NYSDEC Part 373 Permit 3-1323-0025/00249
EPA ID No. NYD000707901

Dear Director, Remedial Bureau C:

In accordance with the provisions of the Module IX – General Ground Water Monitoring Conditions, Section H of the referenced permit, enclosed please find the following document for your review:

*2011 Annual Corrective Action Status Report
IBM Corporation
East Fishkill Facility
Hopewell Junction, New York*

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Please contact Jackie Braungart at (845)892-1672 if you have any questions or require further information.

Sincerely,
International Business Machines Corporation

1 INTRODUCTION

This report has been prepared by the Environmental Engineering Department at IBM Corporation's East Fishkill Facility (IBMEF) and by Groundwater Sciences Corporation (GSC). IBMEF is located at the Hudson Valley Research Park in the Town of East Fishkill, Dutchess County, New York (Figure 1-1).

Under the renewed NYSDEC Part 373 Permit¹, the East Fishkill Facility covers an area of approximately 450 acres referred to as the Main Site. Under the original Part 373 Permit², the Facility covered an area of approximately 600 acres, and included the Main Site, the former West Complex west of Gildersleeve Brook and the Former IBM Recreation Center east of Lime Kiln Road (Plate 1). In January 2006, the former West Complex was sold to PREI Hopewell Junction Associates. In December 2010, the former Recreation Center was sold to the Town of East Fishkill. IBM has maintained the right to use the groundwater monitoring wells on the former West Complex and Recreation Center sites and has continued monitoring and maintenance of the wells. On the Main Site, seven shallow areas and the deep bedrock are contaminated with organic chemicals. These areas of concern (AOCs) are shown on Plate 1 as Area A, Area B, Area C (Landfill), Building 330 (B/330), Area D, Southeast Quadrant (SEQ), Building 322 (B/322), and the Deep Bedrock. There are no AOCs at the former West Complex where only detection monitoring is performed or at the former IBM Recreation Center where only water level monitoring is performed.

IBMEF's groundwater monitoring program was implemented in 1979 to provide the data necessary to manage water quality problems and the site water supply. Groundwater has historically been the primary water supply source for IBMEF and its neighbors. Of the 17 production wells operated by IBM, nine wells (PW-1, -2, -4, -5/5A, -6, -7, -9, -23, and -25) are located on the Main Site (PW-9 is used only for water supply emergencies). The other production wells are located on properties to the north and northwest. Beginning in August 2007, the production wells have been supplemented with municipal water from the Poughkeepsies' Water Treatment Facility via the Central Dutchess Water Transmission Line. Prior to the sale of the property, IBM's former Recreation Center was

¹ New York State Department of Environmental Conservation, November 2, 2011, *6NYCRR Part 373 Hazardous Waste Management Permit, IBM Corporation East Fishkill Facility*.

² New York State Department of Environmental Conservation, September 29, 1995, *Final 6NYCRR Part 373 Hazardous Waste Management Permit, IBM East Fishkill Facility, Module III, Corrective Action Requirements for Solid Waste Management Units and Areas of Concern, and Module IX, General Groundwater Monitoring Conditions*.

supplied by a separate production well located on the Recreation Center property. The parcel is now supplied via municipal water by the Town of East Fishkill.

Groundwater monitoring and remediation activities have undergone a succession of incremental modifications since the late 1970's. In February 1996, a modified Groundwater Monitoring Plan³ (GMP) was prepared and submitted in response to the requirements specified in Module III and Module IX of the site's original NYSDEC Part 373 Permit. The area monitored under the GMP includes the Main Site, former Recreation Center, and the former West Complex. The sampling program described in the GMP was implemented on an interim basis during the first quarter of 1996, pending formal approval of the GMP by the NYSDEC. The monitoring network and sampling frequencies used from 1995 through the third quarter of 1999 were the same as those in the original GMP. In October 1999, the sampling list and sampling frequencies were modified. These modifications were discussed in the 1999 Annual Report⁴ and subsequently were approved by the NYSDEC. In 2003, further minor changes to the GMP were proposed. These changes were presented in the 2002 Annual Report⁵ and were approved by the NYSDEC in 2003. A minor change was made with NYSDEC approval in 2007 when well 834 was decommissioned and was replaced by well 832 for sampling purposes. NYSDEC issued a renewed Part 373 Permit to IBM on November 2, 2011. The GMP remains in effect per Modules II and IX of the renewed Permit.

The current GMP designates 392 wells as Hydraulic Effectiveness Monitoring (HEM) wells. These HEM wells are shown on Plate 1 and are listed in Table A-1 of Appendix A. 179 of these wells plus several other miscellaneous sampling points are monitored routinely as part of the Corrective Action Performance (CAP) Monitoring Network. The CAP monitoring wells and miscellaneous sampling points are listed in Table A-2 of Appendix A. Table A-2 also lists the physical specifications for the CAP monitoring wells. The current GMP sampling schedule is shown on Table A-3 of Appendix A.

⁴ IBM Environmental Engineering and Groundwater Sciences Corporation, May 30, 2000, *1999 Annual Corrective Action Status Report, IBM East Fishkill, New York*.

⁵ IBM Environmental Engineering and Groundwater Sciences Corporation, May 30, 2003, *2002 Annual Corrective Action Status Report, IBM East Fishkill, New York*.

Termination of pumping at PW-5/5A, PW-6, and PW-7 was proposed to provide more efficient and targeted containment and recovery of contaminants at the site. Following approval from NYSDEC to conduct a controlled and monitored experiment, production wells PW-5/5A, PW-6, and PW-7 were removed from service on October 22, 2007. IBM has continued post-shutdown monitoring and data evaluation, and will provide NYSDEC with a completion report and a request for permanent modification to the well field operations. A brief summary of the supplemental shutdown monitoring is described in Section 4.2.2.

1.1 Purpose

This annual groundwater monitoring status report summarizes data collected during 2011 and describes activities performed with regard to the groundwater monitoring program. This report is being submitted to the NYSDEC to comply with the requirements of the original and the renewed Part 373 Permits for all AOCs and solid waste management units (SWMUs) where groundwater is monitored. The annual report for 2010 is dated May 31, 2011⁶ and the semiannual report summarizing data collected during the first half of 2011 is dated November 28, 2011⁷.

1.2 Scope

This report addresses items specified in Module IX, Section H of the 1995 and 2011 Part 373 Permits and in Section 3.3 of the GMP. Each Permit and GMP requirement is quoted below and is cross-referenced to the report sections, appendices, plates, and/or figures, indicated in parentheses, where it is addressed:

1. Summary of all analytical results. (3.2; Appendices D, E, F, G)
2. Quality Assurance/Quality Control (QA/QC) per the GMP. (3.2.2; Appendix F)
3. Pertinent monitoring data recorded in the well record, including the sampling field data sheets. (3.1; Appendix C)
4. Quarterly groundwater elevation and survey data in tabular form, and potentiometric contour maps delineating the zone of capture and the rate and direction of groundwater flow. (2; Appendix B; Plates 2 and 3)

⁶ IBM Environmental Engineering and Groundwater Sciences Corporation, May 31, 2011, *2010 Annual Corrective Action Status Report*, IBM East Fishkill, New York.

⁷ IBM Environmental Engineering and Groundwater Sciences Corporation, November 28, 2011, *2011 Semiannual Data Summary Report*, IBM East Fishkill, New York.

5. Evaluation of contaminant migration, including maps for “Key Compounds” listed in Table 3-1 of the GMP. Isoconcentration maps shall be prepared annually showing the approximate limit of each plume. This limit is defined as the median concentration equal to 5 micrograms per liter ($\mu\text{g/l}$) of one key compound (Freon TF) or the sum of the normalized transformation products of key compounds (tetrachloroethene (PCE) series compounds). Include a statement regarding future contaminant movement. (3.2.1.1; Plates 4, 5, 6, 7)
6. Trend line plots for the Contaminant Reduction Monitoring (CRM) wells. (3.2.1.2.1; Figures 3-1 through 3-21; Table 3-2)
7. Determination of statistically significant increase in contamination at Point-of-Compliance (POC) wells. (3.2.1.2.2; Figures 3-22 through 3-27; Table 3-3)
8. Determination of statistically significant changes in water quality at Corrective Action Monitoring (CAM) wells. (3.2.1.3; Table 3-4)
9. Production or monitoring well maintenance activities planned or performed. (4.1.4, 4.2)
10. Plans for installation of additional wells. (4.2.5)
11. Summary of well installation activities. (4.2.1)
12. Pumping well rates and volumes. (4.1.1; Table 4-1)
13. Contaminant recovery levels. (4.1.2; Table 4-2 and Table 4-3)
14. Treatment efficiency data. (4.1.3; Appendix G)
15. Any problems or other activities planned. (4.2)
16. An evaluation of the progress of the corrective action monitoring program. (4.3)

The above items are addressed in this report for the period January 1, 2011 through December 31, 2011. From 1996 to 2000, data collected during the third quarter of the year was used as the basis for an analysis of groundwater elevations and chemistry because this was the quarter in which the most extensive groundwater sampling was conducted. However, beginning in 2001, most of the monthly, quarterly, semiannual, and annual wells in the CAP monitoring network (Table A-3 of Appendix A) have been sampled during the first quarter. In 2011, the monthly, quarterly, semiannual, and annual CAP wells were sampled from January through June. Therefore, potentiometric data from the first and second quarter of 2011 and chemistry data from January through June was used to construct the maps in this report.

2 HYDROGEOLOGY

Groundwater occurs in saturated zones within both the soil and bedrock beneath the site. In general, recharge to the bedrock passes through or around the overlying soil units, which include fill, alluvial sands and gravels, an extensive but discontinuous layer of glaciolacustrine silt and clay, and an extensive, dense glacial till. The maximum thickness of these soil units is greater than 120 feet. Strong vertical flow of groundwater is induced by four active on-site corrective action pumping wells completed in the deep bedrock.

This section presents the results of quarterly water level monitoring for 2011 in both the soil and bedrock saturated zones and discusses the effects of corrective action pumping on groundwater flow in these units.

2.1 Quarterly Water Levels

In 2011, the hydrogeologic characteristics of the site were evaluated by means of quarterly water level measurements taken principally on February 22 to March 22, May 23 to June 8, August 23 to September 2, and November 14 – 23, 2011 in the designated Hydraulic Effectiveness Monitoring (HEM) wells listed in Table A-1 of Appendix A. This water level data has been converted to groundwater elevations and is tabulated in Appendix B.

2.2 Soil Groundwater Elevations

Plate 2 and Plate 2a show the groundwater elevations for portions of the soil water table during the first quarter of 2011 (February 22 to March 22) and second quarter of 2011 (May 23 to June 8) under dynamic conditions of long-term corrective action pumping in the bedrock. The gray cross-hatched areas on Plate 2 and Plate 2a indicate areas where soils are typically unsaturated, largely as a result of dewatering by corrective action pumping. In some areas, soils that lie on top of buried bedrock ridges or other areas of relatively high bedrock surface elevation are also unsaturated. Plate 2 and Plate 2a show similar unsaturated areas and groundwater elevations. The unsaturated areas shown on Plate 2 are shown on the soil isoconcentration maps, therefore the primary focus of the following discussion will be Plate 2.

2.2.1 Stratigraphic Controls on Groundwater Flow

Groundwater exists in the soils beneath the site under generally unconfined (water table) conditions. Groundwater flow within these soils is controlled by various factors including (1) the upper surface topography of the soil units, (2) the hydraulic characteristics of the soils, (3) the location of recharge and discharge zones, (4) horizontal and vertical gradients, and (5) the vertical hydraulic conductivity across stratigraphic units within the soils, and across the interface between the soils and bedrock.

In the northern parts of the site, the soil water table generally mirrors the surface topography of the extensive but discontinuous glaciolacustrine silt/clay that, together with several areas of extremely dense till, is the primary control on soil groundwater flow. Areas where the silt/clay is present are shown as tan shaded areas on Plate 2. The silt/clay and dense till generally inhibit vertical migration of soil groundwater into the lower soil units and act as barriers to vertical contaminant transport. In areas where the silt/clay is absent and where the till is less dense or absent, soil groundwater passes through deeper soil units and into the bedrock. Areas without saturated soil are shown with cross-hatching on Plate 2.

Significant areas with regard to contamination of soil groundwater are the zones of perched water in the fine- to coarse-grained alluvial sand that lies above the silt/clay in Area A, Area D, and the B/322 AOC.

2.2.1.1 Area A

North of B/309 and B/310, the stratigraphic sequence consists of fill and silty sand overlying dense lodgment till with bouldery till. The glaciolacustrine silt/clay is absent north of B/309 and B/310 and east of B/309, as shown on Plate 2. The stratigraphic sequence from north to south gradually changes from till (north of B/309 and B/310) to include fill, sand, and sand-and-gravel lenses deposited on top of the silty sand that overlies the silt/clay confining unit.

Groundwater is typically perched within the alluvial sand above the silt/clay in Area A, and flows from the northeastern edge of B/310 to the north and northeast. The flow in the northern part of Area A is typically from the northeast corner of B/310 and the western portion of B/303 and B/309 toward an area where the silt/clay is generally absent north of the linkway between B/309 and B/310 (refer to closed “225 feet” contour on Plate 2). The soil groundwater table north of B/309

and the northeast corner of B/310 is located primarily in the till, where soil groundwater typically flows downward into the bedrock in the vicinity of wells 010, 748, and 763. During periods of normal precipitation and above normal precipitation (as was the case in 2011), the area in the vicinity of these wells is saturated and appears as a sink for soil groundwater. It is referred to as the “B/309 sink” (Plate 2).

The remainder of the flow from beneath B/310 in the northern part of Area A is typically toward the northeast corner of B/308 in the vicinity of East Drive where the silt/clay and dense till are absent (Plate 2). In this area, referred to as the “B/308 sink” (refer to closed “240 feet” contour, Plate 2), soil groundwater flow is primarily lateral toward the edge of the silt/clay and generally vertically downward beyond the edge of the silt/clay and into the bedrock, where it is captured by production well PW-2, as described in Section 2.3.

The groundwater flow divide between the B/308 and B/309 groundwater sinks is shown on Plate 2. At the B/384 Sump west of B/308, groundwater is captured and treated by the Area A treatment system at an average rate in 2011 of 1.3 gallons per minute (gpm). Despite this low flow rate, it appears that a significant portion of the easterly flow from the VOC source area beneath B/310 is captured by the Area A treatment system.

Flow from the southeast corner of B/310 is to the south and southeast (Plate 2). A groundwater flow divide in the alluvial unit above the silt/clay north of wells 103 and 980 and beneath B/386 separates the area where shallow groundwater flows to the north toward the B/308 sink from the area where shallow groundwater flows to the south across the edge of the silt/clay and then downward into deeper soils (primarily till) and bedrock in the vicinity of the Central Drainage.

2.2.1.2 B/322 AOC

Groundwater flow in the B/322 AOC controls migration of a plume emanating from the northeastern corner of B/322 near well 735, as discussed in Section 3.2.1.1.1. Groundwater in the alluvial unit above the silt/clay (Plate 2) flows from an area of high top-of-silt/clay elevation in the vicinity of wells 735 and 627 to the south-southwest across the northern half of B/322 and toward B/323. In addition to this southerly component of flow toward B/323, the groundwater flow divide shown for the B/322 AOC shown on Plate 2 also produces a westerly component of flow toward the B/322 remediation system consisting of wells 612, 613, 617, and 618. Groundwater flow into the B/322 remediation system averaged 12.9 gpm in 2011 and is discussed further in Section 4.1.3.4.

2.2.1.3 B/330, Area C (Landfill), and SEQ

In the SEQ, B/330, and Area C (Landfill) AOCs, the silt/clay is mostly absent except for several small areas shaded tan on Plate 2. Although some groundwater in these areas is perched on the silt/clay, the soil groundwater elevations shown on Plate 2 in the B/330 AOC are primarily for the till overlying the bedrock. This till contains the B/330 and Area C (Landfill) AOC soil groundwater plumes, which are discussed further in Section 3.2.1.1.1.

Soil groundwater in the B/330 AOC is mounded in the area between B/330D and B/335 at wells 180, 181, 602, and 603 (Plate 2); part of this area is not capped by a building slab or parking lot and allows for direct infiltration of precipitation. Elsewhere beneath B/330D and areas to the north and west, the overburden is believed to be unsaturated due to the presence of (1) buildings and parking lots that limit infiltration of precipitation, (2) natural soils that are too thin and too permeable to allow perching of groundwater, and (3) production well PW-25, which has dewatered much of the soil beneath the B/330 AOC.

In the SEQ, pumping of PW-23 in the shallow bedrock at an average rate of approximately 8.8 gpm has increased the hydraulic gradients in the overlying soil overburden. The silt/clay is absent in the SEQ and the soil and bedrock units are hydraulically well-connected.

2.2.1.4 Area D

In Area D, a small, localized depression in the water table within the alluvial unit results from the pumping of well 032A, and is discussed further in Section 4.1.3.3.

2.2.1.5 Former West Complex

Much of the former West Complex is topographically higher than the Main Site. As a result, soil groundwater in the western portion of the former West Complex flows from a high in the vicinity of B/692, B/693, and B/694, where groundwater elevations are greater than 270 feet above mean sea level, to the west, northwest, north, and northeast. In the northeastern portion of the former West Complex, groundwater in the vicinity of wells 400 and 403 flows to the northeast beneath John Jay High School and toward Gildersleeve Brook.

Although Plate 2 does not show the silt/clay on the former West Complex, data from borings indicates that the glaciolacustrine silt/clay unit extends beyond the western boundary of the Main Site at Gildersleeve Brook.

2.2.2 Gradients and Groundwater Flow Velocities

The calculated linear velocity of horizontal groundwater flow within alluvial sand above the glaciolacustrine silt/clay ranges between 0.057 and 5.7 feet per day (ft/day), with a median of 0.57 ft/day. Measured hydraulic conductivities as determined from slug tests in monitoring wells screened in the alluvial sand west of B/322 range between 1 and 100 ft/day, with a median value of 10 ft/day. Measured hydraulic gradients range from 0.002 to 0.13, yielding a representative median gradient of 0.020. A porosity of 35% was determined from laboratory tests on soil samples.

2.3 Bedrock Groundwater Elevations

Groundwater in the bedrock water-bearing zone before the start of corrective action pumping generally existed under confined or semi-confined conditions. Groundwater flow in the bedrock unit under these conditions was controlled by vertical recharge from the overlying saturated soil, by direct infiltration in areas where the bedrock flow system was semi-confined, and by the hydraulic conductivity, connectivity, and geometry of fractures in the dolostone bedrock.

2.3.1 Potentiometric Head Distribution

Under natural (non-pumping) conditions, bedrock groundwater flow followed topography in a generalized way, flowing from topographically high areas of natural recharge to discharge zones associated with streams such as Gildersleeve Brook and its tributaries. This generalized natural flow configuration has been altered by long-term corrective action pumping at the five active on-site production wells and by barriers to direct infiltration, such as buildings and parking lots, erected as the site was developed.

Plate 3 shows the potentiometric head distribution in the deep bedrock groundwater system during the period February 22 to March 22, 2011 under dynamic conditions of long-term corrective action pumping at deep bedrock production wells PW-1, -2, -4, and -25. Additional plates were created as part of the continued review of the PW-5/5A, PW-6, and PW-7 shutdown. Plate 3a shows the potentiometric head distribution in the deep bedrock during late May and early June 2011. Plate 3b

shows the potentiometric head distribution in the deep bedrock during late August and early September 2011. Plate 3c shows the potentiometric head distribution in November 2011. Figure 2-1 shows potentiometric head conditions at shallow bedrock production well PW-23 in the Southeast Quadrant. The PW-23 hydraulic capture zone is limited to the immediate vicinity of the well during periods of high groundwater elevations. Elevations recorded during the period May 25 - 31 were used to construct Figure 2-1, and show a larger hydraulic capture zone present during periods of lower groundwater elevations.

The data used in contouring Plates 3, 3a, 3b, and 3c is generally from the deepest of the bedrock wells in a well cluster and corresponds to a screened or open hole interval elevation between approximately 50 and 120 feet amsl (with the exception of shallow bedrock production well PW-23). This elevation interval generally correlates with the principal water-bearing zones in the on-site deep bedrock production wells. (The principal water-bearing zone in PW-23 is at approximately 221 feet amsl, which is significantly higher than the elevation of the principal water-bearing zones in the other production wells.) Only groundwater elevation data from wells used in contouring is shown on Plate 3, 3a, 3b, and 3c.

Groundwater flow directions are generally toward the production wells and steep horizontal gradients occur in the vicinity of the production wells. Bedrock groundwater elevations range from over 270 feet amsl at wells 529 and 542 in the Southeast Quadrant, to less than 110 feet amsl in the vicinity of on-site deep bedrock production wells PW-1, -2, -4, and -25 (Plate 3). Excluding the production wells, the lowest measured bedrock groundwater elevation shown on Plate 3 was 87.87 feet amsl at well 606 on the east side of B/334, in the area dewatered by production well PW-4.

2.3.2 Gradients and Structural Controls on Groundwater Flow

The essentially continuous withdrawal of bedrock groundwater since the early 1960s for site water supply and corrective action has altered the flow dynamics on site and the hydrogeologic conditions within the soil and bedrock water-bearing zones relative to the natural conditions that existed before the start of pumping. In response to corrective action pumping, the lowering of the potentiometric levels within the bedrock water-bearing zone on-site has resulted in a situation where formerly saturated soils are now unsaturated and where the bedrock potentiometric surface is now below the top-of-bedrock surface in some areas. Where this situation has occurred, the bedrock water-bearing zone may have been converted locally from a confined or semi-confined condition to a water table

or unconfined condition, resulting in some unsaturated zones in the upper bedrock, particularly in the area of the production wells PW-1 and PW-25.

The geometry of the bedrock groundwater potentiometric surface under the influence of long-term corrective action pumping suggests that the hydraulic characteristics of the fractured bedrock groundwater system are influenced by the bedrock's structural fabric, which generally trends north-south. This structural fabric has been created by complex folding, fracturing, and faulting. In this regard, the bedrock groundwater potentiometric surface maps (Plates 3, 3a, 3b, and 3c) show various anomalies in contour spacing and patterns of directional hydraulic conductivity that are related to the degree of fracture connectivity between wells and to the variations in directional hydraulic conductivity across the site. The patterns of drawdown and connectivity are controlled by discrete fractures. In general, the north-south features are likely the result of bedding plane fractures and faults, and the east-west features are the result of transverse fractures and faults such as cross joints and tear faults. These structural features are augmented by solution activity that has created significant voids and more permeable weathered zones in the dolostone bedrock. Such voids and weathered zones have been encountered frequently during 30 years of drilling monitoring wells at the site.

The primary controls on the directional variability of hydraulic conductivity in the bedrock are zones of high fracture connectivity such as fracture zones. Groundwater flow paths are not necessarily perpendicular to the potentiometric surface contours shown on Plates 3, 3a, 3b, and 3c because the orientation of the greatest principal hydraulic conductivity (K) of the hydraulic conductivity tensor is not necessarily parallel to the apparent hydraulic gradient. This situation is typical of a fractured bedrock aquifer, where zones of high fracture connectivity facilitate groundwater flow in directions other than those that would be determined by the apparent potentiometric head distribution as shown on the potentiometric surface contour maps (Plate 3, 3a, 3b, and 3c). Therefore, the groundwater flow arrows shown on Plates 3, 3a, 3b, and 3c represent only generalized flow directions and not the actual flow paths of groundwater "particles."

The flow rates in the bedrock aquifer are controlled by fracture geometry, orientation, density, aperture, and smoothness. These parameters are difficult to specifically characterize at this site because of the complex structural geology. As a result, meaningful bedrock groundwater flow velocities are difficult to estimate. However, a range of horizontal gradients in the deep bedrock can be estimated from Plate 3. As in previous years, these horizontal gradients generally range

from 0.1 to 0.5 (near PW-4), except in the northeast corner of the site and the eastern portion of the SEQ. The SEQ exhibits gradients on the order of 0.02 or less (except near PW-23). These estimates are similar to those from previous years.

2.3.3 Hydraulic Containment

Hydraulic containment of groundwater occurs in the bedrock within an area encompassing IBMEF's Main Site, former Recreation Center, and at least the eastern half of the former West Complex. Based on the February - March (Plate 3), May - June (Plate 3a), August - September (Plate 3b), and November 2011 (Plate 3c) potentiometric contours, the site can be divided into five areas of hydraulic capture/containment. The potentiometric contours on Plates 3, 3a, 3b, and 3c show little change in the overall pattern of groundwater flow in 2011. Until the shutdown of PW-5/5A, PW-6, and PW-7 in October 2007, these areas of capture generally had not changed significantly since the startup of PW-25 in late January 2003.

The most extensive area of capture is generated by production well PW-1 in the western third of the Main Site and the eastern half of the former West Complex. This area of capture also encompasses the bedrock beneath shallow Area D and most of the B/322 AOC. It extends to the west beyond Gildersleeve Brook and onto the former West Complex, to the northeast beyond the intersection of West Drive and Route 52, to the east in the area between B/322 and B/315, between B/321 and B/320B, and to the south toward inactive production well PW-6. The northeastern and eastern limits of the groundwater capture area are defined by localized areas of higher potentiometric head greater than 175 feet amsl in the vicinity of well 122 and greater than 205 feet amsl in the vicinity of well 130. The mound in the potentiometric surface at well 130 corresponds to a topographic high in the bedrock surface near the southeast corner of B/322 and, based on previous investigations, is inferred to be an area of low bedrock transmissivity with recharge at the limit of the perched hydrogeologic unit. The bedrock in this area is relatively unweathered with sub-horizontal (flat-lying) bedding.

A second extensive area of hydraulic capture in the bedrock is located in the northeastern quadrant of the Main Site and is the result of pumping production well PW-2. This area of capture is bounded on the west by a groundwater flow divide separating it from the area of capture for well PW-1. As discussed above, this flow divide is defined by localized areas of high potentiometric head in the vicinity of a buried bedrock ridge. On the southern boundary, a groundwater flow

divide separates flow toward PW-2 from flow toward PW-4. The area of capture includes the bedrock beneath most of shallow Areas A and B, and extends to the north at least to Route 52 and to the east at least to Lime Kiln Road and possibly to Shenandoah Road. Inactive production well PW-9 is located in the extreme northeastern corner of the site near the intersection of Route 52 and Lime Kiln Road and lies within the area captured by PW-2. PW-9 has not been pumped for a sustained period since 2003 and so does not affect the potentiometric surface in that area.

The third area of hydraulic capture is created by production well PW-4. As with PW-2, the western boundary of this area is defined by localized areas of high potentiometric head in the vicinity of a buried bedrock ridge. The eastern boundary is an area of high potentiometric head associated with the bedrock ridge in the SEQ AOC. The southeastern and southwestern boundaries are defined by the pumping centers associated with production well PW-25. The groundwater flow divide separating the PW-4 and PW-25 capture areas runs west from the northern corner of B/330C, through B/334, then northwest to the potentiometric high at well 130.

The operation of production well PW-25 creates a fourth area of hydraulic capture. The western boundary of the capture zone extends from the southwestern corner of the former West Complex to the potentiometric high at well 130. Some groundwater to the east of inactive production well PW-5/5A, formerly part of the PW-5/5A capture zone, is also captured by PW-25. As discussed above, the northern boundary this hydraulic capture zone is defined by pumping of PW-4. To the west, the groundwater divide runs from the potentiometric high at well 130 to the west of inactive production well PW-6. The capture area to the east extends to the bedrock ridge in the Southeast Quadrant, and includes the Area C (Landfill) AOC. The area of capture may extend south as far as Interstate 84 and encompasses the bedrock aquifer beneath B/330D, B/335, B/338, most of B/330C, and the southern part of B/334.

The fifth area of hydraulic capture is produced by shallow bedrock production well PW-23 (formerly well 552) in the SEQ. Groundwater flow directions and hydraulic capture appear to vary with seasonal, recharge-related fluctuations in groundwater elevation such that the extent of hydraulic capture contracts when groundwater elevations are higher. During these periods of higher groundwater elevations, the extent of downgradient hydraulic capture from PW-23 is believed to be limited to the immediate vicinity of the well. Consequently, the VOC mass intercepted by the well

is derived from the immediate vicinity of the well⁸. Figure 2-1 shows the shallow bedrock potentiometric contours in the SEQ based on May 2011 groundwater elevations.

Elsewhere in the SEQ AOC, deep bedrock groundwater is captured by the on-site pumping centers. In the eastern portion of the SEQ, the direction of groundwater flow is generally to the north in the area between Lime Kiln and Shenandoah Roads. Groundwater in the deep bedrock then flows westward back onto the Main Site where it is captured by production well PW-2.

3 GROUNDWATER CHEMISTRY

As mentioned in the previous sections, groundwater plumes composed of volatile organic compounds (VOCs) are present in both the soil and bedrock saturated zones at this site. This section presents the results of groundwater monitoring of these plumes for 2011. The results of related QA/QC sampling conducted in 2011 are also discussed.

3.1 Sampling

Sampling was conducted at locations and frequencies specified in Table A-3. A sampling record for each well and surface water location is provided on a CD in Appendix C. This CD contains purging and sampling data for all of 2011, as specified in Table 7-1 of the GMP, "IBM East Fishkill Well Record and Data Format." Purging and sampling data for the first half of 2011 was also provided in the 2011 Semiannual Data Summary Report. The data is stored in a standard database file format (SAMP11a.DBF) readable by most database and spreadsheet applications. SAMP11a.DBF contains the following information sorted by well/location number and sampling date:

1. Well or sample location number
2. Date of sample
3. Sample identification number
4. Equipment used
5. Depth to water prior to purge
6. Purge rate
7. Purge volume
8. Sampler's initials
9. Number of containers for each type of analysis
10. PID reading (if applicable)
11. Whether the well was evacuated
12. Relevant comments

Also included on the CD in Appendix C is the database file FIELD11a.DBF. This file contains field parameter data for pH, temperature, specific conductance, and turbidity for all of 2011. These parameters are measured in the field at the time of sample collection. Field parameters for the first half of 2011 were also provided in the 2011 Semiannual Data Summary Report.

Appendix C also contains a daily summary of meteorological data obtained from the National Climatic Data Center for the Dutchess County Airport, the nearest available station. Meteorological data for a given sample can be obtained by cross-referencing the date of the sample with the corresponding date in this table. Meteorological data for the first half of 2011 was also presented in Appendix C of the 2011 Semiannual Data Summary Report.

3.1.1 First Quarter 2011 Sampling

All monitoring and production wells included in the Groundwater Monitoring Plan (GMP) were sampled for all required parameters during the first quarter of 2011 with the following exception:

1. Field parameters could not be collected at well 108 because of poor well recovery after purging.

3.1.2 Second Quarter 2011 Sampling

All monitoring and production wells included in the Groundwater Monitoring Plan (GMP) were sampled for all required parameters during the second quarter of 2011 with the following exception:

1. There are no June sample results for Central Carbon System (CCS) train 1 between the lead and the lag bed (location 511). The sample vials were broken in the lab.

3.1.3 Third Quarter 2011 Sampling

All monitoring and production wells included in the Groundwater Monitoring Plan (GMP) were sampled for all required parameters during the third quarter of 2011.

3.1.4 Fourth Quarter 2011 Sampling

All monitoring and production wells included in the Groundwater Monitoring Plan (GMP) were sampled for all required parameters during the fourth quarter of 2011.

3.2 Chemistry Results

Environmental sampling, quality assurance/quality control, and additional sampling results are discussed in this section.

3.2.1 Groundwater Chemistry Results

Groundwater chemistry data for samples collected during the first through fourth quarters of 2011 (excluding the production wells and treatment systems) is presented in Appendix D. Groundwater chemistry data for the first and second quarters of 2011 was previously published in the 2011 Semiannual Data Summary Report. The presentation of the data in Appendix D conforms to the requirements of the Part 373 permit.

The concentrations of the required monitoring parameters are presented in a table in numerical ascending order by sample location and then chronologically for each sample location for the period January 1 through December 31, 2011. The inorganic data (F, As, Ni, and Cr) for 2011 is presented in Appendix D separately from the VOC data. The results for duplicate samples (split samples) collected for intralaboratory precision information during 2011 are also presented in Appendix D and are discussed in Section 3.2.2. Supplemental groundwater chemistry data from GMP and non-GMP wells sampled as part of continued monitoring of production wells PW-5/5A, PW-6, and PW-7 can be found in Appendix D.

Table 3-1 lists the maximum concentration and location of the maximum concentration during 2011 for GMP wells (not including production wells and groundwater treatment locations) for each of the chemical constituents/monitoring parameters listed in Tables 1-1 and 1-2 of the GMP. These parameters are included in the sampling program based on their detection histories and historical concentrations relative to the Part 703 New York State Groundwater Quality Standards (NYSGQS).

**Table 3-1. Maximum Groundwater Concentrations in GMP Wells during 2011 (µg/l)
(does not include production wells or groundwater treatment points)**

Parameter	NYSQS (µg/l)	Soil		Bedrock	
		Location	Conc. (µg/l)	Location	Conc. (µg/l)
*Benzene	1	none	not detected	559	1.0
Chlorobenzene	5	767	1.1	559	5.8
1,2-Dichlorobenzene	3	766	5.3	559	94
*1,2,3-Trichlorobenzene	5	none	not detected	118	440
*1,2,4-Trichlorobenzene	5	none	not detected	none	not detected
*1,3-Dichlorobenzene	3	none	not detected	960	0.25
*1,4-Dichlorobenzene	3	none	not detected	559	1.4
Dichlorodifluoromethane (Freon 12)	5	016	27	none	not detected

*Toluene	5	410	2.0	none	not detected

NYSQS - New York State Groundwater Quality Standard (6NYCRR Part 703). All concentrations have been rounded to not more than two significant figures.

* - Parameter required under the original Part 373 Permit, but not the renewed Part 373 Permit.

1 - Due to the very high concentrations of PCE in wells 572, 574 and 118, higher concentrations of these parameters may have been diluted out in the laboratory analysis for these two wells.

2 - Common laboratory contaminant.

3 - Bedrock monitoring wells are not sampled for nickel.

4 - A "general organic guidance value" of 50 µg/l has been established for this parameter (Part 702.15 of the NY State Water Quality Regulations).

3.2.1.1 Groundwater Chemistry Maps

There are at least nine separate plumes in the overburden and at least four in the bedrock. The principal constituents of the plumes are tetrachloroethene (PCE), trichloroethene (TCE), *cis*-1,2-dichloroethene (CIS), vinyl chloride (VC), and 1,1,2-trichloro-1,2,2-trifluoroethane (Freon TF). PCE, TCE, CIS, and VC are discussed as a group and are collectively referred to as the PCE-series compounds. The concentration for this group is determined by normalizing the groundwater concentrations of the transformation products of PCE so as to account for the degradation of PCE by dehalogenation, which occurs at different rates and by different processes across the site. The PCE-series concentration is calculated by multiplying the concentrations of TCE, CIS, and VC by the ratio of the molecular weight of PCE to the molecular weight of each degradation product, and then summing the products. In this way, a more meaningful picture of groundwater contaminant transport can be developed than might otherwise be the case if each of these four compounds were to be examined separately.

Isoconcentration contour maps (Plates 4, 5, 6, and 7) were prepared using groundwater chemistry data collected in January through June 2011. As required by the GMP and Part 373 Permit, these maps show the approximate limit of each plume as defined by the annual median concentration equal to 5 $\mu\text{g/l}$ of one key compound (Freon TF) or the sum of key compounds (normalized PCE-series compounds as described above). The approximate plume limits are shown as dotted 5 $\mu\text{g/l}$ contours on Plates 4 through 7 where sufficient data exists to determine the extent of each plume.

In general, these isoconcentration maps show that contaminant movement is controlled primarily by the direction of groundwater flow in the soil and bedrock. As discussed in Sections 2.3.3 and 2.3.4, site groundwater at concentrations exceeding the NYSGQS is hydraulically contained to the site by corrective action pumping of the on-site bedrock production wells. Control of contaminant movement is dependent on continued corrective action pumping.

3.2.1.1.1 VOC Plumes in Soil and Shallow Bedrock Groundwater

The soil and shallow bedrock groundwater plumes are identified by AOC, beginning with Area A. Area A contains two soil plumes of primarily PCE-series compounds (Plate 4). One of these plumes is in the till and appears to have a source near the northwest corner of B/309 with highest concentrations at well 714. There is also a small plume of Freon TF (Plate 5) in this same area.

The lateral extent of the PCE-series plume is not well defined south of well 714 (Plate 4), where the glaciolacustrine silt/clay inhibits vertical contaminant transport between the shallow soils and the till underlying the silt/clay. A second plume lies in the alluvial sand and gravel above the glaciolacustrine silt/clay and has a source on the eastern side of B/310 where concentrations are greater than 10,000 $\mu\text{g/l}$. Two GMP monitoring wells (015 and 706) and the B/384 Sump (shown on Plate 4) monitor the central portion of this plume. Based on historical data from monitoring wells that are not routinely sampled, this plume extends to the east and northeast, in the direction of groundwater flow toward the area where the silt/clay and dense till are absent northeast of B/308 near well 720 (the “B/308 sink” described in Section 2.2.1.1). The plume also extends to the southeast beneath B/386. PCE-series concentrations less than 100 $\mu\text{g/l}$ are found south of Building 386 and Shenandoah Drive (Plate 4).

Area B contains a small plume with low concentrations (less than 5 $\mu\text{g/l}$) of PCE-series compounds in soil and shallow bedrock near wells 046 (soil, Plate 4) and 628 (shallow bedrock, Plate 6). Active remediation of this plume continued in 2011 using a pump-and-treat system at well 628. Historically, PCE-series concentrations of 2 to 3 $\mu\text{g/l}$ have been detected at soil monitoring well 064 (Plate 4) along Lime Kiln Road northeast of well 628. In 2011, PCE-series parameters were not detected in the first and second quarter at well 064 (as shown on Plate 4). PCE-series concentrations were 1.8 $\mu\text{g/l}$ in the third quarter and 0.8 $\mu\text{g/l}$ in the fourth quarter. Low levels of PCE-series (generally PCE less than 1.5 $\mu\text{g/l}$) have also been detected at quarterly bedrock monitoring well 065 (Plate 6) during periods of reduced precipitation and resulting low groundwater elevations. It is believed that such conditions reduce the zone of capture at shallow bedrock well 628 and allow low concentrations of PCE-series compounds to migrate to wells 064 and 065. PCE-series parameters were not detected in 2011 at well 065. PCE-series compounds were below the NYSGQS at soil and shallow bedrock wells 064 and 065.

The B/330 AOC soil VOC plumes (Plate 4) have multiple source areas and consist primarily of PCE-series compounds. The soil groundwater plumes (Plate 4) are the source of several plumes in the underlying deep bedrock (Plate 6). One of the source areas for the B/330 AOC plumes is located beneath the south-central portion of B/330D near well 572 (Plate 4) where separate-phase PCE has been recovered during sampling of well 572. A second soil VOC plume is located on the northeast side of B/330C near well 956 (Plate 4); this plume is associated with a source in the vicinity of soil monitoring wells 576 and 178, and soil/bedrock monitoring well 574. A third soil

VOC plume is associated with a source near well 181 between B/330D and B/335; this plume appears to merge with the plume originating near well 572.

The soil VOC plume associated with the Area C (Landfill) AOC is also composed primarily of PCE-series compounds and has a source near soil/bedrock monitoring well 561 (Plate 4) and shallow bedrock well 559 (Plate 6). The Area C (Landfill) AOC soil plume (Plate 4) is bounded on the east by unsaturated soils associated with a topographic high in the bedrock, and extends downward into the bedrock (Plate 6). This soil groundwater plume extends to the west toward B/338 and into the bedrock south of deep soil monitoring well 921, where it ultimately is captured by bedrock production well PW-25. The Area C (Landfill) AOC shallow bedrock VOC plume associated with well 559 is also ultimately captured by PW-25, as shown on Plate 6.

Area D contains a small isolated soil groundwater plume (Plate 4) consisting of low levels ($< 10 \mu\text{g/l}$) of PCE-series compounds near shallow pumping well 032A. The predominant component is TCE with lesser concentrations of PCE. There are no bedrock VOC plumes associated with Area D.

The B/322 AOC contains a soil groundwater plume in the alluvial sand and gravel unit consisting primarily of PCE-series compounds (Plate 4) together with a smaller Freon TF plume (Plate 5). The PCE-series plume has a southerly component extending in the direction of groundwater flow toward wells 767 and 793 from a source near well 735 at the northeast corner of B/322, and a westerly component extending from the same source area toward extraction wells 612 and 617 of the B/322 remediation system. The Freon TF plume shown on Plate 5 has only a westerly component extending from wells 735 and 627 toward B/322 extraction wells 612 and 617, but is not detectable at the extraction wells.

The SEQ contains an elongated soil plume of PCE-series compounds approximately 800 feet long extending from a source area near soil monitoring well 048 and production well PW-23 (formerly shallow bedrock well 552) northward toward wells 987 (bedrock) and 990 (soil) along Lime Kiln Road, as shown on Plates 4 and 6. The highest PCE-series concentration in this plume (an average of $1.9 \mu\text{g/l}$) during January through June 2011 was found at well 990. PCE-series parameters were not detected in remaining SEQ wells during the first half of 2011. The plume is being actively remediated by production well PW-23. Concentrations in the shallow bedrock and soil at wells 987

and 990 along Lime Kiln Road were below the NYSGQS for all PCE series compounds. No Freon TF plumes are present in the SEQ.

3.2.1.1.2 VOC Plumes in Deep Bedrock Groundwater

In addition to the shallow bedrock plumes at the Area B, SEQ, B/330 and Area C (Landfill) AOCs, the deep bedrock contains several plumes of PCE-series compounds and Freon TF. One of the bedrock groundwater plumes is located beneath Area A and is captured by production well PW-2 (Plate 6). This Area A bedrock plume consists primarily of PCE-series compounds and has at least three significant source areas:

1. *In the shallow soil near the northwest corner of B/309 (the “B/309 sink”).* This source is suggested by a PCE-series concentration of 1300 $\mu\text{g/l}$ at bedrock well 716 (Plate 6) on the north side of B/310.
2. *In the soils at the northeast corner of B/308 (the “B/308 sink”).* As discussed in Section 2.2.1.1, contaminated groundwater in the overlying sand and gravel unit flows beyond the edge of the silt/clay at the northeast corner of B/308 and passes through relatively permeable soils and into the bedrock (Plate 2). This contaminated groundwater is ultimately captured by production well PW-2.
3. *In the deep bedrock as indicated by historical high PCE-series concentrations at well 118 (200,000 $\mu\text{g/l}$ in the first quarter of 2011).* These concentrations are indicative of dense non-aqueous phase liquid (DNAPL) in the bedrock beneath the Area A source which lies in the shallow soil above the silt/clay.

A Freon TF plume with maximum concentration of 120 $\mu\text{g/l}$ (well 716) exists in the bedrock beneath Area A (Plate 7), and is captured by PW-2. The source appears to be the “B/309 sink”. Freon TF was also detected in well 118 (2,100 $\mu\text{g/l}$). This plume is also captured by PW-2. Freon TF is present at low levels (less than 5 $\mu\text{g/l}$ in wells 739 and 742), and PW-1.

The large bedrock plume associated with the B/330 AOC (Plate 6) has its principal sources in the soil and shallow bedrock, as discussed in Section 3.2.1.1.1. The B/330 AOC plumes are captured primarily by production well PW-25 and a lesser extent by PW-4.

A small source area situated at bedrock well pair 959/960 on the northern side of B/300 (Plate 6) is captured by production well PW-25.

With regard to Freon TF in the deep bedrock, the Freon TF plume (Plate 7) in the B/330 Area is similar in shape to the western half of the PCE-series bedrock plume (Plate 6) and is captured by

production well PW-25 and also by PW-4. The highest Freon TF concentration measured in this plume is found at well 941 (290 $\mu\text{g/l}$).

The source of the low concentrations of PCE-series compounds and Freon TF at wells 739 and 742 (Plate 6 and Plate 7) is not known; however, this groundwater chemistry is captured by PW-1.

3.2.1.2 Chemistry Graphs

In addition to reviewing the 2011 VOC chemistry data with regard to the three-dimensional distribution of VOCs, the data was reviewed by graphing concentration versus time for Freon TF and PCE-series compounds in the Contaminant Reduction Monitoring (CRM) and Point-of-Compliance (POC) wells (refer to Table A-3 in Appendix A for well designations). These X-Y graphs are shown on Figures 3-1 through 3-27 and were prepared using all of the data available from 1990 through the fourth quarter of 2011. Where multiple or duplicate samples were collected during a single day, the concentration was calculated by averaging all of the data from samples collected on that day.

Some of these graphs exhibit downward concentration trends that are apparent by inspection. Other graphs suggest seasonal variations in the chemical concentrations. As required by the Part 373 Permit, the data have been statistically evaluated for trend using *WQStat Plus*⁹, a widely-used water quality statistics program. Several non-parametric tests are available in *WQStat Plus* and two of the non-parametric tests for trend were used to analyze the time versus concentration data for the CRM wells. These tests are the Mann-Kendall Test (using deseasonalized data, where possible) and the Seasonal Kendall Test (a generalization of the Mann-Kendall Test that handles seasonal data internally). These non-parametric tests do not require that the data be normally distributed, and are valid even when data are missing, tied, or censored (e.g., ND@1.0 $\mu\text{g/l}$). Statistically significant trends, where they occur, are defined at a confidence level of 90 percent or higher.

⁹Intelligent Decision Technologies, Ltd., 1998, *WQStat Plus*, version 1.56.

3.2.1.2.1 Contaminant Reduction Monitoring Wells

The results of the Seasonal Kendall Test for trend are shown on Table 3-2 for each CRM well. The statistical outcomes shown on this table are summarized below. Several statistically significant trends in concentration are noted for the period 1990 to 2011:

1. Freon TF concentrations are decreasing at Area A well 010 (soil). PCE-series concentrations are decreasing at the Area A source associated with wells 714 (soil) and 716 (bedrock), at downgradient wells 103, 104, and 016, and at the B/384 sump (sampling point 395).
2. PCE-series concentrations have increased at Area A production well PW-2.
3. Freon TF concentrations at PW-25 exhibit a statistically significant increasing trend.
4. PCE-series concentrations at Area D recovery well 032A and B/322 recovery well 612 exhibit statistically significant decreasing trends.
5. PCE-series and Freon TF concentrations at production well PW-1 exhibit increasing trends since 1990.
6. PCE-series concentrations have decreased at inactive production wells PW-7 and PW-5/5A since shutdown in 2007. PCE-series concentrations have decreased at PW-4; PW-25 began pumping in January, 2003. Prior to the start of pumping at PW-25, PCE-series concentrations showed increasing trends at production well PW-4.

The graph for Area D location 032/032A (Figure 3-3) exhibits an inflection point, or change in overall trend at the beginning of 1995, and so the trend analysis was performed only on data collected since the beginning of 1995. Similarly, the trend analysis periods for wells 943, PW-4, and for the B/384 Sump were adjusted based on an inspection of their respective graphs. The trend period for PW-5/5A and PW-7 was adjusted because pumping was discontinued at these locations in 2007. These period adjustments are noted at the bottom of Table 3-2.

**Table 3-2. Statistical Trends in Contaminant Reduction Monitoring Wells
1990-2011 (except where noted)**

Well	Figure Number	Location	Parameter	Trend	Confidence Limit	Test Type
010	3-1	Area A	PCE-Series Freon TF	No trend Decreasing	-- >95%	SK

PW-7 ⁶	3-19	Bedrock	PCE-Series Freon TF	Decreasing No trend	>95% --	SK
PW-25	3-20	Bedrock	PCE-Series Freon TF	No trend Increasing	-- >95%	SK

Test Type: SK = Seasonal Kendall test

MK = Mann-Kendall test for trend with deseasonalized data, where possible.

1 - Trend is for the period 1995-2011.

2 - Area B well 628 replaced well 863 in October, 2003.

3 - Trend is for the period 1994-2011.

4 - Location designation 395. Trend is for the period 1993-2011.

5 - Trend is for the period 2002-2011; PW-25 began pumping in January, 2003.

6 - Trend is for the period October 2007-2011, after pumping was discontinued.

Note: PW-9, which is used for water supply emergencies only, does not have sufficient data to test for trend. Well 613 is used for emergencies only, and does not have sufficient data to test for trend.

3.2.1.2.2 Point-of-Compliance Wells

The results of the Seasonal Kendall Test for trend are shown on Table 3-3 for each POC well. The statistical outcomes shown on this table indicate statistically significant decreasing trends in PCE-series concentrations at soil monitoring well 990 and at bedrock monitoring well 987. The POC wells do not show any other statistically significant trends.

Table 3-3. Evaluations of Statistical Trends in Point-of-Compliance Wells 1990-2011					
Well	Figure No.	Location	Parameter	Trend	Confidence Limit
064	3-22	Area B	PCE-Series	No trend	--
			Freon TF	No trend	--
065	3-23	Area B	PCE-Series	No trend	--
			Freon TF	No trend	--
066	3-24	Area D	PCE-Series	No trend	--
			Freon TF	No trend	--
067	3-25	Area D	PCE-Series	No trend	--
			Freon TF	No trend	--
987	3-26	Southeast Quadrant	PCE-Series	Decreasing	>95%
			Freon TF	No trend	--
990	3-27	Southeast Quadrant	PCE-Series	Decreasing	>95%
			Freon TF	No trend	--
All wells are soil monitoring wells except wells 065 and 987.					

3.2.1.3 Changes in Water Quality at Corrective Action Monitoring Wells

As required by the Part 373 Permit, statistically significant changes in water quality at the designated Corrective Action Monitoring (CAM) wells (Appendix A, Table A-2) were determined using the Mann-Whitney Test (adjusted for seasonality) for changes in median concentrations of key compounds (PCE-series and Freon TF) over time. A statistically significant change was defined at a confidence limit of 90 percent or higher. This statistical evaluation was performed by grouping the PCE-series and Freon TF data (where appropriate) such that median of the most recent samples from each well was compared to the median of the older samples collected since 1990. For wells sampled semiannually, this means that the data for 2010-2011 was compared to the data for 1990-2008. For wells sampled quarterly or monthly, this means that the data for 2011 was compared to the data for 1990-2010. In this way, the median of at least four recent samples was compared to the median of all of the older samples. Table 3-4 summarizes the results of the Mann-Whitney tests for the CAM wells.

1 – Statistical testing is for the period 2002-2011; PW-25 began pumping in January, 2003.

2 – Statistical testing is for the period October 2007-2011, after pumping was discontinued.

No other CAM wells exhibited statistically significant changes in water quality for the key compounds.

3.2.2 Quality Assurance/Quality Control Results

All GMP samples were collected in 2011 according to the procedures described in Section 2 of the GMP, except as noted in Section 3.1.1. The samples were analyzed by NYSDOH-certified laboratories using SW-846 and EPA methods for VOCs and inorganics. The 2011 field QA/QC chemistry data consists of duplicate samples, trip blanks, equipment rinse blanks, and field blanks. The duplicate samples are presented with the groundwater and production well analytical data in Appendices D and E. The trip, equipment rinse, and field blank results for all of 2011 are presented in Appendix F. QA/QC results for the first and second quarters of 2011 were previously published in the 2011 Semiannual Data Summary Report.

Laboratory precision was tested by filling multiple sampling containers from the same sampling device during each sampling round; these samples were then analyzed for the parameters of interest. Duplicate samples were generally collected once per 20 environmental samples from the groundwater monitoring wells and production wells. These duplicate sample results are indicated by the sample description “REPLICATE” in the analytical data printouts in Appendices D and E. The duplicate sample results are listed next to the corresponding primary sample results. In general, duplicate sample results are in good agreement and gross variations that would indicate serious analytical problems were not observed.

In addition to duplicate samples, trip blanks were prepared by the laboratory using analyte-free deionized (DI) water for each cooler containing VOC samples for each sampling round. The purpose of the trip blanks is to detect VOC contamination during sample transportation and storage. These trip blanks were the first items placed into each cooler by the laboratory and accompanied the empty sample containers from the laboratory to the field, and the filled sample containers from the field back to the laboratory. Environmental samples associated with each trip blank generally can be determined by the date of the trip blank (refer to “Sample Date” heading in Appendix F). 144 trip blanks were collected in 2011 as part of the Part 373 sampling program and supplemental sampling.

VOC parameters acetone, methylene chloride, and 1,2,3-trichlorobenzene were detected in at least one trip blank at concentrations less than 10 parts per billion. Acetone was detected 6 times at concentrations ranging from 1.0 to 3.3 $\mu\text{g/l}$. Methylene chloride was detected in 14 trip blanks at

concentrations ranging from 0.2 to 6.2 $\mu\text{g/l}$. Two trip blanks had 1,2,3-trichlorobenzene concentrations less than 0.4 $\mu\text{g/l}$.

Equipment rinse blanks were collected to confirm the efficiency of decontamination procedures for each sampling round by rinsing non-dedicated equipment with laboratory-supplied analyte-free DI water. 134 rinse blanks were collected in 2011 from water level indicators and non-dedicated pumps. These results are also presented in Appendix F.

Methylene chloride was detected in 37 equipment blanks at concentrations less than 1.5 $\mu\text{g/l}$. Acetone was detected eight times at concentrations less than 5 $\mu\text{g/l}$.

Although field blanks are not required by the GMP, they have been routinely collected since 2000. In 2011, 140 field blanks were collected by pouring analyte-free DI water from laboratory-prepared vials into empty VOC sample vials such that there was no headspace in the sample vials. The field blanks were analyzed for VOCs and serve to detect potential contamination from ambient air during sample collection procedures. Methylene chloride was detected 41 times at concentrations ranging from 0.2 to 1.4 $\mu\text{g/l}$. PCE was detected twice at concentrations less than 0.5 $\mu\text{g/l}$. Acetone was detected 13 times at concentrations ranging from 1.0 to 4.4 $\mu\text{g/l}$.

Considering that acetone and methylene chloride are commonly used by analytical laboratories, the relatively high number of detections of these two parameters in trip, equipment, and field blanks suggests that a low-level systematic contamination or laboratory bias may have affected all three types of QA/QC samples. Associated data was qualified as appropriate. Based on discussions with laboratory personnel, DI water used for trip, equipment and field blanks may have been cross-contaminated or incompletely processed. Upgrades to the onsite DI water system have been completed to avoid this problem in the future. Overall, the equipment rinse blank and field blank results do not suggest serious problems with field decontamination procedures.

4 CORRECTIVE MEASURES

Activities associated with the corrective action program at IBMEF are summarized in the following subsections.

4.1 Program Activities

This section discusses ongoing corrective measures activities performed throughout 2011, including groundwater pumping and treatment, and production well and treatment system maintenance.

4.1.1 Groundwater Pumping and Collection Operations

The Corrective Measures Program involves the operation of five groundwater collection and treatment systems and the monitoring of a previously remediated landfill. The groundwater collection and treatment systems are referred to as the Central Carbon, Area A, Area B, Area D, and B/322 systems and are described in Section 4.1.3. The Central Carbon System (CCS) treats groundwater from the bedrock production wells PW-1, -2, -4, -23 and -25. PW-6 was pumped for a short time period in May and PW-6 and PW-7 were pumped for several days at the end of October and the beginning of November. The wells were pumped during water supply emergencies related to problems with the off-site well fields. For the remainder of 2011, PW-5/5A, PW-6 and PW-7 were pumped for sampling purposes only as part of the production well rebalancing plan. The Areas A, B, D, and B/322 treatment systems operate in shallow remediation areas. Chemistry data for the bedrock production wells is presented in Appendix E, and chemistry data for the groundwater collection and treatment systems is presented in Appendix G.

During 2011, Main Site production wells PW-1, -2, -4, -23, and -25 were operated as groundwater withdrawal wells for the site's corrective measures program. In addition to supplementing the site's water supply, the purpose of the production well system on the Main Site is to control and contain the bedrock groundwater plumes. Contaminated groundwater from deep bedrock production wells PW-1 and -4, from shallow bedrock production well PW-23, and from PW-5/5A, -6, -7, and -9 (when operating), is pumped through trains #1, #2 and #3 of the CCS in B/316 and is treated for process water use. Trains #1, #2 and #3 are run in parallel and are separate from the other CCS trains. Contaminated groundwater from deep bedrock production well PW-2, which generally exhibits higher concentrations than the other production wells, is pumped through a separate granular activated carbon (GAC) train located in B/316. In 2011, discharge from the PW-2 GAC

train was run through trains #1, #2 and #3 of the CCS. Groundwater from PW-25 is treated by a train #4 of the CCS at B/316. In 2011, all water treated by the B/316 GAC systems was used as process water. CCS treated water may also be discharged to the Industrial Waste Treatment Facility or to surface water under a SPDES permit. Pumping data for the shallow remediation areas and Main Site deep bedrock production wells is presented in Table 4-1.

Table 4-1. 2011 Pumping Volumes		
Remediation Area or Well	Gallons Pumped	Average 2011 Flow Rate (GPM)
PW-1	93,943,941	179
PW-2	60,683,381	115
PW-4	66,300,422	126
PW-5/5A*	96,000	0.2
PW-6*	619,299	1.2
PW-7*	339,388	0.6
PW-25	110,051,494	209
Area A	705,836	1.3
Area B	5,367,970	10.2
Area D	1,284,500	2.4
B/322 (612, 613, 617, 618)	6,785,104	12.9
Southeast Quadrant (PW-23)	4,610,453	8.8
Total	350,787,788	667
Pumping volumes are not shown for PW-9, which was not pumped.		
*Pumps operated for purging and sampling purposes only, except as noted in Section 4.1.1		

Except for periods of maintenance, production wells PW-1, -2, -4, -23, and -25 generally operated continuously throughout 2011. Except for several short water supply emergencies, PW-5/5A, PW-6 and PW-7 have been operated for sampling purposes only since they were shut down on October 22, 2007 as part of the production well rebalancing plan. PW-9 is only used during water supply emergencies and was not pumped during 2011.

4.1.2 Contaminant Removal

Contaminant mass removal was calculated for 2011 using annual median concentration data, together with annual pumping volumes for each shallow remediation area and bedrock production well. Table 4-2 shows that approximately 160 pounds of VOCs were recovered during 2011 from nearly 19 million gallons of extracted groundwater in shallow remediation Areas A, B, and D, plus B/322 (wells 612, 617, 618), and Southeast Quadrant shallow bedrock production well PW-23. Virtually all of the VOC mass recovered in 2011 from the shallow remediation areas came from Area A. The mass recovered from Area B, Area D, B/322, and PW-23 was less than 0.05 pound for each remediation area.

Table 4-2. 2011 Contaminant Recovery Levels Shallow Remediation Areas (lbs)					
Area (Well)	CIS	Freon TF	PCE	TCE	Total by Area
Area A	0.61	0.58	160	3.8	160
Area B	0.0	0.0	0.030	0.0	0.030
Area D	0.0051	0.0	0.010	0.026	0.041
B/322 (612, 613, 617, 618)	0.0013	0.0	0.0	0.0022	0.0035
SEQ (PW-23)	0.0	0.0	0.0	0.028	0.028
Total by Compound	0.62	0.58	160	3.9	160*

*Total pounds removed is the sum of the mass removed by area. This number may not match the sum of the mass removed by compound because of rounding. All calculations are reported to two significant figures.

Table 4-3 shows the contaminant recovery levels for the deep bedrock production well system. Approximately 4.8 tons of VOCs were recovered during 2011 from approximately 332 million gallons of groundwater extracted from the deep bedrock. As was the case in previous years, most of the VOC mass removed from the deep bedrock groundwater system (91 percent) came from production well PW-2. A significant fraction of the VOC mass (8.1 percent) was removed by production well PW-25.

Table 4-3. 2011 Contaminant Recovery Levels Deep Bedrock Production Wells (lbs)					
Well	CIS	Freon TF	PCE	TCE	Total by Well
PW-1	1.6	2.3	16	6.7	27
PW-2	630	140	7,100	840	8,700
PW-4	2.3	2.2	83	24	110
PW-5/5A	0.0	0.0	0.0	0.0	0.0
PW-6	0.0	0.0	0.0	0.0	0.0
PW-7	0.0059	0.0	0.018	0.0068	0.031
PW-25	50	19	550	160	780
Total by Compound	680	160	7,700	1,000	9,600*

*Total pounds removed is the sum of the mass removed by well. This number may not match the sum of the mass removed by compound because of rounding. All calculations are reported to two significant figures.

4.1.3 Groundwater Treatment System Operations

Appendix G presents analytical data for 2011 relating to the efficiency of the groundwater recovery and treatment systems for Area A, Area B, and the Deep Bedrock Production Wells and PW-23 (SEQ AOC), and for groundwater recovery from Area D and the B/322 AOC. Data for the first half of 2011 was previously published in the 2011 Semiannual Data Summary Report. Treatment efficiency and maintenance issues are discussed below.

4.1.3.1 Area A

Treatment efficiency at Area A is calculated from monthly samples collected from the B/384 Sump (sample point 395), the influent storage tank (sample point 395A), and the effluent from the stripping tower (sample point 395B). Results for these sampling points are presented in Appendix G and indicate removal efficiency, based on the ratio of influent (395A) to effluent (395B) concentrations, greater than 99 percent. The average flow rate was 1.3 gpm.

4.1.3.2 Area B

Treatment efficiency for Area B is calculated from monthly samples collected from the influent (well 628), from between the GAC units (sample location 628B), and from the effluent from the lag GAC unit (sample location 628A). Results for these sampling points are presented in Appendix G and indicate typical removal efficiency, based on the ratio of influent to effluent concentrations, of greater than 99 percent. Total VOC influent concentrations at Area B ranged from 0.5 to 1.5 $\mu\text{g/l}$. The average flow rate was 10.2 gpm.

4.1.3.3 Area D

Effluent from well 032A is pumped to the site's Water Pollution Control Facility (WPCF). The average flow rate in 2011 was approximately 2.4 gpm. Groundwater concentrations determined from the sampling port of groundwater extraction well 032A ranged from 1.6 to 2.9 $\mu\text{g/l}$ for TCE, and 1.0 $\mu\text{g/l}$ or less for all other parameters, including PCE and CIS. Influent chemistry data for Area D is presented in Appendix G.

4.1.3.4 B/322 AOC

The B/322 remediation system started up in January 2000 and pumps from extraction wells 612, 613, 617 and 618 to a small pump house whereby the extracted water is discharged to the WPCF. Well 613 is a backup well that was not pumped for a significant period in 2011.

The monthly analytical data for extraction wells 612, 617, and 618, and for the combined discharge from the B/322 containment system (sample location 360) are presented for January through December 2011 in Appendix G. The total VOC concentration in the combined discharge ranged from not detected to 0.6 $\mu\text{g/l}$ in 2011. The average combined flow rate for wells 612, 617, and 618 was 12.9 gpm in 2011.

4.1.3.5 Central Carbon System, PW-2, and PW-25

Treatment efficiency for the Central Carbon System (CCS), which normally handles the discharge from production wells PW-1, -4, -5/5A, -6, -7, -9, and -23, is determined from monthly samples collected from the blended influent to the CCS (location 500), from between the lead and lag carbon beds (locations 511-513) for GAC trains 1, 2, and 3, and from the blended effluent from the CCS (location 555). In 2011, the CCS also handled the discharge of the PW-2 GAC effluent (location 080). The PW-2 effluent joins CCS downstream of the blended influent but before the lead carbon beds; therefore location 080 data is used to calculate CCS removal efficiency. Data for these sampling points is presented in Appendix G.

Treatment efficiency for the production well PW-2 treatment system, when operated separate from the CCS, is determined from sampling of PW-2, from between the lead and lag carbon beds of the PW-2 GAC train (sample point 221), and from the effluent of the PW-2 GAC train (sample point 080). Data for production well PW-2 is presented in Appendix E. Data for sampling points 221 and 080 is presented in Appendix G.

Treatment efficiency for the PW-25 treatment system, which is also separate from the CCS, is determined from sampling of PW-25, from between the lead and lag carbon beds of the PW-25 GAC train (sample point 514), and from the effluent of the PW-25 GAC train (sample point 524). Data for sampling points 514 and 524 is presented in Appendix G.

Results for the sampling points in the CCS indicate removal efficiency, based on the ratio of influent (locations 500 and 080) to effluent (location 555) concentrations, is typically greater than 96 percent for the CCS. Treatment efficiency of the PW-2 train prior to discharging to the CCS was greater than 99 percent. Treatment efficiency for the PW-25 train is typically greater than 98 percent. In 2011, discharge from the PW-25 treatment system and the CCS was used for process purposes water, eventually discharging to surface water under permit via the Industrial Waste Treatment Facility.

4.1.4 Groundwater Treatment System and Production Well Maintenance

The following groundwater treatment system and production well maintenance activities were performed in 2011:

The Area B granular activated carbon was replaced on November 11, 2011.

The pump and motor were replaced in B/322 remediation system well 618 on March 11 and December 9, 2011.

A rebuilt pump and motor and a new check valve were installed in PW-25 on August 30, 2011. The rebuilt equipment subsequently failed, and a new pump and motor were installed on September 23, 2011.

4.2 Other Activities and Issues

This section addresses activities undertaken in 2011 that relate to the groundwater monitoring program at IBMEF. Activities planned for 2012 are also discussed.

4.2.1 Groundwater Well Installation and Maintenance Activities Performed in 2011

A well inventory was performed in the second and third quarter 2011. During this inventory, the depth to bottom was measured to check for siltation in all Hydraulic Effectiveness Monitoring wells

(Appendix A, Table A-1), including wells in the Corrective Action Performance Monitoring Network (Appendix A, Table A-2). Wells were inspected for damage and for the condition of the protective casings. Wells were also checked for the presence and condition of locks, identification tags, survey marks, sanitary seals, and caps. Follow-up work such as well development, painting and repair of protective casings, well seals, and locks was performed as required. As discussed in Section 4.2.5, a replacement extraction well was installed in Area D.

4.2.2 Production Well Rebalancing

In 2007, IBM began implementing a plan to rebalance the on-site production well operations in order to optimize mass recovery and containment. The first step in this plan commenced in October 2007, with the availability of municipal water, and consisted of the termination of pumping at PW-5/5A, PW-6, and PW-7 for a trial period of one year. Pumping at these wells was terminated on October 22, 2007, and the wells will continue to be maintained in an operational condition until completion of the test plan and final data analysis. The post-shutdown monitoring plan involved collection of groundwater elevation and chemistry samples at intervals of one week, one month, three months, six months, and twelve months after shutdown. A summary report¹⁰ was submitted to NYSDEC during the first quarter of 2008 describing the first three months of shutdown activities. A second report submitted in the third quarter 2008 following the six month post-termination data collection¹¹. In 2011, IBM has continued monitoring the post-shutdown bedrock groundwater potentiometric surface (Plate 3, 3a, 3b, 3c). Groundwater sampling has continued at all CAP wells listed in Appendix A-3 and at three non-CAP wells (Appendix D). A comprehensive report will be submitted following final data analysis.

4.2.3 B/330D IW and Sanitary Line Investigation

In 2009, sampling of the B/330D industrial waste (IW) and sanitary lift stations revealed low levels of PCE. IBM informed NYSDEC of the B/330D lift station results via teleconference and a letter in 2009.

¹⁰ IBM Environmental Engineering and Groundwater Sciences Corporation, February 29, 2008, *Field Observation of Alternate Groundwater Extraction Operations: Three Month Data Summary*.

¹¹ IBM Environmental Engineering and Groundwater Sciences Corporation, July 18, 2008, *Field Observation of Alternate Groundwater Extraction Operations: Six Month Data Summary*.

One potential source was a condensate lift station located on the east side of B/330D where elevated levels of PCE were detected. An abandoned, below ground B/335 drain line connected to a B/330D condensate lift station contained groundwater contaminated with PCE. This ductile iron pipe was disconnected from the condensate lift station and capped in February 2010.

Another potential source of PCE was the B/330D original under slab gravity IW system which was no longer in use but connected to the currently used overhead drain system on the west side of B/330D. It was suspected that contaminated groundwater or vapors were entering the IW system through this connection. The overhead drain system was disconnected from the under slab system in December 2009. Elevated levels of PCE continued to be detected in the B/330D IW lift station after this work was completed.

IBM continues to monitor PCE in the IW and sanitary lift station to determine whether there is a correlation between PCE levels and the operation of the B/330D subslab vapor extraction system which was placed on-line at the end of 2010.

4.2.4 VOC Source Assessment RCRA Facility Investigation (RFI)

IBM is conducting work according to its June 2009 “Workplan: RCRA Facility Investigation (RFI) VOC Source Assessment”¹², to address the known and potential presence of volatile organic compounds in indoor air within certain occupied buildings in the IBM East Fishkill Facility. This work plan was approved by NYSDEC and NYSDOH on July 10, 2009¹³.

A subslab vapor extraction system was completed in B/330D in 2010, and is performing well, as described in the performance report submitted to the Agencies in December 2011. A second subslab vapor extraction system was completed in B/310 in 2012, and also appears to be functioning well. A performance report on the B/310 subslab vapor extraction system is planned for submittal to the Agencies in late 2012.

¹² IBM Environmental Engineering to NYSDEC and NYSDOH, June 15, 2009, Work Plan, *RCRA Facility Investigation (RFI), VOC Source Assessment*.

¹³ NYSDEC to IBM Environmental Engineering, July 10, 2009, *Approval of RFI Work Plan, VOC Source Assessment*.

4.2.5 GW-032A Replacement Project

The pump in Area D recovery well 032A failed in early June 2010. The pump was removed from the well and replaced on June 15, 2010, and the well was returned to service. Subsequent investigation found an apparent break in the well screen near the bottom of the well. IBM determined that replacement of the well was necessary, and on April 25, 2011 IBM submitted a work plan to NYSDEC entitled “Work Plan for Recovery Well GW-032A Replacement, Remediation Area D”¹⁴. This work plan was approved by NYSDEC on May 3, 2011¹⁵. On June 14, 2011 a replacement extraction well, GW-032B, was installed. Development and pump testing were completed by the middle of July, and a summary report was sent to NYSDEC on September 12, 2011¹⁶. Pending NYSDEC approval of GW-032B as a suitable replacement well, IBM plans to proceed with the work plan in 2012.

4.2.6 Chloroform Detections in Groundwater

Beginning in August 2007, municipal water from the Poughkeepsies’ Water Treatment Facility via the Central Dutchess Water Transmission Line has been the site’s potable water source. Periodically, IBM conducts flushing of the water supply lines, discharging water with NYSDEC approval to the site storm drains after the water has been dechlorinated. Chloroform has been detected in several groundwater wells near the discharge sites, most notably near Area B extraction well 628, near the site of the potable water influent storage tanks. In 2011, IBM discovered a break in a municipal water supply line near well 720, which shows chloroform levels consistent with the municipal water supply. The line was replaced in March and April 2012 and was placed in service on April 28, 2012. Table 4-4 shows chloroform detections greater than 1 $\mu\text{g/l}$ observed in groundwater monitoring wells and the Area B extraction well. The concentrations in Table 4-4 are consistent with levels found in the potable water supply. Chloroform is not a parameter of concern on the site, and concentrations listed are not included in any calculations or summaries in other sections of this report. IBM will continue to monitor chloroform results in groundwater.

4.2.7 Well Installation and Maintenance Activities Planned for 2012

IBM plans to continue its annual inventory of monitoring wells, repairing wells as necessary. Well installation in Area D is discussed in Section 4.2.5.

4.3 Evaluation of Progress

This section summarizes the progress to date regarding corrective measures at IBMEF, including groundwater withdrawal and treatment, hydraulic control of groundwater flow, and detection trends in site groundwater.

Essentially continuous pumping at PW-1, -2, -4, -23, and -25 was accomplished for all of 2011. Hydraulic control and capture of the dissolved VOC plume in the bedrock groundwater system is

being maintained by the operation of the groundwater production wells, as illustrated on Plates 3, 3a, 3b, and 3c. The potentiometric surface shown on these plates illustrates hydraulic control and capture of the dissolved VOC plume in the bedrock groundwater system has been maintained following production well rebalancing.

Treatment of groundwater by the Area A, Area B, and Central Carbon/PW-2/PW-25 treatment systems and extraction of groundwater by the Area D and B/322 remediation systems continued throughout the year. GAC-treated groundwater from the B/316 carbon systems was used as process water. In 2011, approximately 9,800 pounds of VOCs were removed from approximately 351 million gallons of groundwater pumped from the shallow soil and deep bedrock remediation areas. Since 1979, approximately 152 tons of VOCs have been removed from approximately 12.0 billion gallons of extracted groundwater.

Groundwater sampling activities will continue in 2012 at 179 monitoring wells and sampling points listed in the Groundwater Monitoring Plan and groundwater elevations will be measured quarterly at 392 HEM wells.

 - 10— Freon TF Concentration Contour (ug/l)
 - 1.1— Freon TF Concentration (ug/l)
 - 5— Approximate Limit of Plume as Defined by Annual Median Concentration Equal to 5 ug/l of Freon TF
 - Extent of Clay Mapping
 - Extent of Glaciolacustrine Clay (East Complex only)
 - Inferred Areas of No Saturated Soil (Approximate)

Note: All concentrations have been rounded to a maximum of two significant figures.

Concentrations greater than the MDL but less than the RL, which is 1.0 ug/l x DF for most compounds, are also reported by the laboratory (MDL=Method Detection Limit, RL=Reporting Limit, and DF=Dilution Factor). The MDL varies by compound but is less than the RL for the 23 key compounds at the site. Values greater than the MDL but less than the RL should be considered estimates that would typically be flagged with a "J" qualifier.

The PCE-series concentration is a calculated concentration that uses the weighted sum of four constituent VOC concentrations. In performing this calculation, compounds that were "not detected" are treated as zeroes, and the resulting PCE-series concentration is shown as "0" on the Plates 4 and 6 if none of the four PCE-series constituents was detected. However, the Freon TF concentration is not a calculated concentration; therefore, the concentrations posted on Plates 5 and 7 are shown as less than the RL, which is <1.0 ug/l times the DF where Freon TF was not detected.

Data from January through June 2011, median data plotted where appropriate (i.e. extraction locations, quarterly locations, etc.).

The PCE-series concentration is a calculated concentration that uses the weighted sum of four constituent VOC concentrations. In performing this calculation, compounds that were "not detected" are treated as zeroes, and the resulting PCE-series concentration is shown as "0" on the Plates 4 and 6 if none of the four PCE-series constituents was detected. However, the Freon 113 concentration is not a calculated concentration; therefore, the concentrations posted on Plates 5 and 7 are shown as less than the RL, which is <1.0 ug/l times the DF where Freon 113 was not detected.

Data from January through June 2011, median data plotted where appropriate (i.e. extraction locations, quarterly locations, etc.).

 - ★ Inactive Bedrock Extraction Well (as of mid-January 2003)
 - ★ Shallow Extraction Well
 - 10 --- Freon TF Concentration Contour (ug/l)
 - 3.7 --- Freon TF Concentration (ug/l)
 - 5 --- Approximate Limit of Plume as Concentration Equal to 5 ug/l of Concentration Equal to 5 ug/l of Freon TF

Note: All concentrations have been rounded to a maximum of two significant figures. "0" means not detected.

Concentrations greater than the MDL but less than the RL, which is 1.0 ug/l x DF for most compounds, are also reported by the laboratory (MDL=Method Detection Limit, RL=Reporting Limit, and DF=Dilution Factor). The MDL varies by compound but is typically less than the RL for the 23 key compounds at the site. In general, values greater than the MDL but less than the RL should be considered estimates that would typically be flagged with a "U" qualifier.

The PCE-series concentration is a calculated concentration that uses the weighted sum of four constituent VOC concentrations. In performing this calculation, compounds that were "not detected" are treated as zeroes, and the resulting PCE-series concentration is shown as "0" on the Plates 4 and 6 if none of the four PCE-series constituents was detected. However, the Freon TF concentration is not a calculated concentration; therefore, the concentrations posted on Plates 5 and 7 are shown as less than the RL, which is <1.0 ug/l times the DF where Freon TF was not detected.

Data from January through June 2011, median data plotted where appropriate (i.e. extraction locations, quarterly locations, etc.).

Key:

M.P. = Measuring Point

ft amsl = feet above mean sea level

All coordinates in feet relative to site grid

Table A-2: Well Specifications

Key:

Landfill = Landfill (Area C)

B/330 = Building 330 (Area C)

B/322 = Building 322

SEQ = Southeast Quadrant

BR = Bedrock

WC = West Complex

NA = Not applicable or not available

ft amsl = feet above mean sea level

M.P. = measuring point (generally a survey mark at top of inner monitoring pipe or casing)

Key:

Landfill = Landfill (Area C)
 B/330 = Building 330 (Area C)
 B/322 = Building 322
 SEQ = Southeast Quadrant
 BR = Bedrock
 WC = West Complex

A = Annual
 S = Semiannual

CAM = Corrective Action Monitoring
 PCT = Process Control for Treatment
 CRM = Contaminant Reduction Monitoring
 POC = Point of Compliance Monitoring
 DM = Detection Monitoring
 AM = Annual Monitoring

Q = Quarterly
 M = Monthly
 M* = Monthly when used as a backup well
 * = PW-9 and GW613 are sampled only when in use.
 Current status for both wells is emergency use only.

All listed monitoring wells are hydraulic effectiveness monitoring wells. Refer to Table A-1 for complete list.

X = Sample all listed wells for Volatile Organics.

X1 = Sample for Total Fluoride and Chromium (dissolved & total) .

X2 = Sample for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X3 = Sample annually for Nickel (dissolved & total).

X4 = Sample quarterly for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X5 = Sample monthly for Total Fluoride, Arsenic (dissolved & total) and Chromium (dissolved & total).

X6 = Sample quarterly for Inorganics only when in use. (PW-9 is used only for emergencies.)

Key:

FLOW: Flowing Water

NA: Not Accessible

All Elevations are in feet above mean sea level

4/27/2012

QUALITY CONTROLLED LOCAL CLIMATOLOGICAL DATA

Effective January, 2005, flags will be available for most data elements:

If data are suspect:

s will appended to the value on the web form

s will be placed in a column following the suspect value in the ASCII form

If data are flagged as erroneous, it will not be printed.

**NOTICE OF CHANGE:

Effective July 28, 2000, observations contained in the Quality Controlled Local Climatological Data Hourly Observations table are reported in whole degrees Fahrenheit. The dry bulb, dew point and wet bulb temperatures were originally reported to the nearest tenth of a degree Fahrenheit. The Automated Surface Observing System (ASOS) records temperatures and dew points in whole degrees Fahrenheit and converts these values to the nearest tenth of a degree Celsius for observation transmission. Until this date, these values online have incorrectly been converted back to the nearest tenth of a degree Fahrenheit, implying a level of precision that is not present at the instrument level. We apologize for any inconvenience this may cause.

The Automated Weather Observing System (AWOS) generally records temperatures and dew points in whole degrees Fahrenheit and converts these values to the nearest whole degree Celsius for observation transmission. Also, AWOS stations will often have less data (i.e., fewer weather elements) than ASOS stations.

NCDC forms contain:

whole degree Celsius temperature values for AWOS stations

tenths degrees Celsius temperature values for ASOS stations

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation

D	Compound identified at a secondary dilution factor (Organics)
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit

Explanation of Reporting Conventions and Key to Comment Codes

Reporting Conventions

NA	Not Analyzed
ND@X	Not Detected at Detection Limit X

Code	Explanation

B	Compound detected in the associated method blank at a concentration that may have contributed to the sample result
J	Estimated value - compound meets identification criteria, but result is less than the reporting limit

Appendix G

Groundwater Treatment Analytical Data (Organics): January 1, 2011 to December 31, 2011

Groundwater Treatment Analytical Data (Inorganics): January 1, 2011 to December 31, 2011
