Site Characterization Report
Venus Estates, Inc.
90-11 31st Avenue
Jackson Heights, New York
NYSDEC No. 241120

April 2014

1.0 Introduction

Holzmacher, Mclendon & Murrell, P.C. (H2M) has been retained by Mr. Peter Giampilis (Venus Estates, Inc.) to provide environmental consulting services for the property located at 90-11 31st Avenue in Jackson Heights, New York (the Site). Pursuant to the New York State Department of Environmental Conservation (NYSDEC) Order of Consent and Administrative Settlement Index #R2-0651-10-10 along with the NYSDEC Site Characterization Work Plan approval letter dated June 12, 2012 (**Attachment 1**), site investigative activities were conducted in November and December 2013.

Recently conducted site investigative activities included the installation of two (2) permanent monitoring wells (designated as MW-5 and MW-6) within a one city block radius, surveying of the wells for topographic and top of casing elevations and subsequent sampling for Chlorinated Volatile Organic Compounds (CVOCs) and their related breakdown products. Additionally, a permanent soil gas sampling point was installed within the annular space of permanent monitoring well MW-5 at the time of well construction.

As per the request of the NYSDEC, a video inspection of the building's sanitary line was also completed in January 2014 by City Wide Sewer & Drain Service Corp (City Wide). Results of the video inspection revealed no evidence of any breaches within the building's main sanitary line leading out form the building and connecting to the main sewer trunk line located along 31st Avenue (**Attachment 2**, City Wide letter). The sewer pipe inspection was recorded on a DVD.

Although analytical results indicated levels of CVOC's above the applicable criteria within groundwater samples collected from four (4) of six (6) Site monitoring wells, it is H2M's opinion that the identified CVOC impact to groundwater is not the result of a release emanating from 90-11 31st Street property. Please consider that H2M's soil samples collected in June 2011, in addition to the previously conducted environmental sampling performed by other consultants onsite, does not identify CVOC's within the unsaturated soil column anywhere beneath the subject property in excess of NYSDEC Soil Cleanup Objectives, specifically the area located in the basement, adjacent to the basement sump and in the rear yard. Although, it is recognized that soil contamination in the soil column can contribute to a groundwater concern, specifically for this site, there exists no correlation between CVOCs identified in the groundwater and a pathway (i.e., discharge, piping, sump, etc.) related to any site activities associated with former dry cleaning operations. Based on the findings presented herein, H2M is respectively requesting a No Further Remedial Action Determination and closure of NYSDEC No. 241120 within the NYSDEC's data base.

2.0 Background

2.1 Site History & Description

Based upon information obtained from a site walkthrough and previous reports, the subject property is a storefront located in an area developed as a small urban strip mall that was constructed in 1932 and is identified as Block 1388, Lot 36 on the tax map. The property is rectangular in shape and is predominantly covered by the existing structure, however there is a pedestrian sidewalk to the front and a small vegetated yard to the rear. The building has a basement with limited access beneath a portion of the main level which is utilized for storage and location of the building's boiler and utilities.

The leasehold space that is the subject of the investigation activities is currently occupied by New York Dry Cleaners and is bound on either side by active laundering and clothes cleaning facilities. The subject facility has not performed dry cleaning operations onsite in the past several years (estimated to have terminated in the mid to late 1990's) and operates as a drop shop where dry cleaning activities are performed offsite. When dry cleaning activities were performed onsite, the equipment was located on the first floor, not in the basement.

2.2 Geology & Hydrogeology

2.2.1 Geology

According to the United States Department of Agriculture, Soil Conservation Service - Soil Survey, New York, the Site is located in the Atlantic Coastal Plain physiographic province which is characterized by low hills of unconsolidated sands, gravel and silt. The subsurface deposits consist of the Upper Glacial deposits that are characterized by southward sloping deposits of sand, gravel and silt. The Upper Glacial deposits have a maximum thickness of 600-feet which are underlain by the Magothy, Raritan and Lloyd Formations. The Gardiners clay and the Jameco gravel separate the Upper Glacial deposits and the Magothy Formation along the south west portion of Long Island. The Borough of Queens is underlain by bedrock, although the majority of it is at several hundred feet below land surface.

During subsurface investigation activities conducted by H2M, unconsolidated sandy soils of varying size were observed throughout the entire soil column which extended from grade to the approximate depth of 40-feet bsg at the MW-6 location.

2.2.2 Hydrogeology

The Borough of Queens is characterized by Alton stony loam (As) and the Miami stony loam (Ms) and bedrock. During H2M's November and December 2013 investigative activities groundwater elevation at the Site was identified at approximately 22 to 23 feet above mean sea elevation. Groundwater has been identified to be flowing overall in an east-southeasterly direction which is a notable shift from the July 2011 which was formerly flowing in a west-northwesterly direction of which the cause is unidentified.

Groundwater is not used as a potable water supply for the Borough of Queens. Potable water is supplied to the subject site by the New York City Bureau of Water. The Bureau obtains potable water from the Croton Reservoir located in Westchester County and other fresh water reservoirs in upstate New York.

2.3 Previous Investigations

Based on the use of the property historically as a dry cleaner, there have been several investigations conducted to evaluate the environmental condition of the subject property with respect to historical operations. The following is a brief summary of these investigation activities as reported.

- Initially in June 1996, Tyree Brothers Environmental Services, Inc. advanced one (1) soil boring to a reported terminal depth of 27-feet below ground surface (bgs) within the unpaved area located at the rear of the property. One (1) soil sample was collected from a 2-foot interval (25 to 27-feet bgs) exhibiting the highest elevated photo-ionization detector (PID) reading. Laboratory analytical results for the subject soil sample reported tetrachloroethene (PCE) concentrations at 7.6 parts per billion (ppb), which is below the NYSDEC Soil Cleanup Objective of 1,300 ppb. Depth to groundwater at the time of Tyree's investigation was reported at approximately 26-feet bgs.

- Additional remedial investigative activities were implemented in November 2007 by JJ Blake Technical Services that included the installation and sampling of five (5) soil borings to a depth of four (4) feet bgs. One soil sample was collected from each soil boring and laboratory analyzed for CVOCs. PCE was the only targeted analyte detected in any of the soil samples collected above the laboratory method detection limit. PCE was detected at a concentration of 61 parts per billion (ppb), which is below the NYSDEC soil cleanup objectives. The boring from which this sample was collected was located adjacent to the sump in the basement. The sump is located in the southeast portion of the basement and discharges to the public sewer system.

- Further investigative activities were implemented by GCI in February 2008 which included the collection of a groundwater sample from the front of the subject property within the pedestrian sidewalk, along 31st Avenue. The sample was collected from a temporary well with groundwater encountered at a reported depth interval of 31 to 34 feet bgs that was laboratory analyzed for VOCs. As a result, cis-1,2-dichlorethene (1,2-DCE) and PCE were detected at concentrations above their respective NYSDEC Groundwater Quality Standard of 5 ug/l. 1,2-DCE was detected at a concentration of 73 ug/l and PCE was detected at a concentration of 67 ug/l. Based on the results of this investigation, GCI recommended that the report be submitted to the NYSDEC for a determination as to the need for further assessment and/or remedial actions.

- In November and December 2008, at the direction of the NYSDEC, GCI conducted additional investigation activities that included the collection and analysis of additional soil samples from within and adjacent to the basement sump. Soil samples were collected from two (2) feet below grade and laboratory analyzed for VOCs. The results of the soil sampling indicated compliance with the NYSDEC Soil Cleanup Objectives and Cleanup Levels. In addition, three soil vapor samples and one ambient air sample within the basement were collected at the property. The ambient air sample collected from within the basement were reported to exhibit a trichloroethene (TCE) concentration of <0.2 parts per billion by volume (ppbv) in addition to a reported PCE concentration of 0.3 ppbv. Both concentrations indicate compliance with the New York State Department of Health (NYDOH) guidance values of 0.88 ppbv and 14.01 ppbv, respectively. The three (3) soil vapor samples collected from outside the front door (15 ppbv & 170 ppbv), outside the back door (1 ppbv & 160 ppbv) and beneath the basement floor (130 ppbv & 1,700 ppbv), indicated trichloroethene and PCE concentrations reported above the NYS DOH guidelines.

A summary of all historical environmental sampling conducted by others at the Site had been previously provided to the NYSDEC via email correspondence dated September 27, 2011 and follow-up email dated October 13, 2011.

2.3.1 Previous Site Characterization Investigation Activities

In June 2011, under the direct oversight of H2M, Paragon Environmental Construction, Inc. advanced four (4) permanent monitoring wells. All permanent monitoring wells were constructed with 2-inch diameter schedule 40 PVC piping with 15-feet of 0.010-slot screen which was installed intersect the top of the static water table observed at the time of installation. Subsequent groundwater sampling of the four (4) monitoring wells performed in July 2011 yielded analytical results with elevated levels of CVOC's above the NYSDEC State Ambient Water Quality Standards and Guidance Values within two (2) of the permanent site monitoring wells (MW-3 & MW-4). However, it is important to note, that although chlorinated solvents have not been used at the property since reportedly the late 1990's, dissolved phase groundwater concentrations exhibited an increase of CVOC's at the MW-3 location when compared to the groundwater sample collected within the immediate vicinity during the February 2008 groundwater sampling event. Please note that the groundwater flow direction in July 2011 was flowing predominantly in a north-northwesterly flow direction.

Additionally, in June 2011 two (2) soil samples were collected from the soil column recovered from the MW-3 boring located to the front of the subject property in which analytical results reported all CVOC compounds at concentrations that do not exceed the NYSDEC's Soil Cleanup Objective Unrestricted Use Table 375-6.8(a).

3.0 Recent Site Characterization Activities

3.1 Installation of Monitoring Wells and Soil Gas Sampling Point

In November 2013, under the direct oversight of H2M, NYEG Drilling, LLC installed two (2) permanent monitoring wells using Hollow Stem Auger (HSA) drilling methodology at the locations previously proposed within H2M's revised April 2011 SCWP and ultimately approved by the NYSDEC via letter correspondence date May 5, 2011 (**Attachment 1)**. It is important to note that direct-push which was the proposed method within H2M's approved Site Characterization Workplan dated April 2012 (Revised May 2012) was unsuccessful in penetrating the subsurface greater than 25-feet bgs therefore HSA was the alternate approach selected while drilling on-site in November 2013.

The recovered soil columns from both monitoring well locations were logged and screened (**Attachment 3**, Soil Boring Logs) using a calibrated PID in which no elevated readings were observed within the MW-5 and MW-6 bore hole.

Both permanent monitoring wells were constructed with 2-inch diameter schedule 40 PVC piping with 15-feet of 0.010-slot screen which was installed intersecting the top of the static water table observed at the time of installation. All monitoring wells were completed at grade with flush mounted protective covers. Following installation all wells were surveyed for topographic and top-of-casing elevation by Fehringer Surveying, P.C. of Seaford, New York in order to model groundwater flow direction beneath the Site.

Additionally, considering that HSA was utilized to install monitoring well MW-5 a permanent soil gas point was installed within the annular space at the 6-inch soil interval (21.0 to 21.5 feet bgs) immediately above groundwater during monitoring well construction. The soil gas sampling point was constructed using a stainless steel point with ¼-inch tubing extending to the surface and remaining in the man-way of monitoring well MW-5. The exterior of tubing was be sealed at the surface using a bentonite material to prevent outdoor air infiltration.

3.2 December 2013 Groundwater Sampling Activities

On December 3, 2013, H2M returned to the Site to conduct groundwater sampling activities of the two (2) newly installed and four (4) existing monitoring wells. Prior to well purging, a complete round of static groundwater measurements were collected. Below is a summary table of the data generated to develop groundwater flow contours beneath the subject site. A groundwater contour map is Included as **Figure 2**.

Monitoring Well	TOC Elevation	Depth to Groundwater	Groundwater Elevation
MW-1	50.76	29.06	21.70
MW-2	48.53	25.43	23.10
MW-3	50.90	29.18	21.72
MW-4	45.83	24.21	21.62
MW-5	43.77	21.72	22.05
MW-6	51.89	29.96	21.93

Note: Groundwater elevation above mean sea level

Based on the generated contour map, it was concluded that the groundwater beneath the subject site is flowing predominately in an east-southeast flow direction.

Considering the notable shift in groundwater flow from a west-northwest direction as identified during the previous events conducted in 2011 (but utilizing only four monitoring wells), another complete round of groundwater levels was recorded on March 13, 2014, which confirmed the greater than 90-degree shift in groundwater flow direction. Based upon the two rounds of groundwater elevation data collected groundwater now appears to be flowing from MW-2 towards MW-3, representing an east-southeast direction.

Following the complete round of groundwater measurements on December 3, 2013, the six (6) permanent monitoring wells were purged and sampled using low-flow methodology. During the purging process, water quality indicator parameters (e.g. pH, conductivity, turbidity, etc.) were recorded at five (5) minute intervals until stabilization occurred (**Attachment 4**, Groundwater Sampling Field Form). Groundwater samples were collected following stabilization and submitted to H2M Labs under chain of custody and subsequently analyzed for CVOC compound analysis via EPA Method 8260B. A summary of the groundwater sample results is presented below, in **Table 1** and a copy of the analytical package is provided as **Attachment 5.**

Groundwater CVOC Concentrations (ppb)
New York Dry Cleaners
90-11 31st Avenue
December 3, 2013

Constituent	MW-1	MW-2	MW-3	MW-4	MW-5	MW-6	NYSDEC
cis-1,2-dichloroethene	< 5	< 5	**130**	**11**	< 5	< 5	5
trans-1,2-dichloroethene	1 J	< 10	< 10	< 10	< 10	< 10	5
tetrachloroethene	< 5	2 J	**260**	**74**	**290**	**16**	5
trichloroethene	< 5	< 5	**13**	4 J	< 5	< 5	5
chloroform	< 5	2 J	**9**	2 J	2 J	< 5	7

Note: ppb – parts per billion; NYSDEC – Ambient Water Quality Standards and Guidance Values; ND – non-detectable concentrations; NA – criteria not available.

Analytical results report elevated levels of CVOC's above the NYSDEC State Ambient Water Quality Standards and Guidance Values within four (4) of the site monitoring wells. However, a significant reduction in PCE in MW-3 was observed when compared to July 2011 concentration of 910 ug/l.

3.3 MW-5 Soil Gas Sampling Results

On December 3, 2013 one soil gas sample was collected form the permanent soil gas sampling point located with the annular space of monitoring well MW-5. In accordance with the New York State Department of Health October 2006 *Guidance for Evaluating Soil Vapor Intrusion in the State of New York* document one soil gas sample (SV-1) was collected following a helium tracer test and approximate 3-volume purge and subsequently summited to H2M Labs under chain of custody for volatile organic compound analysis via EPA method TO-15.

A summary of the analytical results are provided within **Table 2** and a copy of the analytical package is provided as **Attachment 6.**

4.0 Conclusions

Based on the previous investigations soils exceeding the NYSDEC Soil Cleanup Objective have never been identified beneath the subject site in which soil sampling dates back to as early as June of 1996. Although, it is recognized that soil contamination in the soil column can contribute to a groundwater concern, specifically for this site, there exists no correlation between CVOCs identified in the groundwater and a pathway (i.e., discharge, piping, sump, etc.) related to any site activities associated with former dry cleaning operations. Since the site is mainly capped with a building there exists no physical mechanism for potential CVOC contaminant migration from the soil column to groundwater. None of the soil and/or vapor data presented above indicates that a CVOC release occurred on the subject site and the Site is bordered by cleaning facilities and is located in a region with multiple dry cleaning facilities within 0.5 miles. To date all identifiable locations in which a potential pathway where chlorinated compounds could have migrated to the subsurface from the subject site have been investigated as follows:

1. Rear (north) vegetated yard (investigated in 1996, 2007);
2. Sump pit (2007, 2008);
3. Subsurface below basement (2007, 2008);
4. Soil in vicinity of sewer line and front (south) of building (2008, 2011)
5. Sanitary line (video inspected in January 2014).

A summary of historic soil samples collected across the Site and Groundwater results are included on Figure 3. Soil samples collected from each of the areas identified above do not indicate

soils in exceedance of State Cleanup Objectives and field indicators do not identify impact throughout the approximate 20-foot unsaturated soil column. If a shallow release was to have occurred either from the immediately adjacent basement sump pit, the building's sanitary sewer line and/or the unpaved rear yard of the property, evidence of impact would be identified within the unsaturated soil column beneath the Site. No evidence of this was identified and the integrity of the sewer line is secure. Also, the former dry cleaning machine was located on the first floor with no operational history of the dry cleaning operation related to the basement (as a means of discharge). The basement remains with limited accessibility via cellar doors installed on the sidewalk and a steep staircase, limiting the potential for historical storage of dry cleaning chemicals. Additionally it is important to note that H2M's understanding of the historic use of the site has been reported to have ceased the use of chlorinated solvents at the subject site around the mid to late 1990's.

Elevated levels of dissolved phase chlorinated compounds are observed within five (5) of the six (6) site monitoring wells which suggests a more regional issue. Please note the similar concentrations of PCE observed within monitoring well MW-3 located in front (south) of the site in addition to monitoring well MW-5 located behind (north) the site which indicates the subject property is located mid-plume of a regional issue. Therefore it is H2M's opinion that the groundwater CVOC impact is most likely emanating from an off-site source located between perimeter wells MW-2 and MW-5 and the subject property.

Considering the information presented above, H2M on behalf of Venus Estates is respectively requesting a No Further Remedial Action Determination and closure of NYSDEC No. 241120 within the NYSDEC's data base and delisting of the 90-11 31st Street, Jackson Heights, New York Property from the NYSDEC's data base.

Acting Commissioner

June 12, 2012

Blair Sonzogni, PG
Holzmacher, McLendon & Murrell, P.C.
119 Cherry Hill Road, Suite 200
Parsippany, New Jersey 07054

Dear Mr. Sonzogni:

Re: Site Characterization Report Addendum (Revised)
NY Dry Cleaners, Site No. 241120

The New York State Department of Environmental Conservation (Department) and NYS Department of Health (NYSDOH) have received the revised Site Characterization Work Plan Addendum, dated April 2012 (Revised May 2012), for the above referenced site. The Department approves the document on the condition that progress reports are submitted monthly. This allows the Department and the responsible party to monitor the progress of one another and plan monthly activities accordingly so the project proceeds at more efficient pace.

Please notify the Department, in writing within 15 days of receiving this letter of your intent as per Section II, E, 2 of the Consent Order. If you agree with this condition please begin to obtain site access for the adjacent property for the installation of monitoring wells MW-5 and MW-6 and begin fieldwork in accordance with the approved schedule.

If you have any questions, please contact me in writing at the above address or by phone at (518) 402-9768.

Sincerely,

Kevin Sarnowicz
Environmental Engineer

January 21, 2014

Blair,

In the beginning there is a small sag in the line where water deposits and sits. At the elbow there is a major sag. There doesn't appear to be any breaks but the sags will eventually cause problems if they are not already. There will be buildups in the sags causing back ups and eventually they will probably break. Let me know if you need anything else.

Thanks,

Steve @ City Wide Sewer & Drain

II. SDG NARRATIVES

H 2 M labs

NARRATIVE FOR VOLATILES
SAMPLES RECEIVED: 12/5/13
SDG #: NJGIAM003

For Sample(s):

MW-1	MW-6
MW-2	FIELD BLANK
MW-3	TRIP BLANK
MW-4	STORAGE BLANK
MW-5	

The above water sample(s) and blank(s) was/were analyzed for a select list of volatile organics by EPA method 8260C in accordance with the NYSDC ASP, Rev. 6/2000, Category B.

All Q. C. data and calibrations met the requirements of the method, and no problems were encountered with sample analysis. The following should be noted:

No matrix spike/matrix spike duplicate was submitted. A lab-fortified blank (LFB) was analyzed, and recoveries indicate good method efficiency.

Two samples were reanalyzed at dilutions due to concentration levels of a targeted analyte above the calibration range. Both sets of data are submitted.

The % RSD in the initial calibration exceeded 20.5% for two compounds, but met the limit of 40% permitted for two analytes. In the continuing calibration verification (CCV), one compound had a variability above 25% but met the limit of 40% (allowed for two analytes).

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

631.694.3040
631.420.8436

QUALIFIERS FOR REPORTING ORGANICS DATA

Value - If the result is a value greater than or equal to the quantification limit, report the value.

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(300\ U)}{D} \text{ x df where } D = \frac{100\% moisture}{100}$$

and df - dilution factor

For example, at 24% moisture, $D = \frac{100 - 24}{100} = 0.76$

$$\frac{(300\ U)}{.76} \text{ x } 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For semivolatile soil samples, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Similarly, pesticide samples subjected to GPC are concentrated to 5.0 mL. Therefore, the CRQL values in Exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specified volume (see Exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed or when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified quantification limit but greater than zero. (e.g.: If limit of quantification is 10 ug/L and a concentration of 3 ug/L is calculated, report as 3J.) The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds, where the identification is based on a mass spectral library search. It is applied to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the N code is not used.

P - This flag is used for a pesticide/Aroclor target analyte when there is greater than 25% difference for detected concentrations between the two GC columns (see Form X). The lower of the two values is reported of Form I with a "P".

C - This flag applies to pesticide results when the identification has been confirmed by GC/MS.. If GC/MS confirmation was attempted but was unsuccessful, do not apply this flag, instead use a Laboratory defined flag, discussed below.

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified target compound.

H 2 M labs

575 Broad Hollow Road
Melville, NY 11747

631.694.3040
631.420.8436

E - This flag identified compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale, except as noted in Exhibit D, the sample or extract must be diluted and re-analyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration ranges in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number. NOTE: For total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak should be considered separately, e.g. a diluted analysis is not required for total xylenes unless the concentration of the peak representing the single isomer exceed 200 ug/L or the peak representing the two coeluting isomers on that GC column exceed 400 ug/L. Similarly, if the two 1,2-Dichloroethene isomers coelute, a diluted analysis is not required unless the concentration exceed 400 ug/L.

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

X - Other specific flags may be required to properly define the results. If used, they must be fully described and such description attached to the Sample Data Summary Package and the SDG narrative. Begin by using "X". If more than one flag is required use "Y" and "Z" as needed. If more than five qualifiers are required for a sample result, used the "X" flag to combine several flags as needed. For instance, the "X" flag might combine "A", "B", and "D" flags for some samples. The laboratory defined flags limited to the letters "X", "Y" and "Z".

The combination of flags "BU" or "UB" is expressly prohibited. Blank contaminants are flagged "B" only when they are detected in the sample.

Y Suspected secondary contamination.

X Analyte is suspected column bleed

Z Analyte had a %D greater then 20% in the daily CCV

COMPUTATIONS FOR VOLATILE ORGANICS
PERFORMED BY RTE DATA SYSTEM OF HP

$$CONC = \frac{Ax}{Ais \times RRF} \quad \frac{Is}{W}$$

WHERE:

CONC = Concentration in sample (ug/L or ug/KG)

Ax = Area of characteristic ion of compound

Ais = Area of characteristic ion of internal standard

RRF = Relative response factor as area per (ng) of compound, divided by area per ng of respective internal standard

Is = Amount of internal standard injected (ng)

W = Volume of sample in (ml) or dry weight (g)

Generally the amount of each internal standard injected is 250 ng.

II. SDG NARRATIVES

H 2 M labs

NARRATIVE FOR VOLATILES
SAMPLES RECEIVED: 12/5/13
SDG #: NJGIAM005

For Sample(s):

SV-1

The above air sample(s) was/were analyzed for a specific list of volatile organic analytes by EPA method TO-15. Data are reported according to the requirements of NYSDEC ASP Rev. 2000, Category B.

All quality control and calibration requirements were met. The following should be noted:

The sample was not analyzed as matrix spike/ matrix spike duplicate (MS/MSD, but data for the two lab fortified blanks indicates good method efficiency. One analyte of the 49 targeted compounds, 1,2,4-trichlorobenzene, had a slightly low recovery of 68% (limit 70%).

The sample had to be reanalyzed at a dilution to keep all analytes within the calibration range. The compounds that exceeded in the original analysis are reported from the dilution.

Sample results are reported in both ppbv and ug/m3 units for targeted analytes but only as ppbv for the TIC compounds.

Alkanes are listed on form 1F but are not included in the number of TICs reported.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

fax 631.420.8436

QUALIFIERS FOR REPORTING ORGANICS DATA

Value - If the result is a value greater than or equal to the quantification limit, report the value.

U - Indicates compound was analyzed for but not detected. The sample quantitation limit must be corrected for dilution and for percent moisture. For example, 10U for phenol in water if the sample final volume is the protocol-specified final volume. If a 1 to 10 dilution of extract is necessary, the reported limit is 100 U. For a soil sample, the value must also be adjusted for percent moisture. For example, if the sample had 24% moisture and a 1 to 10 dilution factor, the sample quantitation limit for phenol (330 U) would be corrected to:

$$\frac{(300\ U)}{D} \times df \text{ where } D = \frac{100\% moisture}{100}$$

and df - dilution factor

For example, at 24% moisture, $D = \frac{100 - 24}{100} = 0.76$

$$\frac{(300\ U)}{.76} \times 10 = 4300\ U$$ rounded to the appropriate number of significant figures

For semivolatile soil samples, the extract must be concentrated to 0.5 mL, and the sensitivity of the analysis is not compromised by the cleanup procedures. Similarly, pesticide samples subjected to GPC are concentrated to 5.0 mL. Therefore, the CRQL values in Exhibit C will apply to all samples, regardless of cleanup. However, if a sample extract cannot be concentrated to the protocol-specified volume (see Exhibit C), this fact must be accounted for in reporting the sample quantitation limit.

J - Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed or when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified quantification limit but greater than zero. (e.g.: If limit of quantification is 10 ug/L and a concentration of 3 ug/L is calculated, report as 3J.) The sample quantitation limit must be adjusted for dilution as discussed for the U flag.

N - Indicates presumptive evidence of a compound. This flag is only used for tentatively identified compounds, where the identification is based on a mass spectral library search. It is applied to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the N code is not used.

P - This flag is used for a pesticide/Aroclor target analyte when there is greater than 25% difference for detected concentrations between the two GC columns (see Form X). The lower of the two values is reported of Form I with a "P".

C - This flag applies to pesticide results when the identification has been confirmed by GC/MS.. If GC/MS confirmation was attempted but was unsuccessful, do not apply this flag, instead use a Laboratory defined flag, discussed below.

H2M labs
575 Broad Hollow Road tel 631.694.3040
Melville, NY 11747 fax 631.420.8436

B - This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates possible probable blank contamination and warns the data user to take appropriate action. This flag must be used for a TIC as well as for a positively identified target compound.

E - This flag identified compounds whose concentrations exceed the calibration range of the GC/MS instrument for that specific analysis. If one or more compounds have a response greater than full scale, except as noted in Exhibit D, the sample or extract must be diluted and re-analyzed according to the specifications in Exhibit D. All such compounds with a response greater than full scale should have the concentration flagged with an "E" on the Form I for the original analysis. If the dilution of the extract causes any compounds identified in the first analysis to be below the calibration ranges in the second analysis, then the results of both analyses shall be reported on separate copies of Form I. The Form I for the diluted sample shall have the "DL" suffix appended to the sample number. NOTE: For total xylenes, where three isomers are quantified as two peaks, the calibration range of each peak should be considered separately, e.g. a diluted analysis is not required for total xylenes unless the concentration of the peak representing the single isomer exceed 200 ug/L or the peak representing the two coeluting isomers on that GC column exceed 400 ug/L. Similarly, if the two 1,2-Dichloroethene isomers coelute, a diluted analysis is not required unless the concentration exceed 400 ug/L.

D - This flag identifies all compounds identified in an analysis at a secondary dilution factor. If a sample or extract is re-analyzed at a higher dilution factor, as in the "E" flag above, the "DL" suffix is appended to the sample number on the Form I for the diluted sample, and all concentration values reported on that Form I are flagged with the "D" flag. This flag alerts data users that any discrepancies between the concentrations reported may be due to dilution of the sample or extract.

A - This flag indicates that a TIC is a suspected aldol-condensation product.

X - Other specific flags may be required to properly define the results. If used, they must be fully described and such description attached to the Sample Data Summary Package and the SDG narrative. Begin by using "X". If more than one flag is required use "Y" and "Z" as needed. If more than five qualifiers are required for a sample result, used the "X" flag to combine several flags as needed. For instance, the "X" flag might combine "A", "B", and "D" flags for some samples. The laboratory defined flags limited to the letters "X", "Y" and "Z".

The combination of flags "BU' or "UB" is expressly prohibited. Blank contaminants are flagged "B" only when they are detected in the sample.

Y Suspected secondary contamination.

X Analyte is suspected column bleed

Z Analyte had a %D greater then 20% in the daily CCV

COMPUTATIONS FOR VOLATILE ORGANICS PERFORMED BY RTE DATA SYSTEM OF HP

$$CONC = \frac{Ax}{Ais \times RRF} \cdot \frac{Is}{W}$$

WHERE:

CONC = Concentration in sample (ug/L or ug/KG)

Ax = Area of characteristic ion of compound

Ais = Area of characteristic ion of internal standard

RRF = Relative response factor as area per (ng) of compound, divided by area per ng of respective internal standard

Is = Amount of internal standard injected (ng)

W = Volume of sample in (ml) or dry weight (g)

Generally the amount of each internal standard injected is 250 ng.
