1.0 INTRODUCTION AND BACKGROUND

1.1 Introduction

Golder Associates Inc. (Golder) prepared this Supplemental Remedial Investigation Report (Report), on behalf of International Business Machines Corporation (IBM), for Solid Waste Management Unit (SWMU) AB: Former Building B001 1,1,1-trichloroethane (TCA) Recovery Unit (SWMU AB) at the former IBM Kingston Facility (site) located at 300 Enterprise Drive, Kingston, Ulster County, New York (see Figure 1).

The SWMU AB investigation described herein was completed using the methods and procedures presented in the *RCRA Facility Investigation Work Plan: Solid Waste Management Unit AB: Former B001 TCA Recovery Unit* (Work Plan) submitted by IBM to the New York State Department of Environmental Conservation (NYSDEC) in March 2009 and the associated *RCRA Facility Investigation Management Plans* (Golder, 2009). NYSDEC approved the Work Plan as submitted on April 28, 2009.

1.2 Site Background

The site is located north of the City of Kingston in the Town of Ulster, Ulster County, New York and is bounded by John M. Clarke Drive and Route 9W to the east, Old Neighborhood Road and Route 209 to the north, Esopus Creek to the west, and Boices Lane to the south (see Figure 2). The approximately 258-acre property was first developed by IBM from farmland during the 1950s. The primary activities included the manufacturing of electric typewriters and the development, manufacture and testing of computer systems and related components and technologies. IBM ceased operations during the early-1990s and the property was subsequently subdivided into multiple parcels. In 1998, IBM sold the site to AG Properties of Kingston, LLC and Ulster Business Complex, LLC. The site is currently managed by TechCity.

The portion of the site located east of Enterprise Drive is referred to as the East Campus and includes the majority of the buildings at the site, many of which are vacant. The portion located west of Enterprise Drive is referred to as the West Campus and includes former IBM Buildings B201, B202 and B203; a large parking area south and west of former Buildings B021, B202, and B203; and generally undeveloped land further to the southwest and north of former Buildings B201, B202, and B203.

The entire site was listed as a Class 4 Site (Site # 356002) in the Registry of Inactive Hazardous Waste Disposal sites in New York State and was managed in compliance with the October 4, 1996 Hazardous Waste Management Permit #3-5154-00067/00090 (6 NYCRR Part 373) (Permit) until the Administrative Order on Consent Index No. D3-10023-6-11 (Order) was signed with NYSDEC by IBM and TechCity on July 8, 2011. The Order, which supersedes and replaces the former Permit, divides the site into ten Operable Units (OUS) as depicted in Figure 2.

Prior to the execution of the Order, IBM completed extensive RCRA Facility Investigations (RFIs) beginning in the 1990s through 2002 to delineate the occurrence and extent of volatile organic compounds (VOCs) in groundwater beneath the site. Corrective Measures implemented by IBM include the operation and maintenance of a perimeter control system that intercepts the groundwater plume. The perimeter control system consists of two stormwater sewer systems, an unsaturated portion of the surficial sand unit that underlies the site, a utility trench barrier wall, and a groundwater collection system (see Figure 2). IBM currently performs groundwater quality monitoring to evaluate the effectiveness of the Corrective Measures.

1.3 SWMU AB Background

SWMU AB consists of a former above-ground TCA recovery unit that was located in the vicinity of column K13A along the western wall of Building B001 (see Figure 2). According to engineering drawings, the former SWMU AB recovery unit comprised a free-standing above-grade evaporator column and associated filter unit and flow gage connected to a 3-inch waste return line located in the overhead utility corridor¹. The TCA recovery unit was associated with a former 4,000-gallon TCA waste underground storage tank (UST) and 1,000-gallon supply UST (i.e., SWMU S)² located to the north of Building B001 along the western exterior of Building B001. Historic IBM documents indicate that recoverable waste solvents from SWMU S were pumped through a filter to the SWMU AB evaporator recovery unit located entirely above ground on the concrete foundation slab. Operations utilizing the former waste TCA tank ceased between 1967 and 1971, presumably ending the use of the evaporator recovery unit.

Potential groundwater impacts were investigated at SWMU AB because previous investigations reported low VOC concentrations (less than 1 microgram per liter [$\mu\text{g/l}$] to less than 5 $\mu\text{g/l}$) in soil gas during a fine-grid soil gas survey (GSC, 1996) in the vicinity of SWMU AB. In addition, TCA and associated degradation compounds (i.e., 1,1-dichloroethene [DCE] and 1,2-dichloroethane [DCA]) have been detected at concentrations above groundwater quality standards in samples collected from monitoring well MW-601S, which is located downgradient of SWMU AB and the SWMU S area.

To further investigate the Building B001 area, including SWMU AB, IBM installed five monitoring wells (MW-275S through MW-279S) downgradient of SWMU S and SWMU AB in 1996. Soil samples collected from the borings for these wells were analyzed for VOCs. Analytical results from vadose zone soil samples did not indicate constituent levels above applicable NYSDEC criteria. Analytical results for groundwater samples collected from these wells indicated constituent concentrations greater than groundwater quality standards.

¹ SWMU AB location taken from IBM Kingston, NY Plant Engineering Drawing No. 001-114-M34 for Building B001 dated 25 February 1966 entitled "Solvent Recovery System – Waste Storage and Pumping Circuit".

² SWMU S was investigated concurrently with SWMU AB in accordance with the NYSDEC approved 2011 *Supplemental Investigation Work Plan Solid Waste Management Unit S: Former B001 Waste TCA Tank*. Investigation results and findings for SWMU S were submitted to NYSDEC in a separate report.

The presence of a groundwater plume downgradient of SWMU AB is based on TCA detections above NYSGWQS in monitoring wells MW-275S, MW-276S, MW-277S, MW-278S, MW-605 and MW-204 (GSC, 2010). The source of these detections was previously inferred to be related to SWMU AB based on the lack of an alternative upgradient source. Following the observation of DNAPL, comprising primarily TCA, to the south and east of SWMU S during the Supplemental Remedial Investigation of SWMU S in October 2011 and additional investigation activities conducted in March 2012, the interpreted extent of TCA-impacted groundwater downgradient of SWMU AB is now attributed to an historic release of TCA from SWMU S³.

1.4 Project Objectives

Pursuant to the Order, IBM proposed to implement the Work Plan in the vicinity of SWMU AB following receipt of notification from TechCity that the investigation area was accessible. In February 2012 IBM received notice from TechCity that the remaining infrastructure had been removed from Building B001, thus providing access for IBM to implement the SWMU AB Work Plan activities.

The primary objectives of the SWMU AB investigation include:

- Evaluation of whether soil and/or groundwater conditions in the immediate SWMU AB area represent a continuing source of VOC (primarily TCA) impacts to site groundwater
- Better definition of the nature and extent of VOC-impacted groundwater downgradient of SWMU AB
- Collection of preliminary water quality, geologic, and hydrogeologic information to support an evaluation of potential additional corrective measures, if appropriate

To meet these objectives, IBM implemented a dynamic investigation approach which included the collection and analysis of real-time data to allow for field adjustment of the number, location, and depth of samples based on investigation findings. As such, the scope and extent of the investigation described in the Work Plan was modified as necessary during the implementation of the investigation to achieve the project objectives.

Section 2.0 of this Report presents a summary of the field investigation activities and procedures. Section 3.0 provides an updated geologic conceptual model in the vicinity of SWMU AB and the investigation results. Section 4.0 provides conclusions based on the data collected during the investigation.

³ *Supplemental Remedial Investigation Report: Solid Waste Management Unit S: Former Waste TCA Tanks (SWMU S SRIR); Golder, 2012*

2.0 INVESTIGATION ACTIVITIES AND PROCEDURES

Activities performed during this investigation include the following tasks. Locations are shown on Figure 3.

- Advancement of eight membrane interface probes (MIP) located near, upgradient, and downgradient of the SWMU AB area along the western interior wall of Building B001
- Advancement of three direct-push probes for geologic logging and/or soil sampling at locations adjacent to MIP probes to confirm MIP results and provide soil characterization data
- Collection of nine soil samples for analysis of VOCs from selected depths at three soil boring locations
- Installation of seven temporary groundwater monitoring wells
- Collection of groundwater samples for analysis of VOCs from the seven temporary groundwater monitoring well locations
- Surveying of MIP, soil boring, and temporary monitoring well locations

In addition to the eight MIP borings performed in the SWMU AB area, Golder utilized MIP data collected from MIP borings performed in proximity to SWMU AB in association with the SWMU S investigations and the industrial waste line investigation (Figure 3). Golder implemented the SWMU AB field investigation concurrently with the second mobilization for the supplemental remedial investigation for SWMU S on March 5, 2012 and completed the investigation on April 13, 2012. Environmental Probing Inc. (EPI) was retained to provide direct-push services and Peak Investigations, LLC (Peak) provided MIP services. Brinnier and Larios, P.C., provided New York licensed surveying services. Lancaster Laboratories, Inc. (Lancaster), a New York State Department of Health (NYSDOH) accredited laboratory, performed analytical services.

2.1 Membrane Interface Probe Investigation

IBM conducted the MIP investigation to further define the lithology and distribution of VOCs in the subsurface in the vicinity of SWMU AB. The MIP is a direct-sensing tool that is advanced into the subsurface using direct-push equipment (e.g., GeoProbe®). The MIP used during the field investigation included a halogen specific detector (XSD), a photo-ionization detector (PID), and an electrical conductivity (EC) meter. The XSD detects the presence of total chlorinated VOCs in the vapor, sorbed, and dissolved-phases. The PID detects the presence of total aromatic hydrocarbon VOCs in the vapor, sorbed, and dissolved-phases. The EC measures soil conductivity with depth as the probe is driven into the ground and is used to help identify changes in lithology and/or other subsurface conditions, including soil moisture and grain size, that change subsurface conductivity. In addition, the MIP includes a sensor for downhole temperature measurement.

EPI advanced a total of eight MIPs during the field investigation at the locations shown on Figure 3. Golder evaluated the data daily and modified subsequent probe locations and depths as appropriate based on the findings. Before positioning the direct-push equipment for subsurface advancement, EPI

hand-augured each location to a depth of approximately 5 feet below ground surface (bgs) as an additional precaution to reduce the potential for hitting subsurface obstructions.

Peak conducted the MIP investigation in general accordance with American Society for Testing and Materials (ASTM) *Standard Practice for Direct Push Technology for Volatile Contaminant Logging with the Membrane Interface Probe (MIP)*—D7532-07 (ASTM, 2007) and Standard Operating Procedure (SOP) SOP-9, provided in the Quality Assurance Project Plan (QAPP)⁴. Prior to advancing the MIP, Peak conducted a response test utilizing a 2-part per million (ppm) trichloroethene (TCE) solution to confirm the rate of response and accuracy of the XSD element. Peak then calibrated the MIP to ground surface prior to advancing the probe into the subsurface. Some offset (i.e., less than 0.5 to 1.0 feet) from true ground surface was observed due to variations in positioning the probe during ground-zero calibration. This offset was considered in targeting sample locations and data evaluation and interpretation.

The MIP is equipped with a heating unit capable of maintaining a temperature of 100 degrees Celsius in the subsurface, ensuring volatilization of dissolved and/or sorbed compounds. At each probe location, EPI held the rate of penetration (ROP) constant at one foot per minute until the target terminal depth had been obtained.

Golder observed initial MIP XSD responses during the performance of the October 2011 SWMU S investigation that were higher than responses observed during previous investigations, requiring a ten-fold attenuation of the XSD response scale. As a result of these elevated MIP XSD responses and the proximity of the SWMU AB investigation area to SWMU S, Golder performed the SWMU AB MIP investigation at the ten-time attenuation setting, which increased the recordable instrument response maximum from one-million to ten-million μ V.

The boreholes typically collapsed upon removal of the probe to a depth of approximately 4 to 6 feet bgs. EPI grouted portions of the boreholes that did not collapse with cement-bentonite slurry in accordance with QAPP SOP-10. Borings advanced through asphalt or concrete areas were patched with the appropriate surface cover upon completion.

EPI decontaminated the direct-push tools between borings in accordance with QAPP SOP-5. Table 1 presents a summary of the MIP nomenclature and locations. Appendix A includes MIP field forms and data plots.

2.2 Soil Borings and Soil Sampling

Golder used information collected during the MIP investigation to identify locations for the advancement of soil borings for use in correlating EC results to lithology and for the collection of soil samples for laboratory analysis. EPI advanced three soil borings at the locations shown on Figure 3 using a direct-

⁴ The QAPP and associated SOPs are included as part of the *RCRA Facility Investigation Management Plans*.

push rig and a dual-tube continuous macro-core sampler for the collection of soil cores. Golder logged the cores for lithology and screened the soil using a PID. Multiple, depth-discrete soil samples were collected from the three soil boring locations for analysis of VOCs to correlate laboratory results with MIP results.

Golder selected samples for laboratory analysis by targeting zones of high MIP XSD response and specific lithologic horizons (i.e., Surficial Sand Unit, Silty-Sand and Clay Transition Unit, and Varved Clay Unit). Encore® samplers were used to collect soil samples for VOC analyses. Lancaster analyzed the samples for VOCs using EPA Method 8260B. Samples were submitted to the laboratory under chain-of-custody procedures in accordance with QAPP SOP-3.

Table 2 presents a summary of the soil samples collected and the analyses performed. Appendix B contains soil boring logs, including soil sample locations and depths. Appendix C contains soil sampling information. Analytical results are presented and discussed in Section 3.3.

2.3 Groundwater Sampling

Golder installed seven temporary wells for the collection of depth-discrete groundwater samples. Groundwater sampling locations and depths were selected based on the results of the MIP investigation and observations made during the soil boring program. Targeted areas included zones of high MIP XSD response and areas of hydrogeologic interest.

The groundwater sampling and analysis program included collection of seven groundwater samples from four temporary well locations (multiple depth-discrete samples were collected at some locations) at the locations shown on Figure 3. Golder collected the depth-discrete samples from temporary monitoring wells co-located with the boreholes advanced to collect lithologic data (i.e., the dual-tube, discrete-depth soil samples as described in Section 2.2). Lancaster analyzed the groundwater samples for VOCs.

Temporary well installation and groundwater sampling were conducted in accordance with QAPP SOP-2. Temporary monitoring well construction information is included in Appendix B and temporary monitoring well locations are shown on Figure 3. A summary of groundwater sample locations, sample type, and analyses performed is presented in Table 3. Groundwater sampling field forms and chain-of-custody information are included in Appendix C. Analytical results are presented and discussed in Section 3.3.

2.4 Data Validation

Golder validated laboratory analytical data following NYSDEC Analytical Services Protocol (ASP) Category B deliverables requirements and the *NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation, Appendix B Guidance for the Development of Data Usability Summary Reports* (May, 2010), to identify data quality issues which could affect the use of the data for decision making purposes. A Data Usability Summary Report (DUSR) is included in Appendix D and Laboratory Data Sheets are included as Appendix E.

2.5 Investigation-Derived Waste

IBM managed investigation-derived waste (IDW) in accordance with QAPP SOP-8.

3.0 INVESTIGATION RESULTS

The following sections present an updated interpretation of the site geologic and hydrogeologic conditions and delineation of the nature and extent of VOC-impacted groundwater within and downgradient of SWMU AB.

3.1 Generalized Site Geology and Hydrogeology

The site is located within the Hudson-Mohawk Lowland Physiographic Province. The bedrock underlying the western portion of the site consists of siltstone and shale of the Middle Devonian Age Lower Hamilton Group. The eastern portion of the site is underlain by both the Lower Hamilton Group and the Lower Devonian Age Onondaga Limestone. The exact location and nature of the contact between these units is not known. The Lower Hamilton Group forms a north-northwest trending bedrock high approximately coincident with Enterprise Drive and is described as calcareous shale in boring logs completed during previous site investigations. A top of bedrock contour map, as interpreted by GSC (GSC, 2002) based on work performed in previous investigations, is presented as Figure 4.

Literature on regional geologic conditions indicate that a glacially-derived sand and gravel unit directly overlies the bedrock west of Enterprise Drive and a glacial till unit overlies the bedrock east of Enterprise Drive. These unconsolidated units are overlain by a varved silt and clay unit that is interpreted to be of lacustrine origin, with a thickness of zero feet in an area where it is absent proximate to the bedrock high, to over 180 feet in the central portion of East Campus as determined by previous site borings. The clay portion of the varved silt and clay unit serves as an aquitard throughout most the site, except in the vicinity of the bedrock high where it is not present.

A well sorted, fine to coarse-grained sand of lacustrine origin, with intermittent, thin, silty-clay zones, overlies the varved silt and clay (or bedrock where the varved silt and clay is absent in the vicinity of the bedrock high). This surficial sand unit ranges in thickness across the site from approximately six feet in the area of the bedrock ridge to greater than 30 feet in the central portion of the East Campus.

A discontinuous transition zone of relatively fine-grained materials is present at the base of the surficial sand unit in some areas of the site (GSC, 1997). The transition zone sediments are interpreted to represent the dynamic depositional environments of a glacial-lacustrine system. As such, the transition zone varies in character across the site, reflecting the dynamics of the paleoenvironment. The transition zone has been observed to comprise clay, silt, and sandy silt members where encountered at different portions of the site. Golder has observed that transition zone sediments vary from fine sand with interbedded silt and clay lenses in the western portions of the East Campus to dense very fine sand and silt north of Building B003. The Transition Zone is absent beneath a most of the West Campus. In the SWMU AB area, Golder observed the Transition Zone to comprise relatively dense silt and very fine sand, as discussed in Section 3.2.

Groundwater within the Surficial Sand Unit overlying the Varved Clay Unit is unconfined. Groundwater flow velocities in the Surficial Sand Unit range from approximately 0.8 feet per day (feet/day) to 2.0 feet/day across the site (GSC, 1997). As illustrated on Figure 5, an east-west trending groundwater divide has been identified in previous investigations at the site underlying Buildings B001, B002, B003, B004 and B005S. Groundwater to the north of the divide flows west and northwest. Groundwater to the south of the divide flows west and southwest.

As a component of the March 2012 SWMU S and SWMU AB investigations, Golder installed seven temporary groundwater monitoring wells within the footprint of Building B001 and on the northern and southern extents of Building B001 to refine the interpretation of groundwater flow directions and the location of the groundwater divide in the SWMU S and SWMU AB area. The results of the groundwater flow direction evaluation are presented in the SWMU S SRIR and are presented on Figure 6.

The results support previous groundwater flow interpretations; principally, that a groundwater divide is present at the site beneath Building B001 south of the SWMU AB area and that groundwater in the vicinity of the former TCA recovery unit flows toward the west-northwest toward the groundwater collection system.

3.2 SWMU AB Area Geology and Hydrogeology

Information obtained during this investigation, previous MIP and soil boring investigations, and work completed by others (i.e., GSC, 1997a and 1997b) was used to prepare a more detailed and updated interpretation of the geologic and hydrogeologic conditions in the SWMU AB area. At each MIP location, Golder identified lithologic unit changes based on the relative magnitude of the EC probe response and used information from the confirmatory soil borings to correlate lithologic units between MIP probe locations.

Generalized descriptions of the near-surface lithologic units encountered during this investigation are as follows:

- **Surficial SAND Unit:** Consists of a light brown, fine to medium grained sand containing variable amounts of finer-grained silt and clay. This unit was typically saturated below a depth of approximately 8.0 feet bgs at the time of the investigation.
- **SILTY-SAND and CLAY Transition Unit (Transition Zone):** Consists of variable amounts of reddish-brown to gray silt, sand, and clay. Typical appearance in a soil core is a silty-sand matrix containing thin lenses of silt and sandy clay. Golder observed this unit to consist of particularly dense silt and very fine sand in the SWMU AB area. Golder encountered this finer-grained zone in the soil borings advanced in the SWMU AB area at depths varying from 18 to 22 feet bgs.
- **Varved CLAY Unit:** Consists of red-brown and gray, plastic, cohesive, wet, clay with intermittent silt zones. Typical appearance in a soil core is clay with laminae of silt and sometimes very fine-grained sand. This unit was encountered between 25 and 26 feet bgs in the SWMU AB area.

Generally, the Surficial Sand Unit in the SWMU AB area extends to approximately 20 feet bgs with the base of the Transition Zone extending to approximately 25 to 26 feet bgs. The top of Transition Zone beneath Building B001 exhibits a gradual slope to the east, toward the north-south trending "valley" identified beneath buildings B001 and B003, where the depth to bedrock and Surficial Sand Unit thickness are generally greater than in other areas of the site (see Figures 4 and 6, respectively). Depth to bedrock decreases sharply to the north-northwest of the investigation area toward Enterprise Drive and the Surficial Sand Unit becomes unsaturated to the west and north, in the vicinity of the bedrock ridge. The water table in this area of the site has been encountered at a depth of approximately 8 feet bgs.

Figures 7 and 8 illustrate the interpreted base of Surficial Sand Unit contours (i.e., top of the Transition Zone, when present, or top of Varved Clay Unit) on a site-wide basis and in the vicinity of the SWMU AB Area, respectively. Geologic cross-sections are presented on Figure 9. Of note is the following:

- The shallow silt and/or clay horizon observed in the Surficial Sand Unit in other areas of the site is largely absent from the majority of borings in the SWMU AB area.
- The Transition Zone in the vicinity of SWMU AB is composed of particularly dense silt and very fine sand.
- The base of the Surficial Sand Unit (i.e. the top of the Transition Zone) in the SWMU AB area is relatively flat, in contrast to Golder's observations in the SWMU S area where the localized depression in the base of Surficial Sand/Transition Zone contact strongly controls the distribution of VOCs in the subsurface.

3.3 MIP XSD and Analytical Sampling Results

The MIP data and the soil and groundwater analytical sampling results provide more detailed lateral and vertical delineation of the distribution of VOCs and a better understanding of the subsurface geochemical conditions in the vicinity of SWMU AB. Tables 7a through 7c illustrate the correlation of investigation results with stratigraphic units along cross-sections A-A' through C-C'. The cross-section locations are illustrated on Figure 8. The following sections present investigation results.

3.3.1 MIP XSD Results

MIP XSD results are summarized in Table 4. MIP XSD response values (in μV) are illustrated on cross-sections A-A' through C-C' on Figure 9 and correlated with investigation results and stratigraphy on Tables 7a thru 7c. The maximum XSD values are presented in plan-view for each MIP probe on Figures 10 and 11, for the saturated Surficial Sand and the Transition Zone, respectively.

Key observations from the collected MIP XSD data include:

- The relative magnitude of MIP XSD detections correlate well with soil and groundwater sampling analytical results, confirming the MIP XSD data are a reliable screening tool for qualitatively identifying the relative difference in total VOC concentration in the subsurface. Based on a general comparison of MIP XSD responses to soil and groundwater analytical results from this investigation, MIP XSD responses of approximately 35,000 μV or less are considered low responses and are interpreted to be

-
- representative of low concentrations of total VOCs (i.e., less than 1 mg/kg in soil and less than 100 µg/l in groundwater).
- MIP XSD responses were less than 40,000 µV in the unsaturated and saturated portions of the Surficial Sand Unit. MIP XSD responses gradually increased in the Transition Zone to the maximum observed response of approximately 130,000 µV and then rapidly decreased to 58,000 µV or less in the Varved Clay Unit (see Table 4 and Figures 10 and 11).

Overall, MIP XSD responses are notably elevated within the Transition Zone when compared to the Surficial Sand and Varved Clay Units and indicate that the highest VOC concentrations are limited to the Transition Zone in the vicinity SWMU AB.

3.3.2 Soil Sampling Results

Golder compared soil sample analytical results to applicable standards in NYSDEC 6NYCRR Part 375 Environmental Remediation Programs supplemented by *DEC Policy CP-51/Soil Cleanup Objectives* (SCOs). Soil sample analytical results are presented in Table 5 and summarized on Figures 12 and 13. Key observations include:

- All VOC compounds were reported as non-detect at laboratory reporting limits in the three soil samples collected from the unsaturated Surficial Sand Unit.
- A total VOC concentration greater than 5 mg/kg was detected in one of the three soil samples collected from the within the top two feet of the Transition Zone (approximately 18 to 20 feet bgs) at the soil boring co-located with the MIP probes where the highest XSD responses (i.e., SAB-MIP-172 and SS-MIP-173) were observed (see Table 7c). The single compound detected at a concentration above SCOS was TCE.
- No VOC compounds were detected above NYSDEC SCOS in the three soil samples collected near the base of the Transition Zone (i.e. approximately 24 to 25 feet bgs).
- TCA was not detected at or above laboratory reporting limits in soil samples collected from the SWMU AB area.

The overall absence of TCA in soil analytical samples indicate that the former SWMU AB TCA evaporator unit is not a source of VOC impacts to soil in the SWMU AB area.

3.3.3 Groundwater Sampling Results

Golder compared groundwater sample analytical results to applicable standards in NYSDEC 6NYCRR Part 703 New York State Groundwater Quality Standards (NYSGWQS) supplemented by *Technical and Operational Guidance Series 1.1.1 (TOGS) Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations*. Groundwater analytical results are presented in Table 6. The distribution of total VOCs is summarized on Figure 14 and 15 for the saturated Surficial Sand Unit and the Transition Zone, respectively. Key observations include:

- VOCs detected in groundwater samples at concentrations below NYSGWQS include chloroform, Freon 113, TCA, tetrachloroethene (PCE), and vinyl chloride.

- VOCs detected in groundwater samples at concentrations at or above NYSGWQS include 1,1,2-trichloroethane (1,1,2-TCA), 1,1-dichloroethane (1,1-DCA), 1,1-DCE, 1,2-DCA, 1,2-dichloroethene (1,2-DCE), and TCE.
- TCA concentrations in groundwater samples collected within the saturated Surficial Sand Unit and Transition Zone ranged between 1.9 to 2.3 µg/l and non-detect to 2.6 µg/l, respectively. All detected concentrations of TCA were below the NYSGWQS of 5 µg/l.
- The VOC reported at the highest concentration in groundwater samples collected in the SWMU AB area is TCE. Concentrations increase with depth, ranging between 38 and 180 µg/l.
- The highest total VOC concentrations in groundwater (i.e., greater than 250 µg/l) were detected in samples collected within the Transition Zone from temporary groundwater monitoring wells located in the immediate vicinity and downgradient of the former SWMU AB evaporator Unit (Figure 15).

The magnitude and distribution of VOC concentrations reported in groundwater samples collected during this investigation are consistent with concentrations reported during historic investigations at groundwater monitoring locations distributed throughout the Building B005 VOC plume. The absence of TCA and the prevalence of TCE reported in groundwater samples collected within the SWMU AB area further supports the conclusion that dissolved-phase VOC impacts detected within the SWMU AB area are the result of the Building B005 VOC plume.

Moreover, the low level concentrations of TCA in SWMU AB groundwater samples, all of which were reported below NYSGWQS, are at least an order of magnitude less than concentrations reported in groundwater samples collected in the SWMU S area. As reported in the SWMU S SRIR (Golder, 2012) and illustrated on Figures 14 and 15, the source of TCA impacts to groundwater downgradient of SWMU AB and SWMU S is attributed to the DNAPL identified in the SWMU S area. The area impacted by DNAPL was delineated during the SWMU S investigation and is located north of SWMU AB. These data, together with the results of the SWMU S investigation, indicate that SWMU AB is not the source of historic TCA concentrations reported in monitoring wells located downgradient of the SWMU AB area.

4.0 CONCLUSIONS

Lithologic information, MIP XSD data, and soil and groundwater analytical data collected during this investigation provide an improved lateral and vertical definition of the near-surface lithologic units and a better understanding of the nature and extent of VOC impacts in the vicinity of SWMU AB. Key findings from this investigation include:

- Based on the groundwater flow direction evaluation, presented in the SWMU S SRIR (Golder, 2012) and illustrated on Figure 6, groundwater flow in the immediate area of SWMU AB is interpreted to flow west-northwest, and support previous groundwater flow interpretations that a groundwater divide is present at the site beneath Building B001 and that groundwater flows to the west-northwest north of the divide and west-southwest south of the divide.
- The Transition Zone in the vicinity of SWMU AB is composed of relatively dense silt and very fine sand.
- The base of the Surficial Sand Unit (i.e. the top of the Transition Zone) in the SWMU AB area is relatively flat, in contrast to Golder's observations in the SWMU S area where the localized depression in the base of Surficial Sand/Transition Zone contact strongly controls the distribution of contaminants in the subsurface.
- MIP XSD responses gradually increase from low (i.e., less than 40,000) in the unsaturated and saturated portions of the Surficial Sand Unit to the maximum observed responses (i.e., approximately 130,000) in the Transition Zone and then decrease rapidly in the Varved Clay Unit (see Table 4 and Figures 10 and 11).
- The overall absence of TCA detections in soil analytical samples indicate that the former SWMU AB TCA evaporator unit is not a source of VOC impacts to soil in the SWMU AB area.
- Concentrations of VOCs in groundwater increase with depth. The highest groundwater VOC concentrations (i.e., greater than 250 µg/l) were detected in samples collected within the Transition Zone from temporary groundwater monitoring wells located throughout the SWMU AB area.
- Concentrations of TCA reported in groundwater samples collected in the SWMU AB area were below NYSGWQS.
- VOCs reported at the highest concentrations above their respective NYSGWQS include TCE, 1,1-DCA, and 1,1-DCE and are consistent with those compounds comprising the Building B005 plume (GSC, 2011).
- The DNAPL identified during the SWMU S investigation is located north of the SWMU AB investigation area and is not associated with SWMU AB. The presence of DNAPL in the SWMU S area is considered the source of TCA impacts to groundwater historically detected downgradient of the SWMU AB and SWMU S areas.

In summary, this investigation identified that the primary dissolved-phase VOC present in groundwater in the SWMU AB investigation area is TCE and that the highest concentrations of VOCs occur in the Transition Zone. TCA was not detected in soil samples collected in the SWMU AB area and TCA detections in groundwater were reported below NYSGWQS. Overall, the magnitude and distribution of VOC concentrations reported in groundwater samples collected during this investigation are generally consistent with concentrations reported during historic groundwater monitoring events. These data

indicate the concentrations reported in groundwater samples collected from locations in proximity to the former SWMU AB evaporator unit are associated with the broader Building B005 VOC plume and not a discrete continuing source in the SWMU AB area.

As presented in the SWMU S SRIR (Golder, 2012), the southern extent of observed DNAPL is limited to an area located approximately 55 feet north of the SWMU AB investigation area and TCA detected above NYSGWQS in groundwater downgradient of SWMU AB is attributed to the DNAPL identified in the SWMU S area.

The results of the SWMU S investigation, together with the results of the SWMU AB investigation presented herein, support the conclusion that soils in the vicinity of SWMU AB are not a continuing source of VOC impacts to groundwater. As such, the investigation of SWMU AB is considered complete and no further action is recommended for SWMU AB.

This table correlates the stratigraphic units with MIP XSD responses and the total detected VOC concentrations in soil and groundwater along geologic cross-section A-A', presented on Figure 9. Analytical results are presented as the total of detected VOC concentrations reported in each sample as a visualization aid. NYSDEC does not currently promulgate a total VOC concentration standard in subsurface media. For complete analytical results for soil and groundwater samples see Tables 5 and 6, respectively.

Notes:

- 1) ft bgs = feet below ground surface
- 2) XSD = Halogen Specific Detector
- 3) μ V = microvolts
- 4) VOCs = Volatile Organic Compounds
- 5) mg/kg = milligram per kilogram
- 6) μ g/l = micrograms per liter
- 7) Color indicative of relative magnitude of XSD response and the total VOC concentration observed at each location.

XSD (μ V)	Soil (mg/kg)	GW (μ g/l)
< 99,999	= ND	= ND
> 100,000	< 1	< 5
> 500,000	< 5	< 500
> 1,000,000	< 50	< 5,000
> 3,000,000	< 500	< 50,000
> 5,000,000	< 5,000	< 500,000
> 5,000	> 5,000	> 500,000

This table correlates the stratigraphic units with MIP XSD responses and the total detected VOC concentrations in soil and groundwater along geologic cross-section B-B', presented on Figure 9. Analytical results are presented as the total of detected VOC concentrations reported in each sample as a visualization aid. NYSDEC does not currently promulgate a total VOC concentration standard in subsurface media. For complete analytical results for soil and groundwater samples see Tables 5 and 6, respectively.

Notes:

- 1) ft bgs = feet below ground surface
- 2) XSD = Halogen Specific Detector
- 3) μ V = microvolts
- 4) VOCs = Volatile Organic Compounds
- 5) mg/kg = milligram per kilogram
- 6) μ g/l = micrograms per liter
- 7) Color indicative of relative magnitude of XSD response and the total VOC concentration observed at each location.

XSD (μ V)	Soil (mg/kg)	GW (μ g/l)
< 99,999	= ND	= ND
> 100,000	< 1	< 5
> 500,000	< 5	< 500
> 1,000,000	< 50	< 5,000

FIGURE NARRATIVE

THIS FIGURE DEPICTS THE APPROXIMATE ELEVATION OF THE GROUNDWATER TABLE (PHREATIC SURFACE) CALCULATED FROM SYNOPTIC DEPTH-TO-WATER MEASUREMENTS IN SELECT SITE MONITORING WELLS COLLECTED BY GOLDER ON MARCH 21, 2012. THE DIRECTION OF GROUNDWATER FLOW AT AND NEAR THE PHREATIC SURFACE CAN BE GENERALLY INTERPRETED AS BEING PERPENDICULAR TO THE GROUNDWATER ELEVATION CONTOUR LINES. GOLDER INFERRED THE GROUNDWATER ELEVATION CONTOURS BASED ON THE DATA ILLUSTRATED. THE ACTUAL ELEVATION OF THE PHREATIC SURFACE IS LIKELY MORE HETEROGENEOUS THAN SHOWN AND ACTUAL CONDITIONS MAY VARY. OTHER INTERPRETATIONS ARE POSSIBLE. THE DEPTH TO GROUNDWATER IS KNOWN TO VARY WITH TIME.

APPENDIX D
DATA USABILITY SUMMARY REPORT

Data Usability Summary Report (DUSR)
SWMU AB Area
Former IBM Kingston Facility
Kingston, New York

This report presents the findings of the data quality assessment performed on the analyses of environmental samples collected between March 19, 2012 and April 12, 2012 at the Former IBM Kingston Facility, located at 300 Enterprise Drive, in Kingston, New York (Site). The chemical data were reviewed to verify:

- Data package completeness following New York State Department of Environmental Conservation (NYSDEC) Analytical Services Protocol (ASP) Category B deliverables;
- Sample holding time and method compliance; and,
- Quality control (QC) parameters, which could affect the use of the data for decision making purposes, are within required specifications.

Nine (9) grab soil samples, two (2) composite soil samples, seven (7) grab water samples, and one (1) composite water sample, were collected from the Site. Additionally, two (2) field duplicates, six (6) trip blanks, three (3) matrix spike/matrix spike duplicates (MS/MSD), and six (6) rinsate blanks were collected for quality control (QC) purposes. Lancaster Laboratories of Lancaster, PA analyzed the samples utilizing one or more of the following method guidelines:

- Volatile Organic Compounds (VOCs) by USEPA SW-846¹ Method 8260B Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS), Revision 2, December 1996;
- Methane by USEPA SW-846 Method 8015B Total Petroleum Hydrocarbons (TPH) as Gasoline and Diesel, Revision 2, December 1996;
- Select metals by USEPA SW-846 Method 6010B Inductively Coupled Plasma-Atomic Emission Spectrometry, Revision 2, December 1996;
- Nitrate / nitrite by USEPA MCAWW² Method 353.2 Determination of Nitrate-Nitrite by Automated Colorimetry, Revision 2, August 1993;
- Chemical oxygen demand by USEPA MCAWW Method 410.4 The Determination of Chemical Oxygen Demand by Semi-Automated Colorimetry, Revision 2, August 1993;

¹ USEPA, 1996, Test methods for evaluating solid waste, physical/chemical methods (SW-846): 3rd edition, Environmental Protection Agency, National Center for Environmental Publications, Cincinnati, Ohio, accessed at URL <http://www.epa.gov/epaoswer/hazwaste/test/sw846.htm>

² USEPA, Methods for Chemical Analysis of Water and Wastes (MCAWW), Environmental Protection Agency, Environmental Monitoring Systems Laboratory, Cincinnati, Ohio, accessed at URL <http://www.epa.gov/waterscience/methods/method/organics/>

- Total phosphorous by USEPA MCAWW Method 365.1 Determination of Phosphorus by Semi-Automated Colorimetry, Revision 2, August 1993;
- Sulfate, chloride, and fluoride by USEPA MCAWW Method 300.0 Determination of Inorganic Ions by Ion Chromatography, Revision 2.1, August 1993;
- Total organic carbon by SM 5310B Total Organic Carbon (TOC) / High-Temperature Combustion Method, Standard Methods 20th Edition³ (1998);
- Biological oxygen demand by SM 5210B Biological Oxygen Demand / 5-Day BOD Test, Standard Methods 20th Edition (1998);
- Total dissolved solids by SM 2540C Solids / Total Dissolved Solids Dried at 180 °C, Standard Methods 20th Edition (1998);
- Total suspended solids by SM 2540D Solids / Total Suspended Solids Dried at 103-105 °C, Standard Methods 20th Edition (1998);
- Alkalinity by SM 2320B Alkalinity / Titration Method, Standard Methods 20th Edition (1998);
- Ammonia by SM 4500-NH3 Nitrogen (Ammonia) / Titrimetric Method, Standard Methods 20th Edition (1998);
- Sulfide by SM 4500 S2 F Sulfide / Iodometric Method, Standard Methods 20th Edition (1998); and,
- Grain size by ASTM Standard D422 Standard Test Method for Particle-Size Analysis of Soils, 63(2007), ASTM International⁴.

Information regarding the sample point identifications, analytical parameters, QC samples, sampling dates and contract laboratory sample delivery group (SDG) designations are summarized in Table 1.

The samples and associated QC data were evaluated following guidelines provided by the NYSDEC DER-10 Technical Guidance for Site Investigation and Remediation, Appendix 2B *Guidance for Data Deliverables and the Development of Data Usability Summary Reports*, May 2010 and utilizing the guidance provided by USEPA Region II Standard Operating Procedures (SOPs) HW-24, Revision 2 (Validating Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry SW846 8260B) and HW-2, Revision 13 (Evaluation of Metals Data for the Contract Laboratory Program (CLP) based on SOW – ILM05.3), where applicable to the analytical methodologies previously noted. Where there was a conflict between the NYSDEC guidelines or USEPA Region II guidelines, method-specific criteria or professional judgment was used.

³ Standard Methods for the Examination of Water and Waste Water, accessed at URL <http://standardmethods.org>

⁴ American Society of Testing and Materials, ASTM International, West Conshohocken, PA, accessed at URL <http://www.astm.org>

The data were evaluated for sample preservation and holding times, method and field blanks, surrogate spikes (volatile organics only), MS/MSDs, post-digestion spikes (metals analysis only), laboratory control samples (LCS), serial dilutions (metals analysis only) and field duplicate precision.

Grain size data provided following ASTM Standard D422 were not evaluated as part of this data usability summary as no QC parameters were analyzed.

Analytical results for the samples collected at the Site were qualified on the basis of outlying precision and accuracy parameters, or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data during the data validation process.

- J** The analyte was positively identified and the associated numerical value is the approximate concentration of the analyte in the sample (due either to the quality of the data generated because certain quality control criteria were not met, or the concentration of the analyte was below the CRQL).
- U** The analyte was analyzed for, but was not detected at a level greater than or equal to the level of the adjusted Contract Required Quantitation Limit (CRQL) for sample and method.

The data generated as part of this sampling event met the QC criteria established in the respective USEPA and NYSDEC guidelines, except as noted below:

- Select results VOC results were qualified as estimated (J) because field duplicate criteria were not achieved.
- One result for cadmium was reported at the CRQL and qualified as non-detect (U) due to laboratory blank contamination.
- Select VOC results were qualified as estimated (J) when surrogate recoveries were outside of QC criteria.

Table 2 summarizes all qualifications applied to the data.

Several samples were analyzed at dilution in order to bring target analyte concentrations within the calibrated range of the analytical instruments. The detection limits of these samples are considered elevated since undiluted results were not provided.

In general, the data generated during the SWMU AB Area Investigation met the QC criteria established in the respective USEPA and NYSDEC guidelines. All data provided by the laboratory met the terms of NYSDEC ASP Category B deliverables, the requested analytical methodology was completed, and sample holding time requirements were observed.

Based on the data validations and data quality assessment, the analytical data for samples collected at the Site were determined to be acceptable (including estimated data) for their intended use. The overall data completeness (i.e. the ratio of the amount of valid data obtained to the amount expected, including estimated data) was 100%, which exceeds the completeness goal identified in Section 4.3.4 of the RFI Management Plans.

10237	Toluene	108-88-3	N.D.	1	6	0.89
10237	1,1,1-Trichloroethane	71-55-6	N.D.	1	6	0.89
10237	1,1,2-Trichloroethane	79-00-5	N.D.	1	6	0.89
10237	Trichloroethene	79-01-6	N.D.	1	6	0.89
10237	Trichlorofluoromethane	75-69-4	N.D.	2	6	0.89
10237	1,2,3-Trichloropropane	96-18-4	N.D.	1	6	0.89
10237	Vinyl Chloride	75-01-4	N.D.	1	6	0.89
10237	Xylene (Total)	1330-20-7	N.D.	1	6	0.89

The GC/MS volatile internal standard peak areas were outside the QC limits. A re-analysis was performed, and the matrix effect was confirmed.

Wet Chemistry	SM20 2540 G	%	%	%
00111 Moisture	n.a.	22.1	0.50	0.50

"Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis.

Quality Control Summary

Client Name: IBM
Reported: 03/30/12 at 07:37 PM

Group Number: 1296319

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B, GC/MS Volatiles**

Batch #: A120811AA (Sample number(s): 6584361-6584367 UNSPK: 6584365)

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside outside acceptance windows: Ethylbenzene, Bromobenzene, 2-Chlorotoluene, 4-Chlorotoluene, 1,3-Dichlorobenzene, 1,4-Dichlorobenzene, 1,2-Dichlorobenzene, Xylene (Total)

Sample #s: 6584369

The GC/MS volatile internal standard peak areas were outside the QC limits. A re-analysis was performed, and the matrix effect was confirmed.

SW-846 8260B 25mL purge, GC/MS Volatiles

Batch #: C120802AA (Sample number(s): 6584373-6584374)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Vinyl Chloride

To: Nicole Maljovec
Subject: RE: Sample Depth Discrepancy between COC and Sample Labels

The correct sample IDs are as follows:

SAB-SB-01-24.5-25.0
SAB-SB-02-19.0-19.5
SAB-SB-02-24.0-24.5

From: Nicole Maljovec [mailto:nmaljovec@lancasterlabs.com]
Sent: Wednesday, March 21, 2012 1:02 PM
To: Gorman, Daniel
Subject: Sample Depth Discrepancy between COC and Sample Labels
Importance: High

Hi Dan,
Can you double check the depths on three samples?

SAB-SB-01-24.0-24.5 (COC) has a depth of 24.5-25.0 on the sample label
SAB-SB-02-19.0-19.5 (COC) has a depth of 20.0-20.5 on the sample label
SAB-SB-02-24.0-24.5 (COC) has a depth of 24.5-25.0 on the sample label

Please let me know if we should follow the COC or the bottle labels for the depths.

Thanks!
Nicole

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J – estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

- A** TIC is a possible aldol-condensation product
- B** Analyte was also detected in the blank
- C** Pesticide result confirmed by GC/MS
- D** Compound quantitated on a diluted sample
- E** Concentration exceeds the calibration range of the instrument
- N** Presumptive evidence of a compound (TICs only)
- P** Concentration difference between primary and confirmation columns $>25\%$
- U** Compound was not detected
- X,Y,Z** Defined in case narrative

Inorganic Qualifiers

- B** Value is <CRDL, but \geq IDL
- E** Estimated due to interference
- M** Duplicate injection precision not met
- N** Spike sample not within control limits
- S** Method of standard additions (MSA) used for calculation
- U** Compound was not detected
- W** Post digestion spike out of control limits
- * Duplicate analysis not within control limits
- + Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Quality Control Summary

Client Name: IBM
Reported: 03/30/12 at 11:18 AM

Group Number: 1297526

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report.

Analysis Name: EPA SW846/8260 (water-25ml) #1

*- Outside of specification

**-This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

Quality Control Summary

Client Name: IBM
Reported: 03/30/12 at 11:18 AM

Limits: 77-114 74-113 77-110 78-110

*- Outside of specification

**-This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

Project Name: IBM - Kingston
LLI Group #: 1297526

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B 25mL purge, GC/MS Volatiles**

Batch #: G120881AA (Sample number(s): 6591078-6591084 UNSPK: 6591078)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Trichloroethene

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J – estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	B	Value is <CRDL, but \geq IDL
B	Analyte was also detected in the blank	E	Estimated due to interference
C	Pesticide result confirmed by GC/MS	M	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	N	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	S	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	U	Compound was not detected
P	Concentration difference between primary and confirmation columns $>25\%$	W	Post digestion spike out of control limits
U	Compound was not detected	*	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

The LCS and/or LCSD recoveries are outside the stated QC window but within the marginal exceedance allowance of +/- 4 standard deviations as defined in the NELAC Standards. The following analytes are accepted based on this allowance: 1,1-dichloroethene.

Wet Chemistry	SM20 2540 G	%	%	%
00111 Moisture	n.a.	5.7	0.50	0.50

"Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis.

10237	Xylene (Total)	1330-20-7	N.D.	1	6	1.07

The LCS and/or LCSD recoveries are outside the stated QC window but within the marginal exceedance allowance of +/- 4 standard deviations as defined in the NELAC Standards. The following analytes are accepted based on this allowance: 1,1-dichloroethene.

Wet Chemistry	SM20 2540 G	%	%	%
00111 Moisture	n.a.	16.7	0.50	0.50

"Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis.

*=This limit was used in the evaluation of the final result

Quality Control Summary

Client Name: IBM

Group Number: 1299021

Reported: 04/13/12 at 08:30 AM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification

**-This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B, GC/MS Volatiles**

Batch #: X120921AA (Sample number(s): 6599211-6599213 UNSPK: P598388)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD were below the acceptance window: 1,1-Dichloroethene

Sample #s: 6599214, 6599229, 6599232

The GC/MS volatile internal standard peak areas were outside the QC limits. A re-analysis was performed, and the matrix effect was confirmed.

Sample #s: 6599211, 6599212, 6599213

The LCS and/or LCSD recoveries are outside the stated QC window but within the marginal exceedance allowance of +/- 4 standard deviations as defined in the NELAC Standards. The following analytes are accepted based on this allowance: 1,1-dichloroethene.

SW-846 8260B 25mL purge, GC/MS Volatiles

Batch #: G120961AA (Sample number(s): 6599209-6599210, 6599219-6599228 UNSPK: 6599224)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: 1,1-Dichloroethene, Trichloroethene

SW-846 6010B, Metals

Batch #: 120901848005 (Sample number(s): 6599221 UNSPK: P599457 BKG: P599457)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium, Sodium, Magnesium

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Arsenic, Antimony

EPA 300.0, Wet Chemistry

Batch #: 12101987121B (Sample number(s): 6599221 UNSPK: P597867 BKG: P597867)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride, Sulfate, Fluoride

EPA 365.1, Wet Chemistry

Batch #: 12093109101A (Sample number(s): 6599221 UNSPK: P600452 BKG: P600452)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Phosphorus as P (water)

EPA 410.4, Wet Chemistry

Batch #: 12094400101B (Sample number(s): 6599221 UNSPK: P599920 BKG: P599920)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chemical Oxygen Demand

Sample #s: 6599221

Reporting limits were raised due to interference from the sample matrix.

SM20 2540 D, Wet Chemistry

Batch #: 12096020602A (Sample number(s): 6599221 BKG: P603122)

From: Gorman, Daniel [Daniel_Gorman@golder.com]
Sent: Thursday, April 05, 2012 7:47 AM
To: Nicole Maljovec
Subject: RE: Sample ID Question & Cooler update

Nicole-

For Sample IWB1-SB-04, the correct ID should be 4.0-4.5: IWB1-SB-04-4.0-4.5.

Also, all sample times are correct on the COC; if there were discrepancies between the COC and the sample labels, please follow the COC for the sample times (as you have).

Thanks-
Daniel

From: Nicole Maljovec [mailto:nmaljovec@lancasterlabs.com]
Sent: Wednesday, April 04, 2012 3:12 PM
To: Gorman, Daniel
Subject: Sample ID Question & Cooler update

Hi Daniel,
I received your voicemail just now and tracked the cooler. It looks like it was just delivered around 2:00. Let me know if haven't received it yet. Also I noticed that only 1 cooler was delivered instead of 3. Let me know where to deliver the other 2 coolers and I'll place the order. Sorry about that one.

On the attached COC, there were a few time discrepancies between the COC and the bottle labels. We followed the COC for entry. If we should follow the labels for the time, let me know and I'll update the group.

For sample IWB1-SB-04-4.0-4.5 (from COC), the encore labels have a depth of 4.5-5.0. Should we enter the depth from the COC or labels?

Thanks!
Nicole

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J – estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	B	Value is <CRDL, but \geq IDL
B	Analyte was also detected in the blank	E	Estimated due to interference
C	Pesticide result confirmed by GC/MS	M	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	N	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	S	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	U	Compound was not detected
P	Concentration difference between primary and confirmation columns $>25\%$	W	Post digestion spike out of control limits
U	Compound was not detected	*	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Quality Control Summary

Client Name: IBM
Reported: 04/20/12 at 03:06 PM

Group Number: 1301104

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Project Name: IBM - Kingston
LLI Group #: 1301104

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B 25mL purge, GC/MS Volatiles**

Batch #: C121041AA (Sample number(s): 6611191-6611200 UNSPK: 6611195)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Trichloroethene, 1,1,1-Trichloroethane

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J – estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	B	Value is <CRDL, but \geq IDL
B	Analyte was also detected in the blank	E	Estimated due to interference
C	Pesticide result confirmed by GC/MS	M	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	N	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	S	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	U	Compound was not detected
P	Concentration difference between primary and confirmation columns $>25\%$	W	Post digestion spike out of control limits
U	Compound was not detected	*	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Wet Chemistry SM20 2540 G

% % %

"Moisture" represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported above is on an as-received basis.

General Sample Comments

State of New York Certification No. 10670

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: IBM

Group Number: 1302007

Reported: 04/24/12 at 08:01 PM

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

LLI Group #: 1302007

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:**SW-846 8260B, GC/MS Volatiles**

Batch #: Q121141AA (Sample number(s): 6615345)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 6615345

Batch #: X121081AA (Sample number(s): 6615344 UNSPK: P612594 BKG: P612311)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Dichlorodifluoromethane, Vinyl Chloride, Trichlorofluoromethane, 1,1-Dichloroethene, 1,1-Dichloroethane, Chloroform, 1,1,1-Trichloroethane, Carbon Tetrachloride, Trichloroethene, 1,2-Dichloropropane, Toluene, Tetrachloroethene, Chlorobenzene, 1,1,1,2-Tetrachloroethane, Ethylbenzene, 1,2-Dichloroethene (Total), xylene (Total), Freon 113, Freon 123a

SW-846 8260B 25mL purge, GC/MS Volatiles

Batch #: G121072AA (Sample number(s): 6615335, 6615341-6615343 UNSPK: P612681)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: 1,1,1-Trichloroethane

8 Data Package Options (please circle if required) Type I (Validation/NJ Reg) TX TRRP-13 NY ASP A Type III (Reduced NJ) MA MCP NY ASP B Type VI (Raw Data Only) CT RCP				Relinquished by _____ Site-specific QC (MS/MSD/Dup) Yes No				Received by Bruce Brush Date 4.3.12 Time 930				Temperature upon receipt 14 °C												
SDG Complete? Yes _____ No _____				(If yes, indicate QC sample and submit triplicate volume.)																				

Environmental Sample Administration

Receipt Documentation Log

Client/Project: IBM

Date of Receipt: 4-13-12

Time of Receipt: 930

Source Code: 50-1

Shipping Container Sealed: YES NO

Custody Seal Present *: YES NO

* Custody seal was intact unless otherwise noted in the discrepancy section

Package: Chilled Not Chilled

Temperature of Shipping Containers							
Cooler #	Thermometer ID	Temperature (°C)	Temp Bottle (TB) or Surface Temp (ST)	Wet Ice (WI) or Dry Ice (DI) or Ice Packs (IP)	Ice Present? Y/N	Loose (L) Bagged Ice (B) or NA	Comments
1	2983	1.4	TB	WI	Y	L	
2							
3							
4							
5							
6							

Number of Trip Blanks received NOT listed on chain of custody: 0

Paperwork Discrepancy/Unpacking Problems:

matrix for 1D SAB|SS|FWB1-WC - DEcon |Purge
Says Soil on coc Rec 3 vials of water.

Unpacker Signature/Emp#:

Bruno Bandy 2299

Date/Time: 4-13-12 10:18

Issued by Dept. 6042 Management

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

- < less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.
 - > greater than
- ppm** parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.
- ppb** parts per billion
- Dry weight basis** Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J – estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers		Inorganic Qualifiers	
A	TIC is a possible aldol-condensation product	B	Value is <CRDL, but \geq IDL
B	Analyte was also detected in the blank	E	Estimated due to interference
C	Pesticide result confirmed by GC/MS	M	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	N	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	S	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	U	Compound was not detected
P	Concentration difference between primary and confirmation columns $>25\%$	W	Post digestion spike out of control limits
U	Compound was not detected	*	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	+	Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL LANCASTER LABORATORIES BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF LANCASTER LABORATORIES AND (B) WHETHER LANCASTER LABORATORIES HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Lancaster Laboratories which includes any conditions that vary from the Standard Terms and Conditions, and Lancaster hereby objects to any conflicting terms contained in any acceptance or order submitted by client.
