Subject: **Data Usability Summary Report (DUSR)**
Validation of Laboratory Analytical Data for Amtrak-Sunnyside Yards
Eurofins SDG Nos.: 460-223463-1; 460-234049-1; 460-235565-1; 460-234659-1; 460-235-54-1; 460-235626-1; and 460-23642-1.

Review has been completed for the data packages generated by Eurofins Environment Testing America of Edison, New Jersey. The data packages pertain to samples collected during May 2021 through June 2021 at Amtrak-Sunnyside Yards. Soil samples were analyzed for semivolatiles, PCBs, and lead.

The data packages submitted by the laboratory contain full deliverables for validation. This usability report is generated from review of the QC summary form information, full review of sample raw data, and limited review of associated QC raw data. The reported QC summary forms and sample raw data have been reviewed for application of validation qualifiers, in accordance with the project QAPP, with guidance from USEPA national and regional validation guidance, and in consideration of the specific analytical method requirements. The following items were reviewed:

- Data completeness;
- Case narrative;
- Custody documentation;
- Holding times;
- Surrogate and internal standard recoveries;
- Method, and field blanks;
- Matrix spikes and duplicates;
- Field duplicates;
- Laboratory control samples;
- Instrument tunes checks;
- Initial calibrations;
- Calibration checks;
- Method compliance; and
- Analytical result verification.

The data review includes evaluation of the items noted in the NYS DER-10 Appendix 2B Section 2.0(c). Deficiencies noted during data review are discussed within the following text. The laboratory QC forms discussed herein can be found within the laboratory data packages.

The sample analyses were performed in general accordance with analytical protocols, and sample results are usable as reported or with minor qualifications as discussed herein.

Some samples were diluted due to extract or matrix effects. This resulted in elevated reporting limits for those samples. Sample results which exceed the calibration range are qualified with an “E” flag, for any analytes that exceed the calibration range.

Data completeness, accuracy, precision, representativeness, and comparability are acceptable. The validator qualifications recommended in this report are provided on the EDDs.

Semivolatile Organic Compounds by EPA 8270

The continuing calibration verification standards meet criteria with the following exceptions:

- Benzo(a)pyrene for SDGs 460-234049-1, and 460-234659-1; and
- Several analytes for SDGs 460-235054-1, 460-235626-1, and 460-236042-1.

The associated sample results are qualified as estimated.

The laboratory control sample had the following recoveries above criteria:

- Several analytes for SDGs 460-233463-1 and 460-235626-1;
- Caprolactam for SDG 460-234575-1;

- Atrazine and benzaldehyde for SDG 460-236042-1.

The detections for these analytes in the associated samples are qualified biased high. Non-detect results are not qualified due to high bias.

The laboratory control sample had the following recoveries below criteria:

- M&P cresols for SDG 460-234049-1.

The detections for these analytes in the associated samples are qualified biased low.

One or more surrogate recovery is below criteria for sample 460-236396-2. The results for this sample is qualified biased low.

The MS/MSD for sample 460-234569-05 had recoveries outside criteria for indeno(1,2,3-cd)pyrene. The results for these analytes in the parent sample have been qualified as estimated.

Subject: Amtrak Sunnyside Yard – Long Island City, New York; Grid Cell WC-21 – PCB Delineation Soil Sampling Results

Roux Environmental Engineering and Geology, D.P.C. (Roux), on behalf of National Railroad Passenger Corporation (Amtrak) has prepared this memorandum to describe the results of the delineation soil sampling activities completed at Sunnyside Yard, 39-29 Honeywell Street, Queens, New York (Yard). Based on previous *in situ* soil characterization sampling conducted at the Yard in June 2021 in support of the Acela Construction Project, polychlorinated biphenyls (PCBs) were detected in soil at a concentration above 50 milligrams per kilogram (mg/kg) in a composite soil sample collected from the 0-5 feet below land surface (ft bls) depth interval within grid cell WC-21. PCBs were detected at a concentration of 79 mg/kg in composite soil sample WC-21 (0-5), collected as a composite of soil from four separate soil borings (WC-21A through WC-21 D) installed within WC-21.

Following receipt of this data, Roux returned to Yard and successfully completed delineation of PCBs over 50 ppm grid cell WC-21. The following subsections provide details on the soil sampling procedures and soil quality/results of the delineation soil sampling activities completed around grid cell WC-21.

Soil Sampling Procedure

On November 2 to November 3, 2021, a total of eight soil borings were installed around the perimeter of grid cell WC-21 and advanced to depths of five ft bls. Soil boring locations are shown on Figure 1. At each location, composite soil samples were collected and submitted for laboratory analysis of PCBs. Two soil borings were completed on each side of grid cell WC-21 (north, west, east, south sides). At each location, an approximate two feet by two feet area was open and soil was extracted using hand tools (post hole digger, hand auger, shovels, etc.) and vacuum assisted technology to facilitate the collection of soil samples from the 0-5 ft bls interval. At soil boring locations WC-21_N1 and WC-21_N2, concrete obstructions (likely related to subsurface utilities) were observed during clearing activities. These two locations were moved approximately 10 feet south into grid cell WC-21, away from the utility/obstruction and new locations were completed.

During soil boring activities, soil from each boring was inspected for evidence of contamination including staining, separate-phase petroleum hydrocarbons, and/or odors and field screened for organic vapors using a photoionization detector (PID). Soil lithology from each soil boring was recorded in accordance with the Unified Soil Classification System. Soil boring logs are provided as Attachment 1. Soil was collected at each soil boring location from the 0-5 ft bls interval and placed in laboratory provided jars.

All soil samples were transported in iced coolers under chain-of-custody procedures to Eurofins Test America of Edison, New Jersey, a New York State Department of Health Environmental Laboratory Accreditation Program-certified laboratory and were analyzed for PCBs via USEPA Method 8082A. Laboratory Analytical Reports are provided in Attachment 2.

Soil Quality/Results

Soil lithology observed included fill material that extended from the surface to five ft bls. This fill material consisted of brown to dark brown sand and gravel with varying amounts of urban fill-like material (including brick, concrete, asphalt, metal, cobble, and/or ceramic tile debris). PID reading from soil

California ■ Illinois ■ Massachusetts ■ New Jersey ■ New York ■ Texas ■ Virginia

screening activities did not indicate the presence of VOCs (i.e., all PID readings were less than one parts per million) and no odors or staining were observed at any of the soil boring locations.

The analytical results for PCBs are summarized in Table 1 (attached). As shown, there were no PCB detections in soil collected from any of the delineation borings around the perimeter of grid cell WC-21 in exceedance of 50 mg/kg. PCBs were detected at concentrations ranging from not detected (WC-21_N2 [0-5]) to a maximum concentration of 13 mg/kg (WC-21_E2_0-5).

Narrative

CASE NARRATIVE

Client: Roux Environmental Eng & Geology DPC

Project: Amtrak-Sunnyside Yards

Report Number: 460-246491-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 11/03/2021; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.4 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

POLYCHLORINATED BIPHENYLS
Samples WC-21_N1_0-5 (460-246491-1) and WC-21_N2_0-5 (460-246491-2) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 11/03/2021 and analyzed on 11/04/2021.

No difficulties were encountered during the PCBs analysis.

All quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE
Samples WC-21_N1_0-5 (460-246491-1) and WC-21_N2_0-5 (460-246491-2) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 11/04/2021.

Percent Moisture exceeded the RPD limit for the duplicate of sample 460-246489-6.

No other difficulties were encountered during the %solids/moisture analysis.

All other quality control parameters were within the acceptance limits.

Narrative

CASE NARRATIVE

Client: Roux Environmental Eng & Geology DPC

Project: Amtrak-Sunnyside Yards

Report Number: 460-246492-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 11/03/2021; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 1.5 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

POLYCHLORINATED BIPHENYLS
Samples WC-21_W1_0-5 (460-246492-1), WC-21_W2_0-5 (460-246492-2), WC-21_S1_0-5 (460-246492-3), WC-21_S2_0-5 (460-246492-4), WC-21_E2_0-5 (460-246492-5) and WC-21_E1_0-5 (460-246492-6) were analyzed for polychlorinated biphenyls in accordance with EPA SW-846 Method 8082A. The samples were prepared on 11/03/2021 and analyzed on 11/04/2021.

The following sample was diluted due to abundance of target analytes: WC-21_E2_0-5 (460-246492-5). As such, surrogate recoveries are below the calibration range or are not reported, and elevated reporting limits (RLs) are provided.

No other difficulties were encountered during the PCBs analysis.

All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS/PERCENT MOISTURE
Samples WC-21_W1_0-5 (460-246492-1), WC-21_W2_0-5 (460-246492-2), WC-21_S1_0-5 (460-246492-3), WC-21_S2_0-5 (460-246492-4), WC-21_E2_0-5 (460-246492-5) and WC-21_E1_0-5 (460-246492-6) were analyzed for percent solids/percent moisture in accordance with EPA Method CLPISM01.2 (Exhibit D) Modified. The samples were analyzed on 11/04/2021.

Percent Moisture exceeded the RPD limit for the duplicate of sample 460-246489-6.

No other difficulties were encountered during the %solids/moisture analysis.

All other quality control parameters were within the acceptance limits.

MEMORANDUM

Date: November 17, 2021

Subject: Amtrak Sunnyside Yard – Acela / Ready Tracks, Long Island City, New York;
Grid Cell WCR-10 – TCLP Lead Delineation Soil Sampling

Roux Environmental Engineering and Geology, D.P.C. (Roux), on behalf of National Railroad Passenger Corporation (Amtrak) has prepared this memorandum to describe the results of the delineation soil sampling completed at Sunnyside Yard, 39-29 Honeywell Street, Queens, New York (Yard). Previous *in situ* soil characterization sampling conducted in June 2021 in support of the Acela Program Construction Project (Acela Program) identified Toxicity Characteristic Leaching Procedure (TCLP) lead in soil at a concentration above the United States Environmental Protection Agency (USEPA) Regulatory Level of five (5) milligrams per liter (mg/L) in a composite soil sample collected from the 0-8 feet below land surface (ft bls) depth interval within grid cell WCR-10. TCLP lead was detected at a concentration of 15.8 mg/L in composite soil sample WCR-10 (0-8), collected as a composite of soil from four distinct soil borings within grid cell WCR-10.

Following receipt of this data, Roux returned to the Yard and successfully completed delineation of TCLP lead over USEPA Regulatory Level of 5 mg/L in WCR-10. The following subsections provide details on the soil sampling procedures and soil quality results of the delineation soil sampling activities completed around grid cell WCR-10.

Soil Sampling Procedure

On November 3 to November 5, 2021, a total of five soil borings were installed on the eastern, southern, and western sides of grid cell WCR-10 that were adjacent to other grid cells and advanced to depths of eight ft bls. There is no grid cell along the northern border of WCR-10. Soil boring locations are provided on Figure 1. As shown, two soil borings were completed on the eastern boundary of WCR-10 (bordering grid cell WCR-11), two soil borings were completed on the southern boundary of WCR-10 (one of each bordering grid cells WC-13 and WC-14), and one soil boring was completed on the western boundary of WCR-10 (bordering grid cell CA-1). All soil boring locations were advanced to a depth of eight ft bls using hand tools (post hole digger, shovels, etc.) and vacuum assisted technology to facilitate the collection of soil samples. Based on the previous sampling depth of the adjacent grid cells, soil samples were collected from the 0-5 ft bls and 5-8 ft bls intervals (soil borings installed on the southern and western sides of WCR-10) and the 0-8 ft bls interval (soil borings installed on the eastern side of WCR-10). Utility clearance activities were completed during soil boring activities in accordance with Roux's and Amtrak's subsurface clearance protocols.

During soil boring activities, soil from each soil boring was inspected for evidence of contamination including staining, separate-phase petroleum hydrocarbons, and/or odors and screened for organic vapors using a photoionization detector (PID). Soil lithology from each soil boring was recorded in accordance with the United Soil Classification System (USCS). Soil boring logs are provided as Attachment 1.

All soil samples were transported in iced coolers under chain-of-custody procedures to Eurofins Test America (Test America) of Edison, NJ, a New York State Department of Health (NYSDOH) Environmental

Laboratory Accreditation Program (ELAP)-certified laboratory and were analyzed for total lead via USEPA Method 6010D and TCLP lead via USEPA Method 1311. Laboratory analytical reports are provided as Attachment 2.

Soil Quality/Results

Soil lithology observed during delineation soil sampling activities included fill material that typically ranged from two to five ft bls. This fill material contained a mix of brown to dark brown sand and gravel with varying amounts of urban fill-like material (including brick, concrete, cobble, and/or wood debris). Below the fill layer, soil typically observed was light brown to brown fine to medium sand with varying amounts of silt, gravel and cobble.

PID screening did not indicate the presence of VOCs (i.e., all PID readings were less than one part per million) and no odors or staining were observed.

The analytical results for total lead and TCLP lead are summarized in Tables 1-2 (attached). The sampling results confirmed that no soil samples collected along the eastern, southern and western sides of WCR-10 were in exceedance of the USEPA Regulatory Level of 5 mg/L for TCLP lead. TCLP lead concentrations ranged from not detected (WCR-10_W_0-5) to 0.0826 mg/L (WCR-10_S1_0-5). Additionally, there were no detections of total lead above New Jersey Department of Environmental Protection Residential / Non-Residential Direct Contact Soil Remediation Standards or Pennsylvania Department of Environmental Protection Clean Fill / Regulated Fill Levels. Total lead concentrations ranged from 17.2 milligrams per kilogram (mg/kg) (WCR-10_E1_0-8) to 93.3 mg/kg (WCR-10_S1_0-5).

Narrative

CASE NARRATIVE

Client: Roux Environmental Eng & Geology DPC

Project: Amtrak-Sunnyside Yards

Report Number: 460-246493-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 11/3/2021 6:00 PM, 11/4/2021 8:00 PM and 11/5/2021 7:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.4º C, 2.7º C and 3.0º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TCLP METALS

Samples WCR-10_E1_0-8 (460-246493-1), WCR-10_E2_0-8 (460-246710-1), WCR-10_W_0-5 (460-246733-1), WCR-10_S1_0-5 (460-246710-2), WCR-10_W_5-8 (460-246733-2), WCR-10_S1_5-8 (460-246710-3), WCR-10_S2_0-5 (460-246733-3) and WCR-10_S2_5-8 (460-246733-4) were analyzed for TCLP Metals in accordance with EPA SW-846 Method 6020B - TCLP/1311. The samples were leached on 11/04/2021 and 11/07/2021, prepared on 11/05/2021, 11/10/2021 and 11/11/2021 and analyzed on 11/06/2021, 11/10/2021 and 11/11/2021.

Samples WCR-10_S1_0-5 (460-246710-2)[10X] and WCR-10_S1_5-8 (460-246710-3)[10X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No difficulties were encountered during the TCLP Metals analysis.

All quality control parameters were within the acceptance limits.

1. Introduction

This Community Air Monitoring Plan (CAMP) was prepared by Roux Environmental Engineering and Geology D.P.C. (Roux) for the Operable Units (OU) -3 and OU-4 of Sunnyside Yard located in Long Island City, New York (Site). A Site Location Map is provided on Figure 1. Sunnyside Yard is located in an urban area in northwestern Queens County (Figure 1). The East River is located approximately one mile to the west while Newtown Creek, which defines the border between Queens and Kings Counties, is located less than 0.5 mile south of the western portion of the Yard. The Yard consists of a railroad maintenance and storage facility that currently encompasses approximately 133 acres. The Yard functions as a maintenance facility for electric locomotives and railroad cars for Amtrak and a train layover storage yard for New Jersey Transit Corporation (NJTC). The Yard is currently in the New York State (NYS) Inactive Hazardous Waste Disposal Site Remedial Program, Site No. 241006, which is administered by New York State Department of Environmental Conservation (NYSDEC). The Yard was subdivided into six operable units (OUs), OU-1 through OU-6, to streamline remedial efforts. The land use surrounding the Yard is a combination of commercial, light industrial and residential areas. The Long Island Rail Road (LIRR) currently owns a portion of the original Yard along the northern boundary (including a portion of OU 3) and maintains rights of way through the Yard.

The monitoring program will be implemented at all times during which earth disturbance activities are occurring. This CAMP is designed to provide a measure of protection for the downwind community (i.e., offsite receptors, including residents and workers nit directly involved with the subject work activities) from potential airborne contaminant releases that may be as a direct result of remedial and construction activities. This monitoring plan is consistent with the New York State Department of Health's (NYSDOH) Generic Community Air Monitoring Plan guidance document included as Appendix 1A of the NYSDEC DER-10.

Test results of previous sampling activities, conducted by Roux since 2007 at the Site indicate that some areas of the Site contain varying levels of metals and / or semivolatile organic compounds (SVOCs), particularly polynuclear aromatic hydrocarbons (PAHs), which exceed the applicable New York State Department of Environmental Conservation (NYSDEC) criteria. The metals and SVOCs were primarily observed in historic fill/soil at varying depths beneath the Site.

The specifics of the CAMP are presented in the following four (4) sections:

- 1.1 VOC Monitoring Approach
- 1.2 Particulate Monitoring Approach
- 1.3 Meteorological Monitoring Approach
- 1.4 Available Suppression Techniques

1.1 VOC Monitoring

Total VOC concentrations in air will be monitored continuously at a location downwind of the excavation activities during all ground intrusive activities. An upwind monitoring station will be set up adjacent to where the excavation is occurring. The VOC monitoring equipment will be located at temporary monitoring stations that will be established daily based on Site logistics and weather conditions. The monitoring work will be conducted using MiniRAE 3000 (or equivalent) portable VOC monitors, or similar type monitors, for all VOC monitoring. The equipment will be calibrated at least once daily using isobutylene as the calibration

gas. One (1) upwind and one (1) downwind monitor will be deployed each day. Each monitoring unit is equipped with an audible alarm to indicate exceedance of the action levels (as defined below and summarized in Table 1).

The equipment is capable of calculating 15-minute running average concentrations, which will be compared to the levels specified below.

- If the ambient air concentration of total VOCs at the downwind perimeter of the Site exceeds 5 parts per million (ppm) above background for the 15-minute average, work activities must be temporarily halted and monitoring continued. If the total organic vapor level readily decreases (per instantaneous readings) below 5 ppm over background, work activities can resume with continued monitoring.
- If the ambient air concentration of total VOCs at the downwind perimeter of the Site persists at levels in excess of 5 ppm over background but less than 25 ppm, work activities must be halted, the source of VOCs identified, suppression techniques employed to abate emissions, and monitoring continued. After these steps, work activities can resume if the total organic vapor level at the Site perimeter is below 5 ppm over the background concentration for the 15-minute average. If levels are in excess of 25 ppm above background, identified contributing ground-intrusive activities will be halted and vapor suppression techniques will be evaluated and modified until monitoring indicates VOC levels at the Site perimeter are below 5 ppm over background. Once VOC levels are below 5 ppm at the Site perimeter, work will resume with continued monitoring.

All 15-minute readings will be recorded and be available for State Regulator (NYSDEC and NYSDOH) personnel to review. Instantaneous readings, if any, used for decision purposes will be recorded. If an exceedance of the action level occurs, an Action Limit Report (ALR) will be completed, identifying the monitoring device location, the measured VOC level, the activity causing the exceedance, meteorological conditions, and the corrective actions taken, as provided in Appendix A. Additionally, the NYSDEC and NYSDOH will be notified within 24 hours of the VOC ALR generation. Daily monitoring equipment locations and meteorological conditions will also be documented on the daily CAMP Monitoring Location Plan. All documentation will be kept on file at the Site.

1.2 Particulate Monitoring, Response Levels and Actions

Particulate concentrations will be monitored continuously at temporary particulate monitoring stations set up at the sidewalk at upwind and downwind locations. The particulate monitoring will be performed using real-time monitoring equipment capable of measuring particulate matter less than 10 micrometers in size (PM-10) and capable of integrating over a period of 15 minutes (or less) for comparison to the airborne particulate action levels (as defined below and summarized in Table 1). Monitoring equipment will be MIE Data Ram monitors or equivalent. A minimum of one (1) upwind and one (1) downwind monitor will be deployed each day, equipped with an omni-directional sampling inlet and a PM-10 sample head. The data logging averaging period will be set to 15-minutes with time and date stamp recording. Alarm averaging will be set at 90 micrograms per cubic meter ($\mu g/m^3$) per 15-minute period. This setting will allow proactive evaluation of Site conditions prior to reaching Action Levels of 100 $\mu g/m^3$ above background. The equipment will be outfitted with an audible alarm to indicate exceedance of the action level. In addition, fugitive dust migration will be visually assessed during all work activities. The monitoring will be used to compare values to the following:

- If the downwind PM-10 particulate level is 100 $\mu g/m^3$ greater than background (upwind perimeter) for the 15-minute period or if airborne dust is observed leaving the Site, then dust suppression techniques must be employed. Work may continue with dust suppression techniques provided that

downwind PM-10 particulate levels do not exceed 150 µg/m^3 above the upwind level and provided that no visible dust is migrating from the Site.

- If, after implementation of dust suppression techniques, downwind PM-10 particulate levels are greater than 150 µg/m^3 above the upwind level, work must be stopped, a re-evaluation of activities initiated, and dust suppression techniques modified. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 µg/m^3 of the upwind level and in preventing visible dust migration.

All 15-minute readings will be recorded and be available for State Regulator (NYSDEC and NYSDOH) personnel to review. Instantaneous readings, if any, used for decision purposes will be recorded. If an exceedance of the action level occurs, an ALR will be completed, identifying the monitoring device location, the measured particulate concentration, the activity causing the exceedance, meteorological conditions, and the corrective actions taken, as provided in Appendix A. Daily monitoring equipment locations will also be documented on the daily CAMP Monitoring Location Plan. All documentation will be kept on file at the Site.

1.3 Meteorological Monitoring

Wind speed (estimated) and wind direction, will be approximated based on field observations of onsite personnel. Meteorological data consisting of temperature, barometric pressure, and relative humidity will be recorded in the field book based upon publicly available information from local weather stations.

1.4 Available Suppression Techniques

Odor Control

Due to the nature of the project, with excavation occurring, the potential for generation of nuisance odors and the need for odor control may be necessary. If nuisance odors are identified, work will be halted and the source of odors will be identified and corrected. Work will not resume until all nuisance odors have been abated. NYSDEC and NYSDOH will be notified of all odor events and of all other complaints about the project.

All necessary means will be employed to prevent on- and off-Site nuisances. At a minimum, procedures will include: (a) limiting the area of open excavations; (b) shrouding open excavations with tarps and other covers; and (c) using foams to cover exposed odorous soils. If odors develop and cannot be otherwise controlled, additional means to eliminate odor nuisances will include: (d) use of chemical odorants in spray or misting systems; and, (e) use of staff to monitor odors in surrounding neighborhoods.

Dust Control

Due to the nature of the project, the potential for generation of nuisance dust and the need for dust control may be necessary. Dust suppression will be achieved through the use of water for wetting excavation areas, if required. Water will be available on-site at suitable supply and pressure for use in dust control.

1.5 Reporting

All recorded monitoring data will be downloaded and field logged periodically, including action limit reports (if any) and daily CAMP monitoring location plans. All records will be maintained onsite and available for NYSDEC/NYSDOH review. A summary of CAMP findings, including excursions, will be provided in the Daily and Monthly Reports. All CAMP monitoring records will be included in the overall Final Engineering Report that will be submitted to the NYSDEC and NYSDOH and will include all of the CAMP data collected, daily monitoring station location maps, and copies of the ALRs (if any). If an ALR is generated due to VOC exceedances, the NYSDEC and NYSDOH will be notified within 24 hours of the exceedance.

TABLE

Action Limit Summary for VOCs and Particulates

Table 1. Action Limit Summary for VOCs and Particulates, Sunnyside Yard (OU-3 & OU-4), Long Island City, NY

Contaminant	Downwind Action Levels*	Action/Response
Volatile Organic Compounds (VOCs) (Monitoring Via Photoionization Detector and Odor Observation)	< 5 ppm	1. Resume work with continuing monitoring.
	5 ppm < level < 25 ppm	1. Work activities must be temporarily halted, source vapors must be identified, suppression techniques employed to abate emissions and monitoring continued. 2. After these steps, if VOC levels (200 feet downwind of the exclusion zone or half the distance to the nearest potential receptor or structure, whichever is less) is below 5 ppm over background, resume work.
	> 25 ppm	1. Identified contributing ground intrusive activities must be halted and vapor suppression techniques must be evaluated and modified until monitoring indicates VOC levels below the action level. 2. After these steps, if VOC levels (half the distance to the nearest potential receptor or structure) are below 5 ppm over background, resume work.
Particulates (Monitoring Via Particulate Meter and Observation)	< 100 ug/m^3	1. If dust is observed leaving the work area, then dust control techniques must be implemented or additional controls used.
	100 ug/m3 < level < 150 ug/m^3	1. Employ dust suppression techniques. 2. Work may continue with dust suppression techniques provided that downwind PM-10 particulate concentration do not exceed 150 ug/m^3 above the upwind level and provided that no visible dust is migrating from the work area.
	> 150 ug/m^3	1. STOP work 2. Re-evaluate activities, modify dust suppression techniques. Work can resume provided that dust suppression measures and other controls are successful in reducing the downwind PM-10 particulate concentration to within 150 ug/m^3 of the upwind level and in preventing visible dust migration.

* Instantaneous readings above background. Particulate readings are based on the respirable (PM-10) fraction. Background readings are taken at upwind locations relative to Work Areas or Exclusion Zones.
