Poughkeepsie, New York
EPA ID No. NYD080480734, NYSDEC Site No. 314001

Dear Mr. Czuhanic and Ms. Kulow:

The enclosed report presents the results of performance monitoring and confirmatory sampling associated with the start-up of a vapor extraction system to address the presence of volatile organic compounds (VOCs) beneath the floor slab of B003 at the IBM Poughkeepsie facility. This work was conducted consistent with the objectives and procedures described in IBM's approved Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) Work Plan, and IBM's Report of Findings for the B003 Source Assessment, the latter of which was submitted to the New York State Department of Environmental Conservation and the New York State Department of Health (the Agencies) on May 1, 2013 and approved on May 15, 2013.

If you wish to further discuss this document or have questions, please contact Mr. Steve Brannen of IBM at (845) 433-1509.

Sincerely,
International Business Machines Corporation

Michael Phelan, Manager
Environmental, Planning and Site Support Services

1.0 INTRODUCTION

This report presents the results of performance monitoring and confirmatory sampling associated with source remediation measures conducted to address the presence of volatile organic compounds (VOCs), principally trichloroethene (TCE), beneath the floor slab of Building 003 (B003) at the IBM Poughkeepsie facility (the Site). A Site locus plan is provided as Figure 1, and the B003 location on the Site is shown on Figure 2.

As documented in the May 2013 Report of Findings¹, indoor air screening and sampling conducted as part of source investigation work indicated the presence of VOCs throughout the first floor of B003. Subslab vapor sampling and analysis indicated that VOC-containing vapor was widespread under the building, with the highest VOC concentrations confirmed within the historical source area beneath the west-central area of the building. In addition, subslab-to-indoor air pressure differentials across the floor slab were found to range from neutral to slightly favorable for vapor entry into the building in most areas. These findings indicated that subsurface VOCs were the source of the VOCs present in indoor air.

Subsequent assessments, including building reconnaissance, review of heating, ventilating, and air conditioning (HVAC) system configuration and operations, and targeted screening revealed potential pathways for subsurface VOCs to enter the building and be entrained in the HVAC systems and distributed throughout the first floor. In particular, the building floor trench system, and certain interior manholes serving the groundwater collection system, were pathways for VOC vapor entry. In addition, the mechanical rooms housing the air handler units (AHUs) for the first floor were imparting a negative pressure on the floor slab, and on the trenches in some locations, that was conducive to vapor entry and entrainment in the HVAC system.

Based on these findings, IBM implemented measures to reduce VOC migration from the subslab to indoor air. These measures included sealing potential pathways for vapor entry, such as certain floor cracks, joints, trench cover plates, and sumps, and implementing several design and operational modifications to certain AHUs to reduce unfavorable differential pressure gradients and increase outside air exchanges. These measures successfully reduced indoor VOC concentrations in portions of the building.

Additionally, IBM has installed a subslab vapor and trench/manhole vapor extraction system as a means of VOC source reduction, and conducted a performance assessment of the system, including confirmatory indoor air sampling following startup of the system. This report documents the results of those actions.

Sanborn, Head Engineering P.C. (Sanborn Head), with assistance from IBM personnel, conducted this performance assessment and sampling work consistent with the objectives and procedures described in IBM's Resource Conservation and Recovery Act (RCRA)

¹ IBM Corporation and Sanborn, Head Engineering P.C., *Report of Findings, Building 003 VOC Source Assessment, IBM Poughkeepsie Facility, Poughkeepsie, New York*, May 1, 2013.

Facility Investigation Work Plan² (the Work Plan), approved by New York State Department of Environmental Conservation (NYSDEC) and the New York State Department of Health (NYSDOH) (collectively, the Agencies). The assessment and this report are subject to the standard limitations of this type of work, as provided in Appendix A.

This report is organized into the following sections:

Section 2 presents an overview of the subslab vapor extraction and trench/manhole vapor extraction systems and summarizes the performance monitoring results.

Section 3 describes the field activities and results of building-wide indoor air screening and confirmatory sampling in B003.

Section 4 presents a summary of the quality assurance/quality control review associated with the confirmatory indoor air sampling results.

2.0 VAPOR EXTRACTION SYSTEM PERFORMANCE

A vapor extraction and treatment system consisting of subslab, floor trench, and manhole extraction components was installed in B003 and put into full-time operation on October 2, 2013. The design basis for the system was communicated to the Agencies in the May 2013 Report of Findings. The Agencies approved the design basis in a May 15, 2013 letter to IBM.

The system is intended to address the confirmed source of VOCs below the building slab and cut off the main VOC preferential pathways, including the building floor trench system and interior manholes. As shown on Figure 4, the trenches run approximately north-south along the east and west sides of B003, with another segment that runs east-west across the middle of the building. They were formerly used for steam condensate return pipes, and now serve as conduits for hot water pipelines for the perimeter heating system. The manholes serve the building underdrain system that conveys VOC-containing groundwater to the on-site industrial wastewater treatment plant.

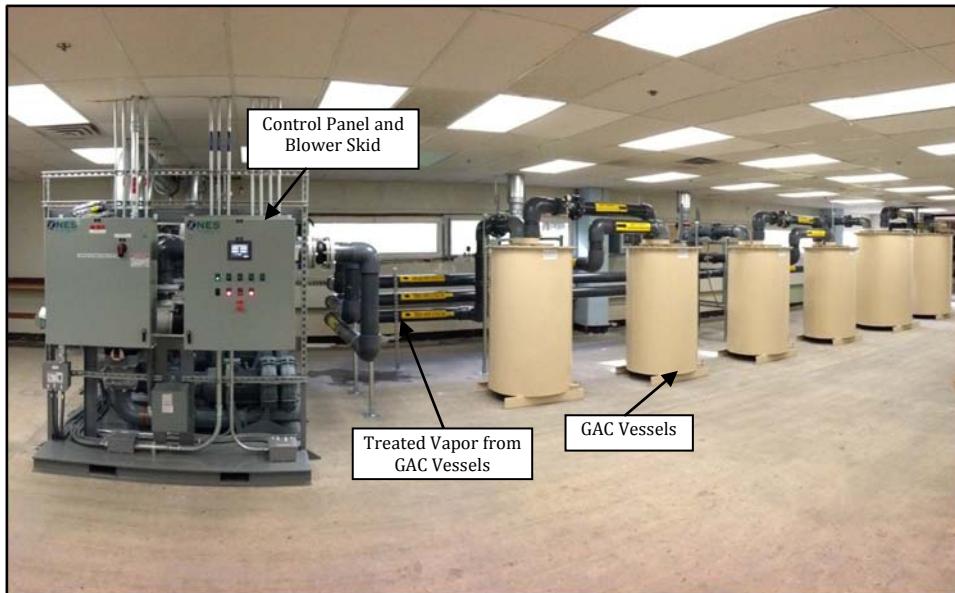

Figure 3 shows a schematic/flow diagram of the vapor extraction system, which consists of the following three components: a subslab vapor extraction system, an east trench/manhole vapor extraction system, and a west trench/manhole vapor extraction system. Each system has a dedicated blower and vapor-phase granular activated carbon (GAC) vessels for removal of VOCs from extracted vapor.

The subslab vapor extraction system consists of 26 extraction ports (EPs) (locations shown on Figure 4). Each of the two separate trench/manhole systems consist of three trench extraction ports (TEPs) and two manhole extraction ports (MHEPs) to remove and treat vapor from the trenches and from the headspace of the groundwater collection system beneath B003 (locations shown on Figure 5). The extracted vapor from each system is

² IBM Corporation and Sanborn, Head Engineering P.C., *RCRA Facility Investigation (RFI) Work Plan, VOC Source Assessment, IBM Poughkeepsie Facility, Poughkeepsie, New York*, October 23, 2012.

treated through three separate treatment trains, each consisting of two GAC vessels connected in a lead-lag series configuration. The vacuum blowers are located downstream of the GAC vessels such that the VOC-containing vapors and the GAC are maintained under a vacuum state during operation. The treated vapor is exhausted through stacks extending above the roofline of B003. Exhibit 1 shows the skid-mounted blower system and GAC treatment vessels installed on the west side of B003.

Exhibit 1: Building 003 Vapor Extraction System

Exhibits 2 and 3 show a subslab extraction port and a trench extraction port, respectively.

Exhibit 2: Subslab Vapor Extraction Port

Exhibit 3: Trench Extraction Port

The following sections describe the performance of the system.

2.1 Subslab Differential Pressure Monitoring Results

The subslab vapor extraction system has achieved subslab depressurization across the floor slab, as shown by the shaded area on Figure 6. Also shown on Figure 6 are the differential pressure readings between the subslab and indoor air recorded after startup in October 2013, as well as the applied vacuum, air flow, temperature, and % relative humidity (RH) measured at each extraction port riser. The United States Environmental Protection Agency's (USEPA) guidance³ considers differential pressure values of 5 Pascals (equivalent to 0.02 in. w.c.) or greater as evidence that vapor extraction has influence at a given subslab monitoring location, although other guidance⁴ and Sanborn Head experience suggests that any measureable depressurization (i.e., 1 Pascal or 0.004 in. w.c., the approximate accuracy limit of digital manometers) should be sufficient to intercept subslab vapor. Therefore, a value of 0.004 in. w.c. was used to determine the extent of subslab depressurization on Figure 6.

Figure 7 shows the differential pressure readings collected from the floor trench/manhole vapor extraction systems, as well as vacuum, airflow, temperature and % RH measured from the trench extraction ports and manhole extraction ports. These data indicate that the entire floor trench network and the manhole headspace are being maintained under vacuum.

2.2 TCE Source Mass Removal and Treatment

The subslab vapor extraction system is successfully removing TCE source mass from below the floor slab, and the trench/manhole vapor extraction systems are intercepting VOC-containing vapor. To estimate the TCE mass removed by the system and monitor the performance of the GAC treatment system, process vapor samples have been collected from the influent, midpoint, and effluent of the GAC vessels on an approximate bi-monthly schedule. These samples were collected in 2.7-liter Summa canisters and analyzed by Alpha Analytical of Mansfield, Massachusetts in accordance with USEPA Method TO-15. IBM will continue to conduct a routine sampling program to monitor TCE source mass recovery and the performance of the GAC treatment system.

The plots on Figure 8 show TCE concentrations versus time at the influent, midpoint, and effluent of the GAC units of each extraction system. The TCE concentrations in the influent from the subslab and East Trench extraction systems exhibit a general decline over time. For the West Trench extraction system, the TCE influent concentrations have been more variable.

Samples collected from the vapor stream being discharged from the lag GAC vessel (GAC effluent) for each system exhibited TCE concentrations that were consistently close to or less than the laboratory reporting limit, which demonstrates the effectiveness of the GAC treatment systems. The midpoint TCE concentrations for the subslab vapor system indicate a gradual increase as GAC adsorptive capacity within the lead vessel is consumed.

³ USEPA, *Engineering Issue: Indoor Air Vapor Intrusion Mitigation Approaches*, EPA/600/R-08-115, October 2008.

⁴ New Jersey Department of Environmental Protection, *Vapor Intrusion Technical Guidance*, March 2013.

The midpoint TCE concentrations have been close to or below the laboratory reporting limit for the West and East Trench systems, indicating that breakthrough of the lead GAC units has not yet occurred. IBM will continue routine process monitoring and will replace the GAC when the GAC has reached its adsorptive capacity.

The plots on Figure 9 show the TCE mass removal rates and cumulative mass removed in the 97 days between October 2 and January 7, 2014. A combined total of approximately 44 pounds of TCE were removed during this period by all three systems⁵. As expected, the mass removal rates show trends similar to the TCE influent concentrations.

The combined TCE mass removal rate by all three systems is currently about 0.4 lbs/day. In the May 2013 Report of Findings, the rate of TCE vapor entry into B003 needed to cause the observed average concentration of TCE in indoor air was estimated at 0.4 lbs/day. Thus, the vapor extraction systems are removing TCE at a rate equivalent to the apparent pre-remediation rate of TCE vapor entry into the building, and should be expected to significantly reduce TCE concentrations in indoor air.

IBM will continue to monitor the system data. In the event that the VOC mass removal rate decreases significantly, such that residual source mass and the potential for VOC vapor entry is similarly significantly reduced, IBM may elect to temporarily shut down the system and sample indoor air to evaluate if VOC levels are acceptable. If so, IBM will then assess, in consultation with the Agencies, if termination or major modification of vapor extraction operations is appropriate (e.g., discontinuing vapor extraction from the subslab ports, trenches, or manholes). IBM will inform the Agencies if it intends to conduct a temporary system shut-down for the purpose of evaluating the effects on indoor VOC levels and possible termination or major modification of system operations.

3.0 INDOOR AIR SCREENING AND CONFIRMATORY SAMPLING

As an initial evaluation of the influence of vapor extraction system operation on indoor air VOC levels, indoor air screening was conducted on October 22, 2013 using a portable gas chromatograph/mass spectrometer (GC/MS), approximately 20 days after system start-up. Indoor air screening was conducted at most of the locations that were screened prior to system installation, as presented in the May 2013 Report of Findings. Indoor air screening locations are shown on Figure 10.

Post-startup, 8-hour indoor air confirmatory sampling using Summa canisters was conducted on November 21, 2013 at the same locations that were sampled during the initial VOC source assessment, with select locations screened using the portable GC/MS prior to initiating confirmatory sample collection. Indoor and ambient outdoor air samples were collected at the locations shown on Figure 11. The ambient outdoor air sample (AA1001) was collected from a location adjacent to the fresh air intake for AHU 3-1-5. For quality assurance/quality control (QA/QC) purposes, one field blank and one field

⁵ Mass removed is calculated based on the influent TCE concentration, flow rate, and hours of operation.

duplicate sample were also collected.⁶ A description of field methods used during indoor air screening and sampling is included in Appendix B.1 of this report.

3.1 Indoor Air Field Screening and Results

October and November 2013 indoor air field screening was conducted using the Inficon HAPSITE Smart portable GC/MS. The portable GC/MS data were used for general screening purposes only to obtain a preliminary qualitative assessment of indoor air conditions after vapor extraction system start-up. Indoor air screening was conducted for 6 of the 8 of the project-specific analytes listed in the RFI Work Plan, including 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (c-1,2-DCE), trans-1,2-dichloroethene (t-1,2-DCE), tetrachloroethene (PCE), and TCE.

Figure 10 presents the indoor air TCE results for pre-remediation screening (November 2012) and post-remediation screening (October and November 2013). Results for each of the six compounds analyzed during the October and November 2013 screening rounds are shown on Table 1. Detected TCE screening concentrations in October and November 2013 ranged from 0.54 to 3.7 µg/m³; these concentrations reflect significant decreases of one to three orders of magnitude compared to the pre-remediation sample results.

3.2 8-Hour Indoor Air Confirmatory Sample Collection and Analysis

The 8-hour, time-integrated samples were collected on November 21, 2013 using 2.7-liter Summa canisters in accordance with the procedures described in the approved RFI Work Plan, Appendix A.1. Sample canisters were deployed approximately simultaneously and were set at a height of approximately 3.5 feet above the floor. The samples were submitted to Alpha Analytical of Mansfield, MA (Alpha) for laboratory analysis of the 8 site-specific VOCs using USEPA Method TO-15 in selective ion monitoring (SIM) mode. Additional sampling information, including sample collection times, initial and final canister pressures, canister identification numbers, and field screening values, is provided in Table 2. Photographs of sample locations are provided in Appendix B.2

Analytical data were provided to New Environmental Horizons (NEH) for an independent, third-party, data validation evaluation. NEH's data validation report is included as Appendix D. NEH found the data to be useable in accordance with the project data quality objectives and subject to only minor qualifications as described further in Section 4.0.

3.3 Summary of Confirmatory Sampling Analytical Data

Table 3 summarizes the November 2013 confirmatory indoor air sampling results. The analytical laboratory report for the confirmatory samples is included in Appendix C.

⁶ A field blank is a canister that is certified clean by the laboratory and filled in the field with ultra-high purity nitrogen. The purpose of a field blank is to assess for the presence of target compounds that could be due to equipment preparation and transportation of equipment to and from the field. A field duplicate sample is collected at the same time and location as another sample. Collection and analysis of field duplicate sample is intended to assess the precision (repeatability) of the sampling and analysis process. The field blank and duplicate samples are submitted to the analytical laboratory for analysis with the other samples.

Figure 11 shows the TCE indoor air concentrations before and after the startup of the vapor extraction system. TCE was detected in the post-vapor extraction system start-up indoor air samples at concentrations ranging from 0.12 to 3.4 µg/m³. These concentrations reflect significant decreases of two to three orders of magnitude compared to the pre-remediation sample results. TCE was also detected in the ambient air and field blank samples at concentrations slightly above the detection limit.

As summarized in Table 3, 3 of the 8 site-specific analytes were not detected in any air sample collected in November 2013, specifically: vinyl chloride, t-1,2-DCE, and 1,1-DCA. With the exception of TCE discussed above, the remaining site-specific compounds were detected in at least one sample and all at concentrations of less than 1 µg/m³.

4.0 QUALITY ASSURANCE/QUALITY CONTROL

Analytical data from the November 2013 confirmatory sampling event were provided to NEH for third-party independent data validation. NEH's data validation report is presented as Appendix D.

NEH's evaluation included a review of sample data to verify that the laboratory conducted the analyses in compliance with the analytical methods required, appropriate laboratory procedures, and consistency with the Work Plan QA/QC requirements. NEH's evaluation was conducted in accordance with USEPA and NYSDEC guidelines for data validation of organic data. NEH prepared a Data Usability Report that summarizes the quality control (QC) issues that required action (i.e., qualification of data) and compared QA/QC criteria to the data quality objectives described in the approved Work Plan.

In summary and as stated above, NEH found the data to be useable in accordance with the project data quality objectives subject to a few minor qualifications that do not affect the findings and conclusions. The following QA/QC considerations were noted by NEH:

- Final canister vacuums for IA1061 (11.61 inches of mercury ["Hg]), IA1065 (10.56 "Hg), and FB1 (13.5 "Hg) were greater than the highest recommended vacuum specified in the Work Plan (10 "Hg). These concentrations were flagged as estimated ("J" or "UJ") by NEH with an indeterminate bias.
- A low level of TCE (0.059 µg/m³) was detected in the nitrogen field blank (FB1). The concentrations of TCE detected in samples AA1001 and IA1030 were within 5 times the concentration detected in the field blank. Therefore, those results were flagged as estimated ("EB") by NEH. The TCE result for IA1030 was assigned a high bias. AA1001 was assigned an indeterminate bias because the TCE value was reported at a level below the calibration range (see following bullet).
- TCE was reported at a concentration below the instrument calibration range for samples AA1001 and FB1. These results were reported as estimated and flagged with a "J" qualifier by the laboratory, and NEH and assigned an indeterminate bias.

5.0 CONCLUSIONS

The installation and operation of the vapor extraction system in Building 003 is successfully meeting its design objectives of reducing TCE source mass below the floor slab and preventing TCE vapor migration. Since the startup of the vapor extraction system, more than 44 pounds of residual TCE source mass have been removed.

Indoor air sampling indicates that the remediation measures have significantly reduced VOC concentrations throughout the first level of the B003. IBM plans to continue to operate and monitor the performance of the vapor extraction and treatment system as appropriate. IBM is preparing an Operation and Maintenance (O&M) Plan for the system, including an O&M Manual, which will be provided in a future submittal to the Agencies. IBM will inform the Agencies if it elects to evaluate termination or major modification of system operations in the future.

Notes:

- This table summarizes data recorded during field screening of grab indoor air samples using a HAPSITE Smart portable gas chromatograph/mass spectrometer (GC/MS), manufactured by Inficon. The instrument was calibrated to manufacturer prepared standards ranging from 0.5 part per billion on a volumetric basis (ppbv) to 50 ppbv, for the following compounds: tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (c-1,2-DCE), trans-1,2-dichloroethene (t-1,2-DCE), 1,1-dichloroethene (1,1-DCE), and 1,1-dichloroethane (1,1-DCA). The field samples were collected by Sanborn Head personnel directly into the HAPSITE sampling probe from the location and on the dates noted in the table. The samples were screened using the HAPSITE in selective ion monitoring (SIM) mode. Results were converted to micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) by Sanborn Head assuming standard temperature (25 °C) and pressure (1 atmosphere) for the conversion. Results were rounded to two significant figures.
- The HAPSITE was used as a field screening tool; therefore, the data should be considered estimated and not suitable for independent validation and decision-making. The findings should be considered in conjunction with results of samples analyzed in accordance with USEPA TO-15 protocol.
- "PID" indicates photoionization detector data presented in ppbv.
- Legend / Flags
 - < - The analyte was not detected above the indicated reporting limit.
 - NS - Not sampled for this parameter.
 - ND - Not detected above the PID reporting limit.

Notes:

1. Samples were collected by Sanborn, Head & Associates, Inc. on November 21, 2013.
2. Samples were collected into 2.7-liter, stainless steel, pre-evacuated SUMMA® canisters using 8-hour metering regulators and inline 2-micron filters. Canisters and regulators were laboratory-certified clean (100% certification).
3. PID screening was conducted using a ppbRAE, calibrated to a 10 parts per billion by volume (ppbv) isobutylene-in-air standard.
4. "NM" indicates not monitored.
 "NA" indicates not applicable.
 "ND" indicates the instrument read 0 ppbv.

Notes:

1. Samples were collected by Sanborn, Head & Associates, Inc. on the dates indicated over an 8-hour sampling interval. The samples were analyzed by Alpha Analytical of Westborough, Massachusetts for the project-specific list of volatile organic compounds (VOCs) by United States Protection Agency (USEPA) Method TO-15 in selective ion monitoring (SIM) mode. "CA" is chloroethane; "1,1-DCA" is 1,1-dichloroethane; "1,1-DCE" is 1,1-dichloroethene; "c-1,2-DCE" is cis-1,2-dichloroethene; "t-1,2-DCE" is trans-1,2-dichloroethene; "PCE" is tetrachloroethene; "TCE" is trichloroethene; and "VC" is vinyl chloride.

2. Results are presented in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

3. In-depth data usability reviews (DURs) were performed on the data by New Environmental Horizons, Inc. (NEH) of Arlington, Massachusetts. All results were considered acceptable, with the understanding of the potential uncertainty (bias) in the qualified results. In some cases, NEH assigned the following qualifiers and biases to the data. Refer to the DUR reports for further details.

"U" indicates the analyte is non-detect at or above the indicated sample specific practical quantification limit (PQL).

"J" indicates the result is an estimated value.

"UJ" indicates the non-detect is estimated at the indicated PQL.

"EB" indicates analyte was also present in the associated field blank.

"H" indicates a high bias.

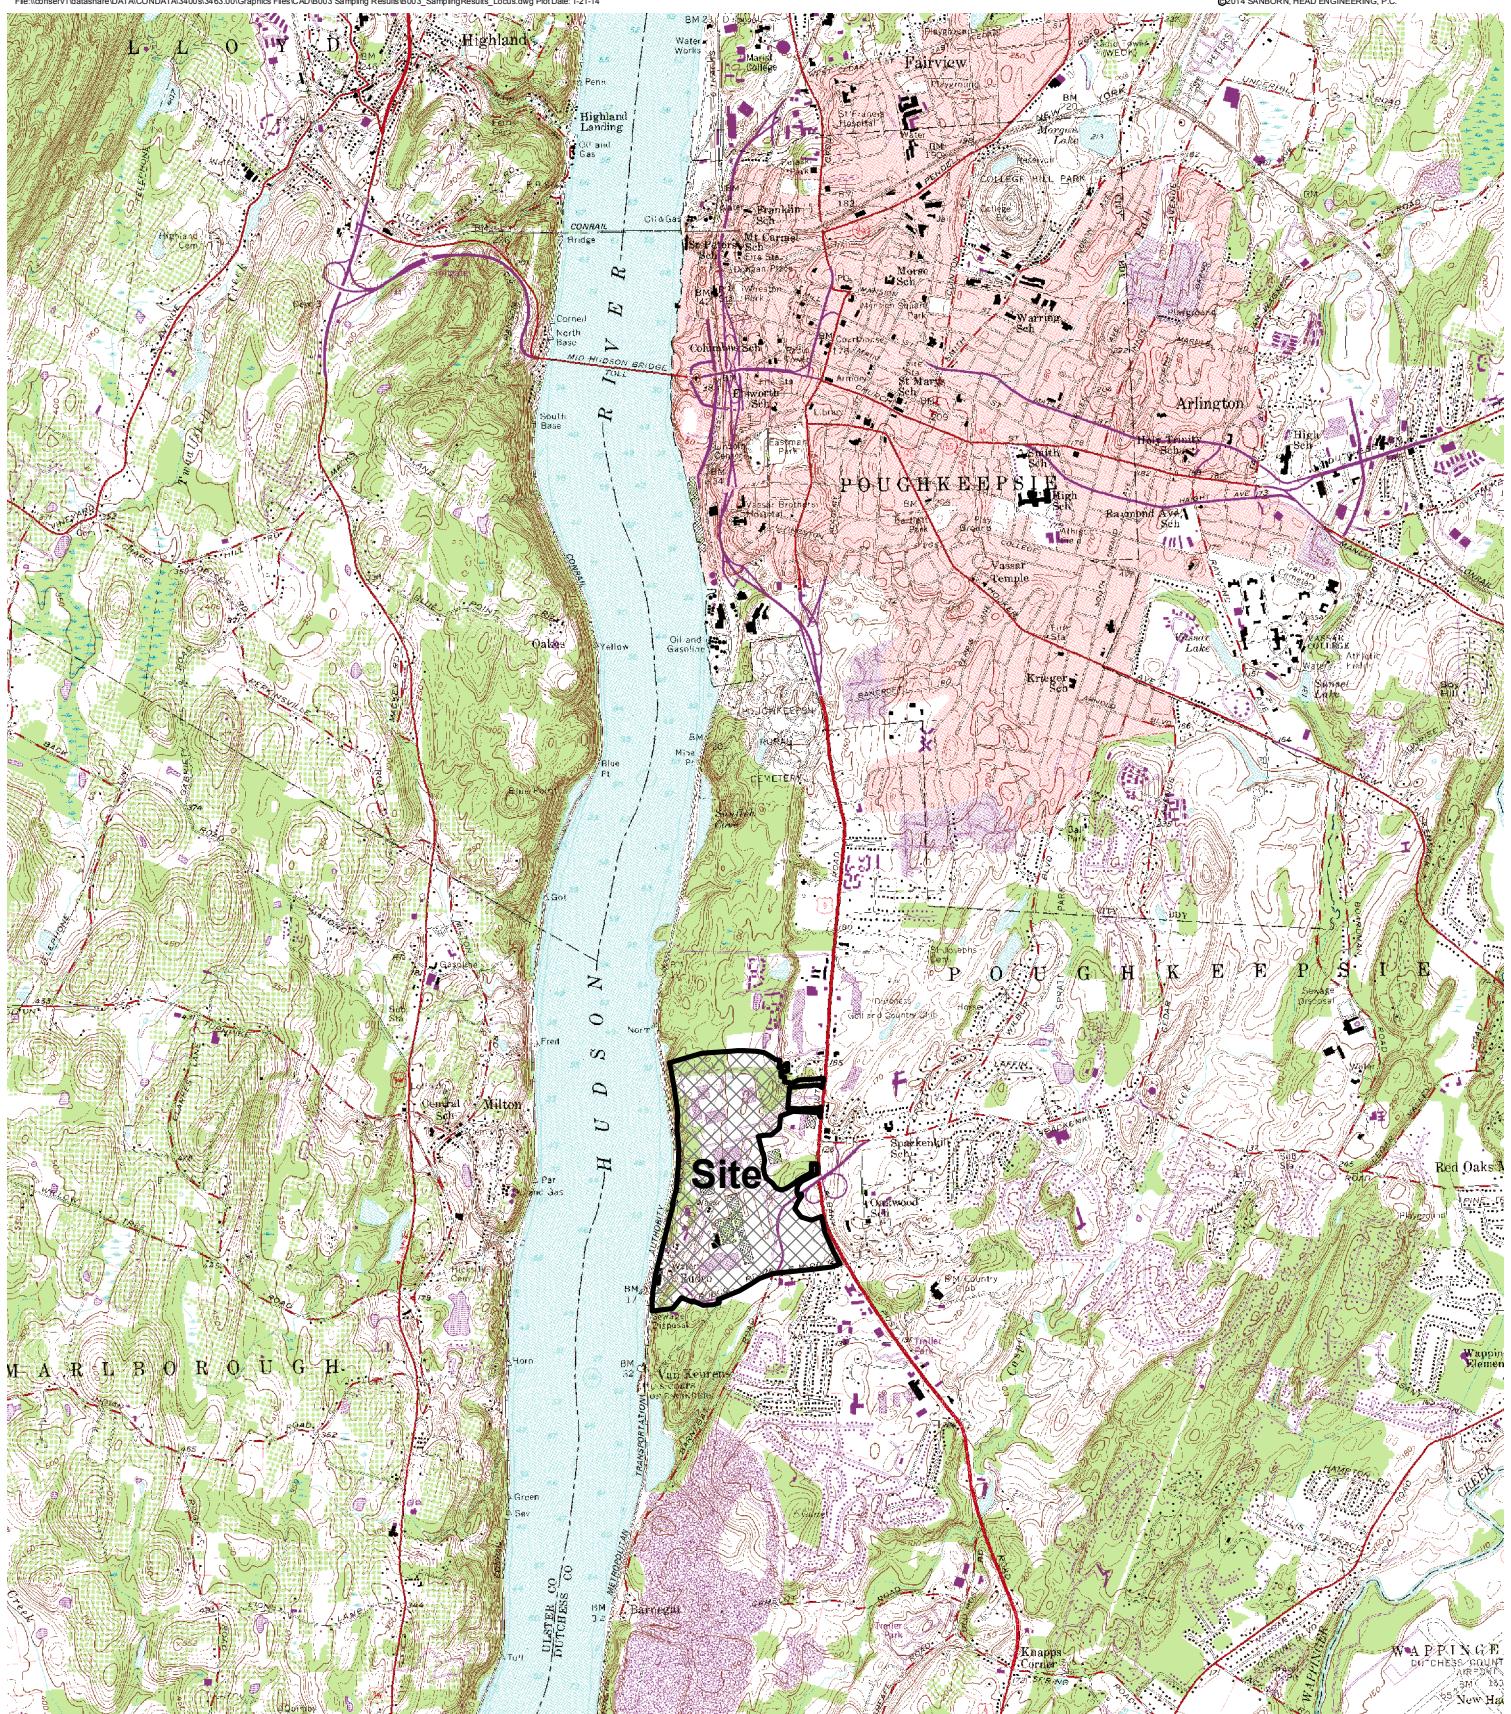

"I" indicates an indeterminate bias.

4. The "AA" designation indicates that the sample consists of ambient air collected from outside the building.

5. The field blank samples were collected by transferring high purity nitrogen provided by the laboratory from one certified clean SUMMA canister into another certified clean SUMMA canister over an approximately 8-hour period.

6. Results were rounded to two significant figures.

APPENDIX A

LIMITATIONS

APPENDIX A

LIMITATIONS

1. The findings and conclusions described in this report are based in part on the data obtained from a finite number of samples from widely spaced locations. The figures are intended to depict inferred conditions during a given period of time, consistent with available information. The actual conditions will vary from that shown, both spatially and temporally. Other interpretations are possible. The nature and extent of variations between sampling locations may not become evident until further investigation is initiated. If variations or other latent conditions then appear evident, it may be necessary to re-evaluate the conclusions of this report.
2. The conclusions contained in this report are based in part upon various types of chemical data, as well as historical and hydrogeologic information developed by previous investigators. While SHPC has reviewed that data available to us at the time the report was prepared and information as stated in this report, any of SHPC's interpretations and conclusions that have relied on that information will be contingent on its validity. SHPC has not performed an independent assessment of the reliability of the data; should additional chemical data, historical information, or hydrogeologic information become available in the future, such information should be reviewed by SHPC and the interpretations and conclusions presented herein may be modified accordingly.
3. Sampling and quantitative laboratory testing was performed by others as part of the investigation as noted within the report. Where such analyses have been conducted by an outside laboratory, unless otherwise stated in the report, SHPC has relied upon the data provided, and has not conducted an independent evaluation of the reliability of these data. It must be noted that additional compounds not searched for during the current study may be present in vapor and groundwater at the site. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their distribution within the groundwater and vapor may occur due to the passage of time, seasonal water table fluctuations, recharge events, and other factors.
4. This report has been prepared for the exclusive use of IBM for specific application to Building 003 at the Poughkeepsie facility in accordance with generally accepted engineering and scientific practices. No warranty, expressed or implied, is made. The contents of this report should not be relied on by any other party without the express written consent of SHPC.
5. In preparing this report, SHPC has endeavored to conform to generally accepted practices of other consultants undertaking similar studies at the same time and in the same geographical area. SHPC has attempted to observe a degree of care and skill generally exercised by the technical community under similar circumstances and conditions.

APPENDIX B.1

SUMMARY OF FIELD METHODS AND QA/QC

APPENDIX B.1

SUMMARY OF FIELD METHODS AND QA/QC

B.1 INTRODUCTION

This appendix describes the field methods, and data quality assurance/quality control (QA/QC) evaluations and results, associated with the Building 003 (B003) vapor extraction system performance monitoring and confirmatory sampling at IBM's Poughkeepsie facility. Field procedures and data QA/QC measures were conducted in general accordance with the standard operating procedures (SOP) provided in IBM's VOC Source Assessment RFI Work Plan (RFI Work Plan).

Tabular summaries of the data described below are provided in Tables 1 and 3 of the main report. The Site-specific analyte list referenced below was presented in the RFI Work Plan and includes the following volatile organic compounds (VOCs): chloroethane (CA), 1,1-dichloroethane (1,1-DCA), 1,1-dichloroethene (1,1-DCE), cis-1,2-dichloroethene (c-1,2-DCE), trans-1,2-dichloroethene (t-1,2-DCE), tetrachloroethene (PCE), trichloroethene (TCE), and vinyl chloride (VC).

B.2 INDOOR AIR SCREENING

B.2.1 Field Methods

Indoor air screening on the first floor of B003 was conducted using an Inficon HAPSITE Smart field-portable gas chromatograph/mass spectrometer (GC/MS) (i.e., HAPSITE). The HAPSITE was used as an air-screening device for 6 of the 8 of the Site-specific VOCs¹. Screening was conducted on October 22, 2013, following the startup of the vapor extraction system; and on November 21, 2013 prior to the deployment of SUMMA canisters for indoor air sampling.

The HAPSITE was calibrated to vendor-prepared standards ranging from 0.5 to 50 parts per billion by volume (ppbv) for the target analytes, and the samples were screened in selective ion monitoring (SIM) mode. Reporting limits were generally based on the lowest point on the calibration curve. However, the reporting limit for PCE and TCE was adjusted to 0.1 ppbv based on the linearity of the calibration curve for those compounds, and because the HAPSITE has a strong response to those compounds at concentrations down to 0.1 ppbv.

HAPSITE sample collection and analysis takes approximately 6 minutes. The line is purged for 1 minute to remove remnants of previous samples, then the concentrator tube is filled for 1 minute. The mass collected in the concentrator is then pumped through the GC/MS for analysis. Total analysis time is approximately 4 minutes and is based on the elution time of the analytes. Prior to HAPSITE screening, the indoor air locations were screened with a photoionization detector (PID).

¹ The HAPSITE was not calibrated for chloroethane or vinyl chloride; therefore, these compounds were not reported.

B.2.2 QA/QC Evaluation

The objective of HAPSITE field screening was to obtain general, order-of-magnitude understanding of VOC concentrations to inform and adjust the focus of the field activities in real time. The HAPSITE data is not intended to support final decisions. Nevertheless, the following QA/QC measures were taken to support evaluation of the field screening data.

Outside air blanks were collected through a carbon filter into the HAPSITE from locations outside of B003 at the beginning of each day. In the event that the blank analysis results indicated that one of the analytes (particularly TCE) had been detected, a “cleaning” method would be run on the HAPSITE. This method runs a blank sample at high temperature to facilitate the removal of chemical traces from previous sampling rounds. The outside air blank was then repeated. This process was generally repeated until satisfactorily low concentrations in the outside air blank analysis had been achieved. Where outside air blank sample results were not reported as “non-detect”, indoor air results similar to (and therefore not discernible from) those recorded for blanks were assumed to be associated with the HAPSITE operating environment and/or residual VOC presence in the HAPSITE column and were therefore considered to be less than the reporting limit of the instrument.

In addition, a grab indoor air sample was collected into a 2.7-liter pre-evacuated SUMMA canister at indoor air screening location IA1025 immediately after the HAPSITE screening sample was collected in October 2013. The sample was submitted for laboratory analysis by USEPA Method TO-15 in SIM mode. The purpose of the grab SUMMA sample was to obtain an understanding of the general comparability of the HAPSITE screening results with the results of a sample subject to laboratory analysis. The results for the grab SUMMA sample are shown on Table 1. Although the HAPSITE screening and grab SUMMA sample are not true field duplicate samples because the sample time intervals and volumes are different for each method, the TCE results indicate order-of-magnitude agreement.

A QA/QC review of the HAPSITE results was conducted in the office at the analyte level by reviewing the HAPSITE output files and chromatographs. The instrument reports values based on the quality of fit of chromatograph peaks and ion pairs, both within and outside of the calibration range. Compounds with a fit of less than 80% were flagged for further consideration during the office QA/QC process. Other factors that were considered when reviewing the data included ion ratios, retention times, and daily blank sample results. Results identified as “false positives” based on this data review were considered to be less than the reporting limit for that compound.

B.3 8-HOUR INDOOR AIR SAMPLING

B.3.1 Field Methods

SUMMA canisters were used to collect 8-hour time-weighted-average indoor air samples at ten locations on the first floor of B003 on November 21, 2013. The indoor air samples were collected in accordance with the Indoor and Ambient Air Sampling SOP included in Appendix A.1 of the RFI Work Plan. The samples were collected into 2.7-liter pre-

evacuated SUMMA canisters at a height of approximately 3.5 feet above the floor. SUMMA canisters were submitted to Alpha Analytical of Mansfield, MA (Alpha) for laboratory analysis of the eight site-specific VOCs using USEPA Method TO-15 in SIM mode. A summary of sampling information for the air samples is provided in Table 2.

B.3.2 QA/QC Evaluation

Field and laboratory QA/QC measures were implemented for the November 21, 2013 8-hour indoor air samples in accordance with Table B.1 of the RFI Work Plan QA/QC Plan. Field QA/QC samples included collection of one field duplicate sample, one ambient air sample, and one field blank using ultra-high purity nitrogen provided by the laboratory.

Analytical data was provided to New Environmental Horizons, Inc. (NEH) of Arlington, Massachusetts for an independent third-party data usability review (DUR). NEH's DUR report is presented as Appendix D.

NEH's evaluation included a review of sample data to verify that the laboratory performed the analyses in compliance with the analytical methods required, and to verify consistency with the QA/QC Plan requirements. The evaluation was conducted in accordance with the USEPA and NYSDEC guidelines for data validation of organic data. NEH prepared a Data Usability Report that summarized the QC issues that required action (i.e., qualification of data) and compared QA/QC criteria to the data quality objectives (DQOs) described in the Work Plan.

In summary, NEH found the data to be usable in accordance with the project DQOs subject to a few minor qualifications. Section 4.0 of the main report provides a summary of the QA/QC considerations noted by NEH.

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Performance criteria for CAM and RCP methods allow for some LCS compound failures to occur and still be within method compliance. In these instances, the specific failures are not narrated but are noted in the associated QC table. This information is also incorporated in the Data Usability format for our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEX data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples free of charge for 30 days from the date the project is completed. After 30 days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples.

Please contact Client Services at 800-624-9220 with any questions.

REISSUE

Project Name: IBM-POK
Project Number: 3463.00

Lab Number: L1323970
Report Date: 12/12/13

Case Narrative (continued)

Report Submission

This report replaces the report previously issued on December 4, 2013. The report has been revised at the request of the client to remove the sample designated IA8005\G, L1323970-01 (formerly IA7005\G) from this report.

The removal of this sample also removes the laboratory duplicate results from this report.

REISSUE

Report Submission

This report replaces the report previously issued on December 3, 2013. The report has been revised to add information about the flow controller for the -03 sample.

Volatile Organics in Air

Canisters were released from the laboratory on October 30, 2013. The canister certification results are provided as an addendum.

The flow controller listed on the chain of custody form for the sample designated IA1030 (L1323970-03) is 0281 but should be 0285. The client was able to verify that 0285 was the flow controller ID number associated with this sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

Title: Technical Director/Representative

List of Organic Method Qualifiers

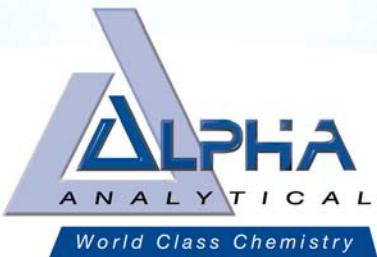

Table 1

Qualifier (Q)	Description
B	Entered if the analyte is found in the associated blank as well as the sample.
C	Applied to pesticide results when the identification has been confirmed by GC/MS.
D	Included when all identified compounds in the analysis are at the secondary dilution factor.
E	Identified compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
J	Indicates an estimated value, may indicate one of the following, depending on the situation: (1) The reported value is estimated and below the MDL. (2) Used when estimating a concentration for TIC where a 1:1 response is assumed or when the result indicates the presence of a compound that meets the identification criteria, but the result is less than the quantitation limit, but greater than zero. (3) QC associated with this analyte is within warning limits.
N	Included for TIC that indicate presumptive evidence of a compound.
U	Entered if the analyte was analyzed for, but not detected.
P	Used for a pesticide/Aroclor target analyte when the concentration difference between 2 GC columns is greater than 25%; the lower value is flagged with a "P".
EMPC	"Estimated Maximum Possible Concentration" – The amount of analyte cannot be accurately quantified, so a maximum concentration has been estimated for the compound.
"XYZ"	"Wildcard" or Laboratory defined qualifier.

Note: Form I allows only one character in each qualifier column. If multiple qualifiers are applicable, please assess qualifier priority in the following order: U, E, J, B, D, C, P, N. Reporting done in the EDD may include multiple qualifiers when applicable, separated by a single space.

(Information obtained from NYSDEC ASP Exhibit B, 7/2005, page 64)

List of Inorganic Method Qualifiers

Table 2

Qualifier	Column (1)	Description
Concentration qualifiers		
B	C	Entered if the reported value was less than the CRDL, but greater than the IDL.
U	C	Entered if the analyte was analyzed for, but not detected.
J	C	Entered if the reported value is estimated and below the MDL.
*	C	Duplicate precision exceeds RPD limit.
M	C	Replicate precision exceeds RPD limit.
"XYZ"	C	"Wildcard" or Laboratory defined qualifier.
Qualifier specific entries		
E	Q	Entered if the reported value is estimated because of the presence of interferences.
Method qualifiers		
A	M	Flame atomic absorption
AS	M	Semi-automated spectrophotometric
AV	M	Automated cold vapor atomic absorption
C	M	Manual spectrophotometric
F	M	Furnace atomic absorption
MS	M	Mass spectrometry (ICP-MS)
NR	M	Analyte is not required to be analyzed
P	M	Inductively coupled plasma (ICP)
" "	M	No data have been entered

(1) The term "Column" is used to indicate under which column heading in the reporting forms that the qualifier will be found under.

Note: Form I allows only one character in each qualifier column. If multiple qualifiers are applicable to column C, please assess qualifier priority in the following order: U, J, B. Reporting done in the EDD may include multiple qualifiers when applicable, separated by a single space.

 cis-1,2-dichloroethene
 Concen: 0.05 ppbV
 RT: 10.20 min Scan# 1476
 Delta R.T. 0.002 min
 Lab File: R226526.D
 Acq: 2 Dec 2013 1:41 pm

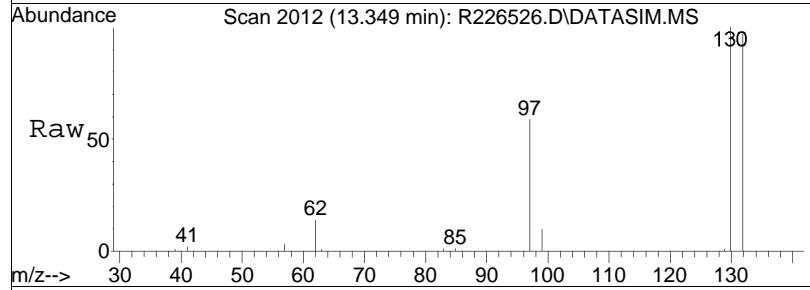

Tgt Ion: 61 Resp: 846
 Ion Ratio Lower Upper
 61 100
 96 76.4 60.6 91.0
 98 46.1 38.6 58.0

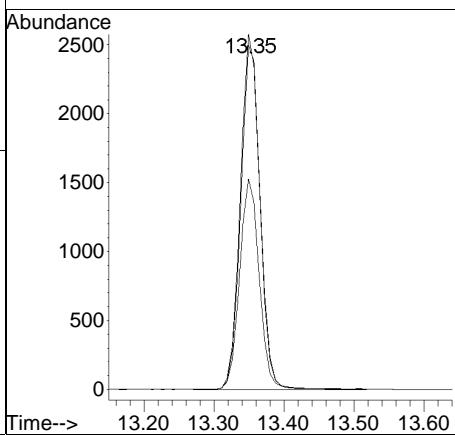

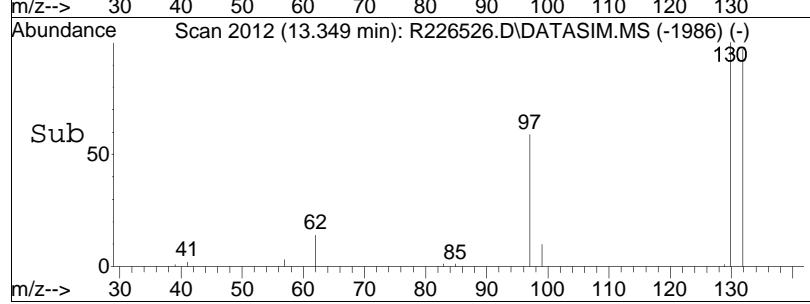

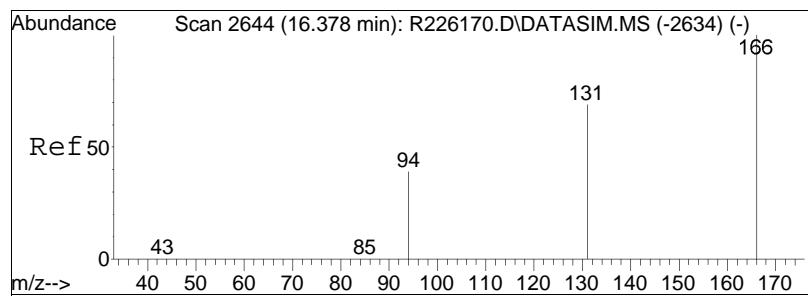

#42
trichloroethene
Concen: 0.23 ppbV
RT: 13.35 min Scan# 2012
Delta R.T. 0.001 min
Lab File: R226526.D
Acq: 2 Dec 2013 1:41 pm

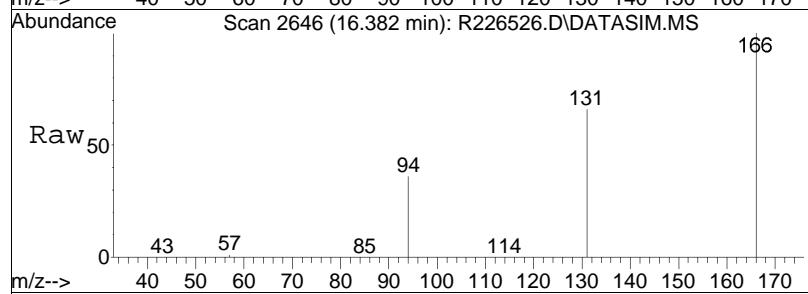

Tgt	Ion:130	Resp:	4951
Ion	Ratio	Lower	Upper
130	100		
132	97.1	77.1	115.7
97	59.3	49.0	73.4

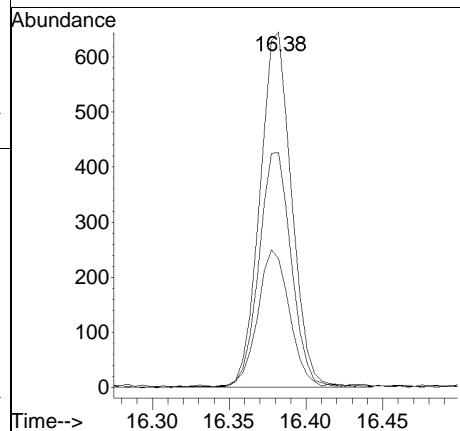

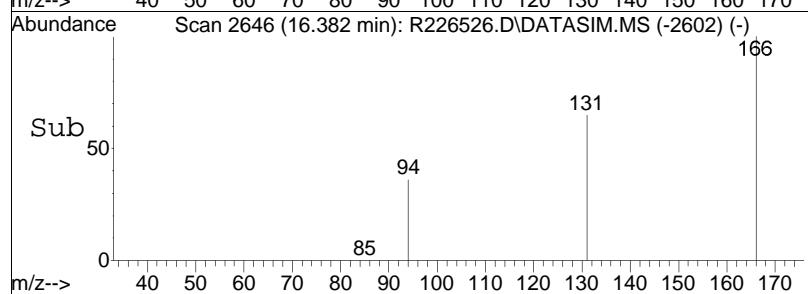

#55
tetrachloroethene
Concen: 0.03 ppbV
RT: 16.38 min Scan# 2646
Delta R.T. 0.004 min
Lab File: R226526.D
Acq: 2 Dec 2013 1:41 pm

Tgt	Ion:166	Resp:	928
Ion	Ratio	Lower	Upper
166	100		
131	66.0	55.1	82.7
94	36.3	31.4	47.0

Manual Integration/Negative Proof Report

Data Path	:	O:\Forensics\Data\AIR2\2013QMethod	:	TSIM131110.M

There are no manual integrations or false positives in this file.

Calculation of Volatile Organic Compounds in Air

The instrument will calculate the concentration (ppbv). If the sample is diluted (DF), the result is multiplied by the DF to generate the final result.

$$\text{Result, ppbv} = C_s \times DF$$

Where:

C_s = Concentration of sample (ppbv)

DF = Dilution Factor

Calculation of Instrument Dilution Factor

For dilutions, smaller sample volumes (< 250mL) are analyzed. The smallest volume that can be analyzed with accuracy is 10 mL.

Samples that arrive at the laboratory with pressures below -15 inches Hg must be pressurized with zero air to greater than -15 inches Hg. This pressurization results in a dilution factor.

Calculation of Dilution Factor

$$DF = V_{cf} / V_{ci}$$

Where:

V_{ci} = volume of air in canister prior to pressurization, L

P =

Conversion of ppbv to ug/m³

$$\text{ug/m}^3 = (\text{ppbv}) * \text{MW} / 24.47$$

Where:

24.47 = molar gas constant (g/g-mole)

MW = molecular weight of the compound of interest

Dilution Factor for Pressurization of Subatmospheric Samples: Three Steps

Step 1: Calculate the volume in the canister prior to pressurization (Assume a 2.7 liter canister is used).

Dilution Factor for Pressurization of Subatmospheric Samples: Three Steps

Step 1: Calculate the volume in the canister prior to pressurization (Assume a 2.7 liter canister is used).

$$V_{ci} = 2.7 * PI / 14.696$$

Step 2: Calculate the volume in the canister after pressurization.

$$V_{cf} = 2.7 * PF / 14.696$$

Step 3: Calculate the dilution factor.

$$DF = V_{cf} / V_{ci}$$

Where:

V_{ci} = volume of air in canister prior to pressurization, L

PI = pressure reading of canister prior to pressurization (psia)

V_{cf} = volume of air in canister after pressurization, L

PF = pressure reading of canister after pressurization (psia)

DF = dilution factor

14.696 = atmospheric pressure (psia)

APPENDIX D

DATA VALIDATION REPORT

Data Usability Report

Method TO-15 Analysis

Client/Company: Sanborn, Head, & Associates, Inc., Concord, New Hampshire (SHA)

Site/Project Name: IBM Poughkeepsie Facility, Poughkeepsie, New York

Laboratory: Alpha Analytical, Mansfield, Massachusetts

Sample Delivery Group: L1323970

Date(s) of Collection: November 21, 2013

**Number and type
Samples & analyses:** 11 Indoor Air samples, 1 Ambient Air sample, and 1 Field Blank for 8 project-specific VOCs by Method TO-15

Senior Data Reviewers: Dr. Nancy C. Rothman, New Environmental Horizons, Inc.
Susan D. Chapnick, New Environmental Horizons, Inc.

Date Completed: January 6, 2014

A Data Validation Checklist Review was performed on the Work Order identified with the following intentions: 1) to determine if the data were generated and reported in accordance with the *RFI Work Plan, VOC Source Assessment, IBM Poughkeepsie Facility, Poughkeepsie, New York, prepared by Sanborn, Head & Associates, October 2012*; USEPA Region 9, *Volatile Organic Compounds (VOCs) in Air (Ambient Air/Soil Vapor/Stack Gas) Samples Collected in Specially-Prepared Canisters and Analyzed by Gas Chromatography/Mass Spectrometry (GC/MS)*, EPA Method TO-15, (January 1999), 01/21/2000 revision; NYSDEC Analytical Services Protocol, June 2005, with NYSDEC Modifications to the EPA Region 9 TO-15 QA/QC Criteria, February 2008; USEPA Region II SOP HW-31, *Validating Air Samples, Volatile Organic Analysis of Ambient Air in Canisters by Method TO-15*, Rev. 4, October 2006; and Method TO-15, *Determination of Volatile Organic Compounds (VOCs) in Air Collected in Specially-Prepared Canisters and Analyzed by Gas Chromatography/Mass Spectrometry (GC/MS)*, Publication EPA/625/R-96/010b, January 1999; 2) to determine if the data met project data quality objectives for acceptable accuracy, precision, sensitivity; and technical usability; and 3) to update the project database with appropriate data quality qualifiers.

I. Sample Descriptions and Analytical Parameters

The sample IDs, date of sampling, identification of MS/MSD/MD, FD, EB, TB, if applicable, and the analytical parameters reviewed are listed in Table 1. Any deviations noted for sample collection or receipt (*e.g.*, temperature or preservation issues) are included in Section II, below.

Table 1. Sample Descriptions and Analytical Parameters

Sample ID	Lab Sample ID	Collection Date	Matrix	Analytical Parameters	Sample Type
IA1034	L1323970-02	11/21/13	Indoor Air	VOCs	Field Sample
IA1030	L1323970-03	11/21/13	Indoor Air	VOCs	Field Sample
IA1018	L1323970-04	11/21/13	Indoor Air	VOCs	Field Sample
DUP1	L1323970-05	11/21/13	Indoor Air	VOCs	Field Duplicate of IA1018
IA1065	L1323970-06	11/21/13	Indoor Air	VOCs	Field Sample
IA1064	L1323970-07	11/21/13	Indoor Air	VOCs	Field Sample
IA1062	L1323970-08	11/21/13	Indoor Air	VOCs	Field Sample
IA1061	L1323970-09	11/21/13	Indoor Air	VOCs	Field Sample
IA1001	L1323970-10	11/21/13	Indoor Air	VOCs	Field Sample
IA1063	L1323970-11	11/21/13	Indoor Air	VOCs	Field Sample
FB1	L1323970-12	11/21/13	Air	VOCs	Field Blank
AA1001	L1323970-13	11/21/13	Ambient Air	VOCs	Field Sample
IA1012	L1323970-14	11/21/13	Indoor Air	VOCs	Field Sample

Analytical method references:

VOC: Method TO-15 operated in the Selected Ion Monitoring (SIM) mode for 8 project-specific VOCs

II. Data Discussion

An In-Depth Data Usability Review was performed on SDG L1221714. This review indicated, overall, that the laboratory met project DQOs. Therefore, compliant with the Work Plan requirements for data validation, an abbreviated checklist review of subsequent air data was performed. Please see the Data Usability Report for SDG L1221714 for complete details on the in-depth TO-15 review. The Data Review Checklist, attached, was completed during this abbreviated assessment to document the review of this SDG.

The samples were received intact and the canister vacuums (initial field, field final, and lab receipt) were considered acceptable for all samples except IA1065, IA1061 and FB1. The final field and lab receipt vacuums for IA1065, IA1061 and FB1 were > 10.0 "Hg, which is above the highest acceptable vacuum specified in the Work Plan. All results for these three samples were estimated (J or UJ) with indeterminate bias due to high receipt vacuum.

A grab sample IA8005\G (lab ID L1323970-01) was collected on November 20, 2013 and originally reported in this SDG; however, on December 6, 2013, SHA requested that the results for this sample be eliminated from the data package.

The field equipment blank (FB1) reported a low level detect for trichloroethene. A comparison was made between the level of this compound in the blank and samples and the following actions were taken (as listed in Table2):

- Trichloroethene was estimated (EB) in samples AA1001 and IA1030 since the sample results may be biased high, unless other QC issues affect the data, based on the presence of trichloroethene in the associated equipment blank.

Laboratory Duplicate (LD) precision evaluation was performed on sample IA8005\G. Precision was acceptable for all target VOCs.

There was one field duplicate (FD) pair: IA1018 / DUP1. FD precision was acceptable for all target VOCs. The sample/LD and FD results are an indication of acceptable precision and representativeness of the samples to the locations collected for all target VOCs in these air samples.

Sensitivity requirements compared to the Reporting Limits (RLs) defined in Table B.1 of the Work Plan were met for all samples.

All other quality control information associated with accuracy, precision, and sensitivity for the VOCs reported met project criteria for these samples with the exceptions summarized in Table 2, below. The attached Data Review Checklist includes all QA/QC reviewed during validation (including QC results that were acceptable) and details on the justification for actions taken.

Data Usability Report
 IBM Poughkeepsie Facility, Poughkeepsie, New York
 2013 Sampling

Table 2. Summary of Data Validation Actions

Field Sample ID	Analyte	Qualifier	Bias	Validation Comments
IA1030	Trichloroethene	EB	H	Equipment Blank Action
AA1001	Trichloroethene	JEB	I	Equipment Blank Action + Result uncertain below the calibration range
FB1	Trichloroethene	J	I	High Receipt Vacuum + Result uncertain below the calibration range
FB1	All VOCs except Trichloroethene	J / UJ	I	High Receipt Vacuum
IA1065 IA1061	All VOCs	J / UJ	I	High Receipt Vacuum

Qualifiers: U = Analyte is non-detect at the "Analyte-Reporting Limit" value; UJ = Non-detect is estimated; J = Result is estimated; EB = detected in field equipment blank; R = Result is rejected and is unusable for project decisions.

Bias: L = Low; H = High; I = Indeterminate

IBM Poughkeepsie Facility, Poughkeepsie, New York
Air Data Review Checklist - Method TO-15

Work Order # L1323970

Lab: Alpha Analytical

Date Sampled: 11/21/2013

Method of Analysis: TO-15 SIM

No. Samples 10 IA + 1FD, 1 AA, & 1 FB

Data Element Acceptable	Canister Receipt	HT	GC/MS Tunes + Calibrations	Internal Stds + Surrogates	LCS	Lab Dup (LCS and LD)	Field Duplicates	RL & Quant.
Yes		√	√	√	√	√	√	
No	Estimate (J or UJ) all results in 3 samples							Accept 2 "J" results

Other Issues :

"EB" added to Trichloroethene in 2 samples (see page 2)

Samples were collected in 2.7 L Summa Canisters for approximately 8 hours. The vacuum for all samples was > 28" Hg in field prior to sample collection (acceptable). COC clearly indicates dates of collection, start and stop times for collection, initial and final vacuum in the field, matrix, samplers initials, canister ID and Flow Controller IDs. The samples were received intact on 11/23/13 and there were no COC issues noted; however, the COC ID for the grab sample is listed as IA7005\G while the narrative indicates this sample as IA8005\G. On December 6, 2013, the data package was re-issued and the results for sample IA8005\G (L1323970-01) were eliminated from the data package at SHA's request; therefore, the COC sample ID issue for this one sample was not discussed.

Canisters were Certified pre-cleaned - certificates of analysis were reported and indicate that all Target compounds were non-detect in the canisters prior to being sent to the field. Four canisters were unused and were returned to the laboratory with the canisters reported in this SDG.

The canister vacuums (field initial, field final and lab receipt) were all acceptable except IA1065, IA1061 and FB1 field final and lab receipt vacuums were greater than 10 "Hg (10.56 "Hg, 11.61 "Hg, and 13.5 "Hg, respectively). All Flow Controller checks had RPDs < 20% - acceptable. ***ACTION: All results for IA1065, IA1061 and FB1 estimated (J or UJ) with indeterminate bias due to high sample receipt vacuum.**

Samples were analyzed by 12/2/13 (within 12 days of collection); therefore HT was met. No Action required.

BFB Tunes: Instrument Airpiano2 3 Tunes (1 for ICAL + 2 for CCAL) - all criteria in all tunes were met and all samples were analyzed within 12 hours of tune; therefore, No Action Required.

ICALs: Instrument Airpiano2 SIM performed on 11/10/13. Full Scan = 11-level calibration from 0.02 to 50 ppbV for 8 Target compounds plus several non-target compounds. %RSD ≤ 15% for all 8 Target Compounds. RLs reported were supported by the ICALs.

Date: 1/3/2014

Data Reviewer: Nancy C. Rothman, Ph.D.

IBM Poughkeepsie Facility, Pughkeepsie, New York
Air Data Review Checklist - Method TO-15

Work Order # L1323970

Lab: Alpha Analytical

Method of Analysis: TO-15 SIM

Associated Blanks: Method Blank: WG655026-5BLANK & WG655026-11BLANK

Field Blanks: FB1

Blank ID	Contaminant / Level	Action Level DF=	Sample and reported result		Corrected Database Result
WG655026-5BLANK	None	0.055 ppbV	No Blank Action Required		
WG655026-11BLANK	None		No Blank Action Required		
FB1	Trichloroethene 0.011J ppbV		AA1001	0.012 J ppbV	0.012 JEB
			IA1030	0.023 ppbV	0.023 EB
		0.295 µg/m³	All other samples >> BAL - No Action		
FB1	Trichloroethene 0.059J µg/m³		AA1001	0.065 J µg/m³	0.065 JEB
			IA1030	0.124 µg/m³	0.124 EB
			All other samples >> BAL - No Action		

Additional Notes:

CCALs: file R226503 on 11/27/13 & file R226523 on 12/2/13 - %D ≤ ± 30% for all 8 Target compounds - No Action required.

Internal Standards: All 3 IS' had areas and RTs within criteria. Alpha does not also add surrogates (not required by method or QAPP) - No Action required.

LCS/LCSD: WG655026-3/-4 & WG655026-9/-10 - %Recovery acceptable for all 8 Targets in LCS and LCSD and LCS/LCSD RPDs all acceptable - lab demonstrated acceptable accuracy and precision for analysis. No Action required.

LD analysis performed on sample IA8005\G - sample/LD precision (Form 3) summary indicates acceptable precision obtained - No Action required.

Date: 1/3/2014

Data Reviewer: Nancy C. Rothman, Ph.D.

Lab: Alpha Analytical

Method of Analysis: TO-15 SIM

Additional Notes:

Field Duplicate Evaluation_ Sample IDs:

Sample = IA1018

FD = DUP1

Analyte Name	DF = 1 RL ($\mu\text{g}/\text{m}^3$)	Sample Result		FD Level	FD Result		RPD	Action	
		$\mu\text{g}/\text{m}^3$	Q		$\mu\text{g}/\text{m}^3$	Q			
1,1-Dichloroethane	0.081	0.081	U	RL	0.081	U	RL	NA	None
1,1-Dichloroethene	0.079	0.079	U	RL	0.079	U	RL	NA	None
Chloroethane	0.053	0.053	U	RL	0.053	U	RL	NA	None
cis-1,2-Dichloroethene	0.079	0.083		< 5xRL	0.083		< 5xRL	0.0	None
Tetrachloroethene	0.136	0.149		< 5xRL	0.149		< 5xRL	0.0	None
trans-1,2-Dichloroethene	0.079	0.079	U	RL	0.079	U	RL	NA	None
Trichloroethene	0.107	0.494		< 5xRL	0.489		< 5xRL	1.0	None
Vinyl chloride	0.051	0.051	U	RL	0.051	U	RL	NA	None

FD precision was acceptable for all target VOCs in FD pair of IA1018 / DUP1 - No Action required.

There were 2 "J" results reported. These "J" were accepted with indeterminate bias due to uncertainty in quantitation below the instrument calibration range. There were no other qualifiers (except "U") reported on the data.

All reporting limits were at or below the RLs required in Table B.1 of the RFI Workplan (as shown on page 4); therefore, sensitivity was acceptable for all results.

The narrative did not raise any additional issues that may affect data quality.

Lab: Alpha Analytical

Table B.1 Compound List and Project-required Reporting Limits (RL)

Target Analyte Name	RL ($\mu\text{g}/\text{m}^3$)
Tetrachloroethene (PCE)	1.4
Trichloroethene (TCE) *	0.22
cis-1,2-Dichloroethene (cDCE)	0.8
trans-1,2-Dichloroethene (tDCE)	0.8
1,1-Dichloroethene (DCE)	0.8
Vinyl chloride (VC) *	0.052
1,1-Dichloroethane (DCA)	0.81
Chloroethane	2.6

Actions (see References below):

Canister Integrity: If certification forms indicate issues, J/U or UJ results in samples

Canister Vacuum (Vac): Initial Field Vac < 25" Hg, J/UJ all results; Lab Receipt Vac > 10" Hg or < 3" Hg, J/UJ results (QAPP criteria); Lab Receipt Vac > \pm 5" Hg of Final Field Vac, J/UJ results; Flow Controller RPD > 20%, J/UJ results

Hold Time (HT): HT > 30 days, J detects/ UJ non-detects

Blank Actions: Action Level = 5 x Level in Blank; Sample-specific Blank Action Level = Action Level x (Sample DF/Blank DF)

Method Blank (MB): Result < RL, U result at RL; RL < Result < Blank Action, U result at level reported

Equipment Blank (EB): Result < Blank Action, EB result at level reported

BFB Tune: SW-846 method 8260B tune criteria not met, professional judgment on R of all data; samples analyzed > 12-hours after tune; professional judgment on J/UJ or R of results

LCS and CCV: Percent Recovery (%Rec) < 10%, J detects, R non-detects; 10% < %Rec < 70%; J/UJ all associated data; %Rec > 130%, J detects - no action for non-detects

Initial Calibration (ICAL): %RSD > 30%, J/UJ associated results

Internal Standard (IS): RT > \pm 0.33 min of IS RT in daily CCV, J/UJ associated results;

Area < 25% Area in CCV, J detects, R non-detects (or professional judgment); 25% < Area < 60% of CCV Area, J/UJ associated results;

Area > 140% of CCV Area, J detects, no action for non-detects

Surrogates: %Rec < 10%, J detects, R non-detects; 10% < %Rec < 70%; J/UJ all associated data; %Rec > 130%, J detects - no action for non-detects

Laboratory Duplicates: LCS/LCSD RPD or Sample/LD RPD > 20% for detects > 5x RL, J associated data; professional judgment for results < 5 x RL

Field Duplicates: RPD > 20% for detects > 5x RL, J associated data; professional judgment for results < 5 x RL

RLs + Quant: Compound reported outside calibration range (< RL or at ppbV level > sample-specific highest ICAL standard for compound), J data. Note if RL > expected RL from Table B.1 of Work Plan (see above)
