Note: Since laboratory accreditations are subject to change, Eurofins TestAmerica places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins TestAmerica laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins TestAmerica attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said complicance to Eurofins TestAmerica.

# Appendix G: Data Usability Summary Reports

cornerstone PLLC

# MEMO

| | |
|---|---|
| ***To:*** | File |
| ***Cc:*** | |
| ***From:*** | Diane Conroy |
| ***Date:*** | December 2021 |
| ***Subject:*** | Data Usability Summary Report for PFAS Analysis in Groundwater at the Nepera-Harriman Site |

The Data Usability Review has been completed for the data packages generated by Test America Laboratories that pertain to groundwater samples collected at the Nepera-Harriman Site during October 2021. Two data packages associated with aqueous samples collected from October 25, 2021 to October 29, 2021 containing results for required constituents, duplicates, field blanks, trip blanks, matrix spikes, laboratory control samples, and method blanks were reviewed.

Data usability was generally performed in conformance with the methods outline in the "*Emerging Contaminants Site Investigation Work Plan*" (Work Plan) prepared for this Facility in October 2019. The following items were reviewed:

- Data completeness
- Review of QA/QC Samples
- Overall Evaluation of Data
- Sample Temperatures
- Holding Times
- Analytical Detection Limits and Sample Quantitation
- Surrogate Recovery
- Matrix Spike/Matrix Spike Duplicate (MS/MSD) Review
- Laboratory Control Sample (LCS)
- Initial/Continuing Calibration
- Gas chromatograph/mass spectrometer/GC/Electron Capture Detector (GC\MS\GC\ECD) Instrument Performance
- Internal Standards
- Target Compound Identification
- System Performance
- Serial Dilution

In addition, the Data Usability Review was performed in accordance with the guidance provided by the New York State Department of Environmental Conservation (NYSDEC) Division of Environmental Remediation (DER) document DER-10. The following items were reviewed:

1. Is the data package complete as defined under the requirements for the most current DEC ASP Category B or USEPA CLP data deliverables?
   *Yes. The laboratory reports provided were complete Category B analytical data packages*

2. Have all holding times been met?
   *Yes. The samples were extracted and analyses were performed within the allowable holding times.*

3. Do all the QC data; blanks, instrument tunings, calibration standards, calibration verifications, surrogate recoveries, spike recoveries, replicate analyses, laboratory controls and sample data fall within the protocol required limits and specifications?
   *Items not mentioned in the following discussion were found to be acceptable as outlined in the validation procedures and as applicable for the methodology.*

4. Have all of the data been generated using established and agreed upon analytical protocols?
   *Yes. The data analyzed was generated using established analytical protocols.*

5. Does an evaluation of the raw data confirm the results provided in the data summary sheets and quality control verification forms?
   *Unless noted specifically in the following text, reported results of the validated samples are substantiated by the raw data, and generated in compliance with the protocol requirements.*

6. Have the correct data qualifiers been used and are they consistent with the most current DEC ASP?
   *The details below provide a description of data qualifiers.*

7. Have any quality control (QC) exceedances been specifically noted in the DUSR and have the corresponding QC summary sheets from the data package been attached to the DUSR?
   *The details below provide a description of the quality control exceedances and the appropriate pages have been attached to this Memo.*

Those items showing deficiencies are discussed in the following sections of the report. Items not mentioned in the following discussion were found to be acceptable as outlined in the above-mentioned validation procedures and as applicable for the methodology. Unless noted specifically in the following text, reported results of the validated samples are substantiated by the raw data, and generated in compliance with the protocol requirements. Note that the Case Narratives attached for each of the Laboratory Reports reviewed may apply to items outside the scope of this Memo.

It should be noted that running serial dilution was suggested in the Work Plan, however in subsequent conversation with the laboratory, this QC technique is more applicable to inorganic parameters and isn't commonly performed on PFAS. Furthermore, isotope dilution was performed to correct for any sample matrix interference that may have been present. This does not affect the usability of the data.

The laboratory reports provided were complete Category B analytical data packages and the data analyzed was generated using established analytical protocols. Copies of the laboratory case narrative, list of data reporting qualifiers, annotated quality control (QC) results, and annotated sample results are attached to this text and should be reviewed in conjunction with this report.

**TEST AMERICA LABORATORY REPORT: J246027-1**

The samples collected for this analysis were delivered to the laboratory in good condition, properly preserved with temperatures within the acceptable range. The samples were extracted and analyses were performed within the allowable holding times. In addition, the laboratory detection limits used met the requirements to adequately compare the reported results to the guidance values outlined in Section 4.8 of the Work Plan.

The reported concentrations in the MS/MSD and LCS samples were within acceptable ranges.

Surrogate Recovery/Isotope Dilution

One surrogate parameter, Perfluorotetradecanoic acid, associated with sample location MH-103D-20211027 recovered low as the laboratory performed its Isotope Dilution QC procedures. The sample results, both detected and non-detected, associated with the low recovery should be qualified with a "J". Where necessary, the appropriate changes have been made in the laboratory report.

Initial/Continuing Calibration

During the continuing calibration, the laboratory noted the results of 1,4-dioxane produced percent differences greater than 25%. As a result, associated laboratory detections should be qualified with an "J". Where necessary, the appropriate changes have been made in the laboratory report.

During the continuing calibration, the laboratory noted a few instances associated with parameters including Perfluorododecanesulfonic acid, N-ethylperfluorooctanesulfonamidoacetic acid (NEtFOSAA), and 1H,1H,2H,2H-perfluorodecanesulfonic acid (M282FTS) in which the percent differences were greater than 25%. However, the laboratory has confirmed that the percent differences reported were within the standard for PFAS analysis therefore the data is considered usable as reported.

With the exceptions noted above, the continuing calibration verification was performed within the acceptance criteria.

Internal Standards, Target Compound Identification, and System Performance

During the analysis, the internal standard areas and the retention times were within acceptable ranges, target compounds were appropriately identified, and the system performance was satisfactory.

Additional Summary

As noted in the case narrative, dilution was required to analyze Perfluorooctanesulfonic acid from samples MHP-MW-3S-20211027, DUP-01-20211027, and MH-104-20211027.

**TEST AMERICA LABORATORY REPORT: J246277-1**

The samples collected for this analysis were delivered to the laboratory in good condition, properly preserved with temperatures within the acceptable range. The samples were extracted and analyses were performed within the allowable holding times. In addition, the laboratory detection limits used met the requirements to adequately compare the reported results to the guidance values outlined in Section 4.8 of the Work Plan.

The reported concentrations in the LCS samples were within acceptable ranges.

Surrogate Recovery/Isotope Dilution

One surrogate parameter, Perfluorotetradecanoic acid, associated with sample location MW-34-20211028 recovered low as the laboratory performed its Isotope Dilution QC procedures. The sample results, both detected and non-detected, associated with the low recoveries should be qualified with a “J”. Where necessary, the appropriate changes have been made in the laboratory report.

Two surrogate parameters, 1H,1H,2H,2H-perfluorooctanesulfonic acid (M262FTS) and M282FTS, associated with sample locations MW-34-20211028, AMW-3-20211028, and AMW-9-20211029 recovered high as the laboratory performed its Isotope Dilution QC procedures. The detected results associated with the high recoveries should be qualified with a “J”. Where necessary, the appropriate changes have been made in the laboratory report.

Matrix Spike/Matrix Spike Duplicates

One parameter, 1,4-dioxane, recovered high during the MS & MSD laboratory QC procedures associated with sample location MW-24S-20211027. The detected results associated with the high recoveries should be qualified with a “J”. Where necessary, the appropriate changes have been made in the laboratory report.

One parameter, Perfluorooctanesulfonic acid, recovered low during the MSD laboratory QC procedures associated with sample location MW- 26S-20211028. The sample results, both detected and non-detected, associated with the low recovery should be qualified with a “J”. Where necessary, the appropriate changes have been made in the laboratory report.

Initial/Continuing Calibration

During the continuing calibration, the laboratory noted the results of 1,4-dioxane produced percent differences greater than 25%. As a result, associated laboratory detections should be qualified with an “J”. Where necessary, the appropriate changes have been made in the laboratory report.

During the continuing calibration, the laboratory noted a few instances associated with parameters including Perfluorobutanoic acid, Perfluorooctanesulfonic acid, M262FTS, and M282FTS in which the percent differences were greater than 25%. However, the laboratory has confirmed that the percent differences reported were within the standard for PFAS analysis therefore the data is considered usable as reported.

With the exceptions noted above, the continuing calibration verification was within the acceptance criteria.

Internal Standards, Target Compound Identification, and System Performance

During the analysis, the internal standard areas and the retention times were within acceptable ranges, target compounds were appropriately identified, and the system performance was satisfactory.

Additional Summary

As noted in the case narrative N-ethylperfluorooctanesulfonamidoacetic acid (NEtFOSAA) and Perfluorobutanesulfonic acid were detected in method blanks. The laboratory appropriately added “B” qualifier to the potentially impacted results.

Also as noted in the case narrative, dilution was required to analyze Perfluorohexanesulfonic acid and Perfluorooctanesulfonic acid from samples AP-101-20211027, AMW-8-20211029, and MH-104-20211027.

## CONCLUSIONS

The samples were analyzed, and results reported with compliance to protocol requirements and with adherence to quality criteria unless otherwise noted. The laboratory results are usable as reported, or usable as qualified, estimated values.

# TestAmerica Report J-246027-1

# Laboratory Case Narrative

# CASE NARRATIVE

## Client: Cornerstone Environmental Group, LLC

## Project: NEPERA - Harriman, NY

## Report Number: 460-246027-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**

The samples were received on 10/27/2021 7:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.5º C and 1.5º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

**SEMIVOLATILE ORGANIC COMPOUNDS - SELECTED ION MODE (SIM) - ISOTOPE DILUTION - 1,4 DIOXANE**

Samples EB-01-20211025 (460-246027-1), MHP-MW-3D-20211025 (460-246027-2), MHP-MW-4S-20211025 (460-246027-3), MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5), MH-103D-20211027 (460-246027-6), MH-105S-20211027 (460-246027-7), MH-105D-20211027 (460-246027-8), MH-103S-20211027 (460-246027-9), MH-104-20211027 (460-246027-10) and MH-101-20211027 (460-246027-11) were analyzed for semivolatile organic compounds - Selected Ion Mode (SIM) - Isotope Dilution - 1,4 Dioxane in accordance with EPA SW-846 Method 8270E SIM 1,4Dioxane. The samples were prepared and analyzed on 10/30/2021.

No difficulties were encountered during the 1,4 Dioxane analysis.

All quality control parameters were within the acceptance limits.

**PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS)**

Samples EB-01-20211025 (460-246027-1), MHP-MW-3D-20211025 (460-246027-2), MHP-MW-4S-20211025 (460-246027-3), MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5), MH-103D-20211027 (460-246027-6), MH-105S-20211027 (460-246027-7), MH-105D-20211027 (460-246027-8), MH-103S-20211027 (460-246027-9), MH-104-20211027 (460-246027-10) and MH-101-20211027 (460-246027-11) were analyzed for Per- and Polyfluoroalkyl Substances (PFAS) in accordance with PFC. The samples were prepared on 11/02/2021 and analyzed on 11/03/2021 and 11/04/2021.

13C2 PFTeDA Isotope Dilution Analyte (IDA) recovery associated with the following sample is below the method recommended limit: MH-103D-20211027 (460-246027-6). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample.

The “I” qualifier associated with samples MH-105S-20211027 (460-246027-7) and MH-105D-20211027 (460-246027-8) is applied because the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification has some degree of uncertainty, however analyst judgment was used to positively identify the analyte(s).

Results for samples MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5) and MH-104-20211027 (460-246027-10) were reported from the analysis of a diluted extract due to high concentration of the target analyte in the analysis of the undiluted extract. The dilution factor was applied to the labeled internal standard area counts and these area counts were within acceptance limits

No other difficulties were encountered during the PFAS analysis.

All quality control parameters were within the acceptance limits.

# Laboratory Qualifiers

## Qualifiers

### GC/MS Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| U | Indicates the analyte was analyzed for but not detected. |

### LCMS

| Qualifier | Qualifier Description |
|---|---|
| *5- | Isotope dilution analyte is outside acceptance limits, low biased. |
| D | Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples. |
| I | Value is EMPC (estimated maximum possible concentration). |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| U | Indicates the analyte was analyzed for but not detected. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# TestAmerica Report J-246277-1

# Laboratory Case Narrative

# CASE NARRATIVE

## Client: Cornerstone Environmental Group, LLC

## Project: NEPERA - Harriman, NY

## Report Number: 460-246277-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**

The samples were received on 10/29/2021 7:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 2.1º C, 2.2º C, 2.4º C and 2.8º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

**SEMIVOLATILE ORGANIC COMPOUNDS - SELECTED ION MODE (SIM) - ISOTOPE DILUTION - 1,4 DIOXANE**

Samples MH-102-20211027 (460-246277-1), AP-101-20211027 (460-246277-2), AMW-2-20211027 (460-246277-3), AMW-1-20211027 (460-246277-4), MW-202S-20211027 (460-246277-5), MW-202D-20211027 (460-246277-6), MW-9S-20211027 (460-246277-7), MW-24S-20211027 (460-246277-8), BP-101-20211028 (460-246277-9), EP-02-20211028 (460-246277-10), MW-23S-20211028 (460-246277-11), MW-37AQ-20211028 (460-246277-12), AMW-5-20211028 (460-246277-13), MW-5S-20211028 (460-246277-14), MW-34-20211028 (460-246277-15), MW-1S-20211028 (460-246277-16), MW-102-20211028 (460-246277-17), MW-26S-20211028 (460-246277-18), MW-7S-20211028 (460-246277-19), AMW-4-20211028 (460-246277-20), AMW-11-20211028 (460-246277-21), AMW-6-20211028 (460-246277-22), AMW-3-20211028 (460-246277-23), DUP-02-20211028 (460-246277-24), MW-201-20211028 (460-246277-25), MW-4S-20211029 (460-246277-26), MW-3S-20211029 (460-246277-27), AMW-8-20211029 (460-246277-28), AMW-9-20211029 (460-246277-29), AMW-7-20211029 (460-246277-30), AMW-10-20211029 (460-246277-31) and MW-53S-20211029 (460-246277-32) were analyzed for semivolatile organic compounds - Selected Ion Mode (SIM) - Isotope Dilution - 1,4 Dioxane in accordance with EPA SW-846 Method 8270E SIM 1,4Dioxane. The samples were prepared on 11/03/2021 and analyzed on 11/03/2021 and 11/04/2021.

1,4-Dioxane failed the recovery criteria high for the MS of sample MW-24S-20211027MS (460-246277-8) in batch 460-811092.

1,4-Dioxane exceeded the RPD limit for the MSD of sample MW-24S-20211027MSD (460-246277-8) in batch 460-811092.

Refer to the QC report for details.

No other difficulties were encountered during the 1,4 Dioxane analysis.

All other quality control parameters were within the acceptance limits.

**PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS)**

Samples MH-102-20211027 (460-246277-1), AP-101-20211027 (460-246277-2), AMW-2-20211027 (460-246277-3), AMW-1-20211027 (460-246277-4), MW-202S-20211027 (460-246277-5), MW-202D-20211027 (460-246277-6), MW-9S-20211027 (460-246277-7), MW-24S-20211027 (460-246277-8), BP-101-20211028 (460-246277-9), EP-02-20211028 (460-246277-10), MW-23S-20211028 (460-246277-11), MW-37AQ-20211028 (460-246277-12), AMW-5-20211028 (460-246277-13), MW-5S-20211028 (460-246277-14), MW-34-20211028 (460-246277-15), MW-1S-20211028 (460-246277-16), MW-102-20211028 (460-246277-17), MW-26S-20211028 (460-246277-18), MW-7S-20211028 (460-246277-19), AMW-4-20211028 (460-246277-20), AMW-11-20211028 (460-246277-21), AMW-6-20211028 (460-246277-22), AMW-3-20211028 (460-246277-23), DUP-02-20211028 (460-246277-24), MW-201-20211028 (460-246277-25), MW-4S-20211029 (460-246277-26), MW-3S-20211029 (460-246277-27), AMW-8-20211029 (460-246277-28), AMW-9-20211029 (460-246277-29), AMW-7-20211029 (460-246277-30), AMW-10-20211029 (460-246277-31) and MW-53S-20211029 (460-246277-32) were analyzed for Per- and Polyfluoroalkyl Substances (PFAS) in accordance with PFC. The samples were prepared on

11/04/2021 and 11/05/2021 and analyzed on 11/08/2021, 11/09/2021 and 11/10/2021.

N-ethylperfluorooctanesulfonamidoacetic acid (NEtFOSAA) was detected in method blank MB 200-173528/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Perfluorobutanesulfonic acid (PFBS) was detected in method blank MB 200-173541/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

The method blank for preparation batch 200-173528 and analytical batch 200-173682 contained N-ethylperfluorooctanesulfonamidoacetic acid (NEtFOSAA) above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and re-analysis of samples was not performed.

Method 537 (modified): The “I” qualifier associated with samples MW-202D-20211027 (460-246277-6) and MW-34-20211028 (460-246277-15) is applied because the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification has some degree of uncertainty, however analyst judgment was used to positively identify the analyte(s).

13C2 PFTeDA Isotope Dilution Analyte (IDA) recovery associated with the following sample is below the method recommended limit: MW-34-20211028 (460-246277-15). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample.

M2-6:2 FTS and M2-8:2 FTS Isotope Dilution Analyte (IDA) recoveries are above the method recommended limit for the following sample: MW-34-20211028 (460-246277-15). Quantitation by isotope dilution generally precludes any adverse effect on data quality due to elevated IDA recoveries.

M2-6:2 FTS and M2-8:2 FTS Isotope Dilution Analyte (IDA) recoveries are above the method recommended limit for the following samples: AMW-3-20211028 (460-246277-23) and AMW-9-20211029 (460-246277-29). Quantitation by isotope dilution generally precludes any adverse effect on data quality due to elevated IDA recoveries.

The method blank for preparation batch 200-173541 and analytical batch 200-173694 contained Perfluorobutanesulfonic acid (PFBS) above the method detection limit. This target analyte concentration was less than half the reporting limit (1/2RL); therefore, re-extraction and/or re-analysis of samples was not performed.

The “I” qualifier associated with samples MW-7S-20211028 (460-246277-19), DUP-02-20211028 (460-246277-24) and AMW-9-20211029 (460-246277-29) is applied because the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification has some degree of uncertainty, however analyst judgment was used to positively identify the analyte(s).

Results for sample AP-101-20211027 (460-246277-2) were reported from the analysis of a diluted extract due to high concentration of the target analyte in the analysis of the undiluted extract. The dilution factor was applied to the labeled internal standard area counts and these area counts were within acceptance limits

Results for samples AMW-8-20211029 (460-246277-28) and AMW-10-20211029 (460-246277-31) were reported from the analysis of a diluted extract due to high concentration of the target analyte in the analysis of the undiluted extract. The dilution factor was applied to the labeled internal standard area counts and these area counts were within acceptance limits

Perfluorooctanesulfonic acid (PFOS) failed the recovery criteria low for the MSD of sample MW-26S-20211028MSD (460-246277-18) in batch 200-173682.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the PFAS analysis.

All other quality control parameters were within the acceptance limits.

# Laboratory Qualifiers

## Qualifiers

### GC/MS Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| F1 | MS and/or MSD recovery exceeds control limits. |
| F2 | MS/MSD RPD exceeds control limits |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| U | Indicates the analyte was analyzed for but not detected. |

### LCMS

| Qualifier | Qualifier Description |
|---|---|
| *5- | Isotope dilution analyte is outside acceptance limits, low biased. |
| *5+ | Isotope dilution analyte is outside acceptance limits, high biased. |
| 4 | MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable. |
| B | Compound was found in the blank and sample. |
| D | Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples. |
| I | Value is EMPC (estimated maximum possible concentration). |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| U | Indicates the analyte was analyzed for but not detected. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# Introduction

This Phase II Emerging Contaminants Investigation Work Plan Addendum has been prepared by Brown and Caldwell Associates and Cornerstone Engineering and Land Surveying, PLLC (BC/Cornerstone) on behalf of ELT Harriman, LLC ("ELT") and Nepera, Inc. and Warner-Lambert Company (the "Corporate Defendants") in further response to the request from the New York State Department of Environmental Conservation (NYSDEC) to conduct an investigation of per- and polyfluoroalkyl substances (PFAS), benzene, and alpha-picoline in soils at the Nepera-Harriman Site, also referred to as the Former Nepera Plant Site (the "Site"). The primary purpose of this supplemental investigation is to further assess the presence and extent of PFAS in soil and groundwater, including areas suggested by recent groundwater investigations. A secondary purpose is to assess the potential presence of benzene and alpha-picoline (2-picoline) in soil in locations upgradient from certain wells where these two compounds have been detected in groundwater.

A detailed description of the Site's background and recent investigations of emerging contaminants (ECs) in soil and groundwater is presented in "Phase II Emerging Contaminants Site Investigation Report, Former Nepera Plant Site, Harriman, New York EPA ID# NYD002014595" (BC/Cornerstone, September 2022).

## Reservation of Rights

The preparation and submission of this Phase II Emerging Contaminants Investigation Work Plan Addendum is subject to a full reservation of rights by all the private parties, including ELT and the Corporate Defendants. Nothing in the work plan or the discussions and submissions related thereto will be cited or construed in support of or against any position regarding which parties are responsible for any environmental liabilities or remediation at the Nepera-Harriman Site, including without limitation the presence of emerging contaminants and any of the costs associated with investigation and the potential remediation of such compounds.

## Section 2

# Background and Objectives

The recent EC investigation, conducted from January 2020 through April 2022, included an extensive investigation of groundwater within the Site and in adjoining off-Site areas. The groundwater investigation included installation of temporary and permanent monitoring wells, measurement of groundwater elevations, and collection of groundwater samples from 50 on-Site wells and 12 off-Site wells. Thirteen of the wells are screened in bedrock. The overburden wells are screened in various glacial and alluvial deposits that have been grouped together as either less permeable "aquitard" deposits (fine sand, silt, clayey silt or cemented kame deposits), or more permeable "aquifer" deposits (sand and gravel). Under most of the Site, the aquitard deposits overlie the coarser aquifer deposits, which in turn overlie relatively impermeable glacial till that was deposited directly on the bedrock surface. In the area of New York State (NYS) Route 17, the coarser aquifer deposits are generally thinner or absent.

The following discussion may be followed by referring to Figures 1 and 2, which show groundwater flow directions and perfluoroctane sulfonic acid (PFOS) concentrations for aquitard wells (Figure 1) and aquifer wells (Figure 2). Although a variety of PFAS compounds were detected in the groundwater samples, PFOS may be considered for present purposes as a proxy for PFAS. New York has established a drinking water Maximum Contaminant Level (MCL) of 10 nanograms per liter (ng/L) for both PFOS and perfluorooctanoic acid (PFOA), and a higher MCL of 100 ng/L for other PFAS compounds. The EC investigation demonstrates that most MCL exceedances are for PFOS, sometimes in combination with PFOA exceedances. A third PFAS compound, perfluorohexanesulfonic acid (PFHxS) exceeds its MCL of 100 ng/L in nine of the 74 groundwater samples. Only one PFOA exceedance occurs without a corresponding PFOS exceedance in the sample. No PFHxS exceedances occur without a corresponding PFOS exceedance in the sample. Given the demonstrated predominance of PFOS, its presence in groundwater can be utilized herein to identify potential source areas for other PFAS compounds.

Figures 1 and 2 respectively show PFOS concentrations in aquitard and aquifer wells. Wells with a PFOS result exceeding the 10 ng/L MCL are depicted with yellow symbols (>10-100 ng/L), orange symbols (>100-500 ng/L) or red symbols (>500 ng/L). The figures also show groundwater elevation contours and inferred flow lines based on March 2022 water level measurements in the respective aquitard and aquifer wells. The groundwater flow lines may be followed upgradient from wells with PFOS exceedances to potential on-Site PFAS source areas.

Some of these potential PFAS source areas were investigated by the soil borings advanced and sampled in January and August of 2020. The boring locations are shown on Figures 1 and 2. The 2020 soil investigations focused upon previously suspected PFAS source areas, including Buildings 2A, 26, 52, 64, 72, and open areas in former Site Areas B, F, and G. The 2020 soil investigations identified elevated concentrations of PFAS compounds, specifically PFOS and PFOA in the vicinity of the former Foam House (Building 72) and to a lesser extent in the open areas of former Site Area F. These previously characterized areas are not included in this supplemental investigation.

As shown in Figures 1 and 2, a total of 19 supplemental soil borings (EC-B-001 through EC-B-019) are proposed to evaluate PFAS in potential source areas. The specific objective of each

supplemental soil boring is identified on Table 1. In general, the proposed supplemental soil sampling locations have been selected to achieve the following goals:

- Identify the Site-wide nature and extent of PFAS compounds in unsaturated and partially saturated (near-water table) soils.
- Characterize soil PFAS concentrations in specific areas suggested by groundwater detections and groundwater flow lines.

An additional objective of the supplemental soil investigation is to characterize soil concentrations of benzene and alpha-picoline concentrations in potential source areas. Benzene has been detected in monitoring wells OW-6, OW-7, MW-25S, and MW-16S. Alpha-picoline has been detected in monitoring wells OW-6 and MW-16S. Two soil borings (G-B-106, G-B-107) will be advanced in areas upgradient from these wells.

In addition to the soil borings referenced above that are proposed with the objective of identifying the Site-wide nature and extent of PFAS compounds, additional groupings of soil borings are proposed to investigate potential shallow sources of PFAS compounds in suspected source areas, or to fill in potential data gaps. These additional locations are described in Attachment A to this Work Plan.

The groundwater investigation also identified relatively elevated PFOS concentrations at aquitard well location AMW-8, and to a lesser extent at MW-37AQ (Figure 1); and at aquifer monitoring well location AP-101 (Figure 2). Supplemental groundwater sampling will be conducted associated with these areas to include the following:

- Collection of groundwater samples from existing aquitard wells MW-35AQ and MW-36AQ
- Installation and sampling of an aquitard monitoring well downgradient of location AMW-8 and adjacent to Arden House Road
- Installation and sampling of a monitoring well couplet (shallow and deep wells) downgradient of location AP-101 adjacent to Arden House Road and immediately west of the West Branch of the Ramapo River
- Establishment of a new staff gauge at the western most Arden House Road bridge over the West Branch of the Ramapo River

In addition to the above, the results of the groundwater investigation within Mary Harriman Park indicate the presence of a likely source or sources of PFAS unrelated to the Nepera Site. While the data clearly indicate a shallow source of PFAS compounds unrelated to Nepera, at the request of NYSDEC, four additional monitoring wells will be installed and sampled as follows:

- One new monitoring well (MH-106) along the southwest Mary Harriman Park property boundary. This new location will serve as an additional upgradient monitoring well.
- Two new monitoring wells (MH-107 and MH-108) will be installed along the park access road to the northwest and southeast of existing well MH-104 to further delineate elevated PFAS concentrations within MH-104.
- One new monitoring well along the southeast Mary Harriman Park property boundary adjacent to Route 17. This new location will serve as an additional monitoring point between the former Nepera Site to the southeast of Route 17 and the park on the northwest side of Route 17.
- Collection of groundwater samples from the four new locations referenced above, plus existing locations MHP-MW-4S, MH-101, MH-102, MH-103S, MH-104S, MH-105S, MW-9S, MW-201, MW-202, MW-24S, AMW-1, and AMW-2.

The objective of the proposed supplemental monitoring well installation and groundwater sampling referenced above is to further delineate the extent to which PFAS compounds may be migrating in

groundwater downgradient of locations with relatively higher concentrations. In addition, surface water samples will be collected to assess surface water quality upstream, adjacent to and downstream of the former Nepera Site.

Section 3

# Proposed Investigation Activities and Procedures

The soil investigation will include the collection of soil samples at the locations shown on Figures 1 and 2 (also see Attachment A Figures A-1 and A-2). The proposed locations for the installation of new monitoring wells and the collection of surface water samples are shown on Figures 3, 4, and 5. The rational for sample collection at each individual location is presented in Table 1.

Sample locations will be identified in the field prior to sampling through use of a Global Positioning System (GPS) or licensed surveyor. Locations may be adjusted in the field based on access constraints or observations regarding potential impacts. Details regarding the procedures for the collection and analysis of soil and groundwater samples, as well as well installation procedures, are described in the following sections.

## 3.1 Sample Collection Procedures

Sample collection will be performed in accordance with the Standard Operating Procedures (SOPs) provided in the original work plan dated August 2019 and current NYSDEC guidance for PFAS sampling. If alternative sample collection methods are required due to field conditions, NYSDEC will be notified, and approval obtained prior to sample collection. Soil sampling locations are discussed below and in Attachment A to this Work Plan Addendum.

### 3.1.1 Soil

Soil borings will be advanced to the designated target depth (zone of saturation) and continuously sampled in accordance with the SOP. Soils will be observed for physical properties such as color, sorting, grain size, etc. and described using the modified Burmister® system. Samples will be screened in the field using a photoionization detector (PID) and readings for each sample interval will be recorded on the boring log and/or the field logbook.

**PFAS**

Proposed locations for the collection of soil samples for analysis of PFAS compounds are shown on Figure 1 and in Attachment A Figures A-1 and A-2.

Soil samples will be collected using one of two methods: Geoprobe® (macro core) or two-inch stainless-steel split-spoons. If soil samples are collected via Geoprobe®, a new acetate liner will be used for each sample. If sampling is performed using a two-inch stainless-steel split-spoon, the split-spoons will be field decontaminated prior to each use. Surficial samples may also be collected manually utilizing a pre-cleaned stainless-steel spoon or hand auger.

Both surficial and deeper soil samples will be homogenized in a stainless-steel bowl prior to being put in sample containers. After the completion of sample collection, any excess soil will be carefully placed back in the borehole. The remainder of the borehole will be restored to grade with additional soil.

At each of the sample locations, a minimum of two soil samples will be collected unless otherwise noted. A soil sample will be collected from the 0-1-foot depth interval, below any debris, slab, pavement, or vegetative cover depending on the conditions at each sample location. A one-foot surficial interval has been chosen due to the sample volume needed for analysis, based on prior Site experience. The one-foot interval is also expected to retain a substantial fraction of PFAS compounds that may have been released at the surface (if any). The deeper sample will be collected from the one-foot interval above soil saturation unless evidence of potential impact is apparent at a different depth interval, in which case the deeper sample will be collected from that interval.

Additional samples for PFAS, or PFAS, benzene, and a-picoline analysis will be obtained from soil borings focused within areas identified has having relatively higher concentrations in groundwater as described in Attachment A to this Work Plan.

**Benzene and Alpha-Picoline**

Proposed locations for the collection of soil samples for analysis of benzene and alpha-picoline are shown on Figure 1 and in Attachment A Figures A-1 and A-2.

Soil samples will be collected using one of two methods: Geoprobe® (macro core) or two-inch stainless-steel split-spoons. If soil samples are collected via Geoprobe®, a new acetate liner will be used for each sample. If sampling is performed using a two-inch stainless-steel split-spoon, the split-spoons will be field decontaminated prior to each use. Surficial samples may alternately be collected manually utilizing a pre-cleaned stainless-steel spoon or hand auger.

At each of the sample locations, a minimum of two soil samples will be collected unless otherwise noted. A soil sample will be collected from the 0-1-foot interval, below any debris, slab, pavement, or vegetative cover depending on the conditions at each sample location. The deeper sample will be collected from the one-foot interval above soil saturation unless evidence of potential impact (e.g., elevated PID readings, odor, staining) is apparent at a different depth interval, in which case the deeper sample will be collected from that interval.

### 3.1.2 Groundwater

The supplemental groundwater investigation will include the installation of a new aquitard well (designated AMW-12), an aquitard/aquifer monitoring well couplet designated AP-102S and AP-102D (shown on Figure 3), and four new monitoring wells within Mary Harriman Park designated MH-106 through MH-109 (shown on Figure 4). Note that the proposed aquitard well locations are intended to monitor the shallowest depth at which the water table is observed in the field. Based on the information available, it is anticipated that the soils at these locations will consist of generally low permeable material (in contrast to higher permeable sands and gravel) and the locations will therefore monitor the aquitard. However, in the event that the shallow water table is present in higher permeability material, the wells will still be completed at this shallow depth, to meet the objective stated above, but would be identified as aquifer wells due to the higher permeability of the surrounding soils. As noted in the report, the surficial aquitard is not present at all locations.

Following installation of the monitoring wells, groundwater samples will be collected from both new and existing locations as described further below.

#### 3.1.2.1 Monitoring Well Installation

New aquitard monitoring well location AMW-12 will be constructed consistent with the other AMW series monitoring wells by using a sonic drill rig to advance a boring to approximately 20 feet below ground surface while collecting continuous soil cores. The soil cores will be screened at the surface with a PID and visually described for grain size and to note the depth of saturation to identify the

appropriate interval for the monitoring well screen. The well will be screened within the upper 10 feet of the saturated zone consistent with the previously installed aquitard wells.

The new monitoring well couplet at the AP-102 location (AP-102S and AP-102D) will also be constructed using a sonic drill rig. A borehole will be advanced through the overburden soils to refusal on bedrock with continuous soil sampling. The soil samples will be screened upon retrieval at the surface with a PID and logged. On the basis of the observed conditions, two wells will be constructed. The shallow well will be completed within the approximate upper ten feet of the saturated zone (i.e., water table) and the second will be completed within the most permeable soils observed at that location. Assuming the conditions at the proposed location are similar to those observed at AP-101, this will result in a shallow well screened in low permeability clayey silt materials and the second in fine to coarse sand with some gravel. The length of the screened interval will be determined in the field but will be no shorter than five feet and no greater than 15 feet in length. The two well screens will be separated vertically by a minimum of five feet.

Monitoring well locations MH-106 through MH-109 will be constructed similar to and with the same objectives as locations MH-101 through MH-105. Specifically, a sonic drilling rig will advance a borehole to refusal on bedrock with continuous soil sampling. The soil samples will be screened upon retrieval at the surface with a PID, and visually described for grain size and visible evidence of staining. The observations will be recorded in a field logbook. Upon reaching refusal, the soil descriptions will be reviewed and the interval representing the most permeable soil deposits (i.e., those soils representing the aquifer materials) will be identified for construction of a monitoring well.

Each of the above wells will be constructed of two-inch diameter polyvinyl chloride (PVC). Standard well construction practices will be followed (i.e., each well will be constructed with a sand pack around the screen, bentonite seal above the screen, and cement bentonite grout to the ground surface) in accordance with DER Guidelines on Installation of Overburden Wells for Environmental Investigations. A flush-mount protective casing will be installed, and the location will be surveyed for vertical and horizontal control by a licensed NYS surveyor. Once constructed, the wells will be developed until there is no visible improvement in the clarity of the water. Drill cuttings and purge water will be collected in 55-gallon drums and staged on Site for subsequent disposal.

A staff gauge location will also be established on the Arden House Road bridge over the West Branch of the Ramapo River closest to the new AP-102 well cluster location so that subsequent water level measurements in the wells may be compared to the nearby stream elevation.

#### 3.1.2.2 Groundwater Sampling

A minimum of two weeks following completion of the new monitoring wells, water quality samples will be collected from the new and existing monitoring wells summarized in Table 1. Purging and sampling will be conducted with a QED Sample Pro Bladder pump with disposable bladder. Tubing will be high-density polyethylene (HDPE) and the tubing and bladder will be dedicated to each location and disposed of following sampling. The body of the bladder pump will be decontaminated between sampling locations using a potable water rinse, scrubbed with potable water and Alconox®, another potable water rinse and then air dried. Certified PFAS free water obtained from the lab will then be used to collect an equipment blank to document the effectiveness of the decontamination efforts. Sampling will be conducted using U.S. Environmental Protection Agency (EPA) Low Flow Sampling procedures. Purge water will be directed through a flow-through cell and field parameters will be monitored for stabilization in accordance with the EPA Low Flow/Purge methodology. Following stabilization of the field parameters, the sample will be collected directly from the pump tubing into laboratory provided containers. The containerized samples will be placed in a cooler with ice pending shipment to the laboratory under chain-of-custody (COC).

The collection of additional groundwater samples from other existing monitoring wells (i.e., those not specifically identified in Table 1) is not proposed. While fluctuations in PFAS concentrations over time are to be anticipated, these fluctuations are not anticipated to change the overall characterization of the Site. In addition, the analysis of PFAS compounds has been added to the Five-Quarter Groundwater Monitoring Program such that significant changes in concentration would be identified, if present. In the event that significant changes are identified, or potentially new technologies indicate the collection of additional groundwater data would be beneficial, additional groundwater sampling may be proposed.

#### 3.1.2.3 Groundwater Elevation Measurement

Following survey of the new monitoring wells and staff gauge location, a round of water levels will be collected from available monitoring wells. Water level measurements will be collected with an electronic water level meter to an accuracy of 0.01 feet.

The resulting measurements will be used to calculate the groundwater/surface water elevation at each location and updated potentiometric surface maps will be prepared.

### 3.1.3 Surface Water Sampling

Surface water samples will be collected for analysis of PFAS compounds from nine locations as illustrated in Figure 5. Sample designations are based on the distance northwest (negative distance) or southeast (positive distance) of the centerline of the bridge crossing Route 17 followed by an “N”, “S”, "E" or “W” to designate the north, south, east, or west side of the stream from which the sample will be collected. Two samples (SW-11.50S and SW-7.35S) will be collected from the North Branch of the Ramapo River (stream) adjacent to MH-1A and where the stream enters the Mary Harriman Park pond, respectively, one (SW-1.40S) from the pond immediately upstream of the dam, one (SW-0.90N) from the north side of the stream, north of NY Route 17 where the Harriman Sewage Treatment Plant discharges and one (SW-0.00S) under the centerline of the bridge to characterize surface water quality upstream of the Nepera Site. Sample SW+8.65S will be collected immediately adjacent to the Site near the permitted lagoon discharge point, while sample SW+14.0S will be collected just downstream from the Site. SW+22.7W will be collected at the intersection of Arden House Road and the stream immediately upgradient of the Avon Parcel and SW+43.00E will be collected near the point that the stream exits the Avon Parcel near the railroad tracks.

The locations shown on Figure 5 and described above are approximate and the final locations will be determined in the field contingent upon access. The collection of surface water samples as part of prior investigations has demonstrated that access to the stream is difficult due to steep, near vertical banks, heavy vegetation along the banks and numerous fallen trees across the stream. Accessing the stream using a boat is not feasible due to shallow stretches and numerous fallen trees. Conversely, wading down the stream is also not feasible due to fallen trees as well as stretches that are deep (over topping waders). Therefore, access can only be attained from the shore and wading limited distances within the stream for sample collection.

Samples will be identified with the location IDs described above followed by the sample collection date (e.g., SW-01-MM-DD-YYYY).

## 3.2 Chain-of-Custody Procedures

Custody requirements address sample custody and handling in the field and during laboratory receipt, analysis and disposition. All samples will be subject to complete custody documentation.

In the field, samples will be in physical possession or in view of the sampler/custody holder (typically the field sampling team leader). The sample may also be placed in a (designated) secure area by the custody holder.

Before sending samples to the analytical laboratory (typically by lab courier pick up), appropriate sections of the COC will be filled out. Sample containers will be labeled and must contain at least the following information: sample ID, sample date and time, and requested analysis. The COC will accompany the samples to the analytical laboratory; a copy of the COC stays in custody of the sampler.

The laboratory personnel will be responsible for the care and custody of samples from the time of receipt until the sample is exhausted or disposed. Custody rules will apply throughout the life of the sample in the laboratory. Documentation of sample custody within the laboratory will become a permanent part of the laboratory project files. The laboratory will submit an analytical report, including custody documentation.

## 3.3 Sample Analyses

Analytical services will be performed by a laboratory certified for analysis of the targeted analytes under the New York State Department of Health (NYSDOH) Environmental Laboratory Approval Program (ELAP).

### 3.3.1 Soil

Soil samples will be analyzed for the following analyte groups, using the method listed below:

- **PFAS Analyte List (NYSDEC, January 2021)** – Draft EPA Method 1633 (total matrix)
- **Benzene** – EPA Method 8260D (total matrix and Synthetic Precipitation Leaching Procedure [SPLP])
- **Alpha-Picoline** - EPA Method 8270E (total matrix and SPLP)

Table 2 provides a summary of each sample type, quantity, analyte, container, holding time and preservation method. Table 3 provides the reporting limits for the analyses.

### 3.3.2 Groundwater

Groundwater samples will be analyzed for PFAS using the methods listed below:

- Draft EPA Method 1633 (total matrix)[1]

## 3.4 Survey

Soil boring locations will be located by survey prior to conducting sampling to ensure sample locations are accurate. New monitoring well locations will be surveyed following completion. Sample and monitoring well locations will be surveyed by a New York-certified land surveyor. The survey will utilize the NYS Plane coordinate system (North American Datum of 1983 [NAD 83], East Zone, Feet). Vertical elevations will be references to North American Vertical Datum of 1988 (NAVD 88).

[1] As directed by NYSDEC (NYSDEC, June 2021), Draft EPA Method 1633 is to be used after November 1, 2022 and represents a change from the previously approved use of Method 537. Laboratory certification for draft Method 1633 may not be in place and may not cover all matrices at the time this Work Plan was developed and/or when the work is implemented.

## 3.5 Data Management Plan

### 3.5.1 Sample Nomenclature

Each soil sample collected will receive a distinct sample identifier. The sample identifier will consist of three parts; the first part will identify the area or investigation phase in which the sample was collected; the second part will identify the sample matrix; the third part will identify the specific sample. A complete list below identifies the different area and matrix identifiers. As an example, a soil sample collected to investigate emerging contaminants using a split spoon or a macro core from Boring 1 would be designated EC-B-001. The "EC" designates emerging contaminants, "B" identifies the sample as a soil boring, and "001" identifies the specific boring number. Each boring identifier will additionally have the depth interval added to the end of the identifier. In the example above, if the sample was collected from the 0-1 foot interval the sample identifier would be "EC B 001 0-1".

Groundwater samples will be identified by the monitoring well location ID and sample date. For example, a sample collected on November 15, 2022 from MW-35AQ will be identified as MW-35AQ-11152022.

The Quality Assurance/Quality Control (QA/QC) samples will also be identified in three parts; sample type, date, and a unique number if more than one type is collected in a single day. For example, a duplicate would be identified as "DUP-mmddyy" and a second duplicate collected on the same day would be "DUP-mmddyy-1".

Below are the matrix/sample codes:

- "B" indicates a soil boring
- "GW" – indicates groundwater sample collected from a temporary location
- "MW" – indicates groundwater sample collected from a permanent monitoring well
- "FB" indicates a field blank
- "DUP" indicates a duplicate
- MS indicates matrix spike
- MSD indicates matrix spike duplicate

### 3.5.2 Data Record

Data will be received from the laboratory as both a hard copy and as an electronic data deliverable. Data will be imported and stored in a database, which will include a minimum of three data tables. These three main data tables will be a results table, a parameter table, and a sample table. The results table will have each of the sample results stored; the parameter table will contain details regarding the analysis; and the sample table will contain information about the sample.

Data collected in the field, including PID data, will be stored electronically with the soil boring log data.

### 3.5.3 Tabular and Graphical Displays

Data will be presented in tables generated using the database and spreadsheets. Graphical displays, maps, figures, and boring logs will be generated using survey data from the database and Geographic Information System (GIS) or CAD depending on the application. Boring logs will be presented using Gint© or other similar logging software.

# 3.6 Quality Assurance Plan

## 3.6.1 Data Quality Objectives

Method analyses that are selected must, at a minimum, have detection limits that meet the relevant standards, criteria or guidance. Reporting limits are specified in Table 3.

## 3.6.2 Quality Assurance/Quality Control Samples

The field QA/QC samples to be collected are as follows:

## 3.6.3 Field Duplicates

Field duplicates are a second aliquot of a field sample. Variations in the sample and duplicate can be indicative of sample heterogeneity and/or possible inaccuracy or imprecision of sample collection or laboratory methodologies. One Field Duplicate will be collected for every 20 samples of the same matrix.

Field duplicates for soil samples (except samples to be analyzed for volatile organic compounds [VOCs]) will be collected by homogenizing the sample volume in plastic bowls with plastic spoons, or by kneading the material in a plastic bag (e.g., Ziploc© bag). Once homogenized, the material will be evenly distributed into the sample containers. Field duplicates for samples to be analyzed for VOCs will be collected directly from the soil core using the VOC sampling tool (e.g., Terra Core®) at a point as close as possible to the primary sample. Sample collection materials (bowls, spoons, plastic bags, gloves) will be laboratory decontaminated or single use.

### 3.6.3.1 Field Blanks

Field blanks, also referred to as equipment blanks, are used to determine if the sampling equipment used in the field might contribute appreciable concentrations of constituents to the samples. Laboratory certified PFAS free water is run over, or through, the sampling equipment and collected in the same type of sample containers as other samples. Ideally, the results for this analysis will show non-detects for the constituents analyzed. One field blank will be collected from non-dedicated equipment every day that samples are collected, or one per 20 samples, whichever is greater. Field blanks will not be collected from dedicated/disposable equipment such as acetate sleeves used with a Geoprobe®.

### 3.6.3.2 Matrix Spike/Matrix Spike Duplicate Samples

Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples will be used to determine if there are matrix interferences that may affect the analytical results. MS/MSD samples are obtained by collecting three times the required sample volume from a given sampling location. One set of MS/MSD samples will be collected for every 20 samples.

## 3.6.4 Test Methods

The following methods will be used for analysis:

- PFAS – Draft EPA Method 1633
- Benzene – EPA Method 8260D (total matrix and SPLP)
- Alpha-Picoline – EPA Method 8270E (total matrix and SPLP)
- SPLP – EPA Method 1312

Data will be reported in Category B format along with the required quality assurance data on the required forms and with raw data including calibration data, blank data, chromatograms, quant

reports, sample prep logs, sample run logs and percent moisture work sheets (as applicable) and will be provided in electronic format. Soil samples will be reported on a dry weight basis.

## 3.6.5 Data Validation

### 3.6.5.1 Qualitative Data Validation

Data validation services will be performed by a qualified data validator. For each data package a Data Usability Summary Report (DUSR) will be produced.

The criteria for qualitative data validation include the following:

- Data Completeness
- Sample Temperatures
- Holding Times
- Analytical Detection Limits and Sample Quantitation
- Surrogate Recovery
- MS/MSD Review
- Laboratory Control Sample (LCS)
- Review of QA/QC Samples
- Overall Evaluation of Data
- Gas chromatograph/mass spectrometer/GC/Electron Capture Detector (GC\MS\GC\ECD) Instrument Performance
- Initial Calibration
- Continuing Calibration
- Internal Standards
- Target Compound Identification
- System Performance
- Serial Dilution

### 3.6.5.2 Qualitative Data Validation Criteria

**Data Completeness**

The data completeness criterion incorporates a checklist of what should be found in a data package. It also identifies the types of forms used for certain analyses. A complete data set is considered to have the following: case narrative, data summary, surrogate recovery summary, MS/MSD summary, and LCS summary. In addition to identifying missing components of the data package, the data completeness check also includes verifying the following criteria: proper analytical method selection and documentation, use of the proper analytical data sheets, appropriate report formats, sample preservation documentation, and documentation clarity.

**Sample Temperatures**

Most environmental samples are required to be held within a temperature range of 2-6°C. The rationale for this range is that temperature affects various chemical and biological degradation processes, including solubility. Freezing of samples should be avoided as well.

**Holding Times**

Various parameter groups have different allowable holding times. Holding times are a function of solubility, rates of decay, evaporation, and other factors that are function of time and potentially

affect the concentrations of contaminants. The following lists the holding times for the constituents included in the various levels of data validation.

- PFAS Compounds – 14 days
- Benzene – 14 days
- Alpha-Picoline – 14 days

The results of samples that are tested outside of the holding time ranges are considered estimates, since there may have been sufficient time for a constituent loss or a reduction in concentration to have occurred.

### Analytical Detection Limits

Various analytes and various concentrations require different detection limits. This review focuses on whether or not the detection limits are sufficiently low to detect relevant concentrations of the samples by comparison to data quality objectives (DQOs) or project action limits and examines diluted samples. As a sample is diluted to bring the concentration within the calibration curve the detection limit changes as a multiple of the dilution factor. This elevated detection limit will be avoided to the extent practical; however, in some cases the elevated detection limit may not impact the DQOs.

### Surrogate Recovery

Surrogate recoveries are performed on each organic sample. Surrogate recoveries are one of several ways to examine the potential for matrix interference. Chemicals that are not specifically analyzed for are added (spiked) to the sample matrix in a known quantity, and the laboratory analyzes the sample.

The result is weighed against the known quantity added, and the percent difference between the spiked concentration and the analytical result provides a measure of possible matrix interference. Surrogate recovery data are reported as a percentage. The Relative Percent Difference (RPD) may be reported if a surrogate recovery duplicate is performed.

In general, if a lab has recoveries that are too low, then the results for that analysis are considered to be biased low, and if too high, the results are considered to be biased high. In each case the results should be considered an estimate and are qualified as such. In extreme cases where the recoveries are poor, in that they have a zero recovery, the data should be considered for rejection.

### MS/MSD

MS/MSDs are similar to the surrogate recovery in that they are spiked samples performed in the sample matrix. There are several distinct differences, however. One difference is that the chemicals added are the same chemicals that are being analyzed for; moreover, MS/MSDs are performed on each constituent group analyzed in the samples, not just organic compounds. MS/MSDs also address whether or not the matrix interferes with the analysis.

As with surrogate recoveries, low MS/MSD recoveries indicate that the results may be biased low, and high recoveries indicate results that may be biased high. As with surrogate recoveries, MS/MSD data are reported in the form of percentages.

### Laboratory Control Sample

LCSs examine the laboratory's accuracy and precision, where the focus is on the laboratory equipment and procedures. Unlike the MS/MSDs and the surrogate recovery analyses, the LCS analysis is performed with laboratory grade de-ionized water. The LCS results are reported in

percentages, with low results indicating that the results may be biased low, while high results indicate the results may be biased high.

### Laboratory Case Narrative

The laboratory case narrative describes inconsistencies observed by the laboratory during analysis. The case narrative states what was done differently, if anything, from prescribed methods, identifies holding time violations if any, and outlines other difficulties the lab may have encountered.

### Analytical Detection Limits and Sample Quantitation

For organic compounds, the accuracy of the contract required quantitation limits (CRQL) and the reported quantitation results are calculated through a series of equations. Quantitation results are a function of the mass and area of internal standard ion added, the amount of dilution, the volume of water purged during the process and the relative response factor (RRF). The RRF is a ratio of the internal standard concentration and ion area to the target ion's concentration and ion area. The CRQL is adjusted simply by multiplying by the dilution factor.

### Overall Evaluation of Data

The overall evaluation of the data is a holistic assessment of all the data. The entire data package and data review results are reviewed, and a narrative is prepared outlining concerns and comments about the quality of the data. Rarely are additional qualifications or rejections made based on the overall evaluation.

### GC/MS/GC/ECD Instrument Performance

GC/MS/GC/ECD instrument performance, also referred to as "tuning", is designed to demonstrate accurate mass resolution, identification, and sensitivity of the equipment. Instrument performance is evaluated using standard solutions and rarely results in rejections.

### Initial Calibration/Continuing Calibration

Initial and continuing calibrations are standards for instrument calibration ensuring that the instruments are detecting the appropriate concentration ranges and produce a linear calibration curve. The initial calibration demonstrates that the equipment is capable of detecting the appropriate ranges and is producing the proper calibration curve. The continuing calibration produces 12 hour RRF and checks the instrument daily throughout its use on the sustainable development goals (SDGs). The RRF is used to calculate quantitation and must be greater than 0.05 and produce percent differences within a range of plus or minus 25 percent.

### Internal Standards

Internal standards evaluate GC/MS sensitivity and responses for stability. The internal standard areas must not vary by greater than a factor of two from the calibration standard, and the retention time within the columns must not vary by more than thirty seconds.

### Target Compound Identification

Target compound identification examines the GC/MS results for false readings. The ions are scrutinized for concentration variances; the ions present within the standard mass spectrum with a relative percent intensity greater than 10 percent must also appear in the sample spectrum. If the ions that have a relative percent intensity greater than 10 percent are not in the sample spectrum they must be accounted for. Ions that are in both the standard and sample spectrum must have a relative percent intensity that is within 20 percent of each other.

### System Performance

System performance examines the accuracy of the instrumentation. As samples are analyzed, changes may occur that will impair the various instruments' ability to accurately analyze data. Sudden, severe shifts in the Reconstructed Ion Chromatogram (RIC) baseline can indicate decreasing resolution of the calibrated zero concentration. Inexplicable peaks, split peaks, or unusually high background readings can all also indicate problems with the instruments and may lead to inaccurate readings.

### Serial Dilution

The serial dilution examines matrix interference from physical or chemical sources. One serial dilution must be performed for each type of sample matrix, concentration level, or SDG, depending on what would be more frequent. Field Blanks must not be used. The dilution must be within 10 percent of the original concentration if that concentration is greater than 50 times the instrument detection limit (IDL).

A complete copy of the DUSR, signed by the reviewing validator, will be provided to the NYSDEC.

## 3.7 Report

A Supplemental EC Investigation Report will be prepared following the receipt of all laboratory data. The report content will include:

- Technical overview of findings including description of work performed, deviations (if any) from this work plan, findings and results, and conclusions and recommendations
- Sample location map
- Tables and figures summarizing sampling results including location, media, sample interval, identification numbers, analytical results and comparison to guidance values and Part 375 Soil Cleanup Objectives with exceedances highlighted, as follows:
  - Soil:
    - PFOS
      - Unrestricted Use Guidance Value – 0.88 micrograms per kilogram (µg/kg)
      - Residential Use Guidance Value – 8.8 µg/kg
      - Restricted Residential Guidance Value – 44 µg/kg
      - Commercial Guidance Value – 440 µg/kg
      - Industrial Guidance Value – 440 µg/kg
      - Protection of Groundwater Guidance Value – 1.0 µg/kg
    - PFOA
      - Unrestricted Use Guidance Value – 0.66 µg/kg
      - Residential Use Guidance Value – 6.6 µg/kg
      - Restricted Residential Guidance Value – 33 µg/kg
      - Commercial Guidance Value – 500 µg/kg
      - Industrial Guidance Value – 600 µg/kg
      - Protection of Groundwater Guidance Value – 0.8 µg/kg

    - Benzene (total)
        - Unrestricted Soil Cleanup Objective– 0.06 milligrams per kilogram (mg/kg)
        - Residential Use Soil Cleanup Objective – 2.9 mg/kg
        - Restricted Residential Soil Cleanup Objective – 4.8 mg/kg
        - Commercial Guidance Soil Cleanup Objective – 44 mg/kg
        - Industrial Guidance Soil Cleanup Objective – 89 mg/kg
        - Protection of Groundwater Soil Cleanup Objective – 0.06 mg/kg
        - Groundwater Guidance Value (SPLP Results) – 1 microgram per liter (µg/L)
    - Alpha-Picoline
        - Groundwater Guidance Value (SPLP Results) – 50 µg/L
  - Groundwater and Surface Water:
    - PFOS
        - April 2023 Human Health Criterion - 2.7 ng/L
    - PFOA
        - April 2023 Human Health Criterion – 6.7 ng/L
- Soil boring and monitoring well logs
- Field data sheets
- Electronic data deliverables
- DUSRs

## Section 4

# Schedule

Field activities will be scheduled approximately one month following receipt of NYSDEC approval of this Work Plan Addendum, to allow for coordination with contractors and analytical laboratories and surveying/marking out proposed boring locations. The soil sampling is anticipated to require approximately three weeks to complete. Analysis of soil samples is anticipated to require three to four weeks.

Monitoring well installation is anticipated to be completed in approximately four days following access approval from the Village of Harriman. Groundwater sampling will be conducted following a two-week stabilization period and is anticipated to be completed in two days.

Upon receipt of the results, an updated EC Site Investigation Report will be prepared presenting the results from the investigations conducted during 2020-2022 including the additional investigation described in this Work Plan Addendum.

The NYSDEC will be notified at least five business days in advance of each sampling event.

NOTES:
1. PFAS compounds to be analyzed by Draft EPA Method 1633, following NYSDEC guidance titled *Sampling, Analysis, and Assessment of Per- and Polyflouroalkyl Substances (PFAS)* dated June 2011.
2. PFAS soil samples to be collected at the 0-1 foot depth interval (below any pavement), and the 1 foot interval above soil saturation unless another depth interval is selected based on visible indication of potential impacts.
3. Benzene/a-Picoline soil samples to be collected at the 0-0.5 foot depth interval (below any pavement), and the 1 foot interval above soil saturation unless another depth interval is selected based on elevated PID readings.

Note: Modifications to the Work Plan Addendum are detailed in the October 2023 Phase II Emerging Contaminants Site Investigation Report Response to Comments and Associated Report Addendum

**TABLE 2**
**ANALYTICAL METHODS AND HOLDING TIMES**
**FORMER NEPERA PLANT SITE**

# Attachment A: Additional Soil Sampling Proposed By The Corporate Defendants

## Attachment A

# Additional Soil Sampling Proposed By The Corporate Defendants

Additional soil sampling has been proposed by the Corporate Defendants to supplement sampling conducted by ELT Harriman and more fully delineate potential PFAS, benzene, and alpha-picoline sources within the unsaturated overburden. Proposed supplemental sampling locations are shown on Figures A-1 and A-2 to this attachment.

## Proposed Supplemental Soil Sampling Activities and Procedures

The supplemental soil investigation to be performed by the Corporate Defendants will include the collection of soil samples at the locations shown on Figures A-1 and A-2. Locations proposed for supplemental soil sampling fall within the five areas identified within the Emerging Contaminant Report where PFAS concentrations were identified within groundwater samples at relatively higher concentrations than other locations, two additional areas (F-GW-04 and MW-26S) requested by NYSDEC for further soils investigation, and three additional borings, also in response to NYSDEC comments, to fill a data gap in the vicinity of the foam house. These areas include:

- **AMW-8 Area** – AMW-8 is an aquitard well located northeast of the main plant area and south of Arden House Road and the lagoon. This well had the highest reported concentrations of PFOS within the aquitard (833 ng/L). Eight additional borings (EC-B-030 through EC-B-037) will be completed in this area.
- **Temporary Well G-GW-01** – G-GW-01 is a temporary well that was screened in the aquitard interval with a PFOS concentration of 426 ng/L. It was located northeast of the main plant area and upgradient of AMW-8 (south). This temporary well is potentially associated with soil impacts localized to this area and/or known soil impacts in the Building 72 area. Two additional borings (EC-B-045 and EC-B-046) will be completed in this area.
- **AMW-9/AMW-10 Area** – AMW-9 and AMW-10 are located in the central portion of the main plant area. PFAS concentrations in these wells may be associated with previously identified soil impacts in the Building 72 area. Seven additional borings (EC-B-038 through EC-B-044) will be completed in this area.
- **MW-37 Area** – MW-37 is located in the southwest corner of the lagoon, north of Arden House Road. Further sampling in this area will help to investigate a possible localized surficial source that is suggested by relatively high concentrations of PFOS in groundwater. Ten additional borings (EC-B-020 through EC-B-029) will be completed in this area.
- **OW-6 Area** – OW-6 is located in the south-southeast corner of the site outside the main plant area. This location had the highest groundwater PFOS, and total PFAS, concentrations on Site. The area is also characterized by elevated concentrations of benzene alpha-picoline. Eight additional borings (EC-B-047 through EC-B-054) will be completed in this area and samples from this area will be analyzed for PFAS, benzene and alpha-picoline (2-picoline).

- **Temporary Well – F-GW-04** – F-GW-04 is a temporary well that was screened in the aquitard interval with a PFOS concentration of 101 ng/L. This location is in the far northeast corner of the main plant area. Additional soil borings will be completed to investigate a possible shallow source in this area. Six additional borings (EC-B-058 through EC-B-063 will be completed in this area.
- **MW-26S Area** – MW-26S is a shallow aquitard monitoring well located adjacent to the North Branch of the Ramapo River, off the northeast corner of the lagoon. The PFOS concentration at this location was 286 ng/L. Additional soil borings will be completed to investigate a possible shallow source in this area. Nine additional borings (EC-B-064 through EC-B-072) will be completed in this area.
- **Foam House (B-72)/OW-6 Area** – Three additional borings (EC-B-055 through EC-B-057) will be completed between existing borings completed in the vicinity of the Foam House (B-72) and proposed borings to be completed around OW-6.

Six of the eight areas identified above fall within portions of the Site underlain by low-permeability soils (aquitard areas). PFAS compounds (and benzene) are anticipated to bind to soil in these areas such that both groundwater and contaminant movement are minimized and the mass flux of contaminants to groundwater is low even if identified concentrations are elevated. Elevated concentrations of PFAS compounds identified within the aquitard wells are therefore anticipated to be located proximate to these wells in the low-permeability soil. OW-6 and the surrounding area is located within a portion of the site that transitions from low-permeability soil to higher-permeability soil. Elevated concentrations of PFAS and benzene identified within this well may be associated with either impacts in soil proximate to OW-6 or an upgradient source in groundwater.

Sample locations will be identified in the field prior to sampling through use of a GPS or licensed surveyor. Locations may be adjusted in the field based on access constraints or observations regarding potential impacts. Details regarding the procedures for the collection and analysis of soil and groundwater samples, as well as well installation procedures, are described below.

## Sample Collection Procedures

Sample collection will be performed in accordance with the Standard Operating Procedures (SOPs) provided in the original work plan dated August 2019 and current NYSDEC guidance for PFAS sampling. If alternative sample collection methods are required due to field conditions, NYSDEC will be notified, and approval obtained prior to sample collection.

## PFAS

Soil samples will be collected using one of two methods: Geoprobe® (macro core) or two-inch stainless-steel split-spoons. If soil samples are collected via Geoprobe®, a new acetate liner will be used for each sample. If sampling is performed using a 2-inch stainless steel split-spoon, the split spoons will be field decontaminated prior to each use. Surficial samples may also be collected manually utilizing a pre-cleaned stainless-steel spoon or hand auger.

Soil borings will be advanced to the designated target depth (zone of saturation) and continuously sampled in accordance with the SOP. Soils will be observed for physical properties such as color, sorting, grain size, etc. and described using the modified Burmister® system. Samples will be screened in the field using a photoionization detector (PID) and readings for each sample interval will be recorded on the boring log and/or the field logbook.

Both surficial and deeper soil samples will be homogenized in a stainless-steel bowl prior to placement in sample containers. After the completion of sample collection, any excess soil will be carefully placed back in the borehole. The remainder of the borehole will be restored to grade with additional soil.

At each of the sample locations, a minimum of two soil samples will be collected unless otherwise noted. A soil sample will be collected from the 0-1 foot depth interval, below any debris, slab, pavement, or vegetative cover depending on the conditions at each sample location. A one-foot surficial interval has been chosen due to the sample volume needed for analysis, based on prior site experience. The one-foot interval is also expected to retain a substantial fraction of PFAS compounds that may have been released at the surface (if any). The deeper sample will be collected from the one-foot interval above soil saturation unless evidence of potential impact is apparent at a different depth interval, in which case the deeper sample will be collected from that interval.

## Benzene and Alpha-Picoline

Soil samples obtained from the OW-6 area will be collected using one of two methods: Geoprobe® (macro core) or two-inch stainless-steel split-spoons. If soil samples are collected via Geoprobe®, a new acetate liner will be used for each sample. If sampling is performed using a two-inch stainless-steel split-spoon, the split-spoons will be field decontaminated prior to each use. Surficial samples may alternately be collected manually utilizing a pre-cleaned stainless-steel spoon or hand auger.

At each of the sample locations, a minimum of two soil samples will be collected unless otherwise noted. A soil sample will be collected from the 0-1-foot interval, below any debris, slab, pavement, or vegetative cover depending on the conditions at each sample location. The deeper sample will be collected from the one-foot interval above soil saturation unless evidence of potential impact (e.g., elevated PID readings, odor, staining) is apparent at a different depth interval, in which case the deeper sample will be collected from that interval.

Note that additional samples may be collected for benzene and/or alpha-picoline analyses based on the results of field screening (i.e., elevated PID readings) or visual observations.
