Dear Ms. Verrigni:

This letter summarizes the field activities performed by ARCADIS (on behalf of Orange and Rockland Utilities, Inc. [O&R]) on November 23, 2010 at the Port Jervis former manufactured gas plant (MGP) site and presents the results of the bench-scale treatability study performed to evaluate the use of in-situ stabilization (ISS) within a portion of the site. The scope of these activities was presented in a November 19, 2010 letter titled *Proposed Supplemental PDI Activities* (Work Plan), which was approved by the New York State Department of Environmental Conservation (NYSDEC) on November 19, 2010.

Field Activities

The primary goals of the field activities were to 1) gain additional information regarding the condition, dimensions, and contents of the foundation of former Gas Holder A and 2) collect samples for the ISS treatability study. The field activities were performed on November 23, 2010 within the O&R Operations Center and included the drilling of four soil borings, installation of one piezometer, and gauging of monitoring well MW1S. The soil boring locations (PDI-SUPP 1 through PDI-SUPP-4) and piezometer (PZ1) are shown on Figure 1 and soil boring/well construction logs are provided in Attachment A.

Soil Borings and Piezometer

The drilling and well installation work was performed by NYEG Drilling, LLC (NYEG) under the oversight of an ARCADIS geologist. A representative of the NYSDEC was also on-site to observe the field activities. Prior to initiating drilling activities, boring locations were hand-cleared to a depth of approximately 5 feet below ground surface (bgs) to facilitate the identification of potential utilities. Once hand-cleared, soil borings were drilled using hollow-stem auger (HSA) methods and soil sampling was performed using 3-inch diameter split spoon sampling devices. Each soil sample was visually characterized for soil type and the presence of non-aqueous phase liquid (NAPL). Soil cuttings from each boring location were field screened for the presence of volatile organic compound (VOC) vapors using a photoionization detector (PID) and were subsequently stored in new 55-gallon drums within the limits of the O&R Operations Center.

Soil borings PDI-SUPP-1 and PDI-SUPP-2 were drilled within the limits of the foundation of former Gas Holder A and were advanced to the foundation floor, which was encountered at a depth of approximately 14 feet bgs. As indicated in the boring logs for these locations, soils at the bottom of the holder foundation were heavily impacted with NAPL.

Soil borings PDI-SUPP-3 and PDI-SUPP-4 were drilled outside of the foundation of former Gas Holder A and were each advanced to a depth of approximately 29 feet bgs. At these locations, soil samples were collected continuously between approximately 15 and 29 feet bgs. Observations at soil borings PDI-SUPP-3 and PDI-SUPP-4 were generally consistent with those made in April 2010 during the drilling of soil borings PDI-SB5 and PDI-SB2, respectively, and included moderate to heavy impacts of brown and yellow-brown NAPL below approximately 17 feet bgs. Representative soil samples from PDI-SUPP-3 and PDI-SUPP-4 were collected, homogenized, placed into 5-gallon buckets, and shipped to the ARCADIS laboratory in Durham, North Carolina for the ISS treatability study. Approximately 3 gallons of potable (municipal) water was also collected while on-site and shipped to the ARCADIS laboratory.

As shown on Figure 1 and the boring logs (Attachment A), piezometer PZ1 was constructed at soil boring location PDI-SUPP-3 with 1-inch Schedule 40 PVC and was screened between 10 and 25 feet bgs.

Well Gauging

While on-site, monitoring well MW1S was gauged and accumulated NAPL (approximately 0.06 gallons) was removed along with approximately 3 gallons of groundwater. The NAPL-groundwater mixture was placed in a 5-gallon bucket and stored on-site within a 55-gallon drum. Additional information regarding the well gauging and NAPL bailing activities at the site is provided in the June 2011 *PDI Status Report for NAPL and Groundwater/Hydrogeologic Assessments*.

Community Air Monitoring

Community air monitoring was performed during the field investigation to provide real-time measurements of total airborne VOCs and particulate matter less than 10 microns in diameter (PM_{10}) at the downwind perimeter of the work area. The community air monitoring procedures and action levels for total VOCs and PM_{10} were set forth in the NYSDEC-approved *Community Air Monitoring Plan* (CAMP), which was included as Appendix E of the *Remedial Design Work Plan* (RD Work Plan; ARCADIS 2010). Community air monitoring stations (one upwind and one downwind location) were established at the start of the work day based on the predominant wind direction and general location of work activities at the site. Each monitoring station included a PID and dust meter equipped with data logging capabilities. The action levels for total VOCs and PM_{10} were not exceeded during the field investigation.

Handling/Management of Investigation-Derived Waste

Investigation-derived waste (IDW) generated during the field investigation was stored within the limits of the O&R Operations Center and included: 1) soil cuttings from the hand-clearing and drilling activities; 2) decontamination wash-water; 3) personal protective equipment and plastic sheeting (from the decontamination pad); and 4) NAPL (removed from monitoring well MW1S). IDW was stored in appropriately labeled 55-gallon drums and transported off-site for proper disposal on December 17, 2010.

ISS Bench-Scale Treatability Study

The objective of the bench-scale treatability study was to identify a technically appropriate and cost-effective mix design that would 1) reduce the potential mobility of NAPL through solidification/stabilization and 2) demonstrate chemical compatibility with the site constituents of concern (COCs). Each potential mix design was subject to geotechnical and chemical testing to evaluate its effectiveness in meeting these criteria.

The treatability study was designed to simulate (to the extent practicable) the potential full-scale remedial process by using: 1) MGP-impacted soil collected at the site; 2) municipal (potable) water available at the site; and 3) regionally available reagents.

Baseline Testing

Untreated samples of the soil homogenate were submitted to Hampton ClarkeVeritech, Inc. (HCV) and Geotechnics, Inc. (Geotechnics) for the following baseline chemical and geotechnical analyses, respectively:

- VOCs by EPA SW-846 Method 8260;
- Semivolatile organic compounds (SVOCs) by EPA SW-846 Method 8270;
- RCRA metals by EPA SW-846 Methods 6010 and 7471;
- Soil classification by ASTM D2487;
- Loss on ignition by ASTM D2974;
- Grain size by ASTM D422;
- Atterberg limits by ASTM D4318; and
- Moisture content by ASTM D2216.

The results of the chemical analyses are summarized in Table 1 and the chemical and geotechnical laboratory data reports are provided in Attachment B (on CD).

Samples of the untreated soil homogenate were also leached by HCV over a 24-hour period in deionized water using a modified version of EPA Method 1312 (Synthetic Precipitation Leaching Procedure [SPLP]) and American Nuclear Society Standard 16.1-1986 (ANS 16.1). The modified leaching procedure is described in the ARCADIS Standard Operating Procedure (SOP) provided in Attachment C. This SOP was originally submitted (electronically) to NYSDEC on December 9, 2010 and has since been revised to address NYSDEC comments dated December 15, 2010. After 24 hours, the soil leachate was poured off and analyzed for VOCs, SVOCs, and RCRA metals. The results of those analyses are summarized in Table 2.

A sample of the potable water was also submitted to HCV for testing. The properties of the water were as follows:

Parameter	Units	Result
Hardness	mg/L as $CaCO_3$	15
pH	S.U.	7.2
Total Dissolved Solids	mg/L	47

Mix Designs

The mix designs were prepared at the ARCADIS Durham, North Carolina laboratory using the soil homogenate, potable water, and admixtures containing different percentages of Portland cement, bentonite clay, and blast furnace slag (BFS) cement. The reagents and percentages for each admixture were selected based on previous project experience at former MGP sites.

Portland cement is the same cement widely used in highway and building construction. Bentonite clay, a colloid clay with excellent swelling/sealing properties, is mined in Wyoming and widely used in impermeable soil barriers and a variety of other industries. BFS is a by-product of steel manufacturing that is ground to cement size for grouting applications. BFS cement forms more and stronger bonds than Portland cement, but requires an activator, such as lime (e.g., Portland cement), to initiate solidification. The advantage of BFS cement (when combined with Portland cement) is that it can produce stronger and more impermeable materials than Portland cement alone.

The reagents used in the bench-scale treatability study were obtained from the following sources:

Reagent	Brand/Trade Name or Type	Supplier/Manufacturer	Location
Portland Cement	Type I-II	Lafarge North America, Inc. (Lakes and Seaway Region)	Oswego, NY
Bentonite Clay	Hydrogel®	Wyo-Ben, Inc.	Greybull, WY
BFS Cement	NewCem®	Lafarge North America, Inc. (Lakes and Seaway Region)	Oswego, NY

For each mix design, the soil and admixture were thoroughly blended together with a minimum volume of potable water to create a self-leveling soil slurry in the approximate consistency of masonry mortar. Molds were prepared from the resulting slurry and allowed to cure at the ARCADIS laboratory in sealed containers under indoor ambient temperature and humidity.

To evaluate their effectiveness in reducing the potential mobility of NAPL, mix designs were tested at seven and 28 days for unconfined compressive strength (UCS) by ASTM D1633 and hydraulic conductivity (permeability) by ASTM D5084. The design objectives for the treated soil matrix were to achieve a 28-day UCS between 50 and 500 pounds per square inch (psi) and a maximum 28-day permeability of $1x10^{-6}$ centimeters per second (cm/sec).

Initial (Phase I) Mix Designs

Four mix designs (ISS1 through ISS4) were initially prepared using the following admixtures:

Mix Design	Admixture (% by Dry Weight)		
	Portland Cement	Bentonite	BFS Cement
ISS1	0.5%	0.5%	7.0%
ISS2	0.75%	0.5%	5.25%
ISS3	1.5%	0.5%	7.0%
ISS4	10%	0.5%	0.0%

Mix designs ISS2 through ISS4 were tested by Geotechnics at seven and 28 days for UCS and permeability. Mix design ISS1 had not cured sufficiently after seven days and was only tested at 28 days for UCS and permeability. The seven- and 28-day test results are summarized in Table 3 and show that two of the initial mix designs (ISS3 and ISS4) achieved the UCS and permeability design objectives.

Following receipt of the 28-day UCS results, additional molds were prepared for mix design ISS3 and re-tested at seven days to confirm/verify the initial seven-day UCS results. The additional seven-day UCS results for mix design ISS3 are also summarized in Table 3 and show a slight increase in strength over the initial seven-day UCS results.

Additional (Phase II) Mix Designs

The seven-day UCS results for the initial mix designs indicated (at the time) that mix designs ISS1 through ISS3 may not achieve the UCS design objective. Accordingly, two additional mix designs (ISS5 and ISS6) were prepared and tested while awaiting the 28-day UCS results for mix designs ISS1 through ISS4. The mix designs for ISS5 and ISS6 were optimized from the mix design for ISS4 (which achieved the highest seven-day UCS result) and were created using the following percentages of Portland and BFS cement:

Mix Design	Admixture (% by Dry Weight)		
	Portland Cement	Bentonite	BFS Cement
ISS5	7.0%	0.5%	0.0%
ISS6	3.5%	0.5%	7.5%

Consistent with the initial mix designs, mix designs ISS5 and ISS6 were tested by Geotechnics at seven and 28 days for UCS and permeability. The seven- and 28-day test results are summarized in Table 3 and show that both ISS5 and ISS6 achieved the desired UCS and permeability design objectives.

Monolith Leaching

Of the four mix designs (ISS3 through ISS6) that met the UCS and permeability design objectives, ISS3 and ISS6 were selected for leaching and analysis to determine their effectiveness in reducing the leachability of COCs. Mix design ISS4 was not selected due to its high early (seven-day) strength, which could 1) affect the workability of the soil-grout mixture in the field (during construction) and 2) limit the potential for re-mixing ISS areas (if needed). Mix design ISS5 was not selected due to its anomalous UCS results (28-day strength was slightly less than the seven-day strength).

Monoliths for mix designs ISS3 and ISS6 were submitted to HCV for leaching and analysis in accordance with the ARCADIS SOP (Attachment C). Each monolith underwent 20 24-hour leaching cycles and the leachate from the first (i.e., day 1) and every fifth leaching cycle (i.e., days 5, 10, 15, and 20) was analyzed for VOCs, SVOCs, and RCRA metals. The leachate results for the ISS3 and ISS6 monoliths are summarized in Table 2 with the leachate results for the baseline (untreated) soil. Table 2 also identifies the Class GA groundwater standards and guidance values (where available) from the NYSDEC's Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1, titled *Ambient Water Quality Standards and Guidance Values* (NYSDEC 1998). Copies of the laboratory data reports are provided in Attachment B (on CD).

As indicated in Table 2, concentrations of benzene, ethylbenzene, toluene, and xylenes (collectively, BTEX) decreased rapidly and were not detected above their respective Class GA groundwater standards after the first (day 1) leaching cycle. 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, isopropylbenzene, and p-isopropyltoluene were also detected in the baseline soil leachates at concentrations greater than their Class GA groundwater standard of 5 micrograms per liter (ug/L). With the exception of 1,2,4-trimethylbenzene, none of these constituents were detected in the monolith leachates at concentrations greater than 5 ug/L. 1,2,4-

trimethylbenzene was detected at a concentration of 5.3 ug/L in the day 1 leachate of the ISS3 monolith, but at concentrations less than 5 ug/L in the subsequent leachates for this monolith.

Methylene chloride, which is not a site COC, was consistently detected in the baseline soil and monolith leachates at concentrations exceeding its Class GA groundwater standard of 5 ug/L. As documented in the HCV laboratory reports (Attachment B), these methylene chloride detections were the result of laboratory contamination, not the samples themselves.

Seven polycyclic aromatic hydrocarbons (PAHs) – namely, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, indeno(1,2,3-cd)pyrene, and naphthalene – were detected in the baseline soil leachates at concentrations greater than their respective Class GA groundwater standards or guidance values. With the exception of naphthalene, these PAHs were detected at J-qualified (estimated) concentrations ranging from 0.23 ug/L to 1.1 ug/L. Naphthalene was detected in the baseline soil leachates at the highest concentrations of any PAH (100 ug/L and 74 ug/L in the two baseline samples).

Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, and naphthalene were also detected in the monolith leachates at concentrations greater than their respective Class GA groundwater standards or guidance values. Benzo(a)anthracene, benzo(b)fluoranthene, and chrysene, which each have a Class GA groundwater guidance value of 0.002 ug/L, were detected in certain monolith leachates at estimated concentrations ranging from 0.21 ug/L to 0.44 ug/L. These estimated concentrations were generally consistent with the estimated concentrations observed in the baseline soil leachates. Benzo(a)pyrene, which has a Class GA groundwater standard of “non-detect”, was detected in the day 20 leachate of both the ISS3 and ISS6 monoliths at estimated concentrations of 0.28 ug/L and 0.23 ug/L, respectively.

Naphthalene was detected in the ISS3 and ISS6 monolith leachates at initial (day 1) concentrations of 98 ug/L and 92 ug/L, respectively, and at successively lower concentrations in each leaching cycle thereafter. The final (day 20) naphthalene concentration was 29 ug/L in both the ISS3 and ISS6 monolith leachate, but was still greater than the Class GA groundwater guidance value of 10 ug/L.

Volume Increase of Treated Soil

The addition of Portland cement, bentonite, and BFS cement to the MGP soil matrix causes the mixture to expand during curing. This volume increase must be accounted for during field-scale implementation to prevent an unacceptable amount of mounding above the current ground surface. The volume increase or "bulking" of treated soils was calculated using the following formula[1]:

$$\text{Bulking Factor} = (1 + R) * \frac{D_{in\text{-}situ}}{D_{treated}} * \frac{1 + MC_{treated}}{1 + MC_{in\text{-}situ}} - 1$$

R = Dry weight ratio of solidifying agent to waste

$D_{in\text{-}situ}$ = Bulk unit weight of in-situ waste

$D_{treated}$ = Bulk unit weight of compacted, treated material

$MC_{in\text{-}situ}$ = Moisture content of in-situ waste

$MC_{treated}$ = Moisture content of treated material

The calculation yielded an expected bulking factor of between 6% and 14% for mix designs ISS3 and ISS6.

Conclusions

The data generated during the ISS treatability study indicates that the solidification/stabilization of NAPL at the site is technically feasible. Physical encapsulation or solidification will further decrease the concentration of MGP-related compounds partitioning to groundwater and the potential for NAPL mobilization to off-site areas. Mix designs ISS3 and ISS6 meet or exceed the UCS and permeability design objectives and reduce the leachability of most site COCs. However, upon further evaluation and consideration of the implementation risks, O&R has decided not to proceed with the ISS design. O&R will implement the excavation remedy as stipulated in the ROD.

Notes:
1. Groundwater standards and guidance values are from the New York State Department of Environmental Conservation's Division of Water Technical and Operational Guidance Series (TOGS) 1.1.1, titled *Ambient Water Quality Standards and Guidance Values* (NYSDEC 1998).
2. ug/L - Micrograms per liter.
3. -- - No standard or guidance value listed in TOGS 1.1.1 for this parameter.
4. Yellow highlighting identifies values that exceed the applicable groundwater standard or guidance value.
5. ND - Analyte was not detected. The number in parentheses is the associated Reporting Limit (RL).
6. TOGs 1.1.1 does not include Class GA groundwater standards or guidance values for m&p-xylene and total xylenes; the principal organic contaminant (POC) standard of 5 ug/L applies to the individual isomers of m-, o-, and p-xylene. For the purposes of this table, a screening value of 5 ug/L has been used for m&p-xylene to identify results that may indicate an exceedance of the POC standard for either m- or p-xylene.

Data Qualifiers:
B - Analyte was present in the Method Blank and sample.
J - Concentration is below the RL but above the Method Detection Limit (MDL). The concentration reported is an estimate.

Project: Port Jervis ISSS

HCV Project: 0122205

Hampton-Clarke/Veritech (HC·V) received the following samples on December 22, 2010:

Client ID	HCV Sample ID	Matrix	Analysis
PJ Baseline-1	AC56495-001	Soil	VO (8260B), BNA (8270C), Metals (6010B/7471A), SPLP VO (8260B), SPLP BNA (8270C), SPLP Metals (6010B/7470A)
PJ Baseline-2	AC56495-002	Soil	VO (8260B), BNA (8270C), Metals (6010B/7471A), SPLP VO (8260B), SPLP BNA (8270C), SPLP Metals (6010B/7470A)

Volatile Organic Analysis:

Data conforms to method requirements.

Base Neutral/Acid Extractable Analysis:

There is no surrogate recovery data for sample AC56495-001 due to high sample dilution. The surrogates and spiking compounds were diluted out form Matrix Spike and Matrix Spike Duplicate in batch SMB4129. All QC criteria were met in the Laboratory Control Sample (MBS).

Metals Analysis:

Reported to MDL per client request. When reporting to the MDL, detections are typically found in the blanks. Acceptance criteria for blanks are based on the RL.

SPLP Volatile Organic Analysis:

Methylene chloride was recovered in extraction fluid blank EF-SPLP FL 1014 and in samples AC56495-001 and 002 suggesting laboratory contamination.

The recovery of Toluene is biased low, outside QC limits in the Matrix Spike Duplicate in batch 5385. All QC criteria were met in the Laboratory Control Sample (MBS).

SPLP Base Neutral/Acid Extractable Analysis:

The recovery of 3&4-Methylphenol is biased high, outside QC limits in the Matrix Spike and Matrix Spike Duplicate in batch WMB4136. All QC criteria were met in the Laboratory Control Sample (MBS).

The recovery of 2,4,6-Tribromophenol surrogate is biased low, outside QC limits in non-spiked sample AC56498-001. The sample was re-extracted as a Base Neutral only, therefore the re-extract could not be used.

SPLP Metals Analysis:

Reported to MDL per client request. When reporting to the MDL, detections are typically found in the blanks. Acceptance criteria for blanks are based on the RL.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

REPORTING DEFINITIONS

DF = Dilution Factor

MDL = Method Detection Limit

RL = Reporting Limit *

RT = Retention Time

NA = Not Applicable

ND = Not Detected

DATA QUALIFIERS

B- Indicates analyte was present in the Method Blank and sample.

d- For Pesticide and PCB analysis, the concentration between primary and secondary columns is greater than 40%. The lower concentration is generally reported.

E- Indicates the concentration exceeded the upper calibration range of the instrument.

J- Indicates the concentration is below the Reporting Limit (RL) but above the MDL (Method Detection Limit). The concentration reported is an estimate.

*For Clean Water Act and SW846 Organic Methods and Metals Methods, the Reporting Limit is determined by the concentration of the lowest standard in the calibration curve.

*For Clean Water Act and SW846 Wet Chemistry methods, the Reporting Limit is determined by the concentration of the lowest standard in the calibration curve. For most gravimetric methods the Reporting Limit is defined as a value 3 to 5 times the MDL.

Samples AC57097-001 through -020 were prepped for SPLP analysis according to Arcadis Standard Operating Procedure "Monolith Leaching Method".

SPLP Volatile Organic Analysis:

Methylene chloride was recovered in Extraction Fluid Blanks EF-3-1014 and EF-3-V-1014 and in samples AC57097-001, 005, 010, 015, and 020 suggesting laboratory contamination.

Samples AC57097-015 and 020 was activated and tumbled outside holding time.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

REPORTING DEFINITIONS

DF = Dilution Factor

MDL = Method Detection Limit

RL = Reporting Limit *

RT = Retention Time

NA = Not Applicable

ND = Not Detected

DATA QUALIFIERS

B- Indicates analyte was present in the Method Blank and sample.

d- For Pesticide and PCB analysis, the concentration between primary and secondary columns is greater than 40%. The lower concentration is generally reported.

E- Indicates the concentration exceeded the upper calibration range of the instrument.

J- Indicates the concentration is below the Reporting Limit (RL) but above the MDL (Method Detection Limit). The concentration reported is an estimate.

*For Clean Water Act and SW846 Organic Methods and Metals Methods, the Reporting Limit is determined by the concentration of the lowest standard in the calibration curve.

*For Clean Water Act and SW846 Wet Chemistry methods, the Reporting Limit is determined by the concentration of the lowest standard in the calibration curve. For most gravimetric methods the Reporting Limit is defined as a value 3 to 5 times the MDL.
