# Executive Summary

This report presents the results and analysis associated with the Emerging Contaminants (EC) Investigation at the former Nepera plant in Harriman, New York (the "Site") with additional soil and groundwater investigation work proposed based upon the findings to date. The EC investigation addresses the nature and extent of emerging contaminants consisting of 1,4-dioxane and per- and polyfluoroalkyl substances (PFAS). This investigation was conducted in phases, with results from early phases of work guiding subsequent phases of work following review and approval from the New York State Department of Environmental Conservation (NYSDEC).

Phase I consisted of the advancement of 34 soil borings for the collection of soil samples, the installation and sampling of five temporary groundwater monitoring wells, the installation of four new permanent monitoring wells and the collection of groundwater samples from 25 new and existing permanent monitoring wells. The Phase I report was submitted to NYSDEC in April 2021 and included a proposal for additional monitoring well installations and groundwater sampling.

Phase II consisted of the installation of 20 new monitoring wells (both on and off Site), the collection of 38 groundwater samples from both new and existing permanent monitoring wells, and an assessment of the influence on groundwater flow associated with operation of the Village of Harriman water supply well MH-1A located approximately 1,100 feet northwest of the Site in Mary Harriman Park.

The groundwater data from this phase of the investigation is generally consistent with historical data and the Conceptual Site Model (CSM). Data confirm that there is a groundwater "ridge" in the vicinity of MW-33 and MW-34 within the central portion of the Site. As such, groundwater generally moves from southwest to northeast in all units. Groundwater contours also indicate that groundwater flow underlying Mary Harriman Park, northeast of locations MH-104 and MH-105, is cross-gradient to the Site. Because MH-1A is a water supply well, zones of influence and capture were evaluated. These data suggest the pumping of MH-1A does not influence the groundwater at the Site, and vice versa.

Both the soil and groundwater investigation results yielded only sporadic detections of 1,4-dioxane. Throughout both phases of investigation, analytical results only returned one groundwater and one soil exceedance of 1,4-dioxane (12 micrograms per liter [µg/L] and 140 milligrams per kilogram [mg/kg], respectively).[1] Therefore, further sampling for 1,4-dioxane is not recommended and is only briefly discussed. Aside from evaluating groundwater flow, this report focuses on the distribution of PFAS and the relationship of that distribution to the existing CSM.

Results of PFAS groundwater sampling within wells at the Site and within Mary Harriman Park indicate (1) perfluorohexanesulfonic acid (PFHxS) was detected in generally the same spatial distribution and concentration ranges as perfluorooctanesulfonate (PFOS) on Site, (2) five potential separate source areas exist on Site, and (3) separate, non-Site source(s) of PFAS compounds are impacting Mary Harriman Park.

[1] New York Drinking Water Maximum Contaminant Level = 1 µg/L and New York Unrestricted Use Soil Cleanup Criteria = 100 mg/kg.

Based on these results, this report provides recommendations for additional soil sampling to further define the nature and extent of impacted soils in five potential source areas. This report also recommends the installation and sampling of additional downgradient groundwater monitoring wells adjacent to the West Branch of the Ramapo River to further define the nature and extent of impacted groundwater in the aquitard and aquifers identified during the Phase II groundwater investigation.

Section 1

# Introduction

## 1.1 Overview

In May 2017, the New York State Department of Health (NYSDOH) (in collaboration with the Orange County Health Department) sampled the public water supply wells in Mary Harriman Park. This initial sampling resulted in detections of perfluorooctanoic acid (PFOA) and PFOS in public water supply well MH-1A. In addition, to evaluate the presence of PFOS and PFOA in the vicinity of Mary Harriman Park, the NYSDEC conducted sampling during June 2017 to evaluate on-Site (Nepera) groundwater, as well as surface water from Mary Harriman Park Lake and the West Branch of the Ramapo River. This investigation also confirmed the presence of PFOA and PFOS.[2] The purpose of this EC Site Investigation Report is to evaluate emerging contaminants at the Nepera-Harriman Site and nearby Mary Harriman Park.

The investigation contained in this report was proposed in the final *Emerging Contaminants Site Investigation Work Plan*, dated October 2019.[3] The investigation was completed in response to a request from the NYSDEC to conduct an investigation of PFAS and 1,4-dioxane (EC) in soils and groundwater at the Nepera-Harriman Site, also referred to as the Former Nepera Plant Site (the "Site").

## 1.2 Site Description

The Nepera-Harriman Site is located on NY Route 17 in the Village of Harriman, Orange County, approximately one mile west of Exit 16 of the New York State Thruway (Figure 1-1). The Site is bounded to the northwest by New York State (NYS) Route 17, to the northeast by the West Branch of the Ramapo River, to the southeast by undeveloped land currently owned by ELT Harriman, LLC (ELT) (commonly referred to as the "Avon parcel") and to the southwest by the Erie Lackawanna Railroad. The Site occupies approximately 28 acres and can generally be divided into two areas: (1) approximately 10 acres located to the northeast of Arden House Road on which the former administrative offices were located, and a parking lot and stormwater lagoon are located, and (2) approximately 18 acres to the southwest of Arden House Road on which the former manufacturing facilities were located. The Site was previously used for the manufacture of pharmaceutical and specialty chemicals from 1942 to 2005 and was acquired by ELT in 2007. In 2015, the buildings, tank farms, distilling operations, and other manufacturing areas were decommissioned and demolished according to NYSDEC standards. The primary features of the Site as of 2005, prior to demolition activities, is presented in Figure 1-2. Also visible in Figure 1-2 are the location of industrial and sanitary sewer lines underlying the Site.

---

[2] New York State Department of Environmental Conservation letter to Corporate Defendants, September 12, 2017.

[3] The *Emerging Contaminants Site Work Plan*, dated October 2019, was revised after subsequent initial sampling. The additions to the work plan are detailed in the *Revised Emerging Contaminants Site Investigation Work Plan Addendum* (dated June 19, 2020), the proposed additional investigation work included with the *Emerging Contaminants Site Investigation Report* (EC SIR) (dated April 2021), and the approval for installation of pressure transducers in Mary Harriman Park wells by agreement with the Village of Harriman (dated March 9, 2022).

Previously completed and approved remedial actions at the Site have included, but are not limited to, drum and contaminated soil removal (Area F, Area K, Building 53), groundwater extraction and treatment, biosparging, interim remedial measures (IRM) along the stream bank, Resource Conservation and Recovery Act (RCRA) Corrective Action, and other actions as required by the Record of Decision (ROD), RCRA Corrective Action, and subsequent agreements with the NYSDEC. A discussion of the various remedial investigations is presented in the *Sitewide Characterization Summary Report* (SCSR).[4] Additionally, the SCSR contains: (1) a detailed description of the regional and Site setting including physiography, geology, hydrogeology, and hydrology, (2) the CSM as developed under the ROD, (3) exposure and ecological assessments, and (4) significant Site events.

Subsequent Site investigation reports include:

- *Supplemental Remedial Investigation Report, Former Nepera Plant Site, Brown and Caldwell Associates*, October 2014, May 2014, revised May 2015
- *Supplemental Remedial Investigation Report, Former Nepera Harriman Site, Cornerstone Engineering & Land Surveying, PLLC*, November 2014, revised August 2016
- *Emerging Contaminants Site Investigation Report, Former Nepera Harriman Site, Brown and Caldwell Associates and Cornerstone Engineering and Geology, PLLC*, April 2021

This report has been generated in response to a request from the NYSDEC to evaluate PFAS and 1,4-dioxane (EC) in soils and groundwater at the Nepera-Harriman Site. 1,4-Dioxane, which is generally associated with chlorinated solvents, was not used as a raw material or manufactured at the Site. Based upon prior investigations, the other contaminants of concern (COCs) at this Site are benzene, toluene, xylene, pyridine, alpha-picoline, 2-aminopyridene, and mercury, none of which are chlorinated solvents. Chlorinated solvents (specifically chlorobenzene) have only been detected sporadically in groundwater and at low levels.[4] Similarly, PFAS compounds (which are the focus of this report) were not used as raw materials or manufactured at the Site.

## 1.3 Conceptual Site Model

The CSM was initially presented in the *Conceptual Site Model and Supplemental Remedial Action Work Plan* and was summarized again in the March 2011 SCSR[3]. The additional data collected to date, inclusive of soil descriptions obtained at new monitoring well locations and the spatial distribution of PFAS compounds, continues to support the CSM with further refinement of off-Site conditions to the southeast and northwest. The CSM informs the assessment and understanding of data collected as part of this investigation and is visually illustrated in the cross-section provided in Figure 1-3. The heterogeneous geology (shown in the cross section) changes gradationally across the study area and causes groundwater travel times to vary depending on the grain size and associated permeability of the soils. Soils principally comprised of fine sands, silt and clay represent an aquitard, as compared to soils comprised of fine and/or coarse sand which represent an aquifer. In general, groundwater underlying the central portion of the former Nepera Site is first present within low permeability soils identified as an aquitard. Groundwater flow through the aquitard in this area is impeded by the comparatively low permeability soils and moves both horizontally and vertically with discharge to the underlying coarser-grained soils identified as an aquifer. Groundwater flow through the aquifer (glacial outwash) underlying the central portion of the Site is generally to the northeast. Within the southeast corner of the Site and off-Site to the southeast, the aquitard is not present. In this portion of the Site, soils consist of fine sand and silt with lenses of fine to medium sand. While groundwater generally flows from southwest to northeast across the

[4] *Sitewide Characterization Summary Report*, Brown and Caldwell Associates and Cornerstone Engineering and Land Surveying, PLLC, March 2011.

Site, groundwater flow in the southeast corner has a localized shift and flows to the southeast. In these deposits, the rate of flow is limited such that degradable Site COCs such as benzene, are degraded before reaching downgradient monitoring wells (e.g., MW-4S). However, Site COCs which are not readily degraded, such as PFAS compounds, are detected in downgradient monitoring wells. Finally, as shown on Figure 1-3, the coarse-grained soils comprising the aquifer underlying the central portion of the Site gradually become thinner and finer grained to the northwest of the Site, across NY Route 17 and underlying Mary Harriman Park, such that aquifer materials are no longer present and the low permeability soils represent an aquitard. As noted above, and as shown on Figure 1-3, lateral changes in the grain size of the soils, and the associated change from aquitard to aquifer, occur gradually with no distinct boundaries.

Section 2

# Scope of Investigation

This section presents the scope of the investigation, as well as any modifications that were necessary as the result of field conditions. Field work was completed in compliance with the approved work plans and addenda, Part 375 regulations, and NYSDEC guidance for emerging contaminants sampling. Notification of mobilization for sampling activities was provided to the NYSDEC at least seven days in advance. Field work was completed in compliance with a Health and Safety Plan (HASP).

## 2.1 Site Investigation Objectives

The investigation objectives are as follows:

- Investigate the distribution of 1,4-dioxane and PFAS compounds in the soil across the Site.
- Investigate the distribution of 1,4-dioxane and PFAS compounds in groundwater across the Site and in Mary Harriman Park.
- Refine the CSM by gathering additional groundwater data from locations to the southeast and northwest of the Site.
- Define the zones of influence, and capture, associated with water supply well MH-1A to evaluate the extent, if any, of hydraulic connection between the Site and Mary Harriman Park.
- Investigate potential sources of groundwater impacts, on-Site and in the vicinity.

## 2.2 Soil Investigation

The initial Supplemental Remedial Investigation (SRI) soil investigation was conducted between January 8 and 10, 2020. Seventeen borings were completed in the vicinity of Building 2A, Building 26, Building 52, and Building 72, as well as near monitoring wells where PFAS compounds had been detected in prior sampling.

Following review of the initial round of soil sampling results, a second mobilization was conducted between August 10 and 11, 2020.[5] The second mobilization included 17 additional borings to further delineate potential PFAS sources within the vadose zone identified in January 2020. The saturated soils which exhibited characteristics of an aquitard were further investigated and delineated under the groundwater sampling portion of the investigation.

The sample locations are presented on Figure 2-1 and summarized in Table 2-1. Samples were analyzed for the following analyte groups, using the following methods:

- PFAS Target Analyte List (NYSDEC, April 2018) – U.S. Environmental Protection Agency (EPA) Method 537, revision 1.1 (modified)
- 1,4-Dioxane – SW-846 Method 8270 SIM with Isotope Dilution
- PFAS Synthetic Precipitation Leaching Procedure (SPLP) – Method 1312 – Contingent analysis for samples where PFOA or PFOS concentrations exceeded 1 part per billion (ppb).

[5] The scope was established in the *Emerging Contaminants Site Investigation Work Plan Addendum*, dated June 19, 2020.

Cascade Technical Services completed the borings, and the soils were logged by Brown and Caldwell (BC).

Prior to completing the soil borings, each sample location was identified in the field by a NYS licensed surveyor, MJ Engineering and Land Surveying, P.C. Subsequently, all sample locations were cleared for underground structures and other potential obstructions by a geophysical contractor (Enviroprobe Service, Inc. and Subsurface Environmental Technologies for the January 2020 and August 2020 sampling events, respectively). Oversight of field sampling activities was provided by NYSDEC representatives Parag Amin on January 8, and David Herman on January 9.

## 2.3 Groundwater Investigation

The initial phase of groundwater investigation began in August 2020.[6] For this evaluation, Cascade Drilling installed five temporary wells and four permanent monitoring wells (two individual locations and one couplet location). Both the temporary and permanent wells were subsequently sampled by a representative of Cornerstone PLLC (Cornerstone). In addition, Cornerstone completed a Site-wide measurement of groundwater levels for use in refinement of the CSM.

The scope of the second groundwater investigation phase began in September 2021.[7] This phase of work included the installation of 11 shallow on-Site monitoring wells screened at the water-table and within the low-permeability aquitard soils (where present and as discussed above in the soil investigation section), seven off-Site monitoring wells screened in the most permeable overburden deposits at each location, and two off-Site monitoring wells in the upper 15 feet of bedrock. Note that soils characteristic of aquifer materials were not identified during well installation within Mary Harriman Park. Therefore, the completed wells represent aquitard wells.

Permanent and temporary monitoring well locations are shown on Figure 2-2 and summarized in Table 2-2. All groundwater samples were analyzed for the PFAS Target Analyte List and 1,4-dioxane, consistent with the soil samples described above (i.e., PFAS Target Analyte List (NYSDEC, April 2018) –EPA Method 537, revision 1.1 (modified) and 1,4-dioxane – SW-846 Method 8270 SIM with Isotope Dilution).

Following completion of the off-Site wells referenced above the Village of Harriman approved the installation of pressure transducers in monitoring wells within the Mary Harriman Park. After approval, Cornerstone installed pressure transducers in 20 monitoring wells to assess the MH-1A's zone of influence, and zone of capture, for a period of two weeks beginning on March 18, 2022. Sixteen of these monitoring wells are within Mary Harriman Park and four monitoring wells are located on the Site. The NYSDEC agreed with this recommendation and further study was completed as described below.

## 2.4 Work Plan Modifications

Modifications to the approved Site investigation scope were necessary in response to conditions encountered in the field. Changes to the initially proposed scope of work, and the significance of those changes are described below.

---

[6] *Work Plan Addendum, Emerging Contaminants Site Investigation Work Plan, Former Nepera Plant Site, Cornerstone Engineering, Geology and Land Surveying PLLC and Brown and Caldwell Associates*, March 9, 2020, Revised June 19, 2020.

[7] *Emerging Contaminants Site Investigation Report, Former Nepera Plant Site, Brown and Caldwell Associates and Cornerstone Engineering and Land Surveying, PLLC*, April 2021

### 2.4.1 Soil Investigation

Soil sampling was conducted in accordance with the approved work plan with the exception of the depth intervals. The work plan specified target intervals of 0-2 inches below any debris, slab, pavement, or vegetative cover for surficial soil samples and the one-foot interval above soil saturation, unless evidence of potential impact was apparent at a different depth interval. Due to field conditions (extensive debris) and the large volume of soil required for SPLP analysis, surficial samples were collected from a depth interval of 0-1 foot below ground surface. In some instances, a sample interval of larger than one foot was required for deeper samples. This change in sampling intervals does not impact data usability or the evaluation of the main objective: to investigate potential source areas related to groundwater impacts.

### 2.4.2 Groundwater Investigation

Groundwater sampling was completed in accordance with the approved work plan with two exceptions. First, the work plan specified that samples would be taken through a retractable screen attached to the Geoprobe® rods. Instead, temporary polyvinyl chloride (PVC) well points were used to collect groundwater samples. This change was necessary because, at many locations, Site soils had generally low permeability which required extended time for sample collection. Second, a few of the proposed on-Site wells were shifted slightly from their proposed locations due to obstructions in the field. These shifts in location were minimal and did not affect the intent of the originally proposed location.

Section 3

# Field Sampling Methodology

## 3.1 Soil Investigation

Soil samples were collected using Geoprobe® (macro core) direct-push technology, with new acetate liners used for each sample interval. Soil boring logs are provided in Appendix A.

Soil sampling was conducted in accordance with the standard operating procedures in the October 2019 *Emerging Contaminants Site Investigation Work Plan*. Each soil sample was field screened for volatile organic compounds (VOCs) using a photoionization detector (PID), calibrated daily in accordance with the manufacturer specifications. During sampling with the macro core, the sample was screened immediately upon opening the sampling device. The PID was utilized to monitor for VOCs within "pockets" of the soil burrowed with a gloved hand of the sampler. The PID sampling tip was placed within the pocket and then enclosed by the cupped hand of the sampler. Conditions were allowed to stabilize, and a reading was taken and recorded. This process was repeated at each observed change in material or evidence of impact. The portion of the soil cores sampled for analysis was biased toward the portion demonstrating the highest PID readings.

VOC samples were collected directly from the non-homogenized core and containerized. Soil samples for PFAS analysis were removed from the split-spoon or acetate liner and placed in high-density polyethylene (HDPE), glass, or polypropylene sample bottles with Teflon®-free caps, provided by the laboratory.

After the completion of sample collection, excess soil was placed back in the borehole. No investigation-derived waste was generated as part of the soil investigation.

In addition to the 34 soil samples described above, continuous soil samples were collected from ground surface to 25 feet below ground surface at each temporary well location. These soil logs are located within Appendix B and were used to refine the understanding of Site geology.

## 3.2 Groundwater Investigation

The groundwater investigation consisted of the installation of temporary and permanent monitoring wells, collection of water levels, collection of groundwater quality samples, the collection of information related to the Village of Harriman water supply wells, and assessment of the influence on groundwater flow associated with operation of water supply well MH-1A pursuant to the scope of work outlined within the April 2021 EC SIR (BC/Cornerstone 2021) approved by the NYSDEC.

### 3.2.1 Temporary Monitoring Well Installation and Sampling

From August 5 to August 7, 2020, five temporary monitoring wells were installed using a Geoprobe® owned and operated by Cascade Drilling and sampled by Cornerstone. The locations were surveyed in the field using a Trimble R10 GNSS Receiver with real-corrections from NYSNet Real Time Network. Soil samples were collected from each boring, screened with a PID, and logged by Cornerstone. The soil logs were subsequently used to select the most permeable interval for well completion.

The temporary wells were purged using a peristaltic pump and one representative groundwater sample was collected from each location through temporary one-inch diameter PVC pipe attached to a five-foot long well screen. Purging was completed at a low flow rate to reduce turbidity and the temporary wells were evacuated multiple times to reduce turbidity until there was no visible improvement. In some cases, Cornerstone completed multiple evacuations of the temporary wells, but the groundwater remained cloudy and/or had a brown tint. Once a visible improvement in turbidity was no longer observed, the discharge tubing was connected to a flow through cell attached to a Horiba U22 multiparameter meter that was calibrated daily. Field parameters were monitored until stabilization in accordance with the EPA Low Flow Sampling Procedures.[8] As noted above, the turbidity in some of the temporary wells remained high, but at stabilized levels. Turbidity in the collected groundwater samples can exaggerate the PFAS results if the compounds are adsorbed on suspended particulates. However, there does not appear to be a correlation between elevated turbidity levels and PFAS concentration in these results. Collection of groundwater samples occurred directly through HDPE tubing dedicated to each well into laboratory provided bottles (unpreserved polypropylene 250 milliliters (ml) with non-Teflon screw on cap for PFAS and amber glass 250 ml preserved with hydrochloric acid for 1,4-dioxane). At location F-GW-01, the yield was sufficiently low that the temporary well was evacuated three times followed by sample collection. As noted above, HDPE tubing was dedicated to each well and the silicon tubing used in the peristaltic pump was replaced between each location. The collected samples were labeled with the temporary well location ID, sampling date and time and samplers initials, and immediately placed on ice. The samples were sent under chain-of-custody, via lab courier, to Eurofins-Test America Laboratory for analysis of 1,4-dioxane and PFAS compounds.

Following sample collection, the temporary PVC wells were removed, and cuttings were used to backfill the borehole to the original grade. Any remaining cuttings and purge water generated during sampling were containerized in 55-gallon steel, DOT-approved drums, labeled and staged for subsequent disposal.

### 3.2.2 Monitoring Well Installation (Phase I)

In Phase I, four monitoring wells were installed to preliminarily assess the distribution of emerging contaminants and the refinement of the CSM. Three aquifer monitoring wells were installed using a Geoprobe® equipped with hollow-stem augers (MW-201, MW-202, and MW-203). The hollow-stem auger met refusal at the top of the bedrock, therefore, mobilization of a sonic rig was necessary for the installation of one bedrock well (MW-202D). Drilling was completed by Cascade Drilling from August 5 through 19, 2020.

Soil samples were collected from each boring, screened with a PID, and logged by Cornerstone. The soil logs were subsequently used to select the most permeable interval for completion of four monitoring wells. All wells were constructed with two inch diameter PVC riser pipe, PVC wire-wrap screens, sand pack around the screens and cement-bentonite grout to ground surface. The aquifer wells were constructed with 20-foot screens. The bedrock well was constructed with a 10-foot screen, consistent with pre-existing wells on Site. Well construction logs are provided in Appendix C. Following completion, the wells were developed until the development water was visually clear and then completed with a locking protective casing. Drill cuttings and development water were contained in 55-gallon drums for subsequent disposal. Locations and elevations were surveyed by licensed NY surveyor Kennedy and Associates.

[8] Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures, EPA/540/S-95/504, April 1996.

### 3.2.3 Monitoring Well Installation (Phase II)

In Phase II, 20 monitoring wells were installed between September 23 and October 7, 2022 using a sonic drilling rig owned and operated by Aquifer Drilling and Testing (AMW-1 through AMW-11, MH-101 through MH-105, MH-103D, MH-105D, AP-101, and BP-101). Soil samples were collected from each boring and screened with a PID using methodology described previously. PID readings above 1 part per million (ppm) were recorded at location MH-102, AMW-1, AMW-2, and AMW-4 (see Appendix C) with the highest values (maximum value of 74.4 ppm) and a strong odor observed at AMW-9. Following PID screening, the soils from each boring were logged by Cornerstone. For the AMW locations, the soil logs were subsequently used to identify the depth of saturation and construct wells within the upper 10 feet of the saturated zone. For MH-101 through MH-105, AP-101, and BP-101, the borehole at each location was advanced to refusal on bedrock and the soil descriptions were reviewed to identify the interval with the most permeable soils (in which, the wells were screened). The length of the screened interval was based upon the geology at each location and were constructed to be between 5 feet and 20 feet in length. MH-103D and MH-105D were constructed in the upper 15 feet of bedrock adjacent to the shallow wells at these locations. All wells were constructed with two-inch diameter PVC riser pipe, PVC wire-wrap screens, sand pack around the screens and cement-bentonite grout to ground surface. Well construction logs, which include soil descriptions, are provided in Appendix C. Following completion, the wells were developed until the development water was visually clear and then completed with a locking protective casing. Drill cuttings and development water were contained in 55-gallon drums for subsequent disposal. Locations and elevations were surveyed by NY licensed surveyor Kennedy and Associates.

### 3.2.4 Groundwater Elevations and Sampling

Depth to groundwater measurements were obtained with a Solinst electronic water level meter from monitoring wells and piezometers across the Site on September 8, 2020, October 25, 2021, and March 18, 2022. These data are summarized in Table 3-1 and also include surface water measurements taken from staff gauges at the Mary Harriman Park Pond, the bridges over the West Branch of the Ramapo River at NY Route 17 and Arden House Road. Table 3-1 also summarizes the water-bearing unit (i.e., aquitard, aquifer, or bedrock) assigned to each location. Potentiometric surface maps were drawn for the aquitard wells, aquifer wells, and top of bedrock wells, as discussed in Section 4.

Note that some well locations (e.g., MH-101, MH-102, MH-105S) are assigned as aquitard wells although the general description of the soils adjacent to the screened interval consists of a mix of sand and sub-angular gravel with minimal amounts of silt. The presence of the sub-angular gravel indicates that these soils represent ice contact kame deposits as opposed to glacial melt-water deposits. While the large percentage of sand and gravel suggests high permeability, and the RI Report (Conestoga-Rovers Associates, July 1995) groups these deposits with aquifer wells, the RI Report further elaborates stating:

> "The various types of kame deposits are highly variable in texture and sorting. Additionally, kame deposits may contain a large fraction of calcareous cement which reduces the permeability. The succession of different deposits at any location causes considerable variability in the aquifer thickness and transmissivity"

The above description is consistent with the soils observed in the field at the above referenced locations, with some sand and sub-angular gravel intervals described as saturated (suggesting aquifer materials) and other intervals described as "damp" indicating the soils are sufficiently dense and/or cemented such that they are generally low permeability. In addition to the variability

observed at any given location, there is also variability between locations within the same general area, suggesting that the more permeable intervals are not laterally extensive. Collectively, this resulted in grouping the above referenced locations as aquitard wells, even though there are some more permeable layers observed at individual locations.

Grouping these locations as aquitard wells, however, does not imply that there is no lateral groundwater flow through this area. Rather, the grouping of these wells as aquitard or aquifer wells simply reflects the rate of groundwater flow through the area. In fact, if these locations were re-grouped as aquifer wells and the water levels were plotted on the aquifer potentiometric surface maps presented in Section 4.0, the contours would be virtually identical to those currently shown and the interpolated groundwater flow directions shown on Figure 4-4 and Figure 4-9 would not change. In other words, re-grouping of these locations would not change the conclusions presented in the report in any way.

#### 3.2.4.1 Groundwater Sampling

Groundwater samples were collected from 63 new and existing monitoring wells during the period September 9–11, 2020 and October 25-29, 2021. Each location was sampled with a peristaltic pump equipped with dedicated silicone and HDPE tubing. Purging and sampling was conducted in accordance with low-flow methodology.[8] Field sampling forms are provided in Appendix D. The collected samples, as well as the associated blind duplicate and field blank quality assurance/quality control (QA/QC) samples, were labeled with the well location ID, sampling date and time and samplers initials, and immediately placed on ice. The samples were sent under chain-of-custody, via lab courier, to Eurofins-Test America Laboratory for analysis of 1,4-dioxane and PFAS compounds as described above. Purge water was collected in five-gallon buckets and transferred to 55-gallon drums for subsequent off-Site disposal.

As also noted above with regard to the temporary wells, some of the wells stabilized with elevated turbidity levels and elevated turbidity can potentially exaggerate the reported PFAS concentrations. However, there does not appear to be a correlation between elevated turbidity levels and PFAS concentration in these results.

### 3.2.5 Village of Harriman Water Supply Wells

To address the NYSDEC request to identify water supply wells within a half-mile radius of the Site, the Village of Harriman was contacted regarding known potable wells within the Village. According to a July 31, 2020 email from the Village's attorney, no private potable wells are allowed within the Village, and therefore, none are within the half-mile radius of interest for this investigation. Historically, wells were located northeast of the Site along NY Route 17, at the former Automotive City, Tom Sullivan Chevrolet, and Motel. However, these wells have reportedly been abandoned. The motel has been demolished and verbal communications with the Village of Harriman Water Superintendent indicate that the current business is connected to municipal water.

Figure 3-1 illustrates the location of the Village's active water supply wells in relation to the Site. The available permitted capacities for the identified water supply wells, as obtained from the Village's Water Withdrawal Permit, and aquifer unit, were provided previously and are not repeated herein.

#### 3.2.5.1 MH-1A Zone of Influence

As presented in Section 1 of this report, sampling of the Village of Harriman public water supply wells by the NYSDOH in Mary Harriman Park identified PFOA and PFOS in water supply well MH-1A above the EPA Health Advisory Level of 70 nanograms per liter (ng/L). In accordance with the approved work plan, and as reported herein, monitoring wells were installed within Mary Harriman Park and groundwater obtained from both new and existing monitoring wells were sampled for PFAS

compounds. PFAS compounds were identified in Mary Harriman Park groundwater (discussed in Section 4) and during monthly coordination calls with NYSDEC, Cornerstone recommended further study to assess the zone of influence and zone of capture attributable to operation (pumping) of MH-1A.

MH-1A is located approximately 1,100 feet northwest of NY State Route 17 and the Site. The well is operated on an "on demand" basis and the well pump is turned on and off automatically as required by the Village's water supply needs, pumping at a rate of approximately 68 gallons per minute (gpm). In order to assess the zone of influence and zone of capture associated with MH-1A, Solinst Levellogger® pressure transducers were installed in 20 wells (Table 3-2). Each pressure transducer was programed to record the total pressure at one-minute intervals for a period of two weeks (March 18 – April 1, 2022). In addition, a "Baralogger" was also set to record barometric pressure at the same sampling intervals so that the raw data could be corrected for changes associated with barometric pressure using software provided by Solinst. The barometrically-corrected data at each location were then uploaded to a Microsoft Excel file where the data were converted from feet of water over the transducer to feet above mean sea level (i.e., elevation) and presented in graphical format (Appendix E). In addition to the groundwater elevation at each location, the graph was annotated to indicate when the pump at MH-1A was on or off, based upon the observed drawdown in MH-1A.

Section 4

# Investigation Results

## 4.1 Soil Investigation Results

The soil investigation work completed to date (i.e., Phase 1 soil sampling) was conducted in January and August 2020, was presented previously in the April 2021 EC SIR and is reiterated here for completeness. It should again be noted that saturated soil results above the intermittent clay layer are addressed through the groundwater investigation protocols.

The 2020 soil investigation consisted of a total of 34 soil borings conducted across the Site, 17 in January 2020 and another 17 in July 2020. Soil samples were collected continuously during the drilling of each of the soil borings resulting in the collection of 60 analytical samples. The soils were scanned for VOCs with a PID and general observations of soil type, moisture and/or any evidence of impacts were also made. Boring logs are provided in Appendix A. Borings were logged as the top of the soil representing ground surface and ground coverings such as pavement or concrete were noted in the logs.

Generally, the soils encountered were a mix of fill and medium-fine sand with varying amounts of silt. The deeper borings generally ended within a sandy silt or clay unit. Wet soils were encountered at varying depths across the Site depending on the elevation of the boring location. Wet soils were as shallow as 1 foot below ground surface along the center of the Site (in the vicinity of SWMU Buildings 2, 5, 20, and 28), and as deep as 5.4 feet below ground surface along the north-northwestern boundary of the Site (in the vicinity of Building 1).

### 4.1.1 PFOS/PFOA Results

The soil sample analytical results for PFOS and PFOA are presented in Table 4-1 and Figure 4-1. The following discussion compares these results to the NYSDEC 2020 Guidance Values (NYSDEC, January 2020) as called for in the approved work plan. However, the NYSDEC subsequently updated the guidance in June 2021 with guidance values for protection of groundwater of 1.1 micrograms per kilogram (µg/kg) for PFOA and 3.7 µg/kg for PFOS (NYSDEC, June 2021).

PFOS was detected in samples from 32 of 34 boring locations. PFOS exceedances of the 1 µg/kg benchmark were detected in 30 samples collected from 21 boring locations. The highest concentration of PFOS, 1,100 µg/kg, was detected at sample location 72-B-010 at a depth of 0-1 feet below ground surface.

PFOA was detected in samples from 16 of 34 boring locations. PFOA exceedances of the 1 µg/kg benchmark were detected in five samples collected from five boring locations. The highest concentration of PFOA, 6.0 µg/kg, was detected at sample location 72-B-009 at a depth of 0-1 feet below ground surface. Both PFOA exceedances of the benchmark were detected in samples with an exceedance for PFOS.

PFHxS, along with PFOS, was detected most frequently and at the highest concentrations, however there is currently no compound-specific standard for PFHxS for comparison.

### 4.1.2 Synthetic Precipitation Leaching Procedure PFAS Results

SPLP analysis results for PFOS and PFOA are presented in Table 4-2 and on Figure 4-2. As established in the work plan prior to the soil investigation, PFOS and PFOA results from the Total PFOS/PFOA analysis were compared to a benchmark of 1 µg/kg. Samples that exceeded that threshold were submitted for further analysis by SPLP.

SPLP sample results are compared to the 10 ng/L maximum contaminant level (MCL) for drinking water established by the NYSDOH. Exceedances of the 10 ng/L MCL for PFOS were detected in 29 samples collected from 17 boring locations. The highest detected SPLP concentration of PFOS was 40,000 ng/L at location 72-B-010 at a depth of 0-1 feet. Exceedances of the 10 ng/L MCL for PFOA were detected in eight samples collected from five boring locations. The highest detected SPLP concentration of PFOA was 85 ng/L at location 72-B-010 at a depth of 0-1 feet.

The SPLP testing revealed the presence of both PFOS and PFOA in the samples with PFOS at a greater concentration than PFOA. PFOS/PFOA concentrations greater than 10 ng/L were detected in a majority of the 72-B series borings. The ratio of PFOS/PFOA in these samples ranged from 10 to as high as 470 (72-B-010).

The analytical results also show detectable levels of PFHxS, perfluorohexanoic acid (PFHxA), perfluorobutane sulfonic acid (PFBS), perfluorobutanoic acid (PFBA), perfluoroheptanesulfonic acid (PFHpS), and perfluoroheptanoic acid (PFHpA) which are included in the discussion of total PFAS.

Among the additional PFAS compounds, PFHxS was detected at a concentration close to PFOS levels, such that PFHxS, along with PFOS, are the two PFAS compounds detected at the highest concentrations and most frequently.

### 4.1.3 Total 1,4-Dioxane Results

The soil sample analytical results for 1,4-dioxane are presented in Table 4-1.

1,4-Dioxane was detected in samples from 4 of 17 boring locations. The highest concentration of 1,4 dioxane, 140 µg/kg was detected at sample location G-B-105 at a depth of 8-10 feet. This was the only detection that exceeds the Part 375 unrestricted use soil cleanup standard of 100 µg/kg, which also is the standard for protection of groundwater.

Because the 1,4-dioxane results only had one detection that exceeded the unrestricted use and protection of groundwater soil cleanup criterion, these data are not summarized on a figure, nor are they discussed further.

## 4.2 Groundwater Investigation Results

The groundwater investigation summarized in this report has three primary goals:

1. Refine the potentiometric surface presented in the CSM and extend mapping of the potentiometric surface to the northeast (i.e., under Route 17 and Mary Harriman Park) to further assess potentiometric heads (groundwater elevations) and groundwater flow direction, including potential influence of pumping at MH-1A on groundwater flow at the Site.
2. Define the zones of influence, and capture, associated with the pumping of water supply well MH-1A to evaluate the extent, if any, of hydraulic connection between the Site and Mary Harriman Park.
3. Evaluate the distribution of PFAS compounds on Site and in Mary Harriman Park to determine potential source areas.

### 4.2.1 Groundwater Potentiometric Surface Mapping

Groundwater potentiometric surface maps representing water levels collected on March 18, 2022 are provided on Figures 4-3 through 4-5. These maps illustrate data from three hydrogeologic units: the aquitard, the aquifer, and the top of bedrock. The March data were selected for mapping because they represent the most comprehensive data set that include off-Site wells in Mary Harriman Park and adjacent properties and the March 18, 2022, water levels and flow paths are consistent with those observed during other times of the year.

Monitoring wells assigned to the aquitard are shown as black symbols and represent locations where the surrounding soils are generally low permeability silt or fine sand and silt. Note that historically, MW-33 was assigned as an aquifer well because it screens both clay and sand and gravel deposits (see Figure 1-3). However, the groundwater elevation in this well is consistently similar to surrounding aquitard wells, as opposed to aquifer wells. Therefore, MW-33 has been mapped as an aquitard well for this analysis.

Monitoring wells associated with the aquifer are shown as blue symbols. These wells are screened at depths where the soils are higher permeability sand and gravel deposits or fine sand and silt deposits with lenses of fine to medium sand.

Finally, wells shown as green symbols are completed within the upper 15 to 20 feet of bedrock.

The mapped potentiometric surfaces are generally consistent with historical data and the CSM. Overall, the maps illustrate a groundwater high in the vicinity of MW-33 and MW-34 within the central portion of the Site. As a consequence, groundwater generally moves away from the groundwater high in the aquitard, aquifer and bedrock units. However, groundwater flow in the aquitard unit is impeded (i.e., is slower) as compared to the aquifer unit and also flows vertically downward into the underlying aquifer. The contours associated with the aquitard and aquifer groundwater high have been refined, based on the additional data from this sampling program, to illustrate a “ridge” of higher groundwater elevation as opposed to closed contours representing a localized “mound.” Despite this refinement, the overall flow paths illustrated in Figures 4-3, and 4-4 remain consistent with prior mapping and do not alter the overall conclusion that groundwater, in all geologic zones, moves away from the groundwater high at the center of the Site.

The aquifer map (Figure 4-4) illustrates more widely spaced contours underlying the east-central portion of the Site, which is representative of a lower hydraulic gradient in this area. Geologically, this lower gradient is associated with the thicker, coarse grained outwash deposits that are specific to this area. The potentiometric contours presented in this report are fully consistent with the CSM (HydroQual, 2008) and Site geology. The Ramapo River adjacent to the Site has previously been identified as a losing stream due to the wastewater treatment plant discharge upstream of the Site. However, the March 2022 groundwater contour maps suggest that the stream potentially represents a local discharge point. The March 2022 results represent a single data set and may represent seasonal conditions which are not representative of average conditions throughout the year.

The groundwater contours, throughout time, also illustrate that groundwater flow underlying Mary Harriman Park northeast of locations MH-104 and MH-105 is cross-gradient to the Site. This illustrates that there is no influence by the Site on groundwater flow in this area as documented by the investigation to evaluate water supply well MH-1A’s zone of influence and zone of capture (see Section 4.2.2 below).

### 4.2.2 MH-1A Influence on Groundwater Flow

The zone of influence associated with a pumping well represents the radial distance from the pumping well at which a change (depression) in water levels is observed when the pump is operated. However, an observed change in water level at a given location does not indicate that the location is within the zone of capture. The zone of capture, defined as the radial distance at which groundwater will flow to the pumping well, is smaller than the zone of influence. The zone of capture will extend to a larger distance in the upgradient direction and to a much smaller distance in the downgradient direction. Additionally, the zone of influence will extend further downgradient than the zone of capture.

Well construction summaries for the well locations referenced in the discussion below are provided in Table 4-3. Representative pressure transducer data are presented in graphical form for pumping well MH-1A and monitoring wells MHP-MW-5, MHP-MW-3S, MHP-MW-3D, MHP-MW-4S, and MH-104 in Figures 4-6 through 4-8. Similar graphs for the remaining wells in which pressure transducers were installed are provided in Appendix E along with a graph representing barometric pressure changes and precipitation over the period of record. The graphs illustrate change in water levels in the monitoring wells attributable to regional fluctuations, and where present, changes in water levels associated with operation of pumping well MH-1A. Blue and orange symbols on each graph represent the time at which the pump at MH-1A went on and off and the groundwater elevation at each location at that time. Regional (background) changes in groundwater elevations (i.e., rise and fall of water levels unrelated to pumping) were on the order of 0.4 feet over the two-week data collection period, with the most rapid change observed overnight from March 31 to April 1 in response to over one inch of rain.

As shown on Figure 4-6, pumping of well MH-1A results in rapid drawdown of the water elevation in MH-1A with total drawdown on the order of 10.5 feet, followed by a rapid recovery when the well pump shuts off. A similar rapid response is observed in monitoring wells immediately surrounding MH-1A with drawdown of approximately 8 feet observed in MHP-MW-7 located approximately 30 feet northeast of MH-1A and drawdown of approximately 4 feet in MHP-MW-5 approximately 140 feet east of MH-1A (Figure 4-7). As expected, the magnitude of the drawdown diminishes with distance from MH-1A. For example, at the MHP-MW-3S/D cluster (approximately 400 feet away from MH-1A) the response is on the order of 0.10 to 0.20 feet, while at MH-104 (approximately 840 feet away from MH-1A) a minimal response of generally less than 0.10 feet is observed (Figure 4-8). Note that the graphs representing the monitoring wells in Figures 4-6 to 4-8 are plotted using the same vertical scale (ranging from 521 – 526 feet) so that the graphs consistently illustrate the magnitude of the changes in water level from one location to the next.

At several times during the monitoring period, the water levels at MH-104 stabilized or rose while MH-1A is pumping or began to decline while MH-1A was not pumping. This is not readily visible on Figure 4-8, because as noted above, the vertical scale on Figures 4-6 through 4-8 are presented with a consistent “Y” axis to show the relative changes between locations, and there was very little change at location MH-104. However, such changes are readily visible in the graph of the pressure transducer data for MH-104 provided in Appendix E, where the scale of the Y axis is from 523.6 to 524. As observed in the graph of MH-104 in Appendix E, the regional groundwater trends are far more dominant than those observed in response to pumping. For example, overall declining water levels are observed from approximately March 20, 2022 through March 23, 2022, then increasing to March 25, 2022, decreasing to March 31, 2022 and then a sharp increase to the end of the monitoring period on April 1, 2022. An example of when water levels in MH-104 stabilized and then rose while MH-1A was pumping is observed the morning of March 24, 2022, when the water level in MH-104 began to stabilize and then increases that evening while MH-1A was still pumping. The

water level continued to rise through the evening of March 24, 2022 and continue to rise after MH-1A shut down at 12:56 am on March 25, 2022 with no visible change in the rate of recovery. In addition, examples of declining water levels at MH-104, even when MH-1A is off (i.e., the pump is not operating) are observed the evenings of March 26 and 27, 2022 and the morning of March 29, 2022. There are other periods of time when similar conditions are present, although these are the most prominent examples. The above behavior further demonstrates the minimal effects of pumping at this distance from the pumping well and suggests the zone of influence does not extend onto the former Nepera property.

As also shown in the hydrographs presented in Appendix E, the remaining monitoring wells southeast of MH-104 exhibit fluctuations in water levels on the order of 0.05 feet or less, with no influence from pumping observed that is discernable from background fluctuations in monitoring wells MW-9S, MW-201, MW-202, and MW-24S located to the southeast of NYS Route 17 on the former Nepera Site. Therefore, the zone of influence attributable to operation of MH-1A extends only to approximately MH-104, or approximately 850 feet from the pumping well. As noted, this represents the approximate zone of influence.

To evaluate the zone of capture for MH-1A, the transducer data collected over the two-week period were reviewed to determine the longest pumping cycle during this period, which was approximately 19 hours from March 24 at 5:49 am to March 25 at 12:56 am. Groundwater elevations recorded by the transducers at each monitored location immediately before the pump shut off at 12:56 am are plotted on Figure 4-9, which represents a groundwater contour map of the aquifer as influenced by 19 hours of pumping. The groundwater elevation measurements indicate that water supply well MH-1A is located cross-gradient to the Site, confirming the CSM. Further, these data indicate that the zone of capture associated with MH-1A is limited to the area adjacent to well cluster MHP-MW-3S/3D and does not extend to the former Nepera Site (see Figure 4-9). In combination, these data indicate that MH-1A does not influence the groundwater flow direction at the Site. These data also suggest that groundwater at the Site does not mix with groundwater pumped by MH-1A. Collectively these lines of evidence support the conclusion that the Site is not the source of PFAS identified within MH-1A.

### 4.2.3 Groundwater Quality Discussion

In addition to the groundwater flow, the geographic distributions of 1,4-dioxane, PFOS, PFOA, and total PFAS across the Site and Mary Harriman Park were evaluated. Laboratory analytical data reports are provided in Appendix F.

#### 4.2.3.1 1,4-Dioxane Analytical Results

As shown in Table 4-4, groundwater sampling conducted in August and September 2020 and October 2021 identified only one location, G-GW-01 at a concentration of 12 µg/L, where 1,4-dioxane was detected above its MCL of 1 µg/L. Therefore, 1,4-dioxane is not discussed further.

#### 4.2.3.2 PFAS Results

Table 4-4 also summarizes the PFAS results from both the Phase I and Phase II sampling events for both temporary and permanent monitoring wells.[9] PFOS and PFOA results exceeding their respective MCLs are highlighted as are individual PFAS compounds other than PFOS and PFOA at concentrations greater than 100 ng/L. In addition, total PFAS concentrations greater than 500 ng/L are identified as called for by current NYSDEC Guidance for assessment of emerging contaminants.

[9] Phase I analytical data for sampling completed prior to October 2021 have been reported previously under separate cover.

Review of the data indicate PFOS and PFHxS are detected at the highest relative concentrations and most frequently, followed by PFOA and PFBA at typically lower concentrations. The prevalence of PFOS and PFHxS is consistent with the soil SPLP results discussed above in Section 4.1. The data from the various sampling locations can be further divided into subgroups within which PFOS/PFHxS are the dominant PFAS compounds, followed by those where the dominant PFAS compounds are PFOS/PFOA, PFOA/PFBA, and PFOA/PFHxS.

#### 4.2.3.2.1 PFOS and PFOA Mapping

Figures 4-10 through 4-15 show the distribution of PFOS and PFOA, across the Site and Mary Harriman Park for the aquitard, aquifer, and upper bedrock wells. The PFOS figures are also representative of the distribution of PFHxS across the study area and illustrate analytical results for all available sampling completed to date. Concentrations are listed adjacent to each monitoring well/sampling point along with a colored "bubble" that is representative of the concentration at that location.

The breaks in concentration values are based on current NYSDEC guidance. Green represents concentrations of 10 ng/L or less (i.e., the current MCL for PFOA and PFOS), yellow represents concentrations of 10 ng/L to 100 ng/L (i.e., the current guidance of 100 ng/L for PFAS compounds other than PFOA or PFOS), orange represents concentrations between 100 ng/L and 500 ng/L (i.e., current guidance of 500 ng/L for total PFAS) and red represents concentrations greater than 500 ng/L. These colors are applied regardless of compound and are meant to provide a contextual background for the plotted concentrations.[10]

### PFOS

Within the aquitard wells (Figure 4-10), the highest concentrations of PFOS were detected in:

- MH-104 (Mary Harriman Park): 451 ng/L
- AMW-8 (on Site): 833 ng/L
- G-GW-01 (on Site; temporary well location): 426 ng/L
- AMW-9 (on Site): 214 ng/L
- AMW-10 (on Site): 485 ng/L

Within the aquifer wells (Figure 4-11), the highest concentrations of PFOS were detected in:

- MHP-MW-3S (Mary Harriman Park): 839 ng/L,
- MW-37S (on Site): 309 ng/L
- OW-6 (on Site): 1790 ng/L,
- AP-101 (on Site): 840 ng/L..

The highest PFOS concentration observed in bedrock wells (Figure 4-12) was 32.8 ng/L at MW-20D (on Site). Measured PFOS concentrations drop off rapidly in the surrounding area.

PFOS was not detected in off-Site well BP-01 located on the north side of the Ramapo River across from the Site lagoon.

As stated above, the spatial distribution of PFOS is also representative of the PFHxS distribution. See Table 4-4 for individual concentrations.

[10] Sampling, Analysis, and Assessment of Per- and Polyfluoroalkyl Substances (PFAS) Under NYSDEC's Part 375 Remedial Programs, NYSDEC, January 2021.

## PFOA

Within the aquitard wells (Figure 4-13), the highest concentrations of PFOA were detected in:

- G-GW-01 (on Site; temporary well location): 127 ng/L
- MW-34 (on Site): 43.1 ng/L
- AMW-8 (on Site): 48.8 ng/L

Within the aquifer wells (Figure 4-14), the highest concentrations of PFOA were detected in:

- OW-6 (on Site): 99.6 ng/L
- AP-101 (off Site): 36.5 ng/L

The highest PFOA concentration observed in bedrock wells (Figure 4-15) was 34.8 ng/L at MW-20D, followed by 12.3 ng/L in MH-103D (Mary Harriman Park).

No PFOA was detected in off-Site well BP-01 located on the north side of the Ramapo River across from the Site lagoon.

For off-Site wells in Mary Harriman Park, the concentrations of both PFOS and PFHxS in MHP-MW-3S (839 ng/L and 97.1 ng/L, respectively) are both an order of magnitude higher than their respective concentrations in MHP-MW-3D (18.3 ng/L and 3.30 ng/L, respectively). In addition, the high PFOS and PFHxS concentrations at MHP-MW-3S (839 ng/L and 97.1 ng/L, respectively) and MH-104 (451 ng/L and 142 ng/L, respectively) are separated by lower concentrations at MHP-MW-4S (12.7 ng/L and 2.54 ng/L, respectively. These differences, as well as the PFOA concentration in MH-103D, are indicative of separate, non-Site source(s) of PFAS compounds impacting Mary Harriman Park.

Observations with respect to PFAS concentrations in on Site wells identified above include:

### OW-6

OW-6 is located at the south-southeast corner of the Site outside the main plant area and represents the well with the highest concentrations of PFOS, PFHxS, and PFOA (1790 ng/L, 832 ng/L and 99.6 ng/L, respectively). As shown on cross section Figure 1-3, the low permeability aquitard soils consisting of clay to clayey silt are not present in this area and the soils consist of fine sand and silt with lenses of fine to medium sand. The OW-6 results represent the highest PFAS concentrations on Site and the area is also characterized by elevated concentrations of benzene. Consistent with the investigation of this area related to benzene, it is anticipated that the silt lenses referenced above will serve to attenuate PFAS, but like with benzene, will also serve as a long-term source to groundwater. However, unlike benzene, the PFAS compounds do not degrade and, as a consequence, PFAS is detected in downgradient monitoring wells while benzene is not.

### AMW-8

AMW-8 is an aquitard well located northeast of the main plant area south of Arden House Road and the lagoon and represents the highest reported concentrations of PFOS and PFHxS within the aquitard. Notably, the concentrations observed in the underlying aquifer immediately downgradient of AMW-8, at well MW-8S, are nearly two orders of magnitude lower. MW-8S is within the coarse-grained outwash aquifer channel and the large difference in concentration between the aquitard and the aquifer is consistent with the attenuation of PFAS compounds within the low permeability aquitard soils and the greater volume of groundwater flow within the underlying high permeability outwash aquifer, as described by the CSM.

### Temporary Well Location G-GW-01

Temporary well G-GW-01 is located northeast of the main plant area, south of AMW-8, and is completed within the aquitard. PFOS concentrations are similar to those observed in upgradient aquitard well AMW-10 (426 ng/L as compared to 486 ng/L) while PFHxS concentrations are roughly twice the PFHxS concentrations observed at AMW-10 (451 ng/L as compared to 200 ng/L). In addition, nearby aquitard PFOS and PFHxS concentrations at MW-53S and F-GW-01 range from 75 to 13 ng/L and PFOS and PFHxS concentrations within the underlying aquifer just upgradient of temporary location G-GW-01 range from 181 ng/L and 55 ng/L at MW-53D. Finally, location G-GW-01 is located downgradient of prior soil sampling in the Building 72 area that indicate concentrations of PFOS above the 70 ng/L SPLP screening level established by NYSDEC (see Figure 4-2). Collectively, and consistent with the CSM, the distribution of PFAS suggests a localized source in the vicinity of location G-GW-01 that is attenuated, at least to some extent, within the aquitard and/or impacts associated with the Building 72 area.

### AMW-9/AMW-10

AMW-9 and AMW-10 are within the central portion of the main plant area with PFOS and PFHxS concentrations ranging from 485 ng/L to 200 ng/L. In addition, AMW-10 is located near the Building 72 soil sampling locations that document SPLP PFOS concentrations above the 70 ng/L NYSDEC screening levels (see Figure 4-2). PFOS aquifer concentrations down and slightly cross-gradient of this area range from 278 ng/L to 181 ng/L at wells MW-12S, MW-16S and MW-53D while those for PFHxS in the same wells range from 124 ng/L to 55 ng/L. AMW-9/AMW-10 are completed within the aquitard and, consistent with the CSM, attenuation of the PFAS constituents would be anticipated. Likewise, significantly lower concentrations within the underlying aquifer would also be anticipated. The underlying aquifer concentrations, however, show mixed results, with PFOS concentrations lower than those in the overlying aquitard, but still generally above 200 ng/L. Collectively, the data indicate that the Building 72 area is a likely source of the downgradient PFAS concentrations, but that the areal extent of the Building 72 source area may be more extensive than currently defined. Therefore, additional soil sampling within the AMW-9/ AMW-10 area is needed to build upon the Building 72 data and evaluate the potential extent of PFAS in soils within this area.

### MW-37S

The MW-37AQ/MW-37S well cluster is located north of Arden House Road near the southwest corner of the lagoon. PFAS concentrations at this location are higher in the aquifer (MW-37S) than they are in the overlying aquitard (MW-37AQ) and PFOS concentrations are present in downgradient aquifer well MW-1S. A flow path from the main plant area toward MW-1S, as indicated by the PFAS data, is consistent with the observed groundwater flow direction and historical data associated with benzene at MW-1S, although benzene is no longer above groundwater standards at MW-1S due to past remedial actions and degradation. The aquifer results are thus indicative of an upgradient source within the main plant area. However, the PFAS concentrations within aquitard well MW-37AQ are indicative of either a localized surficial source, or lateral groundwater flow within the aquitard to this area. Additional soil sampling would be required to evaluate the potential extent of PFAS in this area.

## 4.3 Data Usability Review

The Category B analytical reports for the October 2021 groundwater samples are presented in Appendix F. The Data Usability Summary Reports (DUSRs) are presented in Appendix G. Laboratory reports and DUSRs for samples collected in 2020 were provided previously in the April 2021 EC SIR.

Data reviews were conducted in accordance with the NYSDEC *Guidance for the Development of Data Usability Summary Reports*. The DUSRs provide detail where data qualification was necessary and applied. The following laboratory reports were reviewed:

- Laboratory Report NEP01
  - No data were rejected as a result of the data review.
- Laboratory Report NEP02
  - No data were rejected as a result of the data review.
- Laboratory Report 410-10389-1
  - No data were rejected as a result of the data review.
- Laboratory Report 460-215550-1
  - No data were rejected as a result of the data review.
- Laboratory Report 460-21804-17
  - No data were rejected as a result of the data review.
- Laboratory Report 460-218179-1
  - No data were rejected as a result of the data review.
- Laboratory Report J246027-1
  - No data were rejected as a result of the data review.
- Laboratory Report J246277-1
  - No data were rejected as a result of the data review.

Electronic Data Deliverable (EDD) files in EQuIS format were uploaded to the Department's Environmental Quality Information System (EQuIS) database for the soil sampling results in March. Water quality data will be uploaded to the Department's EQuIS Site following submittal of this report.

Section 5

# Conclusions

The EC Site Investigation confirmed the presence of PFAS compounds in on-Site soils and on- and off-Site groundwater at concentrations above standards, criteria, and guidance (SCGs). Conclusions are presented below for soil and groundwater. Proposed additional investigation activities to address remaining data gaps are presented in Section 6.

## 5.1 Soil Investigation

The soils investigation completed to date was focused on suspected source areas and indicates that PFOS and PFHxS, for which there is currently no SCG, are detected at the highest concentrations and most frequently. PFAS compounds, particularly PFOS, are present above SCGs in surface and subsurface soil in several areas. PFOS was documented with concentrations greater than 1 µg/kg in several samples collected in the vicinity of Building 72. Exceedances of the 1 µg/kg benchmark for conducting SPLP analysis were found in both surficial and subsurface samples adjacent to Building 72. SPLP testing conducted on these samples indicate concentrations greater than the 70 ng/L threshold identified in NYSDEC guidance.

The highest concentration of PFOS away from Building 72 was 8.8 µg/kg, found at location G-B-105. This sample location is adjacent to well MW-16S, which is located hydraulically downgradient of Building 72.

Several surficial samples collected from the open field north of Building 67 and adjacent to Building 26 also slightly exceeded the 1 µg/kg benchmark for conducting SPLP analysis. However, results of the subsurface samples were below the 1 µg/kg benchmark. SPLP results were below 70 ng/L with one exception; the 0-1-foot sample at F-B-010 had a total PFOS/PFOA result of 88.5 ng/L.

1,4-Dioxane was detected in samples from 4 of 17 boring locations during the initial round of soil sampling. Only one sample exhibited a concentration above SCGs. 1,4-Dioxane was detected at 140 µg/kg in the 8-10-foot interval at sample location G-B-105. The unrestricted use soil cleanup criterion for 1,4-dioxane is 100 µg/kg, which also is the standard for protection of groundwater. Based on these results, no further soil sampling was conducted for 1,4-dioxane.

## 5.2 Groundwater Investigation

### 5.2.1 MH-1A Influence on Groundwater Flow

The investigation confirms that Mary Harriman Park is cross-gradient to the Site, that the soils underlying the eastern portion of the park are low permeability aquitard soils and that operation of water supply well MH-1A does not influence groundwater flow underlying the eastern portion of the Mary Harriman Park or under the Site. Therefore, COCs associated with the Site do not impact the MH-1A water quality.

The elevated concentrations of PFAS present in Mary Harriman Park wells MH-104 and MHP-MW-3S are indicative of a localized shallow source(s) within Mary Harriman Park or possibly impacts from upgradient sources that are unrelated to and independent of PFAS compounds on the Site.

### 5.2.2 Relationship of Site PFAS Concentrations to the CSM

As detailed above, the distribution of PFAS is consistent with the CSM. PFAS analytical results demonstrate the attenuation of PFAS under the central portion of the Site where the aquitard soils are present. In this area, there are lower concentrations within the underlying aquifer materials directly underlying the aquitard and downgradient, consistent with groundwater flow patterns, in both the aquitard and aquifer. In addition, PFAS concentrations downgradient of the main plant area within the coarse-grained outwash channel underlying the central portion of the Site are generally low in concentration, as compared to the overlying aquitard concentrations, suggesting that the flux of PFAS through the overlying aquitard is limited in comparison to the flow rate in the underlying aquifer, which is also consistent with the CSM.

In the southeast area of the Site, where the aquitard is not present, elevated PFAS concentrations are observed within the aquifer materials in the vicinity of monitoring well OW-6, with evidence of migration downgradient to the east, consistent with the hydraulic gradients. As described previously, the rate of groundwater flow to the east is limited in comparison to flow to the northeast, within the above-referenced outwash channel, such that historically, degradable compounds such as benzene have not been present in downgradient wells. However, non-degradable compounds, such as PFAS, are migrating with groundwater to the east.

### 5.2.3 Comparison to Regulatory Criteria

PFAS compounds at the Site are present at concentrations above the NYS MCL for PFOA and PFOS of 10 ng/L. In addition, individual compounds are present at concentrations greater than 100 ng/L and nine locations had reported concentrations for total PFAS above 500 ng/L. This includes two locations within the Mary Harriman Park (MHP-MW-3S and MH-104), one location off Site to the east-southeast (AP-101), three aquitard well locations (AMW-8, AMW-9, and AMW-10), one temporary well location within the central portion of the Site (G-GW-01), and two locations on the southeast side of the Site (OW-6 and MW-12S). Perimeter Site wells that exceed the PFOA and/or PFOS MCL of 10 ng/L include:

- Along the northeastern, downgradient boundary – MW-1S, MW-102, and MW-26S
- Along the southeastern down/cross gradient boundary – MW-3S, MW-4S, and MW-5S
- Along the northwestern down/cross gradient boundary – MW 201, MW-202, MW-202D, MW-24S, AMW-1, and AMW-2

Only one location, G-GW-01 had a reported concentration of 1,4-dioxane above the MCL of 1 µg/L for this compound.

The Mary Harriman Park wells that exceed the PFOA and/or PFOS MCL of 10 ng/L include: MH-101, MH-102, MH-103S, MH-103D, MH-104, MHP-MW-4S, MHP-MW-3S, and MHP-MW-3D. The concentrations and distribution of PFAS compounds within the Mary Harriman Park wells are indicative of a discrete shallow source(s) within the park at locations MH-104 and MHP-MW-3S.

The groundwater investigation indicates that additional soil sampling is needed within the Site to further characterize potential areas of PFOS/PFOA that could be impacting groundwater. These areas include the five locations discussed in Section 4.2.3.2.1.

In addition, the groundwater investigation also indicates that the extent of PFAS impacts may not be fully delineated in the southeast portion of the Site. An additional monitoring well couplet is recommended downgradient of location AP-101 to further investigate the extent of groundwater PFAS impacts in this location.

This groundwater investigation further indicates that additional investigation by others may be helpful to identify source areas within and/or upgradient of Mary Harriman Park that are unrelated to the Site.

Section 6

# Proposed Additional Investigation

Based on the EC results presented above, additional investigation is proposed to identify potential additional source areas in soil and further evaluate groundwater quality downgradient of AMW-8, MW-37 and off-Site monitoring well AP-101. Four additional monitoring wells will also be installed within Mary Harriman Park, as requested by NYSDEC, to provide additional groundwater data within the vicinity of monitoring wells MH-101, MH-102, MH-103, and MH-104. The proposed additional work is briefly described below with a proposed work plan included as Appendix H.

## 6.1 Additional Soil Investigation

Additional soil sampling and analysis will be conducted to further investigate potential sources of PFAS at the Site.

The proposed investigation is detailed in the work plan addendum that is being submitted as Appendix H of this report. As detailed in the work plan addendum, an analysis of the groundwater flow lines that lead to monitoring wells impacted by PFAS points to broader on-Site areas that might be origins of the PFAS-impacted groundwater. Some of the potential source areas suggested by groundwater flow lines can already be ruled out on the basis of previous soil sampling (Brown and Caldwell Associates/Cornerstone Engineering, April 2021). Soil analytical results for some of the previous sampling demonstrate that PFOS/PFOA concentrations are below their respective Soil Cleanup Objectives for Protection of Groundwater. The work plan addendum also includes proposed sampling and analysis to investigate potential sources of volatile organic compounds, specifically benzene and alpha-picoline, in soil which may be contributing to groundwater contamination on Site.

Based on the soil and water quality sampling results, no further investigation is recommended for 1,4-dioxane.

## 6.2 Additional Groundwater Investigation

The supplemental groundwater investigation will include the installation and sampling of additional monitoring wells. These include a new aquitard well (designated AMW-12) downgradient of well AMW-8, an aquitard/aquifer monitoring well couplet designated AP-102S and AP-102D downgradient of well AP-101, and four additional monitoring wells within Mary Harriman Park designated MHP-106 through MHP-109. Groundwater samples will be collected from these new monitoring well locations as well as existing monitoring well locations MW-35AQ, MW-36AQ, MHP-MW-4S, MH-101, MH-102, MH-103S, MH-104S, MH-105S, MW-9S, MW-201, MW-202, MW-24S, AMW-1, and AMW-2.

The proposed additional groundwater investigation is detailed in the work plan addendum that is being submitted as Appendix H of this report.

Notes:
(Dup) - as part of the sample location, indicate a duplicate
J - result is estimated
U - constituent not detected above the associated detection limit
UJ - constituent not detected, associated detection limit is estimated
ft bgs - feet below ground surface
ug/kg - micrograms per kilogram
Samples with PFOS/PFOA >1 ug/kg were analyzed by SPLP; exceedances are highlighted.
The 1,4-Dioxane Part 375 standard for unrestricted use is 100 ug/kg.

**HARRIMAN, NEW YORK**

| Well ID | Well Depth (FBGS)^ | Screened Interval (FBGS)^ | Stratigraphic Unit |
|---|---|---|---|
| **Mary Harriman Park Wells** | | | |
| MH-1A (Pumping Well)* | 64 | 39 - 64 | Aquifer |
| MHP-MW-3S | 14 | 4 - 14 | Aquifer |
| MHP-MW-3D | 35 | 25 - 35 | Aquifer |
| MHP-MW-4S | 15.5 | 5.5 - 15.5 | Aquifer |
| MHP-MW-5** | 50 | 45-50 | Aquifer |
| MHP-MW-7** | 44 | Unknown | Aquifer |
| MH-104 | 27 | 17 - 27 | Aquitard |
| **Nepera Site Monitoring Wells** | | | |
| MW-9S | 21 | 14 - 21 | Aquifer |
| MW-24S | 17.5 | 7.5 - 17.5 | Aquifer |
| MW-201 | 30 | 10 - 30 | Aquitard |
| MW-202S | 32 | 12 - 32 | Aquitard |

Notes:
^ FBGS - Feet Below Ground Surface
*Depth and screened interval obtained from "Well Redevelopment Report Village of Harriman, Harriman, New York" Leggette, Brashears & Grahm, January 1996. A stratigraphic well log is not available.
** Wells are owned by the Village of Harriman and well logs are not available. Depths and screened interval, where reported, were obtained from a Leggette, Brashears & Graham (LBG) Letter dated February 14, 2017. Stratigraphic unit is assigned based on observed response to pumping MH-1A. A location screened across both low and high permeability soils is assigned as an aquifer well.

*New York Drinking Water Maximum Contaminant Level
Other PFAS (not PFOA or PFOS) 100 ng/L or greater
Total PFAS > 500 ng/L
Exceed Pre-4/23 NYSDEC Guidance
Green shaded locations represent off-site wells

Notes:
ng/L - nanograms per liter
ug/L - micrograms per liter
J - Estimated concentration. Value is > Method Detection Limit but < Reporting Limit
U - Not Detected. Value represents the Method Detection Limit
D - Diluted sample
B - Compound detected in blank and sample.

*New York Drinking Water Maximum Contaminant Level
Other PFAS (not PFOA or PFOS) 100 ng/L or greater
Total PFAS > 500 ng/L
Exceed Pre-4/23 NYSDEC Guidance
Green shaded locations represent off-site wells

Notes:
ng/L - nanograms per liter
ug/L - micrograms per liter
J - Estimated concentration. Value is > Method Detection Limit but < Reporting Limit
U - Not Detected. Value represents the Method Detection Limit
D - Diluted sample
B - Compound detected in blank and sample.

- BEDROCK

NOTES:

1. SOIL DESCRIPTIONS WERE NOT AVAILABLE FOR MW–12S, 13S AND 15S.
2. NO LOG IS AVAILABLE FOR MH–1A AND REPORTED DEPTHS RANGE FROM 52' IN TABLE 4 OF THE GROUNDWATER SUPPLY ASSESSMENT, VILLAGE OF HARRIMAN, APRIL 1989 TO 64' AND 67' 3" IN THE JULY 1996 WELL REDEVELOPMENT REPORT AND FEBRUARY 2020 HARRIMAN MH–1A SURGE RESULTS, RESPECTIVELY. MH–1A MAY BE PARTIALLY COMPLETED IN BEDROCK.
3. "2' BOULDER" IN LOG FOR MHP–MW–4S AND "POSSIBLE LIMESTONE BOULDER" FROM 33' TO 38' IN LOG FOR MHMW– 3D LIKELY REPRESENT BEDROCK.
4. BASE MAP TAKEN FROM DRAWING TITLED "PROPOSED ENHANCED OVERBURDEN AQUIFER MONITORING PROGRAM – PHASE I" PREPARED BY ARCADIS IN 2007.

## LEGEND:

- MW-36AQ / AMW-9 — MONITORING WELL IN OVERBURDEN AQUITARD
- MW-23S / AMW-1 — MONITORING WELL IN OVERBURDEN AQUIFER (SAND AND GRAVEL)
- F-GW-01 — TEMPORARY GROUNDWATER SAMPLE COLLECTION POINT
- MW-23D — MONITORING WELL IN BEDROCK
- MW-37S (*309) / AMW-11 (11.2) — MONITORING WELL IN OVERBURDEN AQUIFER (SAND AND GRAVEL) PFOS CONCENTRATION
- PFOS CONCENTRATION LESS THAN 10 NG/L
- PFOS CONCENTRATION 10–100 NG/L
- PFOS CONCENTRATION 100–500 NG/L
- PFOS CONCENTRATION GREATER THAN 500 NG/L

## NOTE:

1. BASE MAP TAKEN FROM DRAWING TITLED "PROPOSED ENHANCED OVERBURDEN AQUIFER MONITORING PROGRAM – PHASE I" PREPARED BY ARCADIS IN 2007.
2. * WELLS WITH RESULTS ONLY FROM SEPT. 2020.
3. 8.46/8.74 NOV. 2021/SEPT. 2020 RESULTS.
4. THE AQUIFER UNIT IS NOT PRESENT AT MARY HARRIMAN PARK LOCATIONS MH–101 THROUGH MH–105. AQUITARD RESULTS ARE PLOTTED TO SHOW RELATIONSHIP BETWEEN THE GROUNDWATER CONCENTRATIONS IN THE AQUITARD DEPOSITS AND THE GROUNDWATER CONCENTRATIONS IN THE AQUIFER DEPOSITS TO THE NORTHWEST AND EAST SOUTHEAST.

# Appendix F: Analytical Laboratory Reports

# ANALYTICAL REPORT

Job Number: 460-246027-1

Job Description: NEPERA - Harriman, NY

For:
Cornerstone Environmental Group, LLC
100 Crystal Run Road
Suite 101
Middletown, NY 10941

Attention: Dr. Tim Roeper

Approved for release.
Maria Luisa Cruz
Project Manager II
11/9/2021 3:50 PM

Maria Luisa Cruz, Project Manager II
777 New Durham Road, Edison, NJ, 08817
(732)549-3900
luisa.cruz@testamericainc.com
11/09/2021

The test results in this report meet all NELAP requirements unless specified within the case narrative. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the Eurofins TestAmerica Edison Project Manager.

Eurofins TestAmerica Edison Certifications and Approvals: Connecticut: CTDOH #PH-0200, New Jersey: NJDEP (NELAP) #12028, New York: NYDOH (NELAP) #11452, NYDOH (ELAP) #11452, Pennsylvania: PADEP (NELAP) 68-00522 and Rhode Island: RIDOH LAO00132

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins TestAmerica Project Manager.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

# CASE NARRATIVE

## Client: Cornerstone Environmental Group, LLC

## Project: NEPERA - Harriman, NY

## Report Number: 460-246027-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) as a result of a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes or interferences which exceed the calibration range of the instrument.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

**RECEIPT**

The samples were received on 10/27/2021 7:30 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.5º C and 1.5º C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

**SEMIVOLATILE ORGANIC COMPOUNDS - SELECTED ION MODE (SIM) - ISOTOPE DILUTION - 1,4 DIOXANE**

Samples EB-01-20211025 (460-246027-1), MHP-MW-3D-20211025 (460-246027-2), MHP-MW-4S-20211025 (460-246027-3), MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5), MH-103D-20211027 (460-246027-6), MH-105S-20211027 (460-246027-7), MH-105D-20211027 (460-246027-8), MH-103S-20211027 (460-246027-9), MH-104-20211027 (460-246027-10) and MH-101-20211027 (460-246027-11) were analyzed for semivolatile organic compounds - Selected Ion Mode (SIM) - Isotope Dilution - 1,4 Dioxane in accordance with EPA SW-846 Method 8270E SIM 1,4Dioxane. The samples were prepared and analyzed on 10/30/2021.

No difficulties were encountered during the 1,4 Dioxane analysis.

All quality control parameters were within the acceptance limits.

**PER- AND POLYFLUOROALKYL SUBSTANCES (PFAS)**

Samples EB-01-20211025 (460-246027-1), MHP-MW-3D-20211025 (460-246027-2), MHP-MW-4S-20211025 (460-246027-3), MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5), MH-103D-20211027 (460-246027-6), MH-105S-20211027 (460-246027-7), MH-105D-20211027 (460-246027-8), MH-103S-20211027 (460-246027-9), MH-104-20211027 (460-246027-10) and MH-101-20211027 (460-246027-11) were analyzed for Per- and Polyfluoroalkyl Substances (PFAS) in accordance with PFC. The samples were prepared on 11/02/2021 and analyzed on 11/03/2021 and 11/04/2021.

13C2 PFTeDA Isotope Dilution Analyte (IDA) recovery associated with the following sample is below the method recommended limit: MH-103D-20211027 (460-246027-6). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample.

The “I” qualifier associated with samples MH-105S-20211027 (460-246027-7) and MH-105D-20211027 (460-246027-8) is applied because the transition mass ratio for the indicated analyte(s) was outside of the established ratio limits. The qualitative identification has some degree of uncertainty, however analyst judgment was used to positively identify the analyte(s).

Results for samples MHP-MW-3S-20211027 (460-246027-4), DUP-01-20211027 (460-246027-5) and MH-104-20211027 (460-246027-10) were reported from the analysis of a diluted extract due to high concentration of the target analyte in the analysis of the undiluted extract. The dilution factor was applied to the labeled internal standard area counts and these area counts were within acceptance limits

No other difficulties were encountered during the PFAS analysis.

All quality control parameters were within the acceptance limits.

# Sample Summary

Client: Cornerstone Environmental Group, LLC
Project/Site: NEPERA - Harriman, NY

Job ID: 460-246027-1

## Qualifiers

### GC/MS Semi VOA

| Qualifier | Qualifier Description |
|---|---|
| U | Indicates the analyte was analyzed for but not detected. |

### LCMS

| Qualifier | Qualifier Description |
|---|---|
| *5- | Isotope dilution analyte is outside acceptance limits, low biased. |
| D | Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples. |
| I | Value is EMPC (estimated maximum possible concentration). |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |
| U | Indicates the analyte was analyzed for but not detected. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

# GC/MS SEMI VOA BATCH WORKSHEET

Lab Name: Eurofins TestAmerica, Edison  Job No.: 460-246027-1

SDG No.:

Batch Number: 810092  Batch Start Date: 10/29/21 08:12  Batch Analyst: Dekkar, Djedjiga X

Batch Method: 3510C  Batch End Date:

| Batch Notes | |
|---|---|
| Method/Fraction | 3510C LVI / 8270E ISOTOPE |
| pH Indicator ID | HC-022887 |
| Analyst ID - Extraction | dD |
| Analyst ID - Spike Analyst | dD |
| Analyst ID - Spike Witness Analyst | OS |
| Sufficient Volume for Batch QC | Yes |
| Acid Used for pH Adjustment ID | 257458 |
| Base Used to Adjust pH ID | OP3015 |
| Prep Solvent ID | Methylene Chloride: 288389 |
| Prep Solvent Volume Used | 180 mL |
| Na2SO4 ID | 204081 |
| Analyst ID - Concentration | dD |
| Equipment ID - Concentration 1 | 31869 |
| Thermometer ID - Concentration 1 | 31869 |
| Concentration 1 Uncorrected Temperature | 35 Degrees C |
| Concentration 1 Corrected Temperature | 35 Degrees C |
| Vial Lot Number | 20046103 |
| Batch Comment | BNA ISOTOPE |

| Basis | Basis Description |
|---|---|
| T | Total/NA |

The pound sign (#) in the amount added field denotes that the reagent was used undiluted. All calculations are performed using the stated concentration for this reagent.

Injection Vol: 20.0 ul Dil. Factor: 1.0000
Method: PFC_LC812 Limit Group: LC_PFC_ICAL
Column: C-18 ( 4.60 mm) Detector EXP1

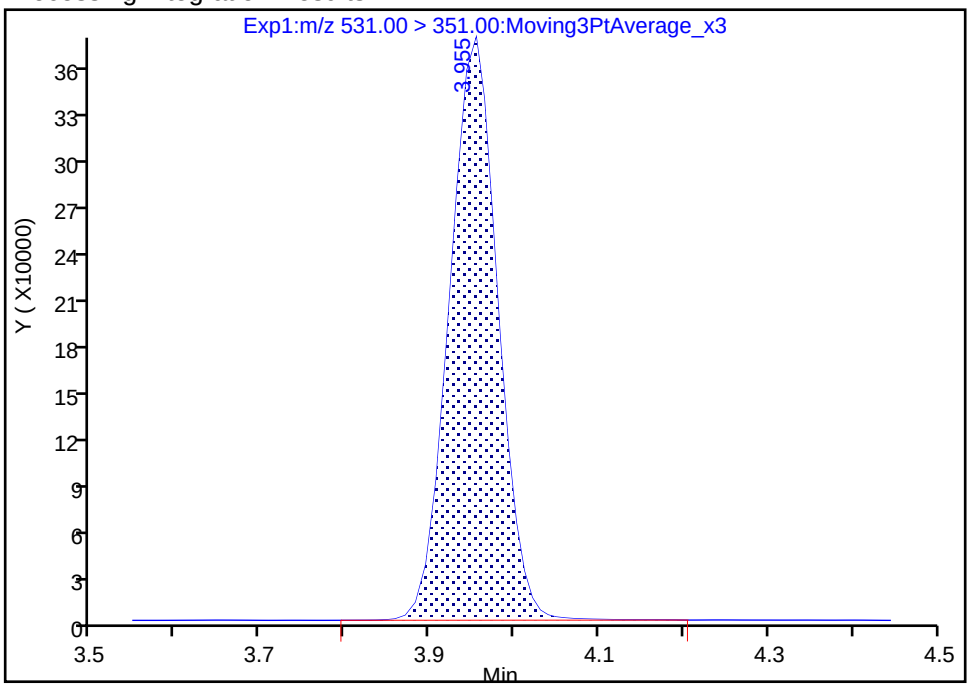
## 69 9-Chlorohexadecafluoro-3-oxanona, CAS: 756426-58-1

Signal: 1

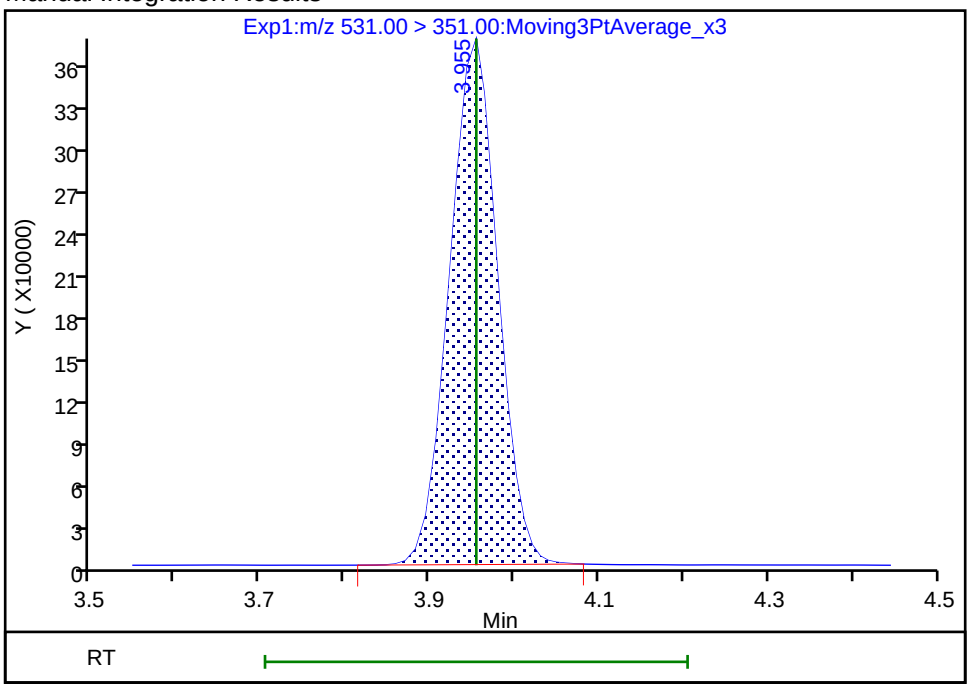
Processing Integration Results

RT: 3.95
Area: 1505461
Amount: 0.880400
Amount Units: ng/ml



Manual Integration Results

RT: 3.95
Area: 1497666
Amount: 0.904563
Amount Units: ng/ml



Reviewer: deannd, 27-Oct-2021 15:07:47
Audit Action: Manually Integrated Audit Reason: Incomplete Integration
