NYSDEC Part 373 Permit 3-1323-0025-00249-0
EPA ID No. NYD000707901

Dear Mr. Dassatti:

In accordance with the provisions of the Module IX – General Ground Water Monitoring Conditions, Section H, Item 2 of the referenced permit, enclosed please find the following document for your review:

*2008 Annual Corrective Action Status Report
IBM Corporation
East Fishkill Facility
Hopewell Junction, New York*

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Please contact Jackie Braungart at (845)892-1672 if you have any questions or require further information.

Sincerely,
International Business Machines Corporation

1 INTRODUCTION

This report has been prepared by the Environmental Engineering Department at IBM Corporation's East Fishkill Facility (IBMEF) and by Groundwater Sciences Corporation (GSC). IBMEF is located at the Hudson Valley Research Park in the Town of East Fishkill, Dutchess County, New York (Figure 1-1).

The East Fishkill Facility covers an area of approximately 600 acres, and includes the Main Site east of Gildersleeve Brook and the former West Complex west of Gildersleeve Brook (Plate 1). In January 2006, the former West Complex was sold to PREI Hopewell Junction Associates. IBM has maintained the right to use the groundwater monitoring wells on the former West Complex and has continued monitoring and maintenance of the wells. On the Main Site, seven shallow areas and the deep bedrock are contaminated with organic chemicals. These areas of concern (AOCs) are shown on Plate 1 as Area A, Area B, Landfill (Area C), Building 330 (B/330), Area D, Southeast Quadrant (SEQ), Building 322 (B/322), and the Deep Bedrock. There are no AOCs at the former West Complex where only detection monitoring is performed.

IBMEF's groundwater monitoring program was implemented in 1979 to provide the data necessary to manage water quality problems and the site water supply. Groundwater has historically been the primary water supply source for IBMEF and its neighbors. Of the 17 production wells operated by IBM, nine wells (PW-1, -2, -4, -5/5A, -6, -7, -9, -23, and -25) are located on the Main Site (PW-9 is used only for water supply emergencies). The other production wells are located on properties to the north and northwest. Beginning in August 2007, the production wells have been supplemented with municipal water from the Poughkeepsies' Water Treatment Facility via the Central Dutchess Water Transmission Line. IBM's Recreation Center is supplied by a separate production well located on the Rec Center property.

Groundwater monitoring and remediation activities have undergone a succession of incremental modifications since the late 1970's. In February 1996, a modified Groundwater Monitoring Plan¹ (GMP) was prepared and submitted in response to the requirements specified in Module IX of the

¹ Groundwater Sciences Corporation and IBM Environmental Engineering, February 1996 (revised October 1999), *Groundwater Monitoring Plan, IBM East Fishkill Facility*.

site's NYSDEC Part 373 Permit². The area monitored under the GMP includes the Main Site and the former West Complex. The sampling program described in the GMP was implemented on an interim basis during the first quarter of 1996, pending formal approval of the GMP by the NYSDEC. The monitoring network and sampling frequencies used from 1995 through the third quarter of 1999 were the same as those in the original GMP. In October 1999, the sampling list and sampling frequencies were modified. These modifications were discussed in the 1999 Annual Report³ and subsequently were approved by the NYSDEC. In 2003, further minor changes to the GMP were proposed. These changes were presented in the 2002 Annual Report⁴ and were approved by the NYSDEC in 2003.

The current GMP designates 392 wells as Hydraulic Effectiveness Monitoring (HEM) wells. These HEM wells are shown on Plate 1 and are listed in Table A-1 of Appendix A. 179 of these wells plus several other miscellaneous sampling points are monitored routinely as part of the Corrective Action Performance (CAP) Monitoring Network. The CAP monitoring wells and miscellaneous sampling points are listed in Table A-2 of Appendix A. Table A-2 also lists the physical specifications for the CAP monitoring wells. The current GMP sampling schedule is shown on Table A-3 of Appendix A. HEM well 832 replaced well 834 on the CAP list in 2008. Well 834 was decommissioned in October 2007.

Termination of pumping at PW-5/5A, PW-6, and PW-7 was proposed to provide more efficient and targeted contaminant containment and recovery at the site. After approval from NYSDEC to conduct a controlled and monitored experiment, PW-5/5A, PW-6, and PW-7 were removed from service on October 22, 2007. Following completion of a one year monitoring period, IBM will provide NYSDEC with a completion report and a request for permanent modification to the well field operations. A brief summary of the supplemental shutdown monitoring is described in Section 4.2.2.

⁴ IBM Environmental Engineering and Groundwater Sciences Corporation, May 30, 2003, *2002 Annual Corrective Action Status Report, IBM East Fishkill, New York*.

1.1 Purpose

This annual groundwater monitoring status report summarizes data collected during 2008 and describes activities performed with regard to the groundwater monitoring program. This report is being submitted to the NYSDEC to comply with the requirements of the Part 373 Permit for all solid waste management units (SWMUs) where groundwater is monitored. The annual report for 2007 is dated May 29, 2008⁵ and the semiannual report summarizing data collected during the first half of 2008 is dated November 24, 2008⁶.

1.2 Scope

This report addresses items specified in Module IX, Section H of the Part 373 Permit and in Section 3.3 of the GMP. Each Permit and GMP requirement is quoted below and is cross-referenced to the report sections, appendices, plates, and/or figures, indicated in parentheses, where it is addressed:

1. Summary of all analytical results. (3.2; Appendices D, E, F, G)
2. Quality Assurance/Quality Control (QA/QC) per the GMP. (3.2.2; Appendix F)
3. Pertinent monitoring data recorded in the well record, including the sampling field data sheets. (3.1; Appendix C)
4. Quarterly groundwater elevation and survey data in tabular form, and potentiometric contour maps delineating the zone of capture and the rate and direction of groundwater flow. (2; Appendix B; Plates 2 and 3)
5. Evaluation of contaminant migration, including maps for “Key Compounds” listed in Table 3-1 of the GMP. Isoconcentration maps shall be prepared annually showing the approximate limit of each plume. This limit is defined as the median concentration equal to 5 micrograms per liter ($\mu\text{g/l}$) of one key compound (Freon TF) or the sum of the normalized transformation products of key compounds (tetrachloroethene (PCE) series compounds). Include a statement regarding future contaminant movement. (3.2.1.1; Plates 4, 5, 6, 7)
6. Trend line plots for the Contaminant Reduction Monitoring (CRM) wells. (3.2.1.2.1; Figures 3-1 through 3-21; Table 3-2)
7. Determination of statistically significant increase in contamination at Point-of-Compliance (POC) wells. (3.2.1.2.2; Figures 3-22 through 3-27; Table 3-3)
8. Determination of statistically significant changes in water quality at Corrective Action Monitoring (CAM) wells. (3.2.1.3; Table 3-4)

⁵ IBM Environmental Engineering and Groundwater Sciences Corporation, May 29, 2008, *2007 Annual Corrective Action Status Report*, IBM East Fishkill, New York.

⁶ IBM Environmental Engineering and Groundwater Sciences Corporation, November 24, 2008, *2008 Semiannual Data Summary Report*, IBM East Fishkill, New York.

9. Production or monitoring well maintenance activities planned or performed. (4.1.4, 4.2)
10. Plans for installation of additional wells. (4.2.2)
11. Summary of well installation activities. (4.2.1)
12. Pumping well rates and volumes. (4.1.1; Table 4-1)
13. Contaminant recovery levels. (4.1.2; Table 4-2 and Table 4-3)
14. Treatment efficiency data. (4.1.3; Appendix G)
15. Any problems or other activities planned. (4.2)
16. An evaluation of the progress of the corrective action monitoring program. (4.3)

The above items are addressed in this report for the period January 1, 2008 through December 31, 2008. From 1996 to 2000, data collected during the third quarter of the year was used as the basis for an analysis of groundwater elevations and chemistry because this was the quarter in which the most extensive groundwater sampling was conducted. However, beginning in 2001, most of the monthly, quarterly, semiannual, and annual wells in the CAP monitoring network (Table A-3 of Appendix A) are now sampled during the first quarter. Therefore, chemistry and potentiometric data from the first quarter of 2008 was used to construct the maps in this report.

2 HYDROGEOLOGY

Groundwater occurs in saturated zones within both the soil and bedrock beneath the site. In general, recharge to the bedrock passes through or around the overlying soil units, which include fill, alluvial sands and gravels, an extensive but discontinuous layer of glaciolacustrine silt and clay, and an extensive, dense glacial till. The maximum thickness of these soil units is greater than 120 feet. Strong vertical flow of groundwater is induced by seven active on-site corrective action pumping wells completed in the deep bedrock.

This section presents the results of quarterly water level monitoring for 2008 in both the soil and bedrock saturated zones and discusses the effects of corrective action pumping on groundwater flow in these units.

2.1 Quarterly Water Levels

In 2008, the hydrogeologic characteristics of the site were evaluated by means of quarterly water level measurements taken principally on January 15 - 24, April 14 - 29, July 3 - 30, and October 8 - 20, 2008 in the designated Hydraulic Effectiveness Monitoring (HEM) wells listed in Table A-1 of Appendix A. This water level data has been converted to groundwater elevations and is tabulated in Appendix B.

2.2 Soil Groundwater Elevations

Plate 2 shows the groundwater elevations for portions of the soil water table during the first quarter of 2008 (January 15 - 24) under dynamic conditions of long-term corrective action pumping in the bedrock. The gray cross-hatched areas on Plate 2 indicated area where soils are typically unsaturated, largely as a result of dewatering by corrective action pumping. In some areas, soils that lie on top of buried bedrock ridges or other areas of relatively high bedrock surface elevation are also unsaturated.

2.2.1 Stratigraphic Controls on Groundwater Flow

Groundwater exists in the soils beneath the site under generally unconfined (water table) conditions. Groundwater flow within these soils is controlled by various factors including (1) the upper surface topography of the soil units, (2) the hydraulic characteristics of the soils, (3) the location of recharge

and discharge zones, (4) horizontal and vertical gradients, and (5) the vertical hydraulic conductivity across stratigraphic units within the soils, and across the interface between the soils and bedrock.

In the northern parts of the site, the soil water table generally mirrors the surface topography of the extensive but discontinuous glaciolacustrine silt/clay that, together with several areas of extremely dense till, is the primary control on soil groundwater flow. Areas where the silt/clay is present are shown as tan shaded areas on Plate 2. The silt/clay and dense till generally inhibit vertical migration of soil groundwater into the lower soil units and act as barriers to vertical contaminant transport. In areas where the silt/clay is absent and where the till is less dense or absent, soil groundwater passes through deeper soil units and into the bedrock. Areas without saturated soil are shown with cross-hatching on Plate 2.

Significant areas with regard to contamination of soil groundwater are the zones of perched water in the fine- to coarse-grained alluvial sand that lies above the silt/clay in Area A, Area D, and the B/322 AOC.

2.2.1.1 Area A

North of B/309 and B/310, the stratigraphic sequence consists of fill and silty sand overlying dense lodgment till with bouldery till. The glaciolacustrine silt/clay is absent north of B/309 and B/310 and east of B/309, as shown on Plate 2. The stratigraphic sequence from north to south gradually changes from till (north of B/309 and B/310) to include fill, sand, and sand-and-gravel lenses deposited on top of the silty sand that overlies the silt/clay confining unit.

Groundwater is typically perched within the alluvial sand above the silt/clay in Area A, and flows from the northeastern edge of B/310 to the north and northeast. The flow in the northern part of Area A is typically from the northeast corner of B/310 and the western portion of B/303 and B/309 toward an area where the silt/clay is generally absent north of the linkway between B/309 and B/310 (refer to closed “230 feet” contour on Plate 2). The soil groundwater table north of B/309 and the northeast corner of B/310 is located primarily in the till, where soil groundwater typically flows downward into the bedrock in the vicinity of wells 010, 748, and 763. During periods of normal precipitation (as was the case in 2008), the area in the vicinity of these wells is saturated and appears as a sink for soil groundwater. It is referred to as the “B/309 sink” (Plate 2).

The remainder of the flow from beneath B/310 in the northern part of Area A is typically toward the northeast corner of B/308 in the vicinity of East Drive where the silt/clay and dense till are absent (Plate 2). In this area, referred to as the “B/308 sink” (refer to closed “240 feet” contour, Plate 2), soil groundwater flow is primarily lateral toward the edge of the silt/clay and generally vertically downward beyond the edge of the silt/clay and into the bedrock, where it is captured by production well PW-2, as described in Section 2.3.

The groundwater flow divide between the B/308 and B/309 groundwater sinks is shown on Plate 2. At the B/384 Sump west of B/308, groundwater is captured and treated by the Area A treatment system at an average rate in 2008 of 0.9 gallons per minute (gpm). Despite this low flow rate, it appears that a significant portion of the easterly flow from the VOC source area beneath B/310 is captured by the Area A treatment system.

Flow from the southeast corner of B/310 is to the south and southeast (Plate 2). A groundwater flow divide (not shown on Plate 2) in the alluvial unit above the silt/clay north of wells 103 and 980 and beneath B/386 separates the area where shallow groundwater flows to the north toward the B/308 sink from the area where shallow groundwater flows to the south across the edge of the silt/clay and then downward into deeper soils (primarily till) and bedrock in the vicinity of the Central Drainage.

2.2.1.2 B/322 AOC

Groundwater flow in the B/322 AOC controls migration of a plume emanating from the northeastern corner of B/322 near well 735, as discussed in Section 3.2.1.1.1. Groundwater in the alluvial unit above the silt/clay (Plate 2) flows from an area of high top-of-silt/clay elevation in the vicinity of wells 735 and 627 to the south-southwest across the northern half of B/322 and toward B/323. In addition to this southerly component of flow toward B/323, the groundwater flow divide shown for the B/322 AOC shown on Plate 2 also produces a westerly component of flow toward the B/322 remediation system consisting of wells 612, 613, 617, and 618. Groundwater flow into the B/322 remediation system averaged 10.5 gpm in 2008 and is discussed further in Section 4.1.3.4.

2.2.1.3 B/330, Landfill, and SEQ

In the SEQ, B/330, and Landfill AOCs, the silt/clay is mostly absent except for several small areas shaded tan on Plate 2. Although some groundwater in these areas is perched on the silt/clay, the soil groundwater elevations shown on Plate 2 in the B/330 AOC are primarily for the till overlying the bedrock. This till contains the B/330 and Landfill AOC soil groundwater plumes, which are discussed further in Section 3.2.1.1.1.

Soil groundwater in the B/330 AOC is mounded in the area between B/330D and B/335 at wells 180, 181, 602, and 603 (Plate 2); part of this area is not capped by a building slab or parking lot and allows for direct infiltration of precipitation. Elsewhere beneath B/330D and areas to the north and west, the overburden is believed to be unsaturated due to the presence of (1) buildings and parking lots that limit infiltration of precipitation, (2) natural soils that are too thin and too permeable to allow perching of groundwater, and (3) production well PW-25, which has dewatered much of the soil beneath the B/330 AOC.

In the SEQ, pumping of PW-23 in the shallow bedrock at an average rate of approximately 26 gpm has increased the hydraulic gradients in the overlying soil overburden. The silt/clay is absent in the SEQ and the soil and bedrock units are hydraulically well-connected.

2.2.1.4 Area D

In Area D, a small, localized depression in the water table within the alluvial unit results from the pumping of well 032A, and is discussed further in Section 4.1.3.3.

2.2.1.5 Former West Complex

Much of the former West Complex is topographically higher than the Main Site. As a result, soil groundwater in the western portion of the former West Complex flows from a high in the vicinity of B/692, B/693, and B/694, where groundwater elevations are greater than 260 feet above mean sea level, to the west, northwest, north, and northeast. In the northeastern portion of the former West Complex, groundwater in the vicinity of wells 400 and 403 flows to the northeast beneath John Jay High School and toward Gildersleeve Brook.

Although Plate 2 does not show the silt/clay on the former West Complex, data from borings indicates that the glaciolacustrine silt/clay unit extends beyond the western boundary of the Main Site at Gildersleeve Brook.

2.2.2 Gradients and Groundwater Flow Velocities

The calculated linear velocity of horizontal groundwater flow within alluvial sand above the glaciolacustrine silt/clay ranges between 0.08 and 8.3 feet per day (ft/day), with a median of 0.8 ft/day. Measured hydraulic conductivities as determined from slug tests in monitoring wells screened in the alluvial sand west of B/322 range between 1 and 100 ft/day, with a median value of 10 ft/day. Measured hydraulic gradients range from 0.002 to 0.079, yielding a representative median gradient of 0.029. A porosity of 35% was determined from laboratory tests on soil samples.

2.3 Bedrock Groundwater Elevations

Groundwater in the bedrock water-bearing zone before the start of corrective action pumping generally existed under confined or semi-confined conditions. Groundwater flow in the bedrock unit under these conditions was controlled by vertical recharge from the overlying saturated soil, by direct infiltration in areas where the bedrock flow system was semi-confined, and by the hydraulic conductivity, connectivity, and geometry of fractures in the dolostone bedrock.

2.3.1 Potentiometric Head Distribution

Under natural (non-pumping) conditions, bedrock groundwater flow followed topography in a generalized way, flowing from topographically high areas of natural recharge to discharge zones associated with streams such as Gildersleeve Brook and its tributaries. This generalized natural flow configuration has been altered by long-term corrective action pumping at the eight active on-site production wells and by barriers to direct infiltration, such as buildings and parking lots, erected as the site was developed.

Plate 3 shows the potentiometric head distribution in the deep bedrock groundwater system during the period January 15 - 24, 2008 under dynamic conditions of long-term corrective action pumping at deep bedrock production wells PW-1, -2, -4, and -25, approximately three months after pumping was discontinued at PW-5/5A, PW-6, and PW-7. Plate 3a shows the potentiometric head distribution in the deep bedrock during the third week in April 2008, approximately six months after

pumping was discontinued at PW-5/5A, PW-6, and PW-7. Plate 3b shows the potentiometric head distribution in the deep bedrock during the middle of October 2008, approximately twelve months after pumping was discontinued at PW-5/5A, PW-6, and PW-7. Plate 3a and Plate 3b were created as part of the PW-5/5A, PW-6, and PW-7 shutdown work plan. Figure 2-1 shows potentiometric head conditions at shallow bedrock production well PW-23 in the Southeast Quadrant. The PW-23 hydraulic capture zone is limited to the immediate vicinity of the well during periods of high groundwater elevations. Elevations recorded during the period October 14 - 15 were used to construct Figure 2-1, and show a larger hydraulic capture zone present during periods of lower groundwater elevations.

The data used in contouring Plate 3 is generally from the deepest of the bedrock wells in a well cluster and corresponds to a screened or open hole interval elevation between approximately 50 and 120 feet amsl (with the exception of shallow bedrock production well PW-23). This elevation interval generally correlates with the principal water-bearing zones in the on-site deep bedrock production wells. (The principal water-bearing zone in PW-23 is at approximately 221 feet amsl, which is significantly higher than the elevation of the principal water-bearing zones in the other production wells.) Only groundwater elevation data from wells used in contouring is shown on Plate 3.

Groundwater flow directions are generally toward the production wells and steep horizontal gradients occur in the vicinity of the production wells. Bedrock groundwater elevations range from nearly 270 feet amsl at wells 529 and 542 in the Southeast Quadrant, to less than 110 feet amsl in the vicinity of on-site deep bedrock production wells PW-1, -2, -4, and -25. Excluding the production wells, the lowest measured bedrock groundwater elevation shown on Plate 3 was 81.10 feet amsl at well 606 on the east side of B/334, in the area dewatered by production well PW-4.

2.3.2 Gradients and Structural Controls on Groundwater Flow

The essentially continuous withdrawal of bedrock groundwater since the early 1960s for site water supply and corrective action has altered the flow dynamics on site and the hydrogeologic conditions within the soil and bedrock water-bearing zones relative to the natural conditions that existed before the start of pumping. In response to corrective action pumping, the lowering of the potentiometric levels within the bedrock water-bearing zone on-site has resulted in a situation where formerly saturated soils are now unsaturated and where the bedrock potentiometric surface is now below the

top-of-bedrock surface in some areas. Where this situation has occurred, the bedrock water-bearing zone may have been converted locally from a confined or semi-confined condition to a water table or unconfined condition, resulting in some unsaturated zones in the upper bedrock, particularly in the area of the production wells PW-1 and PW-25.

The geometry of the bedrock groundwater potentiometric surface under the influence of long-term corrective action pumping suggests that the hydraulic characteristics of the fractured bedrock groundwater system are influenced by the bedrock's structural fabric, which generally trends north-south. This structural fabric has been created by complex folding, fracturing, and faulting. In this regard, the bedrock groundwater potentiometric surface map (Plate 3) shows various anomalies in contour spacing and patterns of directional hydraulic conductivity that are related to the degree of fracture connectivity between wells and to the variations in directional hydraulic conductivity across the site. The patterns of drawdown and connectivity are controlled by discrete fractures. In general, the north-south features are likely the result of bedding plane fractures and faults, and the east-west features are the result of transverse fractures and faults such as cross joints and tear faults. These structural features are augmented by solution activity that has created significant voids and more permeable weathered zones in the dolostone bedrock. Such voids and weathered zones have been encountered frequently during 25 years of drilling monitoring wells at the site.

The primary controls on the directional variability of hydraulic conductivity in the bedrock are zones of high fracture connectivity such as fracture zones. Groundwater flow paths are not necessarily perpendicular to the potentiometric surface contours shown on Plate 3 because the orientation of the greatest principal hydraulic conductivity (K) of the hydraulic conductivity tensor is not necessarily parallel to the apparent hydraulic gradient. This situation is typical of a fractured bedrock aquifer, where zones of high fracture connectivity facilitate groundwater flow in directions other than those that would be determined by the apparent potentiometric head distribution as shown on the potentiometric surface contour map (Plate 3). Therefore, the groundwater flow arrows shown on Plate 3 represent only generalized flow directions and not the actual flow paths of groundwater "particles."

The flow rates in the bedrock aquifer are controlled by fracture geometry, orientation, density, aperture, and smoothness. These parameters are difficult to specifically characterize at this site because of the complex structural geology. As a result, meaningful bedrock groundwater flow velocities are difficult to estimate. However, a range of horizontal gradients in the deep bedrock

can be estimated from Plate 3. As in previous years, these horizontal gradients generally range from 0.1 to 0.4 (near PW-4), except in the northeast corner of the site and the eastern portion of the SEQ. The SEQ exhibits gradients on the order of 0.02 or less (except near PW-23). These estimates are similar to those from previous years.

2.3.3 Hydraulic Containment

Hydraulic containment of groundwater occurs in the bedrock within an area encompassing IBMEF's Main Site and at least the eastern half of the former West Complex. Based on the January (Plate 3), April (Plate 3a), and October 2008 (Plate 3b) potentiometric contours, the site can be divided into five areas of hydraulic capture/containment. Until the shutdown of PW-5/5A, PW-6, and PW-7 in October 2007 these areas of capture generally had not changed significantly since the startup of PW-25 in late January 2003.

The most extensive area of capture is generated by production well PW-1 in the western third of the Main Site and the eastern half of the former West Complex. Most groundwater formerly captured by PW-5/5A is now captured by PW-1. This area of capture also encompasses the bedrock beneath shallow Area D and most of the B/322 AOC. It extends to the west beyond Gildersleeve Brook and onto the former West Complex, to the northeast beyond the intersection of West Drive and Route 52, to the east in the area between B/322 and B/315, between B/321 and B/320B, and to the south toward production well PW-6. The northeastern and eastern limits of the groundwater capture area are defined by localized areas of higher potentiometric head greater than 165 feet amsl in the vicinity of well 122 and greater than 210 feet amsl in the vicinity of well 130. The mound in the potentiometric surface at well 130 corresponds to a topographic high in the bedrock surface near the southeast corner of B/322 and, based on previous investigations, is inferred to be an area of low bedrock transmissivity with recharge at the limit of the perched hydrogeologic unit. The bedrock in this area is relatively unweathered with sub-horizontal (flat-lying) bedding.

A second extensive area of hydraulic capture in the bedrock is located in the northeastern quadrant of the Main Site and is the result of pumping production well PW-2. This area of capture is bounded on the west by a groundwater flow divide separating it from the area of capture for well PW-1. As discussed above, this flow divide is defined by localized areas of high potentiometric head in the vicinity of a buried bedrock ridge. On the southern boundary, a groundwater flow divide separates flow toward PW-2 from flow toward PW-4. The area of capture includes the

bedrock beneath most of shallow Areas A and B, and extends to the north at least to Route 52 and to the east at least to Lime Kiln Road and possibly Shenandoah Road. Production well PW-9 is located in the extreme northeastern corner of the site near the intersection of Route 52 and Lime Kiln Road and lies within the area captured by PW-2. PW-9 has not been pumped for a sustained period for several years and so does not affect the potentiometric surface in that area.

The third area of hydraulic capture is created by production well PW-4. As with PW-2, the western boundary of this area is defined by localized areas of high potentiometric head in the vicinity of a buried bedrock ridge. The eastern boundary is an area of high potentiometric head associated with the bedrock ridge in the SEQ AOC. The southeastern and southwestern boundaries are defined by the pumping centers associated with production well PW-25. The groundwater flow divide separating the PW-4 and PW-25 capture areas runs west from the northern corner of B/330C, through B/334, then northwest to the potentiometric high at well 130.

The operation of PW-25 creates a fourth area of hydraulic capture. Groundwater formerly captured by PW-6 and PW-7 is now captured by PW-25. Some groundwater to the east of PW-5/5A, formerly part of the PW-5/5A capture zone, is also captured by PW-25. As discussed above, the northern boundary this hydraulic capture zone is defined by pumping of PW-4. To the west, the groundwater divide runs from the potentiometric high at well 130 to the west of inactive PW-6. The capture area to the east extends to the bedrock ridge in the Southeast Quadrant, and includes the landfill AOC. The area of capture may extend south as far as Interstate 84 and, and encompasses bedrock beneath B/330D, B/335, B/338, most of B/330C, and the southern part of B/334.

The fifth area of hydraulic capture is produced by shallow bedrock production well PW-23 (formerly well 552) in the SEQ. Groundwater flow directions and hydraulic capture appear to vary with seasonal, recharge-related fluctuations in groundwater elevation such that the extent of hydraulic capture contracts when groundwater elevations are higher. During these periods of higher groundwater elevations, the extent of downgradient hydraulic capture from PW-23 is believed to be limited to the immediate vicinity of the well. Consequently, the VOC mass intercepted by the well is derived from the immediate vicinity of the well⁷. Figure 2-1 shows the shallow bedrock potentiometric contours in the SEQ based on October 2008 groundwater elevations.

⁷ Sanborn, Head, and Associates, September 2002, *Report of Findings, Startup Performance Monitoring, Water Supply Production/Extraction Well-23, IBM East Fishkill Facility, East Fishkill, New York.*

Elsewhere in the SEQ AOC, deep bedrock groundwater is captured by the on-site pumping centers. In the eastern portion of the SEQ, the direction of groundwater flow is generally to the north in the area between Lime Kiln and Shenandoah Roads. Groundwater in the deep bedrock then flows westward back onto the Main Site where it is captured by production well PW-2.

3 GROUNDWATER CHEMISTRY

As mentioned in the previous sections, groundwater plumes composed of volatile organic compounds (VOCs) are present in both the soil and bedrock saturated zones at this site. This section presents the results of groundwater monitoring of these plumes for 2008. The results of related QA/QC sampling conducted in 2008 are also discussed.

3.1 Sampling

Quarterly sampling was conducted at locations specified in Table A-3. A sampling record for each well and surface water location is provided on a CD in Appendix C. This CD contains purging and sampling data for all of 2008, as specified in Table 7-1 of the GMP, "IBM East Fishkill Well Record and Data Format." Purging and sampling data for the first half of 2008 was also provided in the 2008 Semiannual Data Summary Report. The data is stored in a standard database file format (SAMP08.DBF) readable by most database and spreadsheet applications. SAMP08.DBF contains the following information sorted by well/location number and sampling date:

1. Well or sample location number
2. Date of sample
3. Sample identification number
4. Equipment used
5. Depth to water prior to purge
6. Purge rate
7. Purge volume
8. Sampler's initials
9. Number of containers for each type of analysis
10. PID reading (if applicable)
11. Whether the well was evacuated
12. Relevant comments

Also included on the CD in Appendix C is the database file FIELD08.DBF. This file contains field parameter data for pH, temperature, specific conductance, and turbidity for all of 2008. These parameters are measured in the field at the time of sample collection. Field parameters for the first half of 2008 were also provided in the 2008 Semiannual Data Summary Report.

Appendix C also contains a daily summary of meteorological data obtained from the National Climatic Data Center for the Dutchess County Airport, the nearest available station. Meteorological data for a given sample can be obtained by cross-referencing the date of the sample with the corresponding date in this table. Meteorological data for the first half of 2008 was also presented in Appendix C of the 2008 Semiannual Data Summary Report.

3.1.1 First Quarter 2008 Sampling

All monitoring and production wells included in the Groundwater Monitoring Plan (GMP) were sampled for all required parameters during the first quarter of 2008 with the following exceptions:

1. Well 834, sampled quarterly, was decommissioned in the fourth quarter of 2007 because it fell within the construction footprint of a new water storage tank. The decommissioning plan was submitted to NYSDEC on July 2, 2007 and received NYSDEC approval on July 5, 2007. Well 834, an Area B upgradient monitoring well, was replaced by well 832 on the Corrective Action Monitoring Network. Well 832 was not sampled during the first quarter of 2008 but was sampled on April 3 and May 28 in the second quarter.

3.1.2 Second Quarter 2008 Sampling

All groundwater monitoring and production wells listed in the GMP were sampled for all required parameters during the second quarter of 2008.

3.1.3 Third Quarter 2008 Sampling

All groundwater monitoring and production wells listed in the GMP were sampled for all required parameters during the third quarter of 2008.

3.1.4 Fourth Quarter 2008 Sampling

All groundwater monitoring and production wells listed in the GMP were sampled for all required parameters during the fourth quarter of 2008 with the following exceptions:

1. PW-6 and PW-7 were not sampled in December because of repairs to a leaking pipeline.
2. Depth to water measurements were not recorded for Part 373 wells 106 and 624 during sampling in October.

3.2 Chemistry Results

Environmental sampling, quality assurance/quality control, and additional sampling results are discussed in this section.

3.2.1 Groundwater Chemistry Results

Groundwater chemistry data for samples collected during the first through fourth quarters of 2008 (excluding the production wells and treatment systems) is presented in Appendix D. Groundwater chemistry data for the first and second quarters of 2008 was previously published in the 2008 Semiannual Data Summary Report. The IBM East Fishkill Environmental Laboratory, historically the primary laboratory for GMP related sampling, was closed at the end of September 2008. Columbia Analytical Services, based in Rochester, New York, became the primary laboratory. The presentation of the data in Appendix D conforms to the requirements of the Part 373 permit.

The concentrations of the required monitoring parameters are presented in a table in numerical ascending order by sample location and then chronologically for each sample location for the period January 1 through December 31, 2008. For data collected prior to September 22, 2008 a default reporting limit for VOCs was set at $0.5 \mu\text{g/l}$, except where a sample was diluted prior to an analytical run. In that case, the default reporting limit ($0.5 \mu\text{g/l}$) was multiplied by the dilution factor to obtain an appropriate reporting limit. For the remainder of the year, the reporting limits reported by the laboratory have been used. Generally, concentrations less than these reporting limits should be viewed as estimates. The inorganic data (F, As, Ni, and Cr) for 2008 is presented in Appendix D separately from the VOC data.

The results for duplicate samples (split samples) collected for intralaboratory precision information during 2008 are also presented in Appendix D and are discussed in Section 3.2.2.

Supplemental groundwater chemistry data from GMP and non-GMP wells sampled as part of the production well shutdown work plan can be found in Appendix D. A schedule for the production well shutdown chemistry sampling is also presented in Appendix D. Only minor changes in groundwater chemistry were observed during the shutdown observation period. PCE-series concentrations were less than $30 \mu\text{g/l}$ at PW-7 during monthly sampling. PCE-series concentrations were between $100 \mu\text{g/l}$ and $240 \mu\text{g/l}$ in 2007 prior to termination of continuous pumping. It is believed that PW-7 does not intercept higher concentrations of VOCs from the north and northeast

unless the well pumps for a prolonged period. Chemistry in the PW-7 area is now part of the PW-25 capture zone. PCE was detected in well 143 on the east side of B/330D beginning in January, 2008. Concentrations were less than 4 $\mu\text{g/l}$. The well is downgradient from PW-6, which has contained low levels of VOCs, primarily PCE, since a faulty check valve allowed water from PW-7 to cross-contaminate PW-6. IBM reported this incident to NYSDEC via a letter dated June 29, 2005. Chemistry formerly captured by PW-6 may now flow through the well 143 area, which is now part of the PW-25 capture zone.

Table 3-1 lists the maximum concentration and location of the maximum concentration during 2008 for GMP wells (not including production wells and groundwater treatment locations) for each of the chemical constituents/monitoring parameters listed in Tables 1-1 and 1-2 of the GMP. These parameters are included in the sampling program based on their detection histories and historical concentrations relative to the Part 703 New York State Groundwater Quality Standards (NYSGQS).

Table 3-1. Maximum Groundwater Concentrations in GMP Wells during 2008 ($\mu\text{g/l}$) (does not include production wells or groundwater treatment points)*

Parameter	NYSQGS ($\mu\text{g/l}$)	Soil		Bedrock	
		Location	Conc. ($\mu\text{g/l}$)	Location	Conc. ($\mu\text{g/l}$)
Benzene	1	none	not detected	none	not detected

Toluene	5	016	0.38	861	0.78

NYSQGS - New York State Groundwater Quality Standard (6NYCRR Part 703). All concentrations have been rounded to not more than two significant figures.

*In previous years, the groundwater chemistry database included instrument readings below the Method Detection Limit. This practice was discontinued in 2007, resulting in more parameters listed as not detected.

1 - Due to the very high concentrations of PCE in wells 572 and 574, higher concentrations of these parameters have probably been diluted out in the laboratory analysis for these two wells.

2 - Common laboratory contaminant.

3 - Bedrock monitoring wells are not sampled for nickel.

4 - A "general organic guidance value" of 50 $\mu\text{g/l}$ has been established for this parameter (Part 702.15 of the NY State Water Quality Regulations).

3.2.1.1 Groundwater Chemistry Maps

There are at least nine separate plumes in the overburden and at least four in the bedrock. The principal constituents of the plumes are tetrachloroethene (PCE), trichloroethene (TCE), *cis*-1,2-dichloroethene (CIS), vinyl chloride (VC), and 1,1,2-trichloro-1,2,2-trifluoroethane (Freon TF). PCE, TCE, CIS, and VC are discussed as a group and are collectively referred to as the PCE-series compounds. The concentration for this group is determined by normalizing the groundwater concentrations of the transformation products of PCE so as to account for the degradation of PCE by dehalogenation, which occurs at different rates and by different processes across the site. The PCE-series concentration is calculated by multiplying the concentrations of TCE, CIS, and VC by the ratio of the molecular weight of PCE to the molecular weight of each degradation product, and then summing the products. In this way, a more meaningful picture of groundwater contaminant transport can be developed than might otherwise be the case if these four compounds were to be examined separately.

Isoconcentration contour maps (Plates 4, 5, 6, and 7) were prepared using groundwater chemistry data from the first quarter of 2008. As required by the GMP and Part 373 Permit, these maps show the approximate limit of each plume as defined by the annual median concentration equal to 5 $\mu\text{g/l}$ of one key compound (Freon TF) or the sum of key compounds (normalized PCE-series compounds as described above). The approximate plume limits are shown as dotted 5 $\mu\text{g/l}$ contours on Plates 4 through 7 where sufficient data exists to determine the extent of each plume.

In general, these isoconcentration maps show that contaminant movement is controlled primarily by the direction of groundwater flow in the soil and bedrock. As discussed in Sections 2.3.3 and 2.3.4, site groundwater at concentrations exceeding the NYSGQS is hydraulically contained to the site by corrective action pumping of the on-site bedrock production wells. Control of contaminant movement is dependent on continued corrective action pumping.

3.2.1.1.1 VOC Plumes in Soil and Shallow Bedrock Groundwater

The soil and shallow bedrock groundwater plumes are identified by AOC, beginning with Area A. Area A contains two soil plumes of primarily PCE-series compounds (Plate 4). One of these plumes is in the till and appears to have a source near the northwest corner of B/309 with highest concentrations at well 714. There is also a small plume of Freon TF (Plate 5) in this same area.

The lateral extent of the PCE-series plume is not well defined south of well 714 (Plate 4), where the glaciolacustrine silt/clay inhibits vertical contaminant transport between the shallow soils and the till underlying the silt/clay. A second plume lies in the alluvial sand and gravel above the glaciolacustrine silt/clay and has a source on the eastern side of B/310 where concentrations are greater than 10,000 $\mu\text{g/l}$. Two GMP monitoring wells (015 and 706) and the B/384 Sump (shown on Plate 4) define the central portion of this plume. Based on current and historical data from monitoring wells that are not routinely sampled, this plume extends to the east and northeast, in the direction of groundwater flow toward the area where the silt/clay and dense till are absent northeast of B/308 (the "B/308 sink" described in Section 2.2.1.1). The plume also extends to the southeast towards B/386. PCE-series concentrations less than 100 $\mu\text{g/l}$ are found in the vicinity of the groundwater flow divide north of Shenandoah Drive between Buildings 386 and 316 (Plate 4).

Area B contains a small plume with low concentrations (less than 5 $\mu\text{g/l}$) of PCE-series compounds in soil and shallow bedrock near wells 046 (soil, Plate 4) and 628 (shallow bedrock, Plate 6). As in preceding years, this plume was actively remediated in 2008 by a pump-and-treat system at well 628. Historically, PCE-series concentrations of 2 to 3 $\mu\text{g/l}$ have been detected at soil monitoring well 064 (Plate 4) along Lime Kiln Road northeast of well 628. In 2008, PCE-series concentrations were approximately 1.1 $\mu\text{g/l}$ in the first quarter at well 064, 4.1 $\mu\text{g/l}$ in the third quarter, and 2.5 $\mu\text{g/l}$ in the fourth quarter. PCE-series parameters were not detected at well 064 in the second quarter. Low levels of PCE (generally less than 1.5 $\mu\text{g/l}$) have also been detected at quarterly bedrock monitoring well 065 during periods of reduced precipitation and resulting low groundwater elevations. This was the case in the third and fourth quarters of 2008. PCE concentrations at well 065 were 2.4 $\mu\text{g/l}$ in the third quarter and 1.7 $\mu\text{g/l}$ in the fourth quarter. It is believed that such conditions reduce the zone of capture at shallow bedrock well 628 and allow low concentrations of PCE-series compounds to migrate to wells 064 and 065. PCE-series compounds were below the NYSQS at soil and shallow bedrock wells 064 and 065.

The B/330 AOC soil VOC plumes (Plate 4) have multiple source areas and consist primarily of PCE-series compounds. The soil groundwater plumes (Plate 4) are the source of several plumes in the underlying deep bedrock (Plate 6). One of the source areas for the B/330 AOC plumes is located beneath the south-central portion of B/330D near well 572 (Plate 4) where separate-phase PCE has been recovered during sampling of well 572. A second soil VOC plume is located on the northeast side of B/330C near well 956 (Plate 4); this plume is associated with a source in the

vicinity of soil monitoring wells 576 and 178, and soil/bedrock monitoring well 574. A third soil VOC plume is associated with a source near well 181 between B/330D and B/335; this plume appears to merge with the plume originating near well 572.

The soil VOC plume associated with the Landfill AOC is also composed primarily of PCE-series compounds and has source areas near soil/bedrock monitoring well 561 (Plate 4) and shallow bedrock well 559 (Plate 6). The Landfill AOC soil plume (Plate 4) is bounded on the east by unsaturated soils associated with a topographic high in the bedrock, and extends downward into the bedrock (Plate 6). This soil groundwater plume extends to the east toward B/338 and into the bedrock south of deep soil monitoring well 921, where it ultimately is captured by bedrock production well PW-25. The Landfill AOC shallow bedrock VOC plume associated with well 559 is also captured by PW-25, as shown on Plate 6.

Area D contains a small isolated soil groundwater plume (Plate 4) consisting of low levels ($< 10 \mu\text{g/l}$) of PCE-series compounds near shallow pumping well 032A. The predominant component is TCE with lesser concentrations of PCE. There are no bedrock VOC plumes associated with Area D.

The B/322 AOC contains a soil groundwater plume in the alluvial sand and gravel unit consisting primarily of PCE-series compounds (Plate 4) together with a smaller Freon TF plume (Plate 5). The PCE-series plume has a southerly component extending in the direction of groundwater flow toward wells 767 and 793 from a source near well 735 at the northeast corner of B/322, and a westerly component extending from the same source area toward extraction wells 612 and 617 of the B/322 remediation system. The Freon TF plume shown on Plate 5 has only a westerly component extending from wells 735 and 627 toward B/322 extraction wells 612 and 617, but is not detectable at the extraction wells.

The SEQ contains an elongated soil plume of PCE-series compounds approximately 800 feet long extending from a source area near soil monitoring well 048 and PW-23 (formerly shallow bedrock well 552) northward toward wells 987 (bedrock) and 990 (soil) along Lime Kiln Road, as shown on Plates 4 and 6. The highest PCE-series concentration during the first quarter of 2008 in this plume was found at well 990 ($1.3 \mu\text{g/l}$). PCE-series parameters were not detected in remaining SEQ wells. The plume is being actively remediated by production well PW-23. Concentrations in the shallow

bedrock and soil at wells 987 and 990 along Lime Kiln Road were below the NYSGQS for all PCE series compounds. No Freon TF plumes are present in the SEQ.

3.2.1.1.2 VOC Plumes in Deep Bedrock Groundwater

In addition to the shallow bedrock plumes at the B/330 and Landfill AOCs, the deep bedrock contains several plumes of PCE-series compounds and Freon TF. One of the bedrock groundwater plumes is located beneath Area A and is captured by production well PW-2 (Plate 6). This Area A bedrock plume consists primarily of PCE-series compounds and has at least three significant source areas:

1. *In the shallow soil near the northwest corner of B/309 (the “B/309 sink”).* This source is suggested by a PCE-series concentration of 350 $\mu\text{g/l}$ at bedrock well 716 (Plate 6) on the north side of B/310.
2. *In the soils at the northeast corner of B/308 (the “B/308 sink”).* As discussed in Section 2.2.1.1, the northeast corner of B/308 is where contaminated groundwater in the overlying sand and gravel unit flows beyond the edge of the silt/clay and passes through relatively permeable soils and into the bedrock (Plate 2). This contaminated groundwater is ultimately captured by production well PW-2.
3. *In the deep bedrock as indicated by historical high PCE-series concentrations at well 118 (260,000 $\mu\text{g/l}$ in the first quarter of 2008).* These concentrations are indicative of dense non-aqueous phase liquid (DNAPL) in the bedrock beneath the Area A source which lies in the shallow soil above the silt/clay.

A Freon TF plume with maximum concentration of 69 $\mu\text{g/l}$ (well 716, fourth quarter 2008) exists in the bedrock beneath Area A (Plate 7), and is captured by PW-2. The source appears to be the “B/309 sink”. Freon TF is also present at low levels (less than 5 $\mu\text{g/l}$ in wells 739 and 742), and PW-1.

The large bedrock plume associated with the B/330 AOC (Plate 6) has its principal sources in the soil and shallow bedrock, as discussed in Section 3.2.1.1.1. The B/330 AOC plumes are captured primarily by production well PW-25 and a lesser extent by PW-4.

A small source area situated at bedrock well pair 959/960 on the northern side of B/300 (Plate 6) is captured by production wells PW-1 and PW-25.

With regard to Freon TF in the deep bedrock, the Freon TF plume (Plate 7) in the B/330 Area is similar in shape to the western half of the PCE-series bedrock plume (Plate 6) and is captured by

production well PW-25 and also by PW-4. The highest Freon TF concentration in this plume is found at well 941 (33 $\mu\text{g/l}$).

The source of the low concentrations of PCE-series compounds at wells 739 and 742 (Plate 6) is not known; however, this groundwater chemistry is captured by PW-1.

3.2.1.2 Chemistry Graphs

In addition to reviewing the 2008 VOC chemistry data with regard to the three-dimensional distribution of VOCs, the data was reviewed by graphing concentration versus time for Freon TF and PCE-series compounds in the Contaminant Reduction Monitoring (CRM) and Point-of-Compliance (POC) wells (refer to Table A-3 in Appendix A for well designations). These X-Y graphs are shown on Figures 3-1 through 3-27 and were prepared using all of the data available from 1990 through the fourth quarter of 2008. Where multiple or duplicate samples were collected during a single day, the concentration was calculated by averaging all of the data from samples collected on that day.

Some of these graphs exhibit downward concentration trends that are apparent by inspection. Other graphs suggest seasonal variations in the chemical concentrations. As required by the Part 373 Permit, the data have been statistically evaluated for trend using *WQStat Plus*⁸, a widely-used water quality statistics program. Several non-parametric tests are available in *WQStat Plus* and two of the non-parametric tests for trend were used to analyze the time versus concentration data for the CRM wells. These tests are the Mann-Kendall Test (using deseasonalized data, where possible) and the Seasonal Kendall Test (a generalization of the Mann-Kendall Test that handles seasonal data internally). These non-parametric tests do not require that the data be normally distributed, and are valid even when data are missing, tied, or censored (e.g., ND@0.5 $\mu\text{g/l}$). Statistically significant trends, where they occur, are defined at a confidence level of 90 percent or higher.

⁸Intelligent Decision Technologies, Ltd., 1998, *WQStat Plus*, version 1.56.

3.2.1.2.1 Contaminant Reduction Monitoring Wells

The results of the Seasonal Kendall Test for trend are shown on Table 3-2 for each CRM well. The statistical outcomes shown on this table are summarized below. Several statistically significant trends in concentration are noted for the period 1990 to 2008:

1. Freon TF concentrations are decreasing at the Area A wells 010 (soil), and 716 (bedrock), and at production well PW-2. PCE-series concentrations are decreasing at the Area A source associated with wells 714 (soil) and 716 (bedrock), at downgradient wells 103, 104, and 016, and at the B/384 sump (sampling point 395).
2. PCE-series concentrations have increased at Area A production well PW-2.
3. Freon TF concentrations at Landfill bedrock well 943 exhibit a statistically significant decreasing trend.
4. PCE-series concentrations at well 032A (the recovery well for Area D) exhibit a statistically significant decreasing trend.
5. PCE-series concentrations have increased at Area A bedrock well 105 during the period 1990-2008.
6. PCE-series and Freon TF concentrations at production well PW-1 exhibit increasing trends since 1990.
7. PCE-series concentrations have decreased at inactive production well PW-7 since 1994. PCE-series concentrations have decreased at PW-4 and at inactive production well PW-5/5A since 2002 when pumping began at PW-25. Prior to the start of pumping at PW-25, PCE-series concentrations showed increasing trends at locations PW-4 and inactive production well PW-5/5A.

The graph for Area D location 032/032A (Figure 3-3) exhibits an inflection point, or change in overall trend at the beginning of 1995, and so the trend analysis was performed only on data collected since the beginning of 1995. Similarly, the trend analysis periods for wells 943, PW-4, PW-5/5A, PW-7, and for the B/384 Sump were adjusted based on an inspection of their graphs. These period adjustments are noted at the bottom of Table 3-2.

Table 3-2. Statistical Trends in Contaminant Reduction Monitoring Wells 1990-2008 (except where noted)						
Well	Figure Number	Location	Parameter	Trend	Confidence Limit	Test Type
010	3-1	Area A	PCE-Series Freon TF	No trend Decreasing	-- >95%	SK
016	3-2	Area A	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
032A ¹	3-3	Area D	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
103	3-4	Area A	PCE-Series Freon TF	Decreasing No trend	>95% --	MK
104	3-5	Area A	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
105	3-6	Area A (bedrock)	PCE-Series Freon TF	Increasing No trend	>95% --	MK
612	3-7	B/322	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
613	3-8	B/322	PCE-Series Freon TF	Insufficient Data	-- --	None
617	3-9	B/322	PCE-Series Freon TF	No trend No trend	-- --	SK
618	3-10	B/322	PCE-Series Freon TF	No trend No trend	-- --	SK
628 ²	3-13	Area B	PCE-Series Freon TF	No trend No trend	-- --	SK
714	3-11	Area A	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
716	3-12	Area A (bedrock)	PCE-Series Freon TF	Decreasing Decreasing	>95% >95%	SK
943 ³	3-14	Landfill (bedrock)	PCE-Series Freon TF	No trend Decreasing	-- >95%	MK
B/384 Sump ⁴	3-21	Area A	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
PW-1	3-15	Bedrock	PCE-Series Freon TF	Increasing Increasing	>95% >95%	SK
PW-2	3-16	Bedrock	PCE-Series Freon TF	Increasing Decreasing	>95% >95%	SK
PW-4 ⁵	3-17	Bedrock	PCE-Series Freon TF	Decreasing Decreasing	>95% >95%	SK
PW-5/5A ⁵	3-18	Bedrock	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
PW-7 ⁶	3-19	Bedrock	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
PW-25	3-20	Bedrock	PCE-Series Freon TF	No trend No trend	-- --	SK
Test Type: SK = Seasonal Kendall test MK = Mann-Kendall test for trend with deseasonalized data, where possible. 1 - Trend is for the period 1995-2008. 2 - Area B well 628 replaced well 863 in October, 2003. 3 - Trend is for the period 1994-2008. 4 - Location designation 395. Trend is for the period 1993-2008. 5 - Trend is for the period 2002-2008, after the start of pumping at PW-25. 6 - Trend is for the period 1994-2008, after the well was hydrofractured. Note: PW-9, which is used for water supply emergencies only, does not have sufficient data to test for trend. Well 613 is used for emergencies only, and does not have sufficient data to test for trend.						

3.2.1.2.2 Point-of-Compliance Wells

The results of the Seasonal Kendall Test for trend are shown on Table 3-3 for each POC well. The statistical outcomes shown on this table indicate decreasing trends in PCE-series concentrations at soil monitoring well 990 and at bedrock monitoring well 987. The POC wells do not show any other statistically significant trends.

Table 3-3. Evaluations of Statistical Trends in Point-of-Compliance Wells 1990-2008					
Well	Figure No.	Location	Parameter	Trend	Confidence Limit
064	3-22	Area B	PCE-Series Freon TF	No trend No trend	-- --
065	3-23	Area B	PCE-Series Freon TF	No trend No trend	-- --
066	3-24	Area D	PCE-Series Freon TF	No trend No trend	-- --
067	3-25	Area D	PCE-Series Freon TF	No trend No trend	-- --
987	3-26	Southeast Quadrant	PCE-Series Freon TF	Decreasing No trend	>95% --
990	3-27	Southeast Quadrant	PCE-Series Freon TF	Decreasing No trend	>95% --
All wells are soil monitoring wells except wells 065 and 987. Changes in trend compared to the period 1990-2007 are indicated in bold.					

3.2.1.3 Changes in Water Quality at Corrective Action Monitoring Wells

As required by the Part 373 Permit, statistically significant changes in water quality at the designated Corrective Action Monitoring (CAM) wells (Appendix A, Table A-2) were determined using the Mann-Whitney Test (adjusted for seasonality) for changes in median concentrations of key compounds (PCE-series and Freon TF) over time. A statistically significant change was defined at a confidence limit of 90 percent or higher. This statistical evaluation was performed by grouping the PCE-series and Freon TF data (where appropriate) such that median of the most recent samples from each well was compared to the median of the older samples collected since 1990. For wells sampled semiannually, this means that the data for 2007-2008 was compared to the data for 1990-2006. For wells sampled quarterly or monthly, this means that the data for 2008 was compared to the data for 1990-2007. In this way, the median of at least four recent samples was compared to the median of all of the older samples. Changes to the GMP approved in 2003 have changed sampling frequency at several wells; therefore, the date range of the data for the recent sample group was adjusted so as to obtain at least four data points in the recent sample group. Table 3-4 summarizes the results of the Mann-Whitney tests for the CAM wells.

Notes:

For well 941, data from 2006-2008 were compared to data from 1990-2002. This semiannual well was dry in the second half of 2006 and 2007. At least four data points (spanning more than two years) are needed in the recent data group to perform the Mann-Whitney test.

No other CAM wells exhibited statistically significant changes in water quality for the key compounds.

3.2.2 Quality Assurance/Quality Control Results

All GMP samples were collected in 2008 according to the procedures described in Section 2 of the GMP, except as noted in Section 3.1.1. The samples were analyzed by NYSDOH-certified laboratories using SW-846 and EPA methods for VOCs and inorganics. The 2008 field QA/QC chemistry data consists of duplicate samples, trip blanks, equipment rinse blanks, and field blanks. The duplicate samples are presented with the groundwater and production well analytical data in Appendices D and E. The trip, equipment rinse, and field blank results for all of 2008 are presented in Appendix F. QA/QC results for the first and second quarters of 2008 were previously published in the 2008 Semiannual Data Summary Report.

Laboratory precision was tested by filling multiple sampling containers from the same sampling device during each sampling round; these samples were then analyzed for the parameters of interest. Duplicate samples were generally collected once per 20 environmental samples from the groundwater monitoring wells and production wells. These duplicate sample results are indicated by the sample description “REPLICATE” in the analytical data printouts in Appendices D and E. The duplicate sample results are listed next to the corresponding primary sample results. In general, duplicate sample results are in good agreement and gross variations that would indicate serious analytical problems were not observed.

In addition to duplicate samples, trip blanks were prepared by the laboratory using analyte-free deionized (DI) water for each cooler containing VOC samples for each sampling round. The purpose of the trip blanks is to detect VOC contamination during sample transportation and storage. These trip blanks were the first items placed into each cooler by the laboratory and accompanied the empty sample containers from the laboratory to the field, and the filled sample containers from the field back to the laboratory. Environmental samples associated with each trip blank generally can be determined by the date of the trip blank (refer to “Sample Date” heading in Appendix F). 171 trip blanks were collected in 2008 as part of the Part 373 sampling program and supplemental sampling.

VOC parameters dichlorodifluoromethane, acetone, 1,3-dichlorobenzene, PCE, and TCE were detected in at least one trip blank at concentrations less than 15 parts per billion. Acetone was detected six times at concentrations ranging from 0.9 to 12 $\mu\text{g/l}$, and dichlorodifluoromethane was detected four times at concentrations ranging from 0.3 and 0.4 $\mu\text{g/l}$. PCE (0.8 $\mu\text{g/l}$) and TCE

(0.6 $\mu\text{g/l}$) were detected once in the same trip blank. One trip blank had 0.4 $\mu\text{g/l}$ of 1,3-dichlorobenzene.

Equipment rinse blanks were collected to confirm the efficiency of decontamination procedures for each sampling round by rinsing non-dedicated equipment with laboratory-supplied analyte-free DI water. 128 rinse blanks were collected in 2008 from water level indicators. These results are also presented in Appendix F.

Dichlorodifluoromethane and PCE were each detected once in equipment blanks at concentrations less than 1 $\mu\text{g/l}$. Acetone was detected three times at concentrations less than 2 $\mu\text{g/l}$. None of the equipment rinse blank results suggest serious problems with field decontamination procedures.

Although field blanks are not required by the GMP, they have been routinely collected since 2000. Field blanks were collected by pouring analyte-free DI water from laboratory-prepared vials into empty VOC sample vials such that there was no headspace in the sample vials. The field blanks were analyzed for VOCs and serve to detect potential contamination from ambient air during sample collection procedures. PCE was detected three times at concentrations less than 0.6 $\mu\text{g/l}$. Acetone was detected six times at concentrations of less than 3 $\mu\text{g/l}$. The relatively high number of acetone detections in trip, equipment, and field blanks suggests a very low-level systemic contamination or laboratory bias may have affected all three types of QA/QC samples.

In July and early August, 2008, several low level detections of PCE (less than 1 $\mu\text{g/l}$) were noted in several method blanks and associated samples taken as part of GMP and non-GMP monitoring. The laboratory noted that they had a carryover problem due to several samples run that contained high levels of PCE, and corrected the issue. It is possible that some low level detections during this time period were the result of this systemic laboratory contamination.

4 CORRECTIVE MEASURES

Activities associated with the corrective action program at IBMEF are summarized in the following subsections.

4.1 Program Activities

This section discusses ongoing corrective measures activities performed throughout 2008, including groundwater pumping and treatment, and production well and treatment system maintenance.

4.1.1 Groundwater Pumping and Collection Operations

The Corrective Measures Program involves the operation of five groundwater collection and treatment systems and the monitoring of a previously remediated landfill. The groundwater collection and treatment systems are referred to as the Central Carbon, Area A, Area B, Area D, and B/322 systems and are described in Section 4.1.3. The Central Carbon System (CCS) treats groundwater from the bedrock production wells PW-1, -2, -4, -23 and -25. PW-5/5A, PW-6, and PW-7 were not pumped in 2008 except for sampling purposes as part of the production well rebalancing plan. The Areas A, B, D, and B/322 treatment systems operate in shallow remediation areas.

During 2008, Main Site production wells PW-1, -2, -4, -23, and -25 were operated as groundwater withdrawal wells for the site's corrective measures program. In addition to providing the site's water supply, the purpose of the production well system on the Main Site is to control and contain the bedrock groundwater plumes. Contaminated groundwater from deep bedrock production wells PW-1 and -4, shallow bedrock production well PW-23, and from PW-5/5A, -6, -7, and -9 (when operating), is pumped to the CCS in B/316 and is treated for process water use. On November 12, 2008, IBM ceased to be a public water supplier, and all water from the CCS treated after this date was used for process purposes only. Contaminated groundwater from deep bedrock production well PW-2, which generally exhibits higher concentrations than the other production wells, is pumped to a separate granular activated carbon (GAC) system located in B/316 and is used for process water or is discharged to the Industrial Waste Treatment Facility or to surface water under permit. Groundwater from PW-25 is also treated by a separate GAC system at B/316 and is discharged in a manner similar to PW-2. Pumping data for the shallow remediation areas and Main Site deep bedrock production wells is presented in Table 4-1.

Table 4-1. 2008 Pumping Volumes		
Remediation Area or Well	Gallons Pumped	Average 2008 Flow Rate (GPM)
PW-1	139,281,000	264
PW-2	53,070,640	101
PW-4	20,929,800	40
PW-5/5A*	142,400	0.3
PW-6*	216,350	0.4
PW-7*	256,800	0.5
PW-25	96,911,200	184
Area A	450,851	0.9
Area B	4,158,354	7.9
Area D	678,680	1.3
B/322 (612, 613, 617, 618)	5,528,419	10.5
Southeast Quadrant (PW-23)	13,501,000	26
Total	335,125,494	637
Pumping volumes are not shown for PW-9, which was not pumped. *Pumps operated for purging and sampling purposes only.		

Except for periods of maintenance, production wells PW-1, -2, -4, -23, and -25 generally operated continuously throughout 2008. PW-5/5A, PW-6, and PW-7 have been operated for sampling purposes only since they were shut down on October 22, 2007 as part of the production well rebalancing plan. PW-9 is only used during water supply emergencies and was not pumped during 2008. PW-23 was offline from December 9, 2008 to January 19, 2009 for a pipeline repair downstream of the well.

4.1.2 Contaminant Removal

Contaminant mass removal was calculated for 2008 using annual median concentration data, together with annual pumping volumes for each shallow remediation area and bedrock production well. Table 4-2 shows that approximately 100 pounds of VOCs were recovered during 2008 from approximately 24 million gallons of extracted groundwater in shallow remediation Areas A, B, and D, plus B/322 (wells 612, 617, 618), and Southeast Quadrant shallow bedrock production well PW-23. Virtually all of the VOC mass recovered in 2008 from the shallow remediation areas came from Area A. The mass recovered from Area B, Area D, B/322, and PW-23 was less than 0.05 pound for each remediation area.

Table 4-2. 2008 Contaminant Recovery Levels Shallow Remediation Areas (lbs)					
Area (Well)	CIS	Freon TF	PCE	TCE	Total by Area
Area A	0.0	0.0	100	1.9	100
Area B	0.0	0.0	0.048	0.0	0.048
Area D	0.0019	0.0	0.0066	0.019	0.028
B/322 (612, 613, 617, 618)	0.0017	0.0	0.0	0.0	0.0017
SEQ (PW-23)	0.0	0.0	0.0	0.0	0.0
Total by Compound	0.0036	0.0	100	1.9	100

Table 4-3 shows the contaminant recovery levels for the deep bedrock production well system. Approximately 3.8 tons of VOCs were recovered during 2008 from approximately 311 million gallons of groundwater extracted from the deep bedrock. As was the case in previous years, most of the VOC mass removed from the deep bedrock groundwater system (89 percent) came from production well PW-2. A significant fraction of the VOC mass (9 percent) was removed by production well PW-25.

Table 4-3. 2008 Contaminant Recovery Levels Deep Bedrock Production Wells (lbs)					
Well	CIS	Freon TF	PCE	TCE	Total by Well
PW-1	2.7	2.5	26	10	41
PW-2	420	0.0	5700	700	6,800
PW-4	0.61	0.0	26	8.8	35
PW-5/5A	0.0	0.0	0.0014	0.0	0.0014
PW-6	0.0	0.0	0.0015	0.0	0.0015
PW-7	0.0046	0.0	0.021	0.0043	0.030
PW-25	42	13	490	150	700
Total by Compound	470	16	6200	870	7600*

*Total pounds removed is the sum of the mass removed by well. This number may not match the sum of the mass removed by compound because of rounding.

4.1.3 Groundwater Treatment System Operations

Appendix G presents analytical data for 2008 relating to the efficiency of the groundwater recovery and treatment systems for Area A, Area B, and the Deep Bedrock Production Wells and PW-23 (SEQ AOC), and for groundwater recovery from Area D, and the B/322 AOC. Data for the first half of 2008 was previously published in the 2008 Semiannual Data Summary Report. Treatment efficiency and maintenance issues are discussed below.

4.1.3.1 Area A

Treatment efficiency at Area A is calculated from monthly samples collected from the B/384 Sump (sample point 395), the influent storage tank (sample point 395A), and the effluent from the stripping tower (sample point 395B). Results for these sampling points are presented in Appendix G and indicate removal efficiency, based on the ratio of influent (395A) to effluent (395B) concentrations, of greater than 99 percent. The average flow rate was 0.9 gpm. As discussed in the 2006 Annual Report, elevated VOCs were detected in the effluent beginning in February 2006. Repairs to the system mentioned in Section 4.1.4 have been focused on addressing this and other potential issues.

4.1.3.2 Area B

Treatment efficiency for Area B is calculated from monthly samples collected from the influent (well 628), from between the GAC units (sample location 628B), and from the effluent from the lag GAC unit (sample location 628A). Results for these sampling points are presented in Appendix G and indicate a removal efficiency, based on the ratio of influent to effluent concentrations, of greater than 99 percent. Total VOC influent concentrations at Area B ranged from 0.5 to 2.9 $\mu\text{g/l}$ and total VOCs were not detected in the Area B effluent in 2008. The average flow rate was 7.9 gpm.

4.1.3.3 Area D

Effluent from well 032A is pumped to the site's Water Pollution Control Facility (WPCF). Operating parameters for 2008 were an average flow rate of approximately 1.3 gpm and groundwater concentrations determined from the sampling port of groundwater extraction well 032A of approximately 2.0 to 4.8 $\mu\text{g/l}$ for TCE, and approximately 1.7 $\mu\text{g/l}$ or less for all other parameters, including PCE and CIS. Influent chemistry data for Area D is presented in Appendix G.

4.1.3.4 B/322 AOC

The B/322 remediation system started up in January 2000 and pumps from extraction wells 612, 613, 617 and 618 to a small pump house whereby the extracted water is discharged to the WPCF. Well 613 is a backup well that was not pumped for a significant period of time in 2008.

The monthly analytical data for extraction wells 612, 617, and 618, and for the combined discharge from the B/322 containment system (sample location 360) are presented for January through December 2008 in Appendix G. The total VOC concentration in the combined discharge ranged from not detected to 1.6 $\mu\text{g/l}$ in 2008. The average combined flow rate for wells 612, 617, and 618 was 10.5 gpm.

4.1.3.5 Central Carbon System, PW-2, and PW-25

Treatment efficiency for the Central Carbon System (CCS), which handles the discharge from production wells PW-1, -4, -5/5A, -6, -7, -9, and -23, is determined from monthly samples collected from the blended influent to the CCS (location 500), from between the lead and lag carbon beds (locations 511-513) for GAC trains 1, 2, and 3, and from the blended effluent from the CCS (location 555). Data for CCS sampling points is presented in Appendix G.

Treatment efficiency for the production well PW-2 treatment system, which is separate from the CCS, is determined from sampling of PW-2, from between the lead and lag carbon beds of the PW-2 GAC train (sample point 221), and from the effluent of the PW-2 GAC train (sample point 080). Data for production well PW-2 is presented in Appendix E. Data for sampling points 221 and 080 is presented in Appendix G.

Treatment efficiency for the PW-25 treatment system, which is also separate from the CCS, is determined from sampling of PW-25, from between the lead and lag carbon beds of the PW-25 GAC train (sample point 514), and from the effluent of the PW-25 GAC train (sample point 524). Data for sampling points 514 and 524 is presented in Appendix G.

Results for the sampling points in the CCS indicate a removal efficiency, based on the ratio of influent (location 500) to effluent (location 555) concentrations, of typically greater than 99 percent for the CCS. Treatment efficiency for the PW-25 and PW-2 GAC trains, based on the ratio of influent to effluent concentrations, is typically greater than 98 percent for the PW-25 GAC and greater than 99 percent for the PW-2 GAC.

4.1.4 Groundwater Treatment System and Production Well Maintenance

The following groundwater treatment system and production well maintenance activities were performed in 2008:

Maintenance and equipment upgrades continued in the Area A treatment system. Work performed included pump replacements, piping repairs, control system upgrades, and installation of new totalizers. A system audit was performed on system instrumentation and controls, resulting in replacement or addition of several tank level switches. On April 7, 2008, the system was returned to automatic operational mode. The system had been run in hand mode since September 2006 after increases in chemistry were observed in effluent samples.

On February 28, 2008, the pump was replaced in B/322 remediation system well 618. The pump was replaced on B/322 remediation system well 612 on September 4, 2008.

4.2 Other Activities and Issues

This section addresses activities undertaken in 2008 that relate to the groundwater monitoring program at IBMEF. Activities planned for 2009 are also discussed.

4.2.1 Groundwater Well Installation and Maintenance Activities Performed in 2008

A well inventory was performed in July 2008. During this inventory, the depth to bottom was measured to check for siltation in all Hydraulic Effectiveness Monitoring wells (Appendix A, Table A-1), including wells in the Corrective Action Performance Monitoring Network (Appendix A, Table A-2). Wells were inspected for damage and for the condition of the protective casings. Wells were also checked for the presence and condition of locks, identification tags, survey marks, sanitary seals, and caps. Follow-up work such as well development, painting and repair of protective casings, well seals, and locks was performed as required.

4.2.2 Production Well Rebalancing

In 2007, IBM commenced implementation of a plan to rebalance the on-site production well operations in order to optimize mass recovery and containment. The first step in this plan commenced in October 2007, with the availability of municipal water, and consisted of the termination of pumping at PW-5/5A, PW-6, and PW-7 for a trial period of one year. Pumping at these wells was terminated on October 22, 2007, and the wells will continue to be maintained in an operational condition until completion of the test plan and final data analysis. The post-shutdown monitoring plan involved collection of groundwater elevation and chemistry samples at intervals of one week, one month, three months, six months, and twelve months after shutdown. A summary

2008 Annual Corrective Action Status Report

report⁹ was submitted to NYSDEC during the first quarter of 2008 describing the first three months of shutdown activities. A second report submitted in the third quarter 2008 following the six month post-termination data collection¹⁰. A comprehensive report will be submitted after the collection and analysis of the twelve month post-termination data.

4.2.3 Well Installation and Maintenance Activities Planned for 2009

IBM plans to continue its annual inventory of monitoring wells, repairing wells as necessary.

Plans are in place to continue implementation of a disinfection process in PW-2 to minimize biofouling of the carbon in order to improve the operational efficiency.

4.3 Evaluation of Progress

This section summarizes the progress to date regarding corrective measures at IBMEF, including groundwater withdrawal and treatment, hydraulic control of groundwater flow, and detection trends in site groundwater.

Essentially continuous pumping at PW-1, -2, -4, -23, and -25 was accomplished for all of 2008. As noted in Section 4.1.1, PW-23 was offline from December 9, 2008 until January 19, 2009. Hydraulic control and capture of the dissolved VOC plume in the bedrock groundwater system is being maintained by the operation of the groundwater production wells, as illustrated on Plate 3, Plate 3a, and Plate 3b. The potentiometric surface shown on these plates shows hydraulic control and capture of the dissolved VOC plume in the bedrock groundwater system has been maintained following production well rebalancing.

Treatment of groundwater by the Area A, Area B, and Central Carbon/PW-2/PW-25 treatment systems and extraction of groundwater by the Area D and B/322 remediation systems continued throughout the year. The GAC-treated groundwater was used as process water water, or was discharged with other site wastewater to Gildersleeve Brook in compliance with the conditions of

the discharge permit. In 2008, approximately 7,600 pounds of VOCs were removed from approximately 335 million gallons of groundwater pumped from the shallow soil and deep bedrock remediation areas. Since 1979, approximately 139 tons of VOCs have been removed from approximately 10.9 billion gallons of extracted groundwater.

Groundwater sampling activities will continue in 2009 at 179 monitoring wells and sampling points listed in the Groundwater Monitoring Plan and groundwater elevations will be measured quarterly at 392 HEM wells.

 - "c" symbol denotes a dry well. Elevation listed is the bottom elevation of the well.

Note: Generally, the data used in contouring this plate is from the deepest of the bedrock wells in a well cluster and corresponds to a screened or open hole interval elevation between approximately 50 and 120 feet amsl (with the exception of PW-23). This elevation interval generally correlates with the principal water-bearing zones in the on-site deep bedrock production wells. (The principal water-bearing zone in PW-23 is at approximately 221 feet amsl, which is significantly higher than the elevation of the principal water-bearing zones in the other production wells.) Only groundwater elevation data from wells used in contouring is shown on this plate.

- PCE-Series Concentration ug/l
- (4/08) Result from Second Quarter 2008 Sampling
- Approximate Limit of Plume as Defined by Annual Median Concentration Equal to 5 ug/l of PCE-Series Compounds

Note: All concentrations have been rounded to a maximum of two significant figures. "0" means not detected.

IBM East Fishkill maintains an uncensored groundwater chemistry database. For the purposes of this report, 0.5 ug/l was used as the default reporting limit RL for compounds that were not detected, except where a sample was diluted prior to an analytical run. In that case, the default RL 0.5 ug/l was multiplied by the dilution factor DF to obtain the RL for compounds that were not detected.

Concentrations greater than the method detection limit MDL but less than the RL 0.5 ug/l x DF are also reported by the laboratory. The MDL varies by compound but is typically less than the RL for the 23 key compounds at the site. In general, values greater than the MDL but less than the RL should be considered estimates that would typically be flagged with a "U" qualifier.

The PCE-series concentration is a calculated concentration that uses the weighted sum of four constituent VOC concentrations. In performing this calculation, compounds that were "not detected" are treated as zeros, and the resulting PCE-series concentration is shown as "0" on the Plates 4 and 6 if none of the four PCE-series constituents was detected. However, the Freon TF concentration is not a calculated concentration; therefore, the concentrations posted on Plates 5 and 7 are shown as less than the RL <0.5 ug/l times the dilution factor where Freon TF was not detected.

Key:

M.P. = Measuring Point

ft amsl = feet above mean sea level

All coordinates in feet relative to site grid

Table A-2: Well Specifications
Corrective Action Performance Monitoring Network

Well Number	Current M.P. Elevation (ft amsl)	Baseline Depth to Bottom (ft below M.P.)	Baseline Elevation of Bottom (ft amsl)	Well Diameter (inches)	Screen Length (feet)	Completion Date	Site Area	Upgradient (U), Downgradient (D), Sidegradient (S), or Source

Key:

Landfill = Landfill (Area C)

B/330 = Building 330 (Area C)

B/322 = Building 322

SEQ = Southeast Quadrant

BR = Bedrock

WC = West Complex

NA = Not applicable or not available

ft amsl = feet above mean sea level

M.P. = measuring point (generally a survey mark at top of inner monitoring pipe or casing)

Key:

Landfill = Landfill (Area C)
 B/330 = Building 330 (Area C)
 B/322 = Building 322
 SEQ = Southeast Quadrant
 BR = Bedrock
 WC = West Complex

A = Annual
 S = Semiannual

CAM = Corrective Action Monitoring
 PCT = Process Control for Treatment
 CRM = Contaminant Reduction Monitoring
 POC = Point of Compliance Monitoring
 DM = Detection Monitoring
 AM = Annual Monitoring

Q = Quarterly
 M = Monthly
 M* = Monthly when used as a backup well
 * = PW-9 and GW613 are sampled only when in use.
 Current status for both wells is emergency use only.

All listed monitoring wells are hydraulic effectiveness monitoring wells. Refer to Table A-1 for complete list.

X = Sample all listed wells for Volatile Organics.

X1 = Sample for Total Fluoride and Chromium (dissolved & total) .

X2 = Sample for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X3 = Sample annually for Nickel (dissolved & total).

X4 = Sample quarterly for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X5 = Sample monthly for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X6 = Sample quarterly for Inorganics only when in use. (PW-9 is used only for emergencies.)

QUALITY CONTROLLED LOCAL CLIMATOLOGICAL DATA

Effective January, 2005, flags will be available for most data elements:

If data are suspect:

s will appended to the value on the web form

s will be placed in a column following the suspect value in the ASCII form

If data are flagged as erroneous, it will not be printed.

**NOTICE OF CHANGE:

Effective July 28, 2000, observations contained in the Quality Controlled Local Climatological Data Hourly Observations table are reported in whole degrees Fahrenheit. The dry bulb, dew point and wet bulb temperatures were originally reported to the nearest tenth of a degree Fahrenheit. The Automated Surface Observing System (ASOS) records temperatures and dew points in whole degrees Fahrenheit and converts these values to the nearest tenth of a degree Celsius for observation transmission. Until this date, these values online have incorrectly been converted back to the nearest tenth of a degree Fahrenheit, implying a level of precision that is not present at the instrument level. We apologize for any inconvenience this may cause.

The Automated Weather Observing System (AWOS) generally records temperatures and dew points in whole degrees Fahrenheit and converts these values to the nearest whole degree Celsius for observation transmission. Also, AWOS stations will often have less data (i.e., fewer weather elements) than ASOS stations.

NCDC forms contain:

whole degree Celsius temperature values for AWOS stations

tenths degrees Celsius temperature values for ASOS stations

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation

B	The reported value is less than the Contract Required Detection Limit (CRDL), but greater than the Instrument Detection Limit (IDL) (Inorganics)
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit

Key:

GMP Sampling Frequency:

AN = Annual

S = Semiannual

Q = Quarterly

M = Monthly

Production Well Shutdown Sampling Frequency:

A = prior to pumping termination, and at 3, 6, and 12 months after termination of pumping

B = prior to pumping termination, and at one week, 1, 3, 6, and 12 months after the termination of pumping

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation

B	The reported value is less than the Contract Required Detection Limit (CRDL), but greater than the Instrument Detection Limit (IDL) (Inorganics)
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit

Appendix F

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation

B	The reported value is less than the Contract Required Detection Limit (CRDL), but greater than the Instrument Detection Limit (IDL) (Inorganics)
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit
