Re: Final Engineering Report and 2001 Soil Remediation Report; Beekman Highway Garage, Hamlet of Poughquag, New York;  
NYSDEC Site #3-14-094;  
PVE Sheffler File #160581

Dear Mr. Candiloro:

Conrad Geoscience, now a division of PVE Sheffler, LLC has been responsible for the remediation, monitoring and maintenance of the Beekman Highway Garage since 2001. NYSDEC has requested that PVE Sheffler prepare a document which can serve as the Final Engineering Report for the site. Attached is the Soil Remediation Report, prepared by Conrad Geoscience in 2001, which outlines the excavation and disposal of contaminated soil from the site, along with confirmatory soil samples which demonstrate soil quality post-remediation. Summarized below is a description of the site history, remedial actions undertaken in 2001 and ongoing site management.

## BACKGROUND

The Town of Beekman Highway Garage inactive hazardous waste disposal site is located on Town property at the intersection of County Route 7 and Gardner Hollow Road in the Hamlet of Poughquag, Town of Beekman, Dutchess County, New York (Figure 1). The site is situated in the north-central part of the 10-acre Town property. Selected site features are shown in Figure 2. The Highway Garage is listed as a site #3-14-094. Contaminants from site related operations resulted in contamination of local groundwater. A list of all investigation reports is listed below in chronological order:

- Preliminary Site Assessment (PSA) – May 1996
- Order on Consent – July, 1997
- Remedial Investigation (RI) – March 1998
- Focused Feasibility Study (FFS) – March 1999
- Proposed Remedial Action Plan (PRAP) – February 1999
- Record of Decision (ROD) – November 1999

- Soil Remediation Report – April 2001
- Site Management Plan – June 2010; Revised May 2013

Since the site contains remaining contamination after completion of the remedial action, Engineering Controls have been incorporated into the site remedy to provide mitigation of future vapor intrusion and to monitor the natural attenuation of groundwater contaminants in order to ensure protection of public health and the environment. A Deed Restriction has been granted to the NYSDEC, and recorded with the Dutchess County Clerk, that provides an enforceable legal instrument to ensure compliance with this SMP and all ECs and ICs placed on the site. The ICs place restrictions on site use, and mandate operation, maintenance, monitoring and reporting measures for all ECs and ICs. This SMP defines the EC's and IC's and specifies the methods necessary to ensure compliance with all ECs and ICs required by the Deed Restriction for contamination that remains at the site. This plan has been approved by the NYSDEC, and compliance with this plan is required by the grantor of the Environmental Easement and the grantor's successors and assigns.

## FINAL SOIL REMEDIATION REPORT

This document presents the Soil Remediation Report from 2001 as the Final Engineering Report in order for the NYSDEC to issue a Certificate of Completion for the site. Below is a summary of the findings and conclusions of this report.

- Contaminants in this area included the petroleum constituents benzene, toluene, ethylbenzene, and xylene (BTEX). The chlorinated solvent perchloroethylene (PCE), which is not a fuel constituent, was also present. The depth of contamination ranged from 3 to 14 feet below ground surface beneath an area covering approximately 1,100 ft<sup>2</sup>.
- Between December 4 and 7, 2000, Conrad Geoscience supervised the excavation and stockpiling of approximately 650 cubic yards (1,011 tons) of contaminated soil from an area measuring approximately 1,500 square feet and averaging 11 feet in depth.
- Twenty-two post-excavation soil samples (PE-1 through PE-22) were collected from the floor and sidewalls.
- No undissolved product was observed during soil removal. No VOCs were detected in any of the 15 sidewall post-excavation samples at concentrations exceeding recommended soil cleanup objectives
- Only one of the seven floor samples contained VOCs at concentrations exceeding recommended soil cleanup objectives (PE-21). Sample PE-21 contained several VOCs at elevated concentrations: ethylbenzene 21,400 ug/kg; m,p-xylene 77,800 ug/kg; o-xylene 27,200 ug/kg; isopropylbenzene 5,680 ug/kg; n-propylbenzene 18,500; 1,3,5-trimethylbenzene 38,300 ug/kg; 1,2,4-trimethylbenzene 142,000 ug/kg; and naphthalene 49,500 ug/kg. Total VOCs for PE-21 were 373,520.
- None of the other post-excavation soil samples collected from the floor of the excavation exceeded soil cleanup objectives. The value of total VOC concentrations in PE-22 is listed incorrectly; the correct total VOC concentration is 1,612.8 ug/kg. Total VOC concentrations from bottom of excavation samples (PE-1, PE-4, PE-13, PE-14, PE-15 and PE-22) ranged from 6.15 ug/kg (PE-16) to 1,612.8 ug/kg (PE-22).

- The Soil Remediation Report attached (April, 2001) contains tables that include all post excavation soil data.

The attached certification statement attests to the accuracy and completeness of the information contained herein. If you have any questions, please do not hesitate to contact me. Please contact me with any comments or questions.

Sincerely,

PVE Sheffler, LLC

Christopher B. Brown, CPG

Town of Beekman Clerk

I, James M. Venture, am currently a registered professional engineer licensed by the State of New York.

I certify that the data submitted to the Department with this Report (2001 Soil Remediation Report) demonstrates that the remediation requirements have been or will be achieved in accordance with the time frames, if any, established in for the remedy.

I certify that a Site Management Plan has been submitted for the continual and proper operation, maintenance, and monitoring of all Engineering Controls employed at the Site, including the proper maintenance of all remaining monitoring wells, and that such plan has been approved by Department.

I certify that all information and statements in this certification form are true. I understand that a false statement made herein is punishable as a Class "A" misdemeanor, pursuant to Section 210.45 of the Penal Law. I, James M. Venture of PVE Sheffler, LLC, am certifying as Owner's Designated Site Representative for the site.

Remediation Report

TB000013

April 26, 2001

Page 1

## **1 SOIL REMOVAL & DISPOSAL IN FORMER UST AREA**

Remediation has been completed at the Beekman Highway Garage, as set forth in the Remedial Design/Remedial Action plan dated October 2000. The Beekman Highway Garage property is owned by the Town of Beekman, and remediation was carried out under the terms of the consent order between the Town and the New York State Department of Environmental Conservation (NYSDEC) executed in 1997. The remedial program consists of two main parts: 1) Soil removal/disposal in the former fuel tank area; and 2) Groundwater monitoring. This report summarizes the soil removal tasks. Results of groundwater monitoring, which is to be conducted annually, are summarized in a separate report.

Between December 2000 and March 2001, Conrad Geoscience Corp. completed remediation of contaminated soil in the former underground storage tank (UST) area where one gasoline UST and one diesel UST are believed to have leaked. The gasoline tank was removed in 1989. The diesel tank was removed in 1993. No soil contamination was reported at the time of those tank removals, and no spills were reported to the NYSDEC. Volatile organic compounds (VOCs) were detected in the former tank area during the 1997 Remedial Investigation, and contaminated soil was subsequently determined to be present from the surface down to a depth of 14 feet. Depth to groundwater on site is approximately 12 feet below grade.

### **1.1 Excavation & Stockpiling**

Prior to the start of soil excavation, Conrad Geoscience measured in the locations of previous soil borings and the perimeter of soil contamination previously established during the RI/FS (Figure 1). The perimeter was marked on the surface of the pavement with spray paint.

Between December 4 and 7, 2000, Conrad Geoscience supervised the excavation and stockpiling of approximately 650 cubic yards (1,011 tons) of contaminated soil from an area measuring approximately 1,500 square feet and averaging 11 feet in depth. Soil was removed using a track excavator, and was temporarily stockpiled near the western end of the Highway facility. Contaminated soil was placed on 6-mil polyethylene sheeting. Each pile was covered by additional sheets of polyethylene sheeting. Sorbent booms were placed around the perimeter of each pile.

Soil was removed from the UST area to a maximum depth of approximately 11-12 feet, which coincides roughly with the depth of the top of the saturated zone (water table.) A photoionization detector (PID) was used to monitor for the presence of volatile organic compounds (VOCs) in soil as it was removed from the ground. Field PID readings were used to make decisions about widening and deepening the excavation.

In the western part of the excavation, the sidewalls of the 1993 diesel UST excavation were clearly visible. Non-stratified fill material exhibiting high PID readings was excavated from this area, suggesting that contaminated soil removed during the diesel UST exhumation was returned to the hole following removal of the tank. The disturbed fill material contained pieces of broken asphalt, and contrasted sharply with the well-stratified soil exposed in the undisturbed sidewalls of the new excavation.

Final dimensions of the excavation are depicted in Figures 1 and 2. Based on field PID readings and the practical infeasibility of deepening the excavation below the water table at the 12-foot depth, excavation was terminated on December 6, 2001. The excavation was then backfilled to original grade with clean soil. Repaving of the excavated area is scheduled for spring 2001.

## 1.2 Soil Sample Collection

Twenty-two post-excavation soil samples (PE-1 through PE-22) were collected from the floor and sidewalls as excavation progressed (Figures 1 & 2). These were collected to establish soil quality along the base and perimeter of the excavation. Sidewall samples ranged in depth from 6 to 8 feet below grade. Floor samples were taken from a depth of approximately 12 feet, the average depth of the excavation.

Thirteen soil samples were collected for waste characterization purposes. Of these, three (C-1, C-3 and C-4) were collected directly from the open excavation (Figure 1), and ten were collected from the soil stockpiles. Waste characterization samples were collected from every 20 cubic yards of contaminated soil and were combined for a minimum of one composite sample for every 60 yards excavated.

Additionally, three grab samples (G-1, G-2 and G-3) were collected from the vicinity of the former diesel tank and analyzed for VOCs and SVOCs via EPA Method 8260 and 8270, respectively (Figure 1).

Sample containers were labeled with the date and time of collection, analysis requested, and sampler's initials. Chain-of-custody forms accompanied samples to the laboratory. Soil samples were analyzed by Paradigm Environmental Services, Inc. (New York License #10958).

## 1.3 Soil Sample Analysis

Post-excavation soil samples were analyzed for VOCs via EPA Method 8260, and for SVOCs via EPA Method 8270.

Waste characterization samples were analyzed for VOCs (EPA Method 8021 [STARS]) and SVOCs (EPA Method 8270) via the Toxicity Characteristic Leachate Procedure (TCLP); total lead; and ignitability.

Copies of laboratory reports for post-excavation and waste characterization soil samples are appended (Appendix A).

### 1.3.1 Post-Excavation Soil Samples

Table 1 and Figure 2 provide a summary of VOCs detected in post-excavation soil samples. Table 2 provides a summary of SVOCs detected in post-excavation soil samples.

No undissolved product was observed during soil removal. No VOCs were detected in any of the 15 sidewall post-excavation samples at concentrations exceeding recommended soil cleanup objectives. Sidewall samples PE-3, PE-5, PE-6, PE-8, PE-12, PE-18 and PE-19 contained no detectable VOCs. Sidewall samples PE-7, PE-9, PE-10, PE-11, PE-14, PE-16, PE-17 and PE-20 contained total VOCs ranging from 6.15 ug/kg to 503.4 ug/kg.

Only one of the seven floor samples contained VOCs at concentrations exceeding recommended soil cleanup objectives (PE-21). Sample PE-21 contained several VOCs at elevated concentrations: ethylbenzene 21,400 ug/kg; m,p-xylene 77,800 ug/kg; o-xylene 27,200 ug/kg; isopropylbenzene 5,680 ug/kg; n-propylbenzene 18,500; 1,3,5-trimethylbenzene 38,300 ug/kg; 1,2,4-trimethylbenzene 142,000 ug/kg; and naphthalene 49,500 ug/kg. Total VOCs for PE-21 were 373,520. This sample location is believed to squarely underlie the footprint of the former diesel UST.

None of the other post-excavation soil samples collected from the floor of the excavation exceeded recommended cleanup guidelines. Total VOCs for floor samples PE-1, PE-4, PE-13, POE-14, PE-15 and PE-21 ranged from 6.49 ug/kg (PE-15) to 1,177.8 ug/kg (PE-21).

Samples G-1, G-2 and G-3 were grab samples collected from the unsaturated zone within the fill material previously disturbed during the 1993 diesel UST removal and possibly during the 1989 gasoline UST removal. These results are summarized in Tables 3 and 4. Sample G-1 (10-foot depth) contained total VOCs of 303,130 ug/kg. Five compounds in G-1 exceeded recommended soil cleanup guidelines (m,p-xylene; o-xylene; 1,3,5-trimethylbenzene; 1,2,4-trimethylbenzene; and naphthalene.) Sample G-2 (6-foot depth) contained total VOCs of 158,040 ug/kg. Four compounds in G-2 exceeded recommended soil cleanup guidelines (m,p-xylene; o-xylene; 1,3,5-trimethylbenzene; and 1,2,4-trimethylbenzene. Sample G-3 contained total VOCs of 5,241 ug/kg, which does not exceed recommended soil cleanup objectives.

### **1.3.2 Waste Characterization Samples**

Soil samples representative of the contaminated stockpiles are numbered C-1 through C-13. Samples were analyzed for VOCs and SVOCs via the TCLP methodology. Waste characterization sample results are summarized in Table 5 and 6.

### **1.4 Soil Recycling**

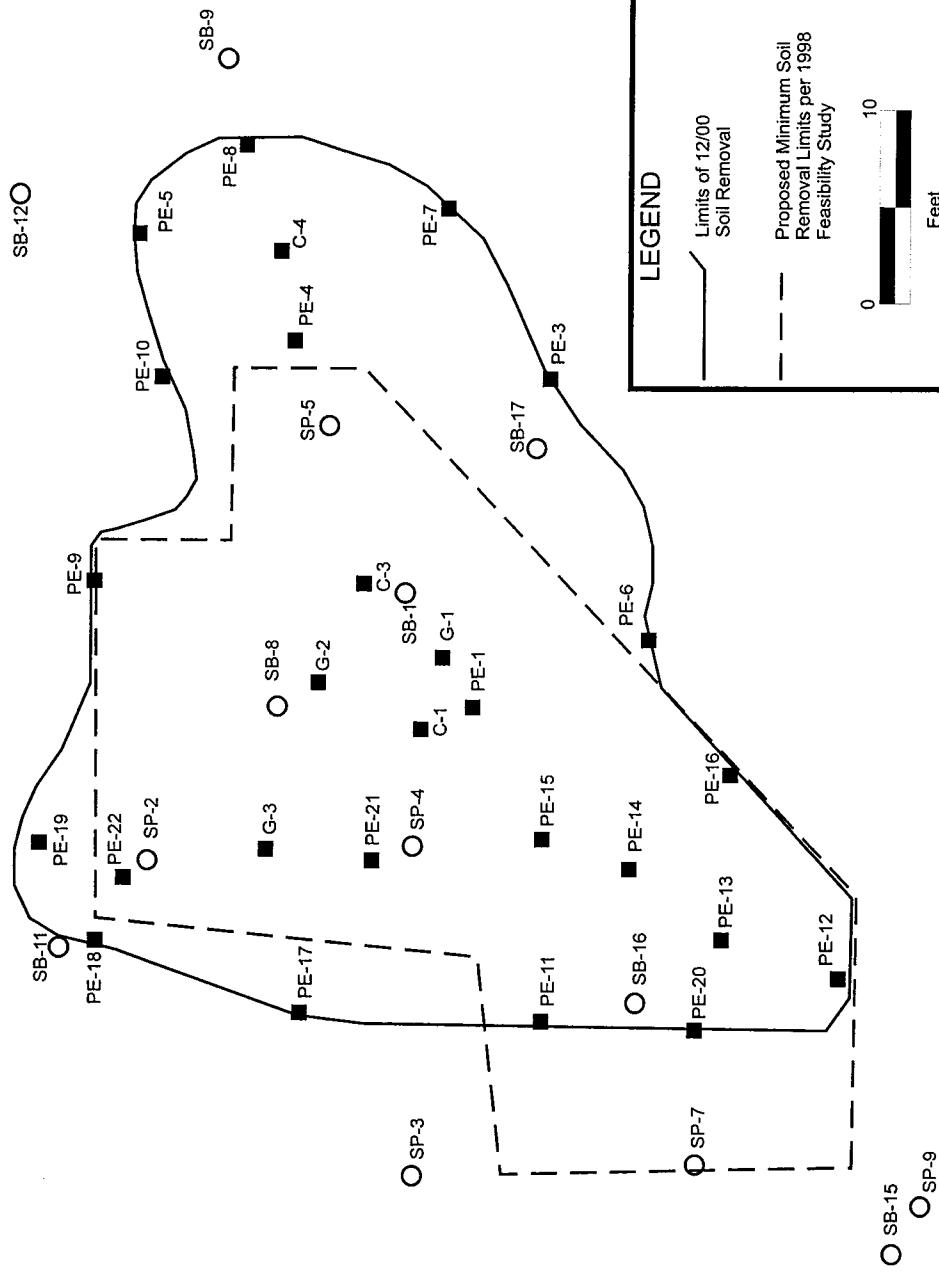

Between March 8 and 20, 2001, stockpiled soil was transported by Tri-X Transport to the Environmental Soil Management Inc. (ESMI) in Fort Edward, New York. At ESMI, the soil was weighed, then thermally treated and recycled. Weigh bills provided by Tri-X and ESMI indicate that a total of 1,011 tons of contaminated soil were transported to ESMI from the Beekman Highway site. Weigh bills are appended (Appendix B).

## **2 CONCLUSIONS**

1. Post-excavation soil sample results indicate that contaminated soil has been removed from the former diesel and gasoline UST area, effectively removing an ongoing source of petroleum contamination.
2. Contaminated soil remains in place within the saturated zone below a depth of 12 feet in the vicinity of the former diesel UST. Sample PE-21 exceeds recommended soil cleanup objectives. However, it is impractical to excavate contaminated soil from below the water table in this limited area.
3. No free product was observed above or below the top of the saturated zone.
4. The absence of benzene and MTBE in soil samples suggests that the spills are not of recent origin and fuel-derived VOCs are attenuating naturally. There are also indications that petroleum hydrocarbons within the saturated zone of the former tank area may also act as a substrate for reductive dehalogenation of PCE and other chlorinated compounds passing through this area with the southerly flow of groundwater.
