1-foot deep) was excavated in OU-3 in accordance with the OU-3 RAWP. Also, in 2010, a lead soil hot spot (measuring 24-feet long by 21-feet wide by 2-feet deep) was excavated in accordance with the OU-3 RAWP. The extent of these former OU-3 hot spot excavations are presented on Figure 3.

A 0.5-acre area of hydrocarbon-impacted soil was visually delineated to the north, west, and east, within the bounds of the historic SPH plume. In 2016 this soil, visually observed to be hydrocarbon-impacted and a potential source for SPH, was excavated to a depth of five ft bls, transported off-site and properly disposed of as part of the approved remedy for OU-3. The excavation was then backfilled with clean fill and brought to grade. The extent of the excavation and remaining residual SPH occurrence is presented on Figure 4.

2.2.3 PCB Remedial Zones

The OU-4 RAWP provided the scope of work for the excavation and off-site disposal of PCB impacted soil at twelve locations (Remedial Zones PCB-1 through PCB-12) and lead impacted soil at one location (Remedial Zone Lead-20). As of September 2020, seven Remedial Zones (PCB-1 through PCB-3 and PCB-5 through PCB-9) have been completed, which has been documented in previous Construction Completion Reports. Due to access limitations, impacted soil at Remedial Zones PCB-4, PCB-10, PCB-11 PCB-12, and Lead-20 remain at the Site. These remaining Remedial Zones within OU-4 are not within the proposed limits of construction for the Acela / Ready Tracks project.

2.2.4 Groundwater

Groundwater beneath the entire Yard is defined as OU-6. Groundwater in OU-6 at the Yard (including OU-3 and OU-4) is slightly impacted at concentrations above the NYSDEC GA standards and is impacted by several upgradient sources, including Standard Motor Products (Site No. 241016, Class 2 Site on NYSDEC Registry of Inactive Hazardous Waste Disposal Sites) by contamination (primarily chlorinated volatile organic compounds [CVOCs], benzene, toluene, ethylbenzene, and xylenes [BTEX], and metals). The extent of the off-site plume impacting the Yard is presented on Figure 3. As per the OU-6 ROD issued by NYSDEC dated March 2010, a no action remedy with monitoring was selected for OU-6 (including groundwater in the area of OU-3). Roux is currently implementing this groundwater monitoring program at the Yard.

2.2.5 Subsurface Structures

Former subsurface structures located in OU-3 were investigated and some were removed. The following is a listing of structures formerly located in OU-3:

- Interior and exterior Engine House service pits (removed in 2008 and 2010);
- Oil House basement (removed in 2008);
- Metro Shed inspection pit (cleaned and backfilled in 1997, partially removed in 2010); and
- Fuel transfer pump vaults (removed in 2010).

Locations of all former subsurface structures are provided on Figure 3. Additionally, this figure shows the approximate locations know remaining subsurface structures in OU-3.

2.2.5.1 Underground Storage Tanks

Nine USTs with capacities ranging from 7,800 to 11,000 gallons were in the two former UST areas, west (three USTs, Nos. 1, 2, and 3) and east (six USTs, Nos. 4 through 9) in OU-3. Locations of all nine USTs are shown on Figure 3. It was reported that UST Nos. 1 through 5 formerly contained No. 2 fuel oil, while Tank Nos. 6 through 9 formerly contained No. 4 fuel oil. In addition, the former Boiler House UST (20,000-gallon No. 2 fuel oil tank) located within OU-4, which was previously abandoned in place, was removed as part of the Mass Transit Authority (MTA) East Side Access (ESA) Project.

On September 3, 2008, removal of the USTs began with UST No. 9. The steel plates covering the manways to the USTs were removed. Any soil overlying the UST and surrounding concrete was removed to access the UST. Once accessed, the surrounding soil was removed to allow removal of the tank. All soil that was removed was stockpiled and visually inspected for impacts (i.e., staining and odors). UST No. 9 was removed and staged on level ground to allow inspection for evidence of cracks or holes. Immediately after inspection, UST No. 9 was rendered unusable by puncturing and cutting the tank into sections. UST No. 9 was cut into manageable pieces and stockpiled for offsite disposal.

Upon opening the top of UST No. 8, it was determined that it had been previously filled with sand and the contractor began removing and stockpiling the sand for offsite disposal. At this time, the Remedial Action was temporarily suspended by the NYSDEC following unsubstantiated nuisance odor complaints from some of the occupants of the 33-00 Northern Boulevard Building. Prior to discontinuing work, however, UST No. 8 was abandoned in place (removal was not permitted due to the unsubstantiated nuisance odor complaints). The entire excavated area was backfilled with ¾-inch stone to grade.

On December 15, 2010, excavation activities were conducted to abandon the remaining seven USTs that had not been addressed during the 2008 remedial activities described above (i.e., UST Nos. 1 through 7). Due to the shallow water table at OU-3, de-watering of the excavation was necessary which was accomplished using centrifugal pumps connected to an oil/water separator (OWS) that allowed for the separation of SPH and water. Water was then transferred from the OWS to temporary storage tanks (Frac tanks) to await proper disposal. SPH was removed from the OWS using a vacuum truck and was disposed of as a PCB hazardous waste.

Each of the seven remaining USTs were unearthed and access to the tanks was created by cutting a lateral opening. Each UST was backfilled with ¾-inch stone to grade. Each of the seven abandoned USTs was

constructed of single walled-steel with rivets at the seams. Additional details regarding the USTs and their current status are provided on Table 2 below. UST locations area shown on Figure 3.

UST ID	Dimensions	Estimated Capacity	Depth to Top of UST	Current Status
UST No. 1	24-ft. long by 8-ft. in diameter	9,000 gallons	8 ft. bls.	Abandoned with ¾-inch stone to grade
UST No. 2	21-ft. long by 8-ft. in diameter	7,800 gallons	7 ft. bls.	Abandoned with ¾-inch stone to grade
UST No. 3	24-ft. long by 8-ft. in diameter	9,000 gallons	8 ft. bls.	Abandoned with ¾-inch stone to grade
UST Nos. 4 through 7	30-ft. long by 8-ft. in diameter	11,000 gallons	8 ft. bls.	Abandoned with ¾-inch stone to grade
UST No. 8	30-ft. long by 8-ft. in diameter	11,000 gallons	8 ft. bls.	Abandoned with ¾-inch stone to grade
UST No. 9	30-ft. long by 8-ft. in diameter	11,000 gallons	8 ft. bls.	Removed. Excavation backfilled with ¾-inch stone to grade

2.2.6 Contamination Remaining at the Yard

Upon completion of the remedial activities described above, only a small portion of the SPH plume remains (one small, isolated area of SPH remains, as show in in Figure 4). Physical evidence of residual petroleum and/or petroleum odor was noted in soil at depth of up to 10 feet bls or greater in some isolated areas, within the historical boundary of the SPH plume. All previously identified soil exceedances of the Yard constituents of concern (COCs) in OU-3 have been remediated and are no longer present in OU-3 area of Yard.

As discussed above, there are a total of five remaining areas where soil is present in excess of the Yard soil cleanup levels (i.e., Remedial Zones) in OU-4; however, none are present within the proposed limits of construction (i.e., area of disturbance).

As part of OU-6, low-level residual impacts remain in groundwater, however, they have been delineated and are subject only to a monitoring only remedy, as per the OU-6 ROD (Roux is currently implementing this groundwater monitoring program as part of OU-6).

After completion of the Yard Remedial Action, Engineering, and Institutional Controls (ECs/ICs) will be required to address contamination remaining at the Yard. Long-term management of these EC/ICs and residual contamination will be performed in accordance with a NYSDEC-approved SMP.

2.2.7 In Situ Soil Characterization and Delineation Sampling

In May/June 2021, all proposed excavated material for the Acela/Ready Tracks project was sampled in situ for reuse and waste characterization evaluation purposes. During soil characterization activities, one soil characterization sample was collected for every approximate 800 cubic yards of soil for reuse and disposal evaluations. Soil characterization samples were submitted for laboratory analysis for Yard-specific criteria compounds (total SVOCs, PCBs and lead) and typical disposal facility requirements, which included target

compound list (TCL) volatile organic compounds (VOCs), pesticides/herbicides, target analyte list (TAL) metals, TCLP RCRA 8 metals, and RCRA characteristics (e.g., reactivity, corrosivity and ignitability) as well as additional analytical parameters required to allow for material acceptance into a specific proposed treatment, storage, and disposal facility (TSDF) including Pennsylvania landfills. Soil sampling methodologies and results are described in the In Situ Soil Characterization Summary Report (Summary Report) dated September 20, 2021 prepared by Roux and included in Appendix D of this EWP. All soil characterization samples (Yard-specific criteria compounds: total SVOCs, PCBs and lead) were validated. A data usability summary report (DUSR) is provided in Appendix D. As indicated in the Summary Report, one composite soil sample, WC-21_0-5, collected from the 0-5 ft bls interval within soil characterization grid cell, WC-21, had a PCB detection of 79 milligrams per kilogram (mg/kg) exceeding Yard-specific soil cleanup objective (25 mg/kg) and one composite soil sample WCR-10_0-8 collected from the 0-8 ft bls interval within soil characterization grid cell, WCR-10, had a TCLP lead detection exceeding United State Environmental Agency (USEPA) criteria. Of note, total lead from sample WCR-10_0-8 was detected at a concentration of 109 mg/kg, which is significantly below the Yard-specific criteria of 3,900 mg/kg. Soil characterization data for Yard-Specific criteria (total VOCS, PCBs and lead and TCLP lead) are summarized on Figures 1 through 8 included in Appendix C.

On November 2 to November 5, 2021, delineation soil sampling activities were completed around WC-21 and WCR-10 to define to boundaries of the PCB (WC-21) and TCLP lead (WCR-10) exceedances for waste characterization delineation purposes. A total of eight PCB delineation samples were collected for laboratory analysis from eight soil borings installed around the perimeter of grid cell WC-21 and advanced to depths of five ft bls. A total eight lead delineation samples were collected for laboratory analysis (total lead and TCLP lead) from five soil borings installed on the eastern, southern, and western sides of grid cell WCR-10 that were adjacent to other grid cells and advanced to depths of eight ft bls. Soil sampling methodologies and results for the PCB and TCLP lead delineation activities are described in the PCB Delineation Soil Sampling Summary Memorandum dated November 11, 2021 and TCLP lead Delineation Soil Sampling Summary Memorandum dated November 17, 2021, which are included in Appendix D of this EWP. Based on the sample results, there were no PCB or TCLP lead detections above Yard-specific criteria (for PCBs) or USEPA criteria (for TCLP lead) and the areas were delineated to the extent of each grid cell boundary (see Figures 1 and 3 in Appendix C).

Based on the Soi Characterization and delineation results, all soil, except soil from the 0-5 ft bls interval within WC-21 and the 0-8 ft bls interval within WCR-10, proposed to be excavated during the Acela/Ready Tracks work meets Yard-specific criteria for reuse as backfill up to one-foot bls.

3. Soil/Materials Management Methods

Since remaining contamination exists at the Site, any future intrusive work that will encounter or disturb the remaining contamination will be performed in compliance with this EWP. Any work conducted pursuant to the EWP must also be conducted in accordance with the procedures defined in a project specific Health and Safety Plan (HASP) prepared by the contractor and Community Air Monitoring Plan (CAMP – see Appendix E) prepared for the Site.

Amtrak and associated parties preparing the remedial documents submitted to the NYSDEC, and parties performing this work, are completely responsible for the safe performance of all intrusive work, the structural integrity of excavations, proper disposal of excavation waste (water and soil), control of runoff from open excavations into remaining contamination, and for structures that may be affected by excavations (such as building foundations and bridge footings). The following sections provide the Soil Management Plan to be implemented during all intrusive work.

3.1 Soil Screening Methods

All excavated material, not already characterized, will be sampled for reuse and/or waste characterization purposes prior to being reused on-site or transportation for off-site disposal. *In-situ* sampling for waste characterization should be performed whenever feasible to allow for direct load out of soils, reducing the size and duration of stockpiling that may be a cause of odor concerns. It is estimated that one soil characterization sample will be collected for every approximate 800 cubic yards of soil and concrete for reuse or disposal. At a minimum, waste characterization samples will be submitted for analysis for the typical disposal facility requirements, which will include target compound list (TCL) volatile organic compounds (VOCs), SVOCs, pesticides/herbicides, PCBs, target analyte list (TAL) metals, TCLP RCRA 8 metals, and RCRA characteristics (e.g., reactivity, corrosivity and ignitability); however, additional analytical parameters will be added if required to allow for material acceptance into a specific proposed treatment, storage, and disposal facility (TSDF). Dedicated sampling equipment will be used for collection of each soil characterization sample.

Visual, olfactory and instrument-based (e.g., photoionization detector) soil screening will be performed by a qualified environmental professional (designated environmental representative of Amtrak) during all excavations into known or potentially contaminated material (remaining contamination). Soil screening will be performed when invasive work is done and will include all excavation and invasive work performed during development, such as excavations for foundations and utility work, after issuance of the COC.

Soils will be segregated based on previous environmental data and screening results into material that requires off-site disposal and material that requires testing to determine if the material can be reused on-site as soil beneath a cover or if the material can be used as cover soil. Further discussion of off-site disposal of materials and on-site reuse is provided in Section 6.

3.2 Soil Staging Methods

Soil stockpiles will be continuously encircled with a berm and/or silt fence. Silt fencing will be used as needed near catch basins, surface waters and other discharge points.

Stockpiles will be kept covered at all times with appropriately anchored tarps and, if necessary, vapor suppressant foam should be applied to minimize the migration of vapors off-site. Stockpiles will be routinely inspected and damaged tarp covers will be promptly replaced.

Stockpiles will be inspected at a minimum once each week and after every storm event. Results of inspections will be recorded in a logbook and maintained at the Site and available for inspection by the NYSDEC.

If SPH impacted soil (stained/odorous soil) is encountered during excavation activities within OU-3, the material will be loaded into lined containers with tight fitting covers and taken offsite for disposal at a permitted facility.

3.3 Materials Excavation and Load-Out

Any proposed soil excavation on the Site will be conducted in accordance with this EWP.

A qualified environmental professional (designated environmental representative of Amtrak) or person under their supervision will oversee all invasive work and the excavation and load-out of all excavated material.

The owner of the property and remedial party (if applicable) and its contractors are responsible for safe execution of all invasive and other work performed under this Plan.

The presence of utilities and easements on the Site will be investigated by the qualified environmental professional. It will be determined whether a risk or impediment to the planned work under this EWP is posed by utilities or easements on the Site.

A truck wash will be operated on-site, as appropriate. The qualified environmental professional will be responsible for ensuring that all outbound trucks will be washed at the truck wash before leaving the Site until the activities performed under this section are complete. Truck wash waters will be collected and disposed of off-site in an appropriate manner.

Locations where vehicles enter or exit the Site shall be inspected daily for evidence of off-site soil tracking.

The qualified environmental professional will be responsible for ensuring that all egress points for truck and equipment transport from the Site are clean of dirt and other materials derived from the Site during intrusive excavation activities. Cleaning of the adjacent streets will be performed as needed to maintain a clean condition with respect to Site-derived materials.

3.4 UST Removal

Eight previously abandoned in place USTs with capacities ranging from 8,200 to 17,600 gallons are located in OU-3, within the historic plume (see Figure 3). All UST removal and soil handling, if needed to facilitate construction, shall be conducted in accordance with this EWP. Odor suppressant foam (or other methods with equivalent effectiveness) will be utilized as required to suppress odors during UST removal activities. Following UST removal activities, if any, endpoint samples will be collected from the excavation in accordance with DER-10. Chemical analysis will be performed on all endpoint samples for a full list of analytes (TCL VOC, TCL SVOCs, TAL metals and PCBs). TCL SVOCs, lead, and PCBs will be compared to Yard-specific criteria, all other compounds will be compared to NYSDEC CP-51 guidance criteria. Identification of unknown or unexpected contaminated media identified by screening during UST removal activities will be promptly communicated by phone to NYSDEC's Project Manager. Reportable quantities of

petroleum product will also be reported to the NYSDEC spills hotline. Petroleum Bulk Storage (PBS) records will be updated for all UST removals.

3.5 Materials Transport Off-Site

All transport of materials will be performed by licensed haulers in accordance with appropriate local, State, and Federal regulations, including 6 NYCRR Part 364. Haulers will be appropriately licensed and trucks properly placarded.

Material transported by trucks exiting the Site will be secured with tight-fitting covers. Loose-fitting canvas-type truck covers will be prohibited. If loads contain wet material capable of producing free liquid, truck liners will be used.

Loaded vehicles leaving the Site will be appropriately lined, tarped, securely covered, manifested, and placarded in accordance with appropriate Federal, State, local, and New York State Department of Transportation (NYSDOT) requirements (and all other applicable transportation requirements).

Truck transport routes must be established before transporting any materials off-site. This route should be the most appropriate route and take into account: (a) limiting transport through residential areas and past sensitive sites; (b) use of city mapped truck routes; (c) prohibiting off-site queuing of trucks entering the facility; (d) limiting total distance to major highways; (e) promoting safety in access to highways; and (f) overall safety in transport.

Trucks will be prohibited from stopping and idling in the neighborhood outside the project Site.

Egress points for truck and equipment transport from the Site will be kept clean of dirt and other materials during Site remediation and development.

Queuing of trucks will be performed on-site in order to minimize off-site disturbance. Off-site queuing will be prohibited.

3.6 Materials Disposal Off-Site

All material excavated and removed from the Site will be treated as contaminated and regulated material and will be transported and disposed in accordance with all local, State and Federal regulations. If disposal of material from this Site is proposed for unregulated off-site disposal (i.e., clean soil removed for development purposes), a formal request with an associated plan will be made to the NYSDEC. Unregulated off-site management of materials from this Site will not occur without formal NYSDEC approval.

Off-site disposal locations for excavated soils will be identified in the pre-excavation notification. This will include estimated quantities and a breakdown by class of disposal facility if appropriate, i.e., hazardous waste disposal facility, solid waste landfill, petroleum treatment facility, C&D recycling facility, etc. Actual disposal quantities and associated documentation will be reported to the NYSDEC in the Construction Completion Report (see Section 9) and the Periodic Review Report. This documentation will include: waste profiles, test results, facility acceptance letters, manifests, bills of lading and facility receipts.

Non-hazardous historic fill and contaminated soils taken off-site will be handled, at minimum, as a Municipal Solid Waste per 6NYCRR Parts 360, 361, 362, 363, 364 and 365. Material that does not meet Unrestricted

SCOs is prohibited from being taken to a New York State C&D debris recovery facility (6NYCRR Part 361-5 registered or permitted facility).

3.7 Materials Reuse On-Site

The qualified environmental professional (designated environmental representative of Amtrak) will ensure that procedures defined for materials reuse in this EWP are followed and that unacceptable material does not remain on-site. All soil to be excavated at the Site during the construction phase will be sampled for reuse and/or waste characterization purposes prior to transportation for off-site disposal. *In-situ* sampling for waste characterization should be performed whenever feasible to allow for direct load out of soils, reducing the size and duration of stockpiling that may be a cause of odor concerns. Contaminated on-site material, including historic fill and contaminated soil, that is acceptable for reuse on-site will be placed below the demarcation layer or impervious surface, and will not be reused within a cover soil layer, and within landscaping berms. Excavated soils to be re-used on-site must meet all Site-specific action soil cleanup levels (lead ≤3,900 mg/kg, PCBs ≤25 mg/kg, and total SVOCs ≤500 mg/kg), exhibit no gross contamination from petroleum constituents, and comply with the appropriate Record of Decision (ROD) for the Yard. As discussed in Section 2.2.7 of this EWP, all soil, except soil from the 0-5 ft bls interval within WC-21 and the 0-8 ft bls interval within WCR-10, proposed to be excavated during the Acela/Ready Tracks work meets Yard-specific criteria for reuse as backfill up to one-foot bls.

In addition, any area disturbed at the Yard will require a one-foot layer (top cover) of documented clean soil, suitable for railroad operations, from a documented source. A one-foot layer of clean soil, suitable for railroad operations, was imported on-site and placed on the compacted backfill material during previous excavation activities (see Figure 4 for the extent of the clean fill). This one-foot layer of clean soil may be excavated, stockpiled on-site, and used as backfill.

Any demolition material proposed for reuse on-site will be sampled for asbestos and the results will be reported to the NYSDEC for acceptance. Concrete crushing or processing on-site will not be performed without prior NYSDEC approval. Organic matter (wood, roots, stumps, etc.) or other solid waste derived from clearing and grubbing of the Site will not be reused on-site.

3.8 Fluids Management

Dewatering will be required during excavation activities to facilitate work below the groundwater table. Prior to dewatering activities, at least five untreated groundwater samples will be collected within the proposed construction area at the Yard and submitted for laboratory analysis to evaluate if the groundwater meets NYCDEP sewer discharge requirements. Additionally, this groundwater data may be used by the CM to support Long Island Well Permit Application, if required for the Acela 21/Ready Tracks project. Extracted groundwater will be treated on-site as necessary to meet NYCDEP requirements and discharged to the NYCDEP sewer system. Dewatered fluids will not be recharged back to the land surface or subsurface of the Site. Prior to discharge to the sewer system, Amtrak's contractor will secure all required permits from the NYCDEP.

Construction wastewater will be generated from personnel/equipment decontamination. Construction wastewater will be collected and stored on-site in leak-tight drums or temporary storage tanks. The wastewater will be sampled and submitted for analysis for disposal/discharge characterization. Based on the laboratory analytical results, the construction wastewater will be disposed off-site at a permitted disposal/recycling facility or discharged to the on-site sewer system upon approval from NYCDEP.

SPH, where encountered, will be collected, and stored separately during dewatering activities. The SPH has the potential to be classified as a NYS B003 hazardous waste and TSCA waste. The SPH will be extracted and containerized to preclude commingling of the SPH with other liquid waste. Waste characterization samples will be collected to confirm waste classifications and determine appropriate means of disposal.

All liquids, not suitable for discharge, which are not directly removed and disposed off-site in vacuum trucks will be stored in temporary on-site tanks to await disposal. Containers used for storing construction wastewater will conform to both federal and state requirements. All storage tanks or containers will be decontaminated following disposal/discharge of wastewater.

All liquids to be removed from the Site, including but not limited to, excavation dewatering, decontamination waters and groundwater monitoring well purge and development waters, will be handled, transported, and disposed in accordance with applicable local, State, and Federal regulations. Dewatering, purge and development fluids will not be recharged back to the land surface or subsurface of the Site unless prior approval is obtained from NYSDEC.

Discharge of water generated during large-scale construction activities to surface waters (i.e., a local pond, stream, or river) will be performed under a SPDES permit.

3.9 Cover System Restoration

After the completion of soil removal and any other invasive activities the cover system will be restored in a manner that complies with the Record of Decision. The existing cover system is comprised of a minimum of 12 inches of clean soil, ballast stone, asphalt pavement, concrete covered sidewalks, and/or concrete building. If the type of cover system changes from that which exists prior to the excavation (i.e., a soil cover is replaced by asphalt), this will constitute a modification of the cover element of the remedy and the upper surface of the remaining contamination. A figure showing the modified surface will be included in the subsequent Periodic Review Report and in an updated Interim SMP for OU-3 and OU-4.

3.10 Backfill from Off-Site Sources

All materials proposed for import onto the Site will be approved by the qualified environmental professional and will be in compliance with provisions in this EWP prior to receipt at the Site. A Request to Import/Reuse Fill or Soil form, which can be found at http://www.dec.ny.gov/regulations/67386.html, will be prepared and submitted to the NYSDEC project manager allowing a minimum of 5 business days for review.

Material from industrial sites, spill sites, or other environmental remediation sites or potentially contaminated sites will not be imported to the Site.

All imported soils will meet the backfill and cover soil quality standards established in 6NYCRR 375-6.7(d). Based on an evaluation of the land use, protection of groundwater and protection of ecological resources criteria, the resulting soil quality standards are listed in Table 375-6.8(b) of 6 NYCRR Part 375. Non-compliant soils will not be imported onto the Site without prior approval by NYSDEC. In accordance with NYSDEC DER-10, gravel, rock, or stone, consisting of virgin material from a permitted mine or quarry may be imported, without chemical testing, to be used as backfill beneath pavement, buildings or as part of the final Site cover, provided it contains less than 10% fines. Soils that meet “exempt” fill requirements under 6 NYCRR Part 360, but do not meet backfill or cover soil objectives for this Site, will not be imported onto the Site without prior approval by NYSDEC. Solid waste will not be imported onto the Site.

Trucks entering the Site with imported soils will be securely covered with tight fitting covers. Imported soils will be stockpiled separately from excavated materials and covered to prevent dust releases.

3.11 Stormwater Pollution Prevention

Based on NYSDEC's email dated March 11, 2021, a stormwater pollution prevention plan/Construction General Permit is not required for the Acela / Ready Tracks work. However, Amtrak will employ best management practices (soil erosion and sediment control measures) for management of storm water in accordance with the Standards and Specifications for Erosion and Sediment Control, dated November 2016, the New York State Stormwater Design Manual, dated January 2015. Hay bales and/or silt fence will be placed and maintained by the remedial contractor at locations upgradient of excavation areas to control storm water runoff and surface water from entering or exiting the excavation. These control measures shall be installed prior to initiating the soil excavation. Any collected surface water will be managed as discussed in Section 3.8.

Accumulated sediments will be removed as required to keep the barrier and check dam functional. All undercutting or erosion of the silt fence toe anchor shall be repaired immediately with appropriate backfill materials.

Manufacturer's recommendations will be followed for replacing silt fencing damaged due to weathering.

Erosion and sediment control measures identified in the construction plans shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters.

4. Excavation Contingency Plan

If previously unidentified contaminant sources are found during post-remedial subsurface excavations or development related construction, excavation activities will be suspended until sufficient equipment is mobilized to address the condition.

Sampling will be performed on product, sediment, and surrounding soils, etc. as necessary to determine the nature of the material and proper disposal method. Chemical analysis will be performed for a full list of analytes (TAL metals, TCL VOC and SVOCs, TCL pesticides and PCBs), unless the Site history and previous sampling results provide a sufficient justification to limit the list of analytes. In this case, a reduced list of analytes will be proposed to the NYSDEC for approval prior to sampling.

Identification of unknown or unexpected contaminated media identified by screening during invasive site work will be promptly communicated by phone to NYSDEC's Project Manager. Reportable quantities of petroleum product will also be reported to the NYSDEC spills hotline. These findings will be also included in the Periodic Review Report.

5. Community Air Monitoring Plan

An air monitoring program will be implemented during all intrusive activities at the Site to measure the concentration of particulates and organic vapors in ambient air in and around the work zone(s).

The Community Air Monitoring Plan (CAMP) should be conducted in accordance with the Site-specific CAMP included as Appendix E of this EWP. The Site-specific CAMP was prepared in accordance with the NYSDOH Generic Community Air Monitoring Plan included as Appendix 1A of the NYSDEC DER-10. In accordance with NYSDOH Generic Community Air Monitoring Plan and as indicated in the Site-specific CAMP, CAMP requires a dedicated air monitoring technician (i.e., qualified environmental professional) to implement real time air monitoring at the Site's upwind and downwind perimeter. The CAMP must include VOCs, particulates, and meteorological data be recorded on a daily basis while intrusive work is being conducted. Action levels for VOCs and particulates are specified in the Site-specific CAMP (Appendix E). Meteorological data consisting of wind speed, wind direction, temperatures, barometric pressures, and relative humidity shall be collected as part of the CAMP. During all phases of work, the CM will be responsible for mitigating any vapor and particulate issues, via suppression techniques as defined in the Site-specific CAMP. CAMP locations will be adjusted on a daily or more frequent basis based on actual wind directions to provide an upwind and at least two downwind monitoring stations.

Exceedances of action levels listed in the CAMP will be reported to NYSDEC and NYSDOH Project Managers.

6. Odor Control Plan

This odor control plan is capable of controlling emissions of nuisance odors off-site and on-site. Specific odor control methods to be used on a routine basis will include assigning a dedicated air monitoring technician (i.e., qualified environmental professional) to monitor odors, active removal of SPH within excavations when encountered, and maintaining covers over stockpiled SPH impacted soils. If nuisance odors are identified at the Site boundary, or if odor complaints are received, work will be halted and the source of odors will be identified and corrected. Work will not resume until all nuisance odors have been abated. NYSDEC and NYSDOH will be notified of all odor events and of any other complaints about the project. Implementation of all odor controls, including the halt of work, is the responsibility of the remedial party's Remediation Engineer, and any measures that are implemented will be discussed in the Periodic Review Report.

If nuisance odors develop during intrusive work, or if odor complaints are received, all necessary means will be employed to control on- and off-site nuisances. At a minimum, these measures will include: (a) limiting the area of open excavations and size of soil stockpiles; (b) shrouding open excavations with tarps and other covers; and (c) using foams to cover exposed odorous soils. If odors develop and cannot be otherwise controlled, additional means to eliminate odor nuisances will include: (d) direct load-out of soils to lined trucks/containers with tight fitting covers for off-site disposal; (e) use of chemical odorants in spray or misting systems; and (f) use of staff to monitor odors in surrounding neighborhoods.

If nuisance odors develop during intrusive work that cannot be corrected, or where the control of nuisance odors cannot otherwise be achieved due to on-site conditions or close proximity to sensitive receptors, odor control will be achieved by sheltering the excavation and handling areas in a temporary containment structure equipped with appropriate air venting/filtering systems.

7. Dust Control Plan

Dust will be controlled by spraying a water mist over the work area if perimeter action levels established in the CAMP are exceeded (see Appendix E). The water mist will be generated by connecting a misting device to a hose, which will be connected to any potable water source. The degree to which these measures will be used will depend on particulate levels in ambient air at the perimeter of the Site as determined through implementation of the CAMP.

A dust suppression plan that addresses dust management during invasive on-site work will include, at a minimum, the items listed below:

- Dust suppression will be achieved through the use of a dedicated on-site water truck for road/work area wetting. The truck will be equipped with a water cannon capable of spraying water directly onto off-road areas including excavations and stockpiles.
- Clearing and grubbing of larger sites will be done in stages to limit the area of exposed, unvegetated soils vulnerable to dust production.
- Gravel will be used on roadways to provide a clean and dust-free road surface.
- On-site roads will be limited in total area to minimize the area required for water truck sprinkling.

8. Other Nuisances

A plan for rodent control will be developed and utilized by the contractor prior to and during Site clearing and Site grubbing, and during all remedial work.

A plan will be developed and utilized by the contractor for all remedial work to ensure compliance with local noise control ordinances.

9. Reporting

During excavation activities, daily reports will be submitted to the NYSDEC, which will include a summary of each day's material removal from or importation to the Site as well as CAMP results. Daily reports will be submitted to the NYSDEC by 12:00pm the following day excavation/soil handling work is completed at the Site.

Following completion of all excavation and backfilling activities, all excavation and disposal activities completed for the Acela/Ready Tracks work, including removal and disposal of WC-21 PCB and WCR-10 TCLP lead hot spots, will be documented in a Construction Completion Report, that will be submitted to the NYSDEC.

1. Introduction

Roux Environmental Engineering and Geology D.P.C. (Roux), on behalf of National Railroad Passenger Corporation (Amtrak), has prepared this *In Situ* Soil Characterization Summary Report (Report) to document the results of the *In Situ* Soil Characterization Program completed at Sunnyside Yard, 39-29 Honeywell Street, Queens, New York (Yard) in support of the Acela 21 Construction Project (Acela 21).

Sunnyside Yard is located in an urban area in northwestern Queens County. The Yard consists of a railroad maintenance and storage facility that currently encompasses approximately 133 acres. The Yard functions as a maintenance facility for electric locomotives and railroad cars for Amtrak and a train layover storage yard for New Jersey Transit Corporation (NJTC). The Yard is currently in the New York State (NYS) Inactive Hazardous Waste Disposal Site Remedial Program, Site No. 241006, which is administered by the New York State Department of Environmental Conservation (NYSDEC). The Yard was subdivided into six operable units (OUs), OU-1 through OU-6, to streamline and accelerate remedial efforts. The work described in this Work Plan was performed within portions of OU-3 and OU-4.

Based on information provided to Roux and a review of the 100% Civil Drawing Package (04_PKG08_CIVIL_100%_2020-09-18) prepared by Gannett Fleming (GF), STV and WSP dated September 18, 2020, it is Roux's understanding that the Acela 21 work will include the excavation of approximately 42,000 cubic yards (CY) of soil for the installation of new subsurface utilities and rail lines, which required characterization for offsite disposal evaluation. As per GF and Amtrak, the majority of the excavated soil is anticipated to be transported offsite for disposal.

2. *In Situ* Soil Characterization Scope of Work

Based on the excavation volume estimate of approximately 42,000 CY of soil provided by Amtrak in an email dated November 16, 2020, location of the proposed water line that runs through Acela 21 area, and the assumed extent of excavation and excavation depths developed (based upon review of the civil drawings provided by Amtrak), Roux has divided the assumed excavation areas within portions of OU-3 and OU-4 into 65 characterization grid cells (grid cells) with varying dimensions (WC-1 through WC-30, WC-4/WC-5 through WC-18/WC-19, WC-21/WC-22, WC-23/WC-24, WCR-1 through WCR-17, CA-1 and CA-2, and WL-1 through WL-6 (areas where the proposed water line extends outside of the main areas of excavation). Sampling locations for each boring completed within each waste characterization grid cells are shown in Figures 1 through 5. As shown, at least four soil borings were completed within each grid cell. Each soil boring was labeled alpha-numerically (i.e., A-1, B-1, C-1, D-1, etc.) within each grid cell (see Figures 1-8). Roux collected a total of 69 soil samples from within the grid cells, which is equal to a sampling frequency of approximately one sample per 600 CY or less of excavated soil. This sampling frequency meets typical waste disposal facility sampling frequency requirements in New York, New Jersey, and Pennsylvania. In addition, five existing onsite stockpiles within waste characterization grid cells were sampled as part of the soil characterization (see Figures 1 and 2 for stockpile locations). Based on Pennsylvania (PA) Landfill sampling requirements (i.e., four soil borings per grid cell) and to facilitate soil sampling activities, 210 soil borings were installed within the 65 grid cells. However, multiple concrete refusals were encountered while attempting to advance to 10 ft bls within grid cell WC-4/WC-5 and the 5-10 ft bls sample could not be collected within this grid cell. Composite/grab soil samples were collected from intervals ranging from 0-2 feet below land surface (ft bls) (CA-1 and CA-2), 0-5 ft, 0-8 ft, 5-10 ft, and/or 10-18 ft bls. Since there will be less volume of soil removed at depth (excavations greater than five ft bls or 10 ft bls in some areas for utility trench excavations), some grids cells were combined (i.e., WC-4/WC-5, WC-6/WC-7, etc.) and four soil borings from each of these combined grid cells were composited into one sample to maintain the four soil borings per grid cell PA Landfill requirement. Soil characterization details are provided in Table 1. The four soil borings that were combined to create these composite samples per combined grid cells are numerically labeled on Figures 1 through 3. Additionally, a total of five soil borings were completed within each CA-1 and CA-2 grid cells due to the long linear footage of these grid cells and shallow sample interval (0-2 ft bls). All soil samples collected from each boring within grid cells CA-1 and CA-2 were composited into one soil sample per grid cell (five-point composite samples). All samples collected for volatile organic compound (VOC) analysis were not composited as described in Section 2.1 below.

2.1 Soil Sampling Methodology

Sixty-nine (69) composite samples and 69 VOC grab samples were collected from the 210 soil borings completed during soil characterization fieldwork. Soil in the 0-5 ft bls interval in grid cells WC-18, WC-19, WC-20, WC-27, and WC-28 was collected from four locations within the existing excavations created during ongoing utility work in the area. Additional soil borings were only advanced within these grid cells where soil below 5 ft bls was sampled (WC-18, WC-19, and WC-20). In addition, five existing onsite stockpiles were sampled as part of the soil characterization and photographs are included in Appendix B. This included a 5-point composite sample collected from each stockpile as well as a grab sample collected from the location within each stockpile with the highest PID reading.

Prior to drilling activities, all proposed soil boring locations were cleared to a depth of at least five ft bls using hand tools (post hole digger, shovels, etc.) and vacuum assisted technology in an effort to identify any unknown subsurface utility or obstruction that may prevent the collection of soil samples. If a utility or

obstruction was observed during clearing activities, the location was moved within the grid cell at least five feet away from the utility/obstruction and a new location was hand cleared. Utility clearance activities were completed in accordance with Roux's and Amtrak's subsurface clearance protocols. Soil generated during utility clearing activities was incorporated in the 0-2 ft bls, 0-5 ft bls or 0-8 ft bls composite/grab soil sample intervals per soil boring.

Following utility clearing activities, composite/grab soil samples were collected at each location by utilizing a Geoprobe 7822DT drill rig at depths ranging between approximately 5 ft bls and 18 ft bls (in areas where deep utilities are proposed) for field screening and laboratory analyses. During clearing and drilling activities, soil from each soil boring was inspected for evidence of contamination including staining, separate-phase petroleum hydrocarbons, and/or odors and screened for organic vapors using a photoionization detector (PID). Soil lithology from each soil boring was recorded in accordance with the United Soil Classification System (USCS). Soil samples consisted of both grab and composite samples representative of the soil depths that are anticipated to be excavated to during construction activities. Note that the samples collected for VOC laboratory analysis (i.e., grab samples) were not composited due to the potential for loss of VOCs through volatilization. All VOC samples for laboratory analysis were collected as grab samples using Encore® samplers. The one- to two-foot interval within the entire composite sample interval from the soil boring within the grid cell that exhibited the greatest evidence of contamination (staining, odor and/or highest PID reading) was collected for VOC analysis. If no impacts were observed, the interval located in the middle of the soil borings (WC-1 through WC-30, WCR-1 through WCR-17, WL-1 through WL-6, WC-6/WC-7 through WC-18/WC-19, WC-21/WC-22, and WC-23/24) or within the middle of one of the five soil borings (CA-1 and CA-2) within each grid cell comprising each sample was selected for VOC analysis. Upon completion of each soil boring to the specified sample depth interval, one composite sample of the soil from that entire interval (i.e., 0-2, 0-5, 0-8, 5-10 and 10-18 ft bls) was submitted for laboratory analyses. Refusal was encountered at approximately 5.5 ft bls with no soil recovery for each of eight soil borings attempted throughout grid cell WC-4/WC-5, therefore, the 5 to 10 ft bls interval in this grid cell could not be collected for laboratory analysis. Soil from the 5-10 ft bls interval within grid cell WC-4/WC-5 will be sampled for waste characterization during excavation activities.

All soil samples were transported in iced coolers under chain-of-custody procedures to Eurofins Test America (Test America) of Edison, NJ, a New York State Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP)-certified laboratory and were analyzed for analytical parameters required by typical disposal facilities, including Pennsylvania Landfill parameters listed below. The analytical parameters (described below) represent the combined New York, New Jersey, and Pennsylvania analyte lists:

3. *In Situ* Soil Characterization Results

Soil lithology observed during Soil Characterization included fill material that was present in majority of the soil characterization grid cells, typically extending from the surface to approximately five ft bls and, in some locations, observed down to 12 ft bls. This fill material contained a mix of sand and gravel with varying amounts of urban fill-like material (including brick, concrete, asphalt, plastic, metal, slag, cobble, and/or wood debris). Below the fill layer, soil typically observed was light brown to brown fine to medium sand with varying amounts of silt and gravel. Lithologic soil boring logs for each completed soil boring are included as Appendix A. Photographic documentation of soil from each characterization grid cell is included as Appendix B.

Evidence of impacts (elevated PID readings, odors, staining, and/or sheen) were observed in the following grid cells: WC-20, WCR-1, WL-1, WL-2, WL-3, and WL-4. The highest PID readings in soil from these six grid cells were as follows:

- WC-20 – 199.9 ppm (Soil Boring D, 13-15 ft bls, odor and staining observed)
- WCR-1 – 32.9 ppm (Soil Boring D, 5-7 ft bls, odor observed)
- WL-1 – 350.1 ppm (Soil Boring B, 3-5 ft bls, odor and slight sheen observed)
- WL-2 – 196.2 ppm (Soil Boring A, 5-7 ft bls, odor observed)
- WL-3 – 221.1 ppm (Soil Boring B, 7-10 ft bls, odor, staining, and slight sheen observed)
- WL-4 – 281.4 ppm (Soil Boring A, 5-7 ft bls, odor observed)

There were no indication of impacts (visual, olfactory or PID readings), based on field screening activities, at any other grid cells or the existing soil stockpiles.

3.1 Laboratory Analytical Results

The *in situ* soil characterization sample results are summarized in Tables 2 through 13 and were compared to common regulatory criteria to provide a general assessment of soil quality at the Site:

- NYSDEC Part 375 Restricted Residential Use Soil Cleanup Objectives (RRSCOs)
- New Jersey Department of Environmental Protection (NJDEP) Residential Direct Contact Soil Remediation Standards (RDCSRS)
- NJDEP Non-Residential Direct Contact Soil Remediation Standards (NRDCSRS)
- Pennsylvania (PA) Clean Fill Concentration Limits (PA Clean Fill)
- PA Regulated Fill Concentration Limits (PA Regulated Fill)

TCLP and RCRA Characteristic (reactivity, ignitability, and corrosivity) results were compared to the United States Environmental Protection Agency (USEPA) Regulatory Standards to evaluate if the results are characteristically hazardous. Laboratory analytical reports are included as Appendix C.

Based on the analytical results, none of the samples exhibited hazardous waste characteristics (TCLP/RCRA Characteristics) as defined by the USEPA, with the exception of samples collected from grid cells WC-21 and WCR-10 and consequently, will require special handling. TCLP lead was detected at a concentration of 15.8 milligrams per liter (mg/L) in composite soil sample WCR-10 (0-8), collected from the 0-8 ft bls interval, compared to the USEPA Regulatory Level of 5 mg/L (TCLP lead). Additionally, PCBs were detected at a concentration of 79 mg/kg in composite soil sample WC-21 (0-5) collected from the 0-5 ft bls interval compared to the Toxic Substances Control Act (TSCA) level of 50 mg/kg.

The laboratory results also indicated the following:

- VOCs were not detected in any sample at concentrations greater than regulatory standards discussed above.
- Several SVOCs were present at concentrations exceeding NYSDEC RRSCOs, NJDEP RDCSRS and NRDCSRS, and/or PA Clean Fill. These SVOCs were predominantly polycyclic aromatic hydrocarbons (PAHs) and are common historic fill contaminants. SVOCs exceeding regulatory criteria include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-c,d)pyrene.
- Metals including arsenic, total chromium, and mercury were detected in several samples at concentrations exceeding NYSDEC RRSCOs and/or NJDEP RDCSRS. Arsenic was detected at a concentration of 183 mg/kg in sample WC-20 (5-10),which exceeded NJDEP NRDCSRS, PA Clean Fill, and PA Regulated Fill for this metal. However, TCLP arsenic was not detected in this sample.
- PCBs were present in several samples throughout the Site at concentrations exceeding regulatory standards discussed above.
- Pesticides were not detected in any sample at concentrations exceeding regulatory standards discussed above.
- EPH was detected in one sample, WL-1 (0-10), exceeding NJDEP RDCSRS.

The data collected as part of this soil characterization is intended to provide Amtrak with an understanding of the environmental subsurface soil conditions that may be encountered during excavation and to provide disposal facility options during future activities at the Site. Additional characterization sampling may be required prior to offsite disposal of the material based on field observations during excavation activities and/or disposal facility requirements.

Narrative

CASE NARRATIVE

Client: Roux Environmental Eng & Geology DPC

Project: Amtrak-Sunnyside Yards

Report Number: 460-233463-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 5/3/2021 6:00 PM, 5/4/2021 7:00 PM, 5/5/2021 5:30 PM, 5/6/2021 7:00 PM and 5/7/2021 8:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 5 coolers at receipt time were 1.3º C, 2.0º C, 2.0º C, 2.3º C and 3.0º C.

Receipt Exceptions

The following sample was cancelled by the client on 5/7/21. WC-7C (6-8) (460-233790-7)

The client cancelled DRO and GRO analysis for all samples on 5/7/21.

The client requested that the back slash in the following sample ID be changed to an underscore due to Equis EDD requirements.
WC-6_WC-7 (5-10) (460-233790-3)

The sample ID of the following sample was revised to put the depth in parentheses per client request:
WC-3-A (0-2) (460-233463-1)

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.
