2.0 Introduction

The property characterized during the investigation is known as the Former Tivoli Water Tower site (site) and is located at 19 Pine Street, Tivoli, New York (Tax ID 6175-18-459087) on a 1.4-acre lot. The site is located in the Village of Tivoli, Dutchess County, New York at 19 Pine Street on a 1.4-acre lot. This particular location is the location of the former Tivoli water tower directly east of Tivoli Memorial Park. The site is located just northwest of village center. It is bordered by Pine St. to the south and residential properties to the north and east. The site is located approximately 150' (feet) above sea level, roughly 0.75 miles east of the Hudson River, and 0.25 miles west of the Stony Creek.

The site consists partly of a basketball court (the remainder on the adjacent parcel), a community garden, and the rest open lawn. It is relatively flat across the site. The site is in residential zoning district, R-15, of Tivoli, NY.

Historically, this site was the location of the Tivoli water tower, which was used as a public water storage facility. Historic imagery suggests a water tower was present on site since around the 1940's. The tower was demolished in September 2021 as part of the Dutchess County Water and Wastewater Authority (DCWWA) water system upgrade project in the Village. Throughout its history the area has been used as a recreational facility which is still in use today.

Given previous data collected at the site, the New York State Department of Environmental Conservation (NYSDEC) determined that a site characterization as defined in DER-10 Section 3.1 was required in order to determine if contaminants are present at concentrations exceeding applicable standards, criteria, and guidance (SCGs). This document presents the work completed and the sampling results obtained under the May 2024 Site Characterization Work Plan.

3.0 Background

The site is currently owned by the Village of Tivoli. As a part of the demolition procedure, Gianco Environmental Services, of Melville, New York, collected pre- and post-demolition surficial soil samples for lead adjacent to each leg of the water tower, and at two background locations located east of the former water tower in 2020. There were several soil samples with lead levels above the applicable use-based soil cleanup objectives for the protection of public health in both the pre- and post-demolition samples. As defined in 6 NYCRR Part 375 Section 1.8(g)(2)(ii), the site is considered for restricted-residential use as it is owned by a single owner and includes active recreational uses, which are public uses with a reasonable potential for soil contact. This potential exposure risk for the site use warranted additional investigation resulting in the classification as a potential site (P-Site), ID #314135, under the inactive hazardous waste disposal site program or State Superfund (SSF).

Tighe & Bond completed a soil assessment summary in December of 2022 to further delineate the extent of the lead contamination attributed to the historic water tower. Findings of this investigation were outlined in the *Soil Assessment Summary*

Report, dated December 19th, 2022. Samples were collected at the 0-6 inch and 6–12-inch intervals at the historic water tower location. An X-Ray Florescence meter (XRF) was utilized within the historic tower footprint and community garden to assess additional areas of the surface soil. Lead laboratory analyses were only performed on select soil samples from both areas. One sample submitted for lab analysis exceeded the restricted residential soil cleanup objective (RRSCO). Based on information available, lead, mercury, chromium, antimony, barium, cadmium, copper, zinc, and other heavy metals were historically incorporated into paints. The NYSDEC determined this investigation was not sufficient to reclassify the P-site as it was not conducted under a NYSDEC-approved work plan, and the analysis incorporated into the investigation was only limited to lead.

4.0 Site Characterization Overview

On May 8th, 2024 personnel with the New York State Department of Environmental Conservation (NYSDEC) mobilized to the site to characterize the surface soils on-site. The SC was completed in accordance with DER-10 and the scope outlined in the work plan dated May 2024, and the Quality Assurance/Quality Control (QA/QC) contained in Appendix A therein. The site characterization was completed to determine whether lead and other heavy metals may be present at hazardous levels posing a threat to public or ecological health, and if further investigation is warranted. Work performed consisted of screening surface soils in the area of the historic water tower and the community garden located on-site with an X-Ray Florescence meter (XRF). Based on the results of the XRF screening, select locations were chosen to collect soil samples for laboratory analysis. XRF screening and soil sampling locations were documented and located by a NYSDEC Licensed Land Surveyor.

5.0 Geology and Hydrogeology

Previous investigations indicate the site surface soils consist of fine to coarse grained sand and silt, presumably a component of the glacial till identified on the USGS surface soils map for the location. According to the USGS Hudson Mohawk Bedrock geology map, the site sits above the Austin Glen Formation which consists of greywacke, with alternating intervals of sandstone, siltstone, and shale. Depth to bedrock is unknown. Regarding specific hydrogeology and groundwater flow, it is likely that groundwater flows east towards Stony Creek, but previous investigations did not include the installation of groundwater wells or piezometers to document groundwater elevations. Observations made during this investigation suggest surface soils on-site consist of primarily silt and sand which is consistent with the USGS surface soils map for the area of the site.

6.0 Surface Soil Field Screening Procedures and Results

A Niton XL3t GOLDD+ XRF was utilized to screen the surface soil approximately every twenty (20) feet, in a gridded pattern in the area of the historic water tower pad (pad) and upwards to forty (40) feet beyond the extent of the pad. Surface soils were screened particularly for lead at the 0–2-inch and 6-12 inch intervals at 42 locations in

the area of and around the water tower pad and at the 0-2 inch interval at six (6) locations in the community garden. Soil sample screening locations are shown in Figure 2. Three (3) locations were screened in the southern eight (8) beds of the community garden and the location of the soil sample “CG1” was chosen based on the highest screening value. The same method was used to determine the sampling location of “CG2” in the northern eight (8) beds of the community garden. A total of 96 surface soil locations were screened in and around the pad at the two specified intervals. The presumed sampling locations outlined in the Site Characterization Work Plan were used as a guide, and the highest screening results were chosen to bias the locations of the soil samples for laboratory analysis.

One-hundred and two (102) XRF measurements were obtained during the field operations. The screening results for lead ranged from 12 parts per million (ppm), at the location identified as CG2 in the community garden, to 2882 ppm, identified as X82, which is the location of SB4 in the footprint of the water tower. Forty-two (42) field measurements exceeded the Unrestricted SCO for lead of 63 ppm. With the exception of 2 of the 102 XRF measurements at X82 and X83, all field measurements were below the Restricted Residential SCO for lead of 400 ppm. The XRF measurements were compared to SCOs only as a reference and confirmatory lab samples were collected and are discussed later in the report. All XRF data can be found on Table 1 along with the crossed reference soil sample identifications.

A field calibrated (PID) was also utilized to screen surface soils at every XRF screening location. No readings above 0.0 ppm were observed on the day of sampling. This result was expected considering the intervals at which the soils were screened, and the use of the area only being utilized as a recreational area.

7.0 Surface Soil Sampling Procedures and Results

Field activities included the collection of twenty-one (21) surface soil samples at the 0-2 inch and the 6-12 inch interval. All samples were obtained by digging a two (2)-inch plug followed by removing soil to a depth of 12 inches in the same hole with a spade shovel. Five (5) surface soil samples were collected and analyzed for full suite analysis of VOCs (USEPA Method 8260), SVOCs (USEPA Method 8270) Target Analyte List (TAL) metals, (USEPA Methods 6010/7471) polychlorinated biphenyls (PCBs) (USEPA Method 8082), pesticides (USEPA Method 8081), cyanide (USEPA Method 9010C),1,4-Dioxane (USEPA Method 8270 SIM), and Per- and Polyfluoroalkyl Substances (PFAS) (USEPA Method 1633). An additional 13 surface soil samples were collected and analyzed for the Target Analyte List of metals under USEPA Methods 6010 and 7471. All samples were analyzed by an ELAP-certified laboratory with Category B deliverables. Sample collection and analysis was completed in accordance with the site-specific QA/QC plan. A field duplicate, and matrix-spike/matrix-spike duplicate (MS/MSD) was also included as part of the soil sampling plan.

Analytical soil data was compared to the NYSDEC Subpart 375-6 Restricted Residential Soil Cleanup Objectives (RRSCOs). All PFAS analytical soil data were

assessed using guidance values for Restricted Residential use provided in the *Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS)*, under NYSDEC's Part 375 Remedial Programs, dated April 2023.

Of the 21 surface soil samples collected, exceedances were only detected in one (1) soil sampling location which included the soil samples SB4 and SB4A. Lead was detected at 3800 ppm at the 0-2 inch interval, identified as SB4, and at 4600 ppm at the 6-12 inch interval, identified as SB4A. These detections are both above the RRSCO of 400 ppm and above the maximum background lead detection of 150 ppm. Analytical results of metals are shown in Table 2A. The total PCBs in SB4A as detected at 1.1 ppm which minorly exceeded the RRSCO of 1.0 ppm. Analytical results of PCBs are shown in Table 2C. No other PCB or metal exceedances were detected above RRSCOs in any of the other samples.

Of the 21 surface soil samples collected, no exceedances above RRSCOs were detected for VOCs, SVOCs, Pesticides, PFAS, Cyanide, or 1,4 Dioxane. No exceedances were detected above RRSCOs in background soil samples, B1 and B1A, and no exceedances were detected in the community garden samples, CG-1 and CG-2. Soil analytical results are presented in Table 2. Surface soil sampling locations are shown in Figure 3.

8.0 Deviations from the Work Plan

On the day of mobilization, surface water was not observed on-site; therefore, surface water samples or outfall sediment samples were not field screened or collected as outlined in the May 2024 Site Characterization Work Plan.

The work plan states that a Human Health Exposure Assessment will be prepared as an element of this report. This assessment has not been prepared since the purpose of this investigation was to determine if contaminants are present at concentrations exceeding applicable standards, criteria, and guidance (SCGs). Results are presented and potential exposure routes are identified based on the results of this investigation in the *Conclusions and Recommendations* section later in the report.

9.0 Green and Sustainable Remediation

The following Best Management Practices (BMPs) were applied to make site characterization practices greener and more sustainable:

- Hand digging the sampling locations instead of using a drilling rig or other means of heavy machinery power.
- Using an XRF to screen for metals.
- Limiting IDW by returning soil back to the area it was removed from.
- Carpooling personnel to and from the site while conducting fieldwork.

10.0 Data Usability

A Data Usability Summary Report (DUSR) was prepared by Environmental Assessment & Remediations which is included in Appendix C of this report. Some data was rejected which is associated with the background samples. The DUSR states: *Within laboratory control sample, Hexachlorocylopentadiene is qualified as rejected "R" values within samples due to recovery below laboratory limits within laboratory control sample B374087-BS1/BSD1. While the other LCS had analytes with recovery above laboratory criteria, but no detection within samples, thus no need for qualification.* Some data was also rejected which is associated with the matrix sample obtained. The report states: *Within matrix sample B374725-MS2, analyte Antimony was recovered below 30% and not detected within parent sample led to a qualification of rejected "R" values. All qualification applied to parent sample SB1A.*

Considering these two rejected analytes associated with its corresponding sample, the data obtained as a part of this investigation is deemed usable and meets criteria for compliance with all associated EPA methods.

11.0 Conclusions and Recommendations

The objective of the site characterization at the Former Tivoli Water Tower site was to determine if contaminants were present at concentrations exceeding applicable standards, criteria, and guidance (SCGs) related to the historic water tower operations on-site including VOCs, SVOCs, PCBs, pesticides, metals, cyanide,1,4 Dioxane, and PFOS. A limited number of soil samples were collected in locations biased relative to the highest XRF screening measurements recorded on-site.

Following sampling activities, it was determined that only one sampled location contained elevated concentrations of lead and PCBs. Lead was detected at a concentration above the RRSCOs in this location in both the 0-2 inch and 6-12 inch intervals, and PCBs was detected at a concertation slightly exceeding the RRSCO in the 6-12 inch interval. While the concentrations in this specific location are above the RRSCO, it is likely that this area contained an elevated amount of paint chips from the historic water tower in this location, leading to the lead and PCB contamination. No other samples exhibited exceedances of analyzed compounds above RRSCOs on-site.

The community garden beds did not exhibit any exceedances above RRSCOs. This result was expected since it is assumed that the soil in the garden beds is from an off-site source. Contaminants present on and around the water tower footprint were identified and a vast majority of the samples did not exhibit exceedances above the RRSCOs.

In consultation with the New York State Department of Health, based on the presence of elevated lead in shallow surface samples in the location of SB4 (3,800 ppm at the 0-2-inch interval) and SB4A (4,600 ppm at the 6–12-inch interval), the NYSDEC recommends that these soils are excavated and removed from the site. A work plan will

be required to remove these soils with endpoint sampling incorporated. The work plan should also include the proper precautions taken while the work is completed, the proper disposal method of the lead contaminated soil, and the source of the clean fill material to be used as backfill.

24E1437-19RE1[DUP], B374779-BLK1

MS-07A

Matrix spike and spike duplicate recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possibility of matrix effects that lead to low bias or non-homogeneous sample aliquot cannot be eliminated.

Analyte & Samples(s) Qualified:

2H,2H,3H,3H-Perfluorooctanoic acid(FPePA)(5:3FT
24E1437-06[SB1A], B374213-MS1, B374213-MSD1

PF-17

Extracted Internal Standard recovery is outside of control limits. Data is not significantly affected since associated analyte is not detected and bias is on the high side.

Analyte & Samples(s) Qualified:

13C2-6:2FTS
24E1437-02[CG-2]

13C2-8:2FTS
24E1437-02[CG-2]

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
B	Analyte is found in the associated laboratory blank as well as in the sample.
B-05	Data is not affected by elevated level in laboratory blank since sample(s) result is "Not Detected".
D	Sample analyzed at a dilution.
DL-03	Elevated reporting limit due to matrix.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
L-02	Laboratory fortified blank/laboratory control sample recovery and duplicate recoveries outside of control limits. Data validation is not affected since all results are "not detected" for associated samples in this batch and bias is on the high side.
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-05	Laboratory fortified blank/laboratory control sample recovery is outside of control limits. Reported value for this compound is likely to be biased on the high side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
MS-07A	Matrix spike and spike duplicate recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possibility of matrix effects that lead to low bias or non-homogeneous sample aliquot cannot be eliminated.
MS-09	Matrix spike recovery and/or matrix spike duplicate recovery outside of control limits. Possibility of sample matrix effects that lead to a low bias for reported result or non-homogeneous sample aliquots cannot be eliminated.
MS-15	Matrix spike and matrix spike duplicate recoveries are outside of control limits. Data validation is not affected since results for this compound in this sample are "not detected", and recovery bias is on the high side.
MS-19	Sample to spike ratio is greater than or equal to 4:1. Spiked amount is not representative of the native amount in the sample. Appropriate or meaningful recoveries cannot be calculated.
MS-22	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.
MS-24	Either matrix spike or matrix spike duplicate is outside of control limits, but the other is within limits. Analysis is in control based on laboratory fortified blank recovery.
PF-17	Extracted Internal Standard recovery is outside of control limits. Data is not significantly affected since associated analyte is not detected and bias is on the high side.
PF-22	Qualifier ion ratio >150% of associated calibration. Detection is suspect.
R-05	Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.
R-06	Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.
S-07	One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.
S-17	Surrogate recovery is outside of control limits. Data validation is not affected since all associated results are less than the reporting limit and bias is on the high side.
V-05	Continuing calibration verification (CCV) did not meet method specifications and was biased on the low side for this compound.
V-06	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side for this compound.
V-20	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
V-35	Initial calibration verification (ICV) did not meet method specifications and was biased on the high side for this compound. Reported result is estimated.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
V-36	Initial calibration verification (ICV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
Z-01	Matrix Spike and Matrix Spike Duplicate recoveries are outside of control limits. Analysis is in control based on Laboratory Fortified Blank and Post Digestion Spike recoveries.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
B	Analyte is found in the associated laboratory blank as well as in the sample.
B-05	Data is not affected by elevated level in laboratory blank since sample(s) result is "Not Detected".
D	Sample analyzed at a dilution.
DL-03	Elevated reporting limit due to matrix.
J	Detected but below the Reporting Limit (lowest calibration standard); therefore, result is an estimated concentration (CLP J-Flag).
L-02	Laboratory fortified blank/laboratory control sample recovery and duplicate recoveries outside of control limits. Data validation is not affected since all results are "not detected" for associated samples in this batch and bias is on the high side.
L-04	Laboratory fortified blank/laboratory control sample recovery and duplicate recovery are outside of control limits. Reported value for this compound is likely to be biased on the low side.
L-05	Laboratory fortified blank/laboratory control sample recovery is outside of control limits. Reported value for this compound is likely to be biased on the high side.
L-07	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD between the two LFB/LCS results is within method specified criteria.
MS-07A	Matrix spike and spike duplicate recovery is outside of control limits. Analysis is in control based on laboratory fortified blank recovery. Possibility of matrix effects that lead to low bias or non-homogeneous sample aliquot cannot be eliminated.
MS-09	Matrix spike recovery and/or matrix spike duplicate recovery outside of control limits. Possibility of sample matrix effects that lead to a low bias for reported result or non-homogeneous sample aliquots cannot be eliminated.
MS-15	Matrix spike and matrix spike duplicate recoveries are outside of control limits. Data validation is not affected since results for this compound in this sample are "not detected", and recovery bias is on the high side.
MS-19	Sample to spike ratio is greater than or equal to 4:1. Spiked amount is not representative of the native amount in the sample. Appropriate or meaningful recoveries cannot be calculated.
MS-22	Either matrix spike or MS duplicate is outside of control limits, but the other is within limits. RPD between the two MS/MSD results is within method specified criteria.
MS-24	Either matrix spike or matrix spike duplicate is outside of control limits, but the other is within limits. Analysis is in control based on laboratory fortified blank recovery.
PF-17	Extracted Internal Standard recovery is outside of control limits. Data is not significantly affected since associated analyte is not detected and bias is on the high side.
PF-22	Qualifier ion ratio >150% of associated calibration. Detection is suspect.
R-05	Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.
R-06	Matrix spike duplicate RPD is outside of control limits. Reduced precision is anticipated for reported result for this compound in this sample.
S-07	One associated surrogate standard recovery is outside of control limits but the other(s) is/are within limits. All recoveries are > 10%.
S-17	Surrogate recovery is outside of control limits. Data validation is not affected since all associated results are less than the reporting limit and bias is on the high side.
V-05	Continuing calibration verification (CCV) did not meet method specifications and was biased on the low side for this compound.
V-06	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side for this compound.
V-20	Continuing calibration verification (CCV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
V-35	Initial calibration verification (ICV) did not meet method specifications and was biased on the high side for this compound. Reported result is estimated.
